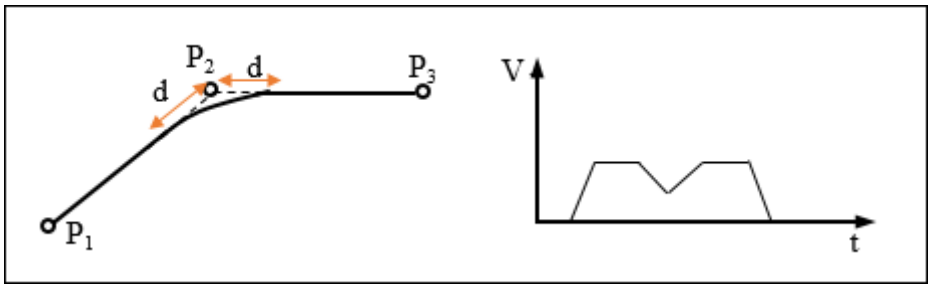
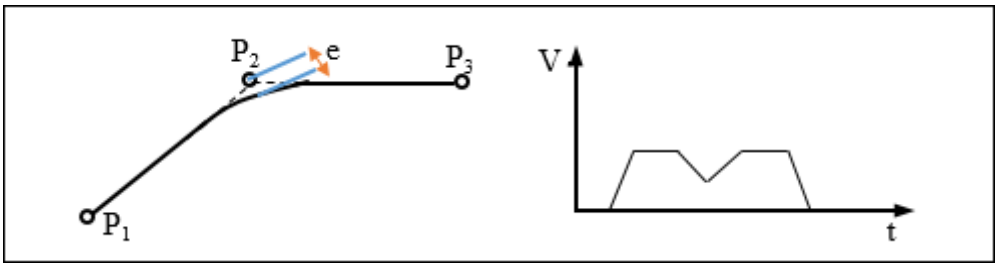
This variable specifies how to blend the velocities of two instructions when Blending is specified for the BufferMode.

- TMNone: Insert no transition curve. If TMNone is selected in a blending mode, the result is currently consistent with the transition between the velocities of the two instructions in buffered mode. Further extensions are planned.



- TMStartVelocity: Transition with given start velocity. Blending transition at a certain ratio (0, 1] of the actual maximum velocity of the current motion control instruction. Effective for transitions between any motion control instructions.



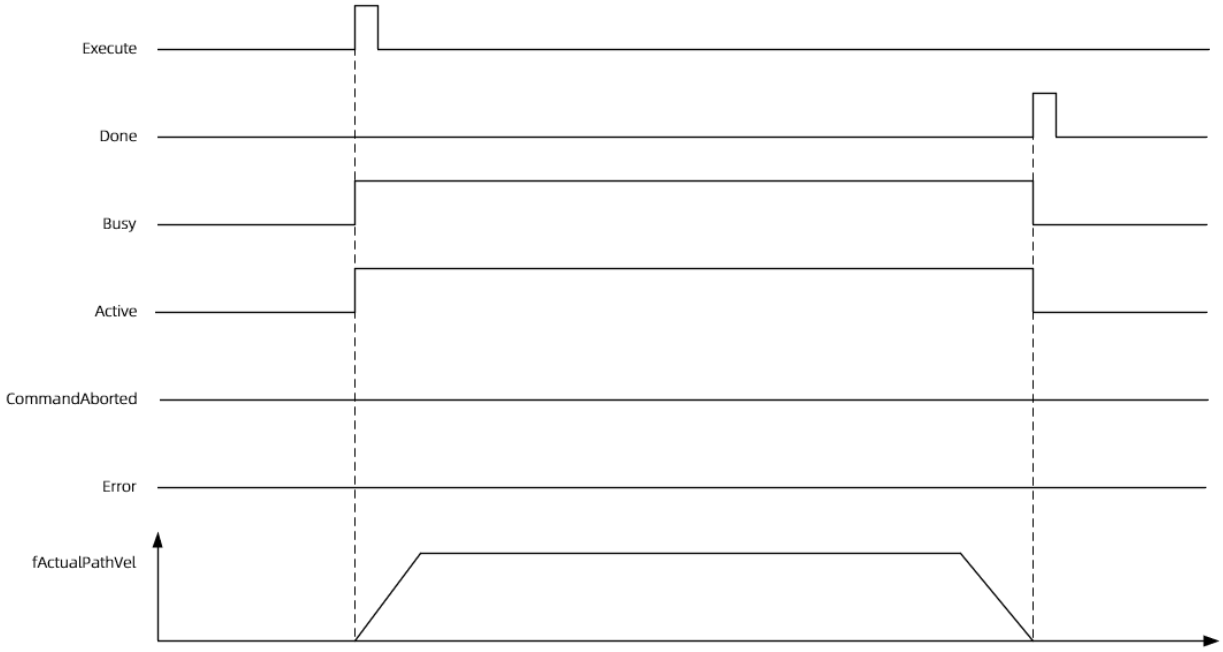
- TMCornerDistance: Corner transition mode In Cartesian space, this parameter specifies the distance before the end of the previous instruction, measured in the main dimension space. The transition trajectory is initiated at this distance to connect with the adjacent trajectory. The distance here is a generalized distance, which depends on the main dimension type setting of the axis group.
  When the primary dimension is set to position: the parameter is the displacement from the transition point to the end point.

  When the primary dimension is set to ratio: The parameter is the ratio (0 to 1) of the resultant distance from the transition point to the endpoint to the total resultant displacement.

- TMMaxCornerDeviation: Transition mode using the maximum corner position deviation. In Cartesian space, this parameter specifies the maximum position deviation in the position subspace during the transition between adjacent instructions. An appropriate transition trajectory is constructed to connect the two adjacent paths, keeping the maximum position deviation within this limit. This is only the position deviation, independent of the main unit. Effective when both adjacent instructions are Cartesian space instructions (LIN/CIRC). Otherwise, they are processed with transition disabled.

- TMDefinedVelocity: Transition with defined velocity. Blending transition at a certain ratio (0, 1] of the actual maximum velocity of the instruction following the current motion control instruction. Effective for transitions between any motion control instructions.

- **Precautions**
  - This instruction only supports relative circular motion in PCS coordinates.
  - The dimensions of the axis group planning parameters (velocity, acceleration, deceleration, and jerk) depend on the primary dimension set during axis group initialization. Different primary dimension types result in different dimensions and meanings for these parameters, and the parameter units are consistent with the axis group settings for the user.
    - UNIT_TRAJECT position. The input planning parameters are processed according to workspace position planning parameters.
    - UNIT_PERCENT and maximum planning parameter ratio: The input planning parameters are processed as a combined ratio coefficient based on workspace pose planning parameters.
  - When the current motion instruction is interrupted, circular motion constructs a transition trajectory in working space along the direction of the velocity at the breakpoint to ensure smooth connection with the subsequent trajectory. This ensures velocity continuity only. However, the acceleration continuity is not guaranteed. For details on the three transition modes supported for aborting, see the motion abort description.
  - The transition trajectory calculation for the aborting instruction is planned according to the acceleration segment parameters set in the instruction. The higher the acceleration segment parameter value, the shorter the transition trajectory and the faster the transition.
  - **If the instruction motion mode is set to an interruption mode and the deceleration distance is insufficient, the function block reports an error. But the axis group does not enter the GroupErrorStop state; the original motion continues to execute.**
  - This instruction can only be initiated when the axis group is in the GroupMoving or GroupStandby state. Attempting to start this instruction in any other state will result in an error.
  - During the execution of this instruction, it can be interrupted by other motion instructions, MC_GroupStop, or MC_GroupHalt.
  - After the execution of this instruction, the axis group (AxesGroup) state is changed from GroupMoving to GroupStandby, or remains in the GroupMoving state.
  - If the current motion is in a static coordinate system, the axis group is changed from the GroupMoving state to the GroupStandby state. If the current motion is in a dynamic coordinate system, the axis group remains in the GroupMoving state.
  - If the motion includes orientation information, the orientation of the intermediate point for the BORDER_ARC three-point arc instruction is ignored; only the orientations of the start and end points are considered.



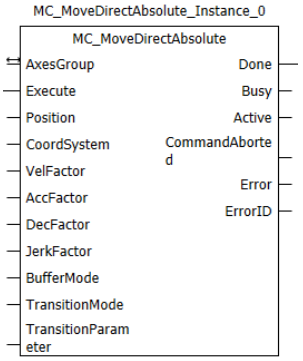
- **Program example**

  The example program for this instruction can refer to the MC_MoveDirectRelative instruction. This instruction can also be combined with other AxesGroup motion instructions.

- **Sequence diagram**

  When "Execute" is started, the output variables "Busy" and "Active" become TRUE. When the target position is reached, the axis group speed becomes 0, the output variable "Done" becomes TRUE, and the output variables "Busy" and "Active" become FALSE.

  An arc interpolation instruction is called to perform interpolation along the X-axis and Y-axis.



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.5.19 MC_MoveDirectAbsolute

The point-to-point instruction for the axis group commands the axis group to move from the current TCP point to an absolute position without requiring a specific path.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
MC_MoveDirectAbsolute	Point-to-point absolute motion		MC_MoveDirectAbsolute_Instance_0(AxesGroup := , Execute := , Position := , CoordSystem := , VelFactor := , AccFactor := , DecFactor := , JerkFactor := , BufferMode := , TransitionMode := , TransitionParameter := , Done => , Busy => , Active =>, CommandAborted =>, Error =>, ErrorID =>);

- **Related variables**

In-out variables

In-out Variable	Name	Data Type	Valid Range	Default Value	Description
AxesGroup	Axis group	18.3.3.2.4.1 AXES_GROUP_REF: Axis Group Structure	-	-	Mapped to an axis group, which is an instance of AXES_GROUP_REF.

Input variable

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Execute	Execute	BOOL	TRUE, FALSE	FALSE	Execute the instruction on a rising edge.
Position	Absolute Position	ARRAY [1..GROUP_DEF.AXIS_NUM] OF LREAL	-	-	For the end position in each dimension in the specified coordinate system, see Axis group type description.

Input Variable	Name	Data Type	Valid Range	Default Value	Description
CoordSystem	Coordinate system type	18.3.3.2.4.19 MC_COORDSYSTEM: Coordinate System Enumeration	ACS, PCS	ACS	Select the application coordinate system type.
VelFactor	Velocity factor	LREAL	(0,1]	0.10	Maximum velocity factor. This value may not necessarily be reached. If the value is greater than 1, it is corrected to 1. If the value is less than or equal to 0, it is corrected to 1e-5.
AccFactor	Acceleration factor	LREAL	(0,1]	0.10	Maximum acceleration factor. This value may not necessarily be reached. If the value is greater than 1, it is corrected to 1. If the value is less than or equal to 0, it is corrected to 0.1.
DecFactor	Deceleration factor	LREAL	(0,1]	0.10	Maximum deceleration factor. This value may not necessarily be reached. If the value is greater than 1, it is corrected to 1. If the value is less than or equal to 0, it is corrected to 0.1.
JerkFactor	Jerk factor	LREAL	[0,1]	0.10	Maximum jerk factor. This value may not necessarily be reached. For the non-trapezoidal motion profiling, the factor will be corrected to 1 if it is greater than 1. If it is less than or equal to 0, it will be corrected to 0.1.

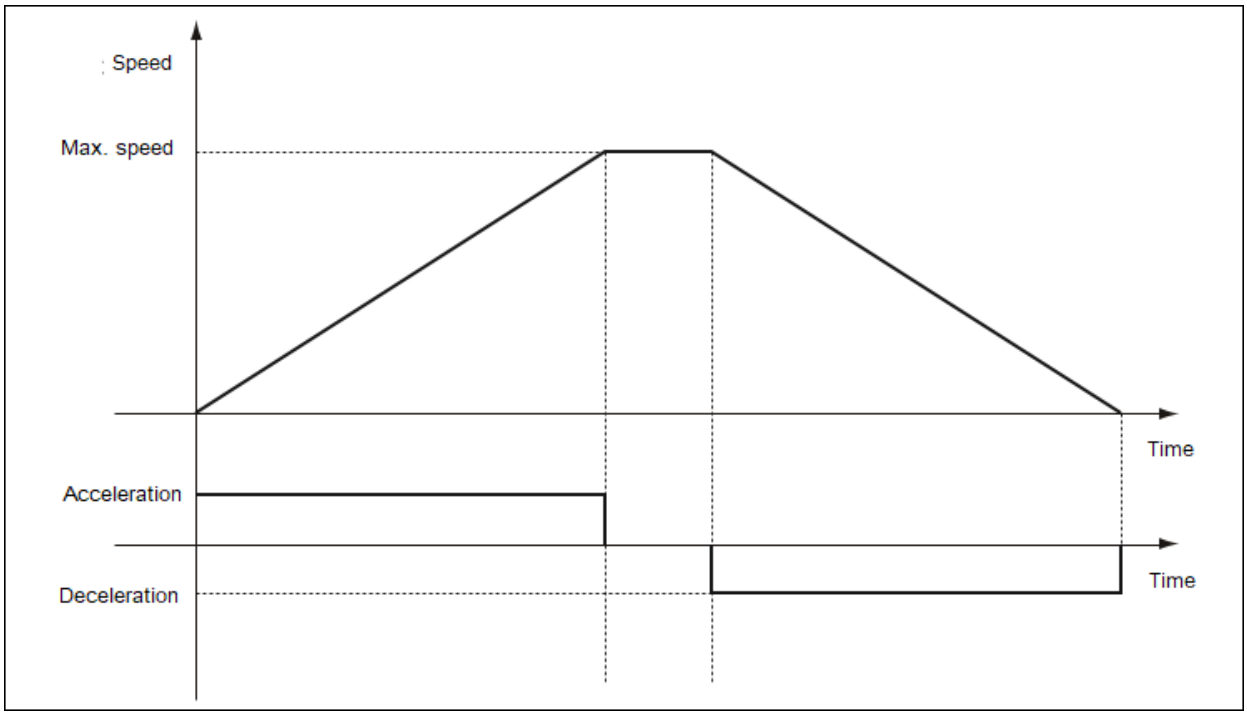
Input Variable	Name	Data Type	Valid Range	Default Value	Description
BufferMode	Buffer mode	18.3.3.2.2.6 MC_BUFFER_MODE: Buffer Mode Enumeration	0: mcAborting 1: mcBuffered 2: mcBlendingLow 3: mcBlendingPrevious 4: mcBlendingNext 5: mcBlendingHigh	0	0: mcAborting (Aborting). 1: mcBuffered (Buffered). 2: mcBlendingLow (Blending with the lowest velocity of both FBs). 3: mcBlendingPrevious (Blending with the velocity of the first FB). 4: mcBlendingNext (Blending with velocity of the second FB). 5: mcBlendingHigh (Blending with the highest velocity of both FBs). Note: Buffer modes 2 to 5 currently have the same effect. All are blending modes. The behavior depends on the TransitionMode and TransitionParameter parameters.
TransitionMode	Transition mode	18.3.3.2.4.10 MC_TRANSITION_MODE: Transition Mode Enumeration	0: TMNone 1: TMStartVelocity 10: TMDefinedVelocity 11: TMResetAbort 12: TMDecAbort	0	Definition of the transition trajectory characteristic types. When BufferMode is set to MC_ABORTING, only the transition mode parameters TMNone, TMResetAbort, and TMDecAbort are allowed. When BufferMode is set to MC_BUFFERED, the transition mode is invalid. When BufferMode is a blending mode (2 to 5), only TMNone, TMStartVelocity, and TMDefinedVelocity are allowed.
TransitionParameter	Transition parameter	LREAL	Velocity [0.0,1.0]	1.0	Transition parameters vary with the transition mode.

Output variable

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Done	Done	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is done.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is received.

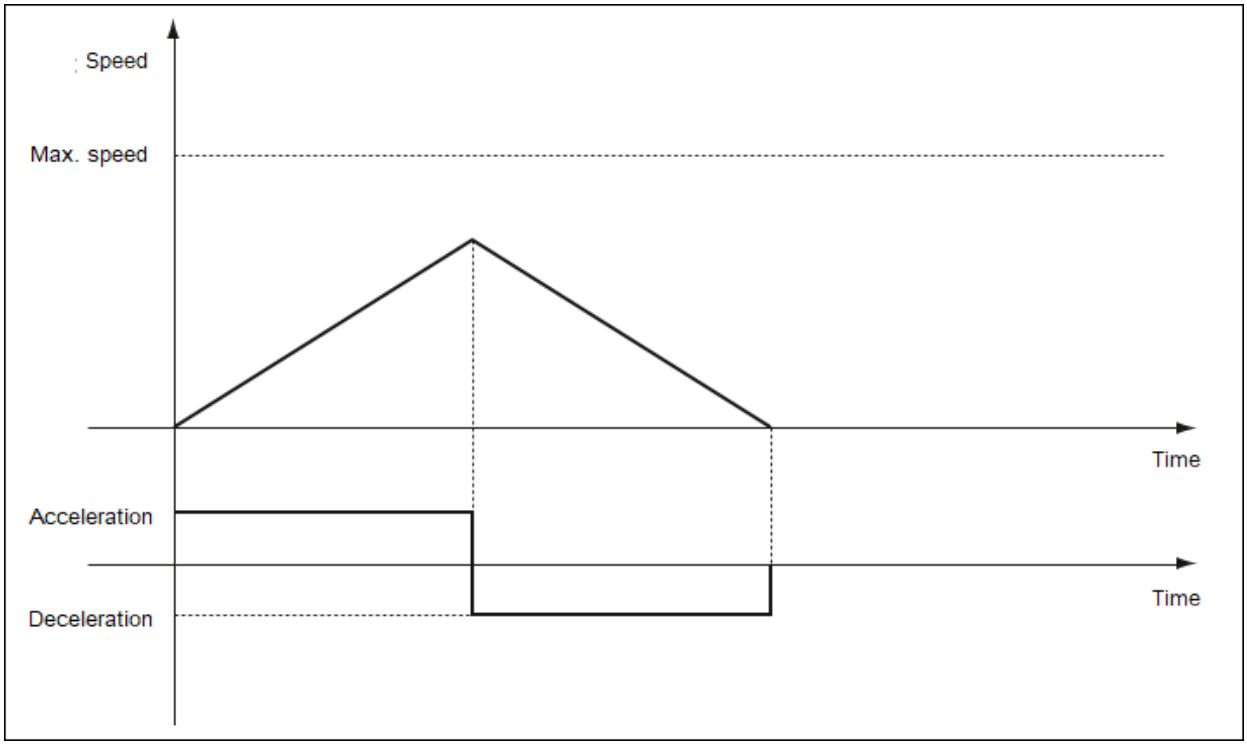
Output Variable	Name	Data Type	Valid Range	Default Value	Description
Active	Instruction has controlled the axis group	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the axis group is being controlled.
CommandAborted	Command aborted	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is aborted.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs.

- **Parameter correction**



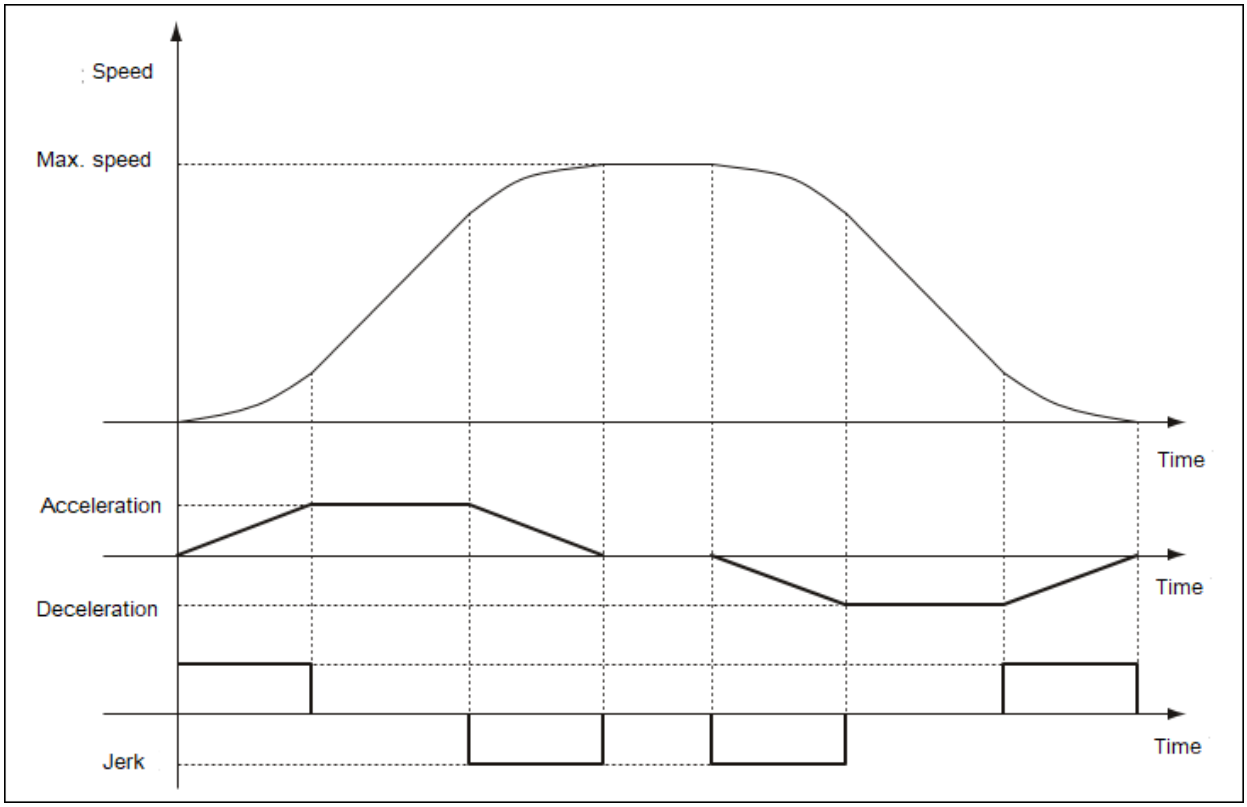
Input Variable	Name	Correction Description for Values Greater Than 1 or Backend Limit	Correction Description for Parameter Value Less than 0	Correction Description for Parameter Value Equal to 0
VelFactor	Velocity factor	If the velocity factor is greater than 1, it is automatically corrected to 1.	If the velocity factor is less than 0, it is automatically corrected to 1e-5 for operation.	If the velocity factor is equal to 0, it is automatically corrected to 1e-5 for operation.
AccFactor	Acceleration factor	If the acceleration factor is greater than 1, it is automatically corrected to 1.	If the acceleration factor is less than 0, it is automatically corrected to 0.1 for operation.	If the acceleration factor is equal to 0, it is automatically corrected to 0.1 for operation.
DecFactor	Deceleration factor	If the deceleration factor is greater than 1, it is automatically corrected to 1.	If the deceleration factor is less than 0, it is automatically corrected to 0.1 for operation.	If the deceleration factor is equal to 0, it is automatically corrected to 0.1 for operation.

Input Variable	Name	Correction Description for Values Greater Than 1 or Backend Limit	Correction Description for Parameter Value Less than 0	Correction Description for Parameter Value Equal to 0
JerkFactor	Jerk factor	If the jerk factor is greater than 1 in the non-trapezoidal motion profiling, it is automatically corrected to 1.	If the jerk factor is less than 0 in the non-trapezoidal motion profiling, it is automatically corrected to 0.1 for operation.	If the jerk factor is equal to 0 in the non-trapezoidal motion profiling, it is automatically corrected to 0.1 for operation.

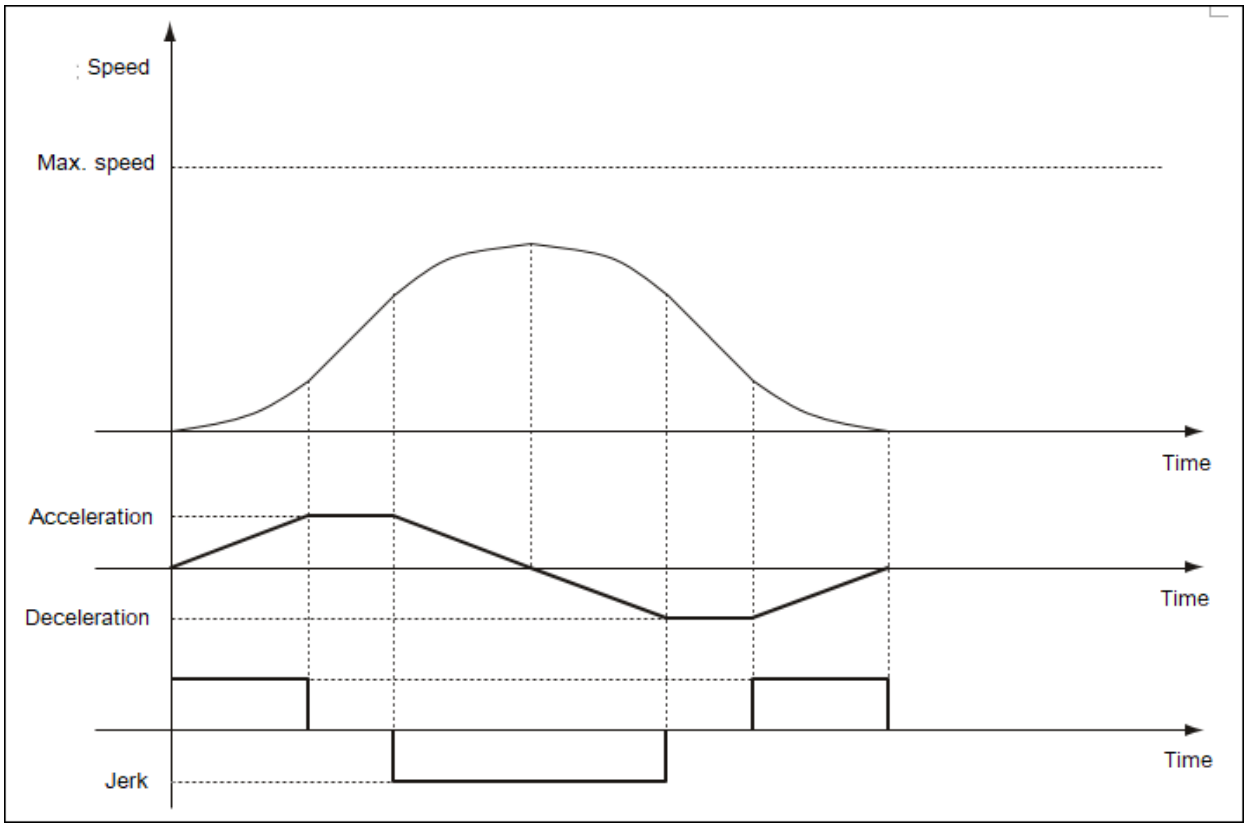


- **Function**
  - This instruction is executed on the rising edge of Execute and performs point-to-point absolute motion from two axes to four axes.
  - Position, CoordSystem, VelFactor, AccFactor, DecFactor, JerkFactor, BufferMode, TransitionMode, TransitionParameter can be specified in the input variables.
  - For the instruction, blending modes 2, 3, 4, and 5 for BufferMode have the same behavior. The transition effect depends on the TransitionMode and TransitionParameter settings.
  - Supports the same-cycle triggering of instructions. The Done output signal of the instruction serves as the trigger signal for Execute.
  - **CoordSystem**
    - Specifies the coordinate system for point-to-point absolute motion.
  - **Position (Absolute position coordinate)**
    - For the axis type corresponding to each position vector in the Position array, see Axis group type description.
    - In absolute motion mode, the axis group uses the set values in the Position array as the target position.
    - When the coordinate system type is set to PCS, the ABC rotary axes of the coordinate system correspond to the ZYX-type Euler angles, respectively. If the configuration supports orientation motion, the configured ABC absolute positions must be within ±180°, otherwise an error will be generated.
    - If the target position exceeds any joint axis limit, starting this instruction will cause an error.
    - If the configuration supports orientation motion, the axis group will move to the target orientation along the shortest path.
  - **VelFactor, AccFactor, DecFactor, JerkFactor**
    - If the velocity of any Axis variable in AxesGroup exceeds the maximum axis velocity limited by the software, it will trigger an error-stop condition.
    - The maximum interpolation speed of each axis in AxesGroup equals the maximum axis velocity limited by the software multiplied by VelFactor. The maximum interpolation acceleration equals the maximum axis acceleration limited by the software multiplied by AccFactor. The maximum interpolation deceleration equals the maximum axis deceleration limited by the software multiplied by DecFactor. The maximum interpolation jerk equals the maximum axis jerk limited by the software multiplied by JerkFactor.

- The trajectory planning curve type of AxesGroup is set according to requirements. If the planning curve type is a trapezoidal curve, the JerkFactor variable does not take effect and is treated as 0.
- For JerkFactor = 0 or JerkFactor ≠ 0, the velocity, acceleration, deceleration, and jerk curves are shown in the figure below.

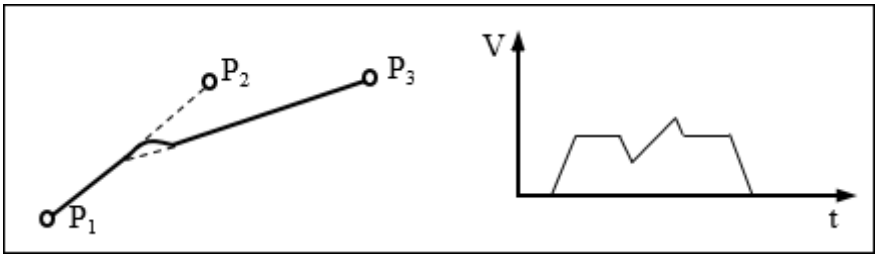


For JerkFactor = 0, the axis group can reach the maximum interpolation velocity.

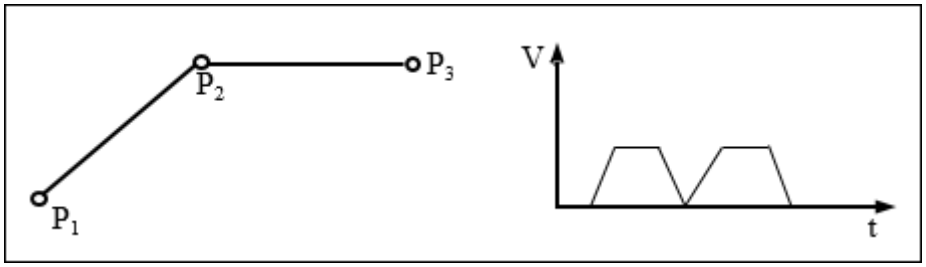


For JerkFactor = 0, the axis group cannot reach the maximum interpolation velocity due to too short travel distance.

For JerkFactor ≠ 0, the axis group can reach the maximum interpolation velocity. (Non-trapezoidal planning curve)

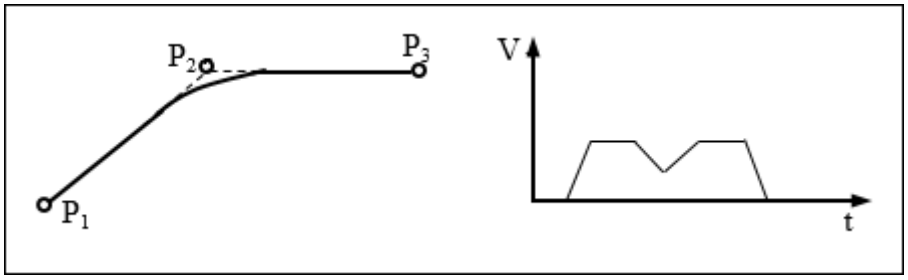


For JerkFactor ≠ 0, the axis group cannot reach the maximum interpolation velocity due to too short travel distance. (Non-trapezoidal planning curve)



- **Re-triggering the instruction**
  - While the instruction is in motion, that is, when the instruction output parameters "Busy" and "Active" are both TRUE, this instruction cannot be re-triggered.
  - While the instruction is in buffer mode, that is, when Busy is TRUE and Active is FALSE, this instruction can be re-triggered after parameter modification. If the modified parameters are invalid, or if the buffered instruction data has already been used in motion calculations, retriggering the buffered

instruction will cause an error. Then, the axis group will enter the GroupStop state, and the currently executing instruction will also report an error.



- **Multiple execution of motion instructions**
  - When this instruction is issued while another motion instruction is being executed, the new instruction can either be switched to immediately or buffered for later execution. Each axis group can buffer up to 8 instructions. In the case of multiple executions, the behavior of this instruction is determined by BufferMode.
  - BufferMode
    - Aborting: MC_ABORTING aborts the currently executing instruction and begins executing this instruction. The abort operation supports three modes, configurable via TransitionMode: TMNone, TMResetAbort, and TMDecAbort. For the meanings of these modes, see the MC_MoveLinearXX instruction description. The following figure illustrates the TMResetAbort mode:

    - Buffer: MC_BUFFERED, this instruction is buffered and executed after the current instruction is completed.

    - Blending: MC_BLEND, the velocities of the two adjacent instructions are blended in the specified manner. This manner is specified in TransitionMode.

  - TransitionMode

    This variable specifies how to blend the velocities of two instructions when Blending is specified for the BufferMode.

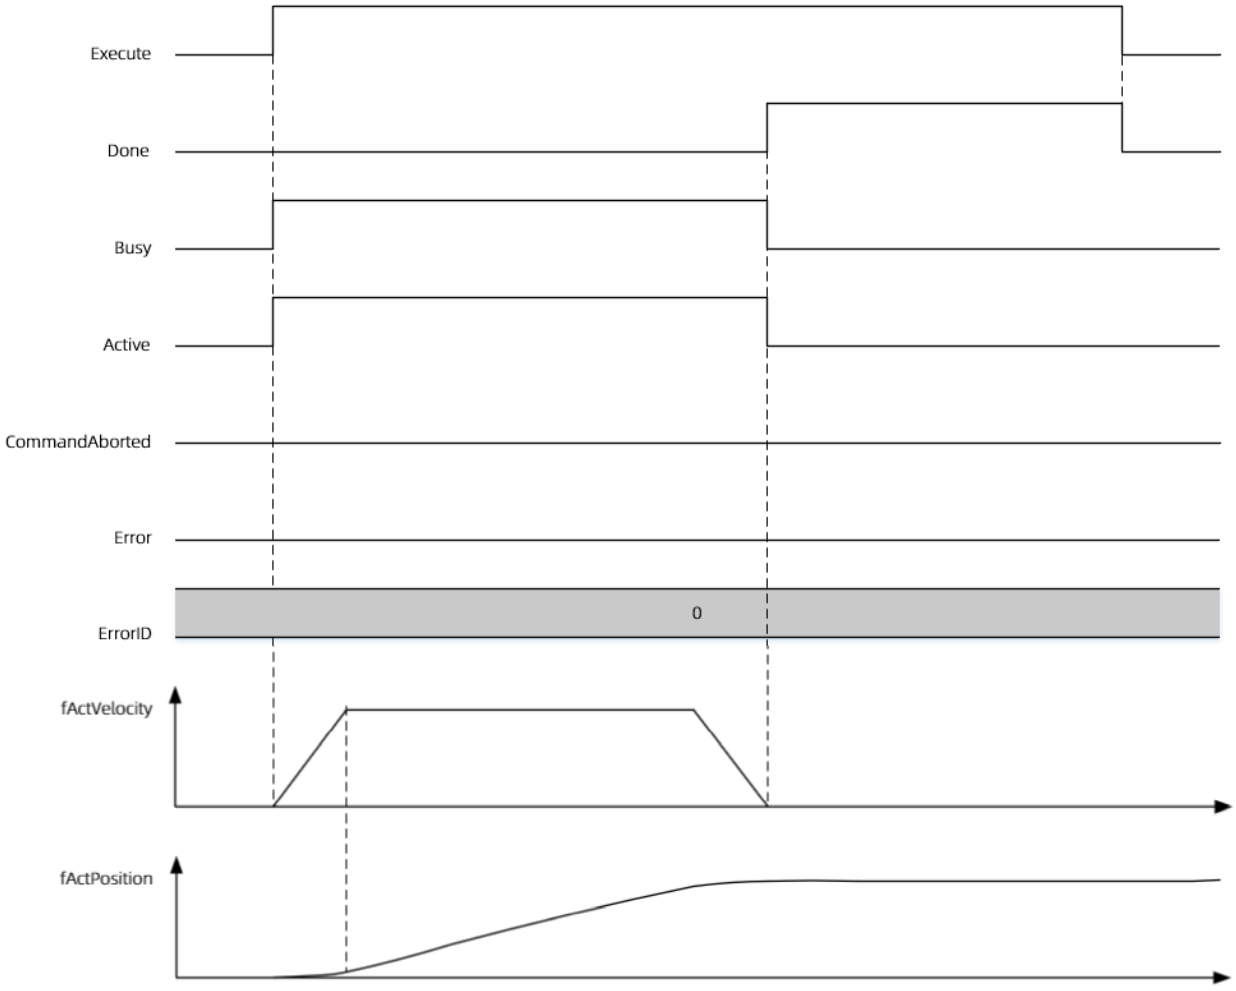
    - TMNone: Insert no transition curve. If TMNone is selected in a blending mode, the result is consistent with the transition between the velocities of the two instructions in buffered mode.

- TMStartVelocity: Transition with given start velocity. Blending transition at a certain ratio (0, 1] of the actual maximum velocity of the current motion control instruction. Effective for transitions between any motion control instructions.

- TMDefinedVelocity: Transition with defined velocity. Blending transition at a certain ratio (0, 1] of the actual maximum velocity of the instruction following the current motion control instruction. Effective for transitions between any motion control instructions.

- **Precautions**
  - This instruction supports point-to-point relative motion in the ACS coordinate system and static PCS coordinates, but does not support point-to-point relative motion in the dynamic PCS coordinates. Motions in both coordinate systems are transformed into the ACS coordinate system for execution. If the target point exceeds any axis limit, an error is generated when this instruction is initiated.
  - When the current motion instruction is interrupted, Direct motion constructs a transition trajectory in joint space along the direction of the velocity at the breakpoint to ensure smooth connection with the subsequent trajectory. This ensures velocity continuity only. However, the acceleration continuity is not guaranteed. For details on the three transition modes supported for aborting, see the motion abort description.
  - The transition trajectory calculation for the aborting instruction is planned according to the acceleration segment parameters set in the instruction. The higher the acceleration segment parameter value, the shorter the transition trajectory and the faster the transition.
  - In dynamic coordinate system, the point-to-point motion is prohibited. Otherwise, the function block will report an error.
  - During the part coordinate system switching process, the point-to-point motion is prohibited before activation. Otherwise, the function block reports an error.
  - This instruction can only be initiated when the axis group is in the GroupMoving or GroupStandby state. Attempting to start this instruction in any other state will result in an error.
  - During the execution of this instruction, it can be interrupted by other motion instructions, MC_GroupStop, or MC_GroupHalt.

- After the execution of this instruction, the axis group (AxesGroup) state is changed from GroupMoving to GroupStandby.
- When this instruction is used in a dynamic coordinate system, the blending transition mode in the PCS coordinate system is not recommended. Due to the tracking of the synchronous belt movement, the execution of this instruction in such scenarios (blending transitions in the PCS) may introduce a dynamic deviation between the programmed point and the actual achieved point in absolute space.



- **Program example**

  The example program for this instruction can refer to the 18.3.3.5.20 MC_MoveDirectRelative instruction. This instruction can also be combined with other AxesGroup motion instructions.

- **Sequence diagram**

  - The instruction runs normally.

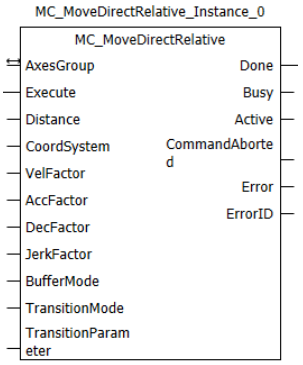
    When Execute is triggered, the Busy and Active output become TRUE. When the target position is reached, the axis group velocity changes to 0, Done becomes TRUE, and Busy and Active become FALSE.

  - The instruction is aborted by other instructions.

    When Execute is triggered, the Busy and Active output become TRUE. When this instruction is aborted by another instruction, CommandAborted becomes TRUE, and Busy and Active become FALSE.

As noted in the precautions, when a motion instruction is aborted, the point-to-point absolute motion immediately replans from the interruption point. In joint space, a deceleration-reversal

transition trajectory is generated along the velocity direction at that point, ensuring smooth blending with the subsequent trajectory segment.



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.5.20 MC_MoveDirectRelative

The point-to-point instruction for the axis group commands the axis group to move from the current TCP point to a relative position without requiring a specific path.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
MC_MoveDirectRelative	Point-to-point relative motion		MC_MoveDirectRelative_Instance_0(AxesGroup := , Execute := , Distance := , CoordSystem := , VelFactor := , AccFactor := , DecFactor := , JerkFactor := , BufferMode := , TransitionMode := , TransitionParameter := , Done => , Busy => , Active =>, CommandAborted =>, Error =>, ErrorID =>);

Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs.

- **Parameter correction**

Input Variable	Name	Correction Description for Values Greater Than 1 or Backend Limit	Correction Description for Parameter Value Less than 0	Correction Description for Parameter Value Equal to 0
VelFactor	Velocity factor	If the velocity factor is greater than 1, it is automatically corrected to 1.	If the velocity factor is less than 0, it is automatically corrected to 1e-5 for operation.	If the velocity factor is equal to 0, it is automatically corrected to 1e-5 for operation.
AccFactor	Acceleration factor	If the acceleration factor is greater than 1, it is automatically corrected to 1.	If the acceleration factor is less than 0, it is automatically corrected to 0.1 for operation.	If the acceleration factor is equal to 0, it is automatically corrected to 0.1 for operation.
DecFactor	Deceleration factor	If the deceleration factor is greater than 1, it is automatically corrected to 1.	If the deceleration factor is less than 0, it is automatically corrected to 0.1 for operation.	If the deceleration factor is equal to 0, it is automatically corrected to 0.1 for operation.
JerkFactor	Jerk factor	If the jerk factor is greater than 1 in the non-trapezoidal motion profiling, it is automatically corrected to 1.	If the jerk factor is less than 0 in the non-trapezoidal motion profiling, it is automatically corrected to 0.1 for operation.	If the jerk factor is equal to 0 in the non-trapezoidal motion profiling, it is automatically corrected to 0.1 for operation.

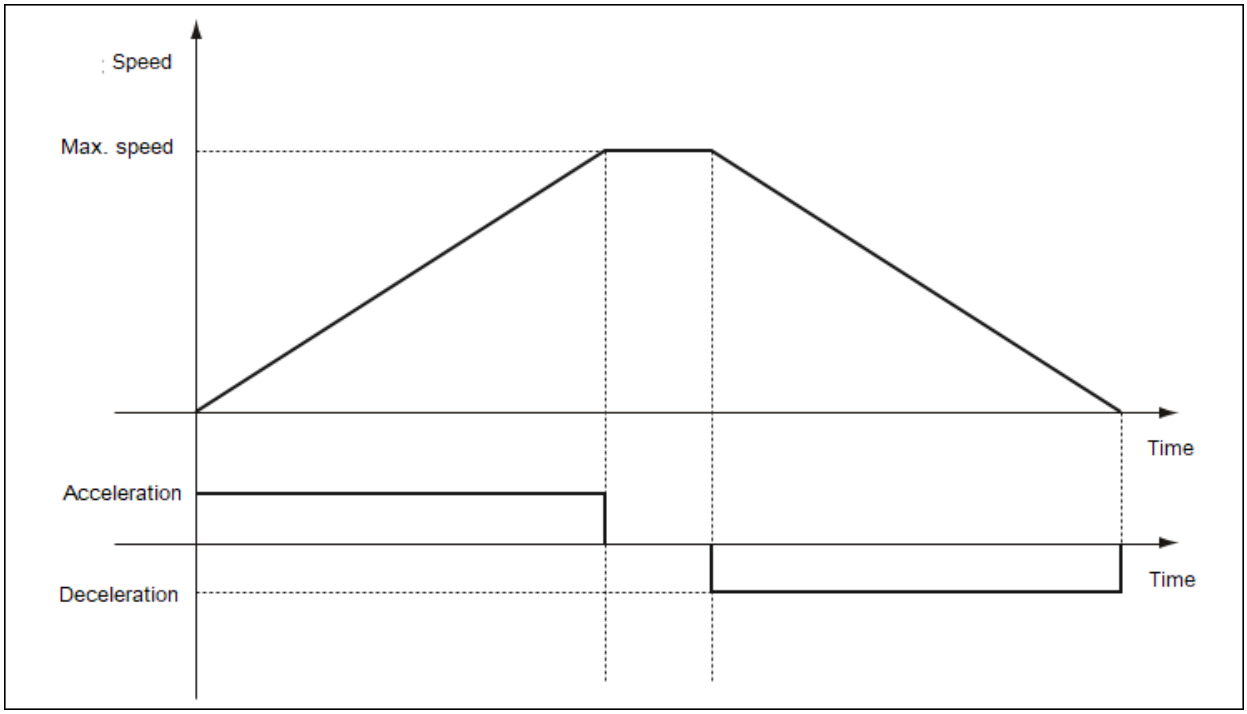
- **Function**
  - This instruction is executed on the rising edge of Execute and performs point-to-point relative motion from two axes to four axes.

- The parameter values for Distance, CoordSystem, VelFactor, AccFactor, DecFactor, JerkFactor, BufferMode, TransitionMode and TransitionParameter can be specified in the input variables.
- When this instruction is initiated, the target position is determined by adding the input variable Distance (relative position) to the starting position of AxesGroup.
- For the instruction, blending modes 2, 3, 4, and 5 for BufferMode have the same behavior. The transition effect depends on the TransitionMode and TransitionParameter settings.
- Supports the same-cycle triggering of instructions. The Done output signal of the instruction serves as the trigger signal for Execute.
- **CoordSystem**
  - Specifies the coordinate system for point-to-point relative motion.
- **Distance (Relative position coordinate)**
  - For the axis type corresponding to each position vector in the Distance array, see Axis group type description.
  - When the coordinate system type is set to PCS, the ABC rotary axes of the coordinate system correspond to the ZYX-type Euler angles, respectively. If the configuration supports orientation motion, the configured ABC relative positions must be within ±180°, otherwise an error will be generated.
  - In relative motion mode, the rules for calculating the target position of the axis group are shown in the table below.

Coordinate system type (calculation of target positions for each axis in the existing axis group configuration)	
ACS	PCS
A1 axis target position = A1 axis current position + Distance [1]	X-axis target position = X-axis current position + Distance [1]
A2 axis target position = A2 axis current position + Distance [2]	Y-axis target position = Y-axis current position + Distance [2]
A3 axis target position = A3 axis current position + Distance [3]	Z-axis target position = Z-axis current position + Distance [3]
A4 axis target position = A4 axis current position + Distance [4]	A-axis target position = A-axis current position + Distance [4]

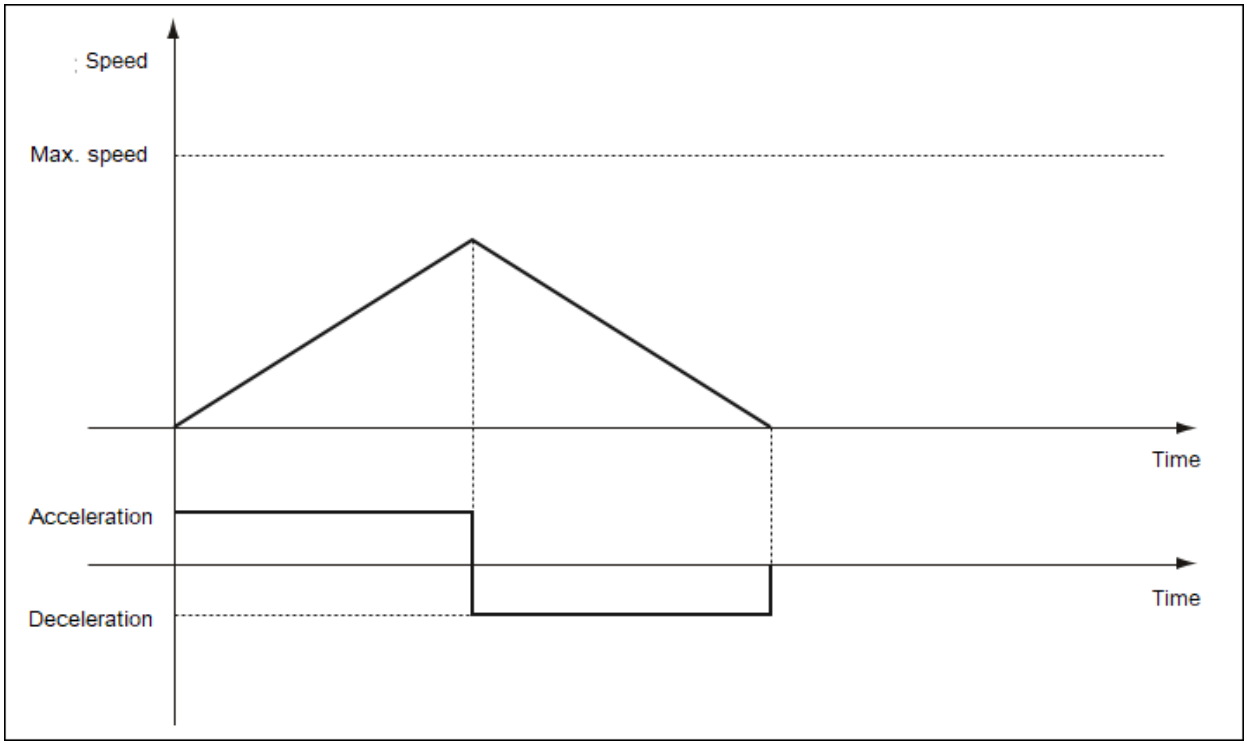
  - If the A-axis target position is not within ±180°, the system will make the following adjustments: if the A-axis target position is greater than 180°, the system will subtract 360° until the result falls within ±180°; if the A-axis target position is less than -180°, the system will add 360° until the result falls within ±180°. Example: $A_{\text{calculated target position}} = 260°$, $A_{\text{converted target position}} = -100°$.
  - If the target position exceeds any joint axis limit, starting this instruction will cause an error.
  - If the configuration supports orientation motion, the axis group will move to the target orientation along the shortest path.
- **VelFactor, AccFactor, DecFactor, JerkFactor**
  - If the velocity of any Axis variable in AxesGroup exceeds the maximum axis velocity limited by the software, it will trigger an error-stop condition.
  - For each axis variable in AxesGroup:

Maximum interpolation velocity = Maximum axis velocity limited by the software x VelFactor.



Maximum interpolation acceleration = Maximum axis acceleration limited by the software x AccFactor.

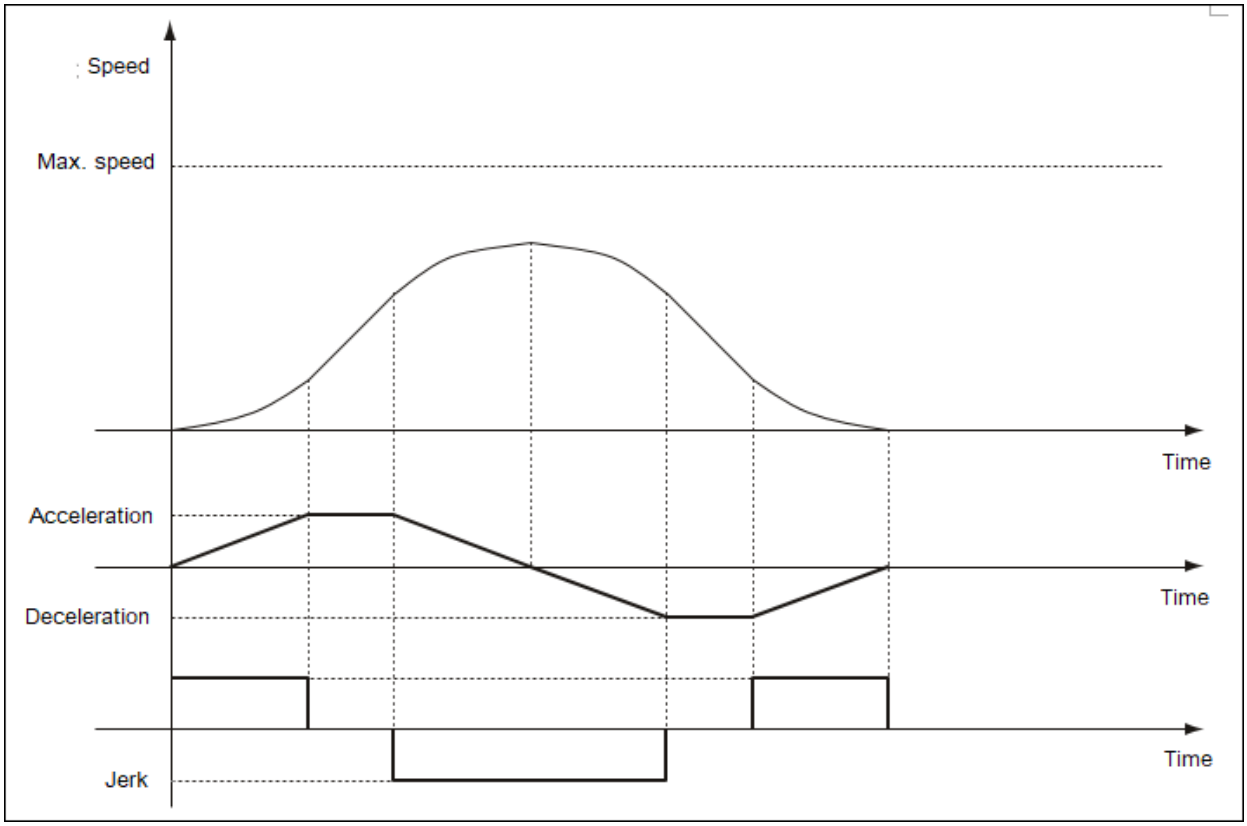
Maximum interpolation deceleration = Maximum axis deceleration limited by the software x DecFactor.



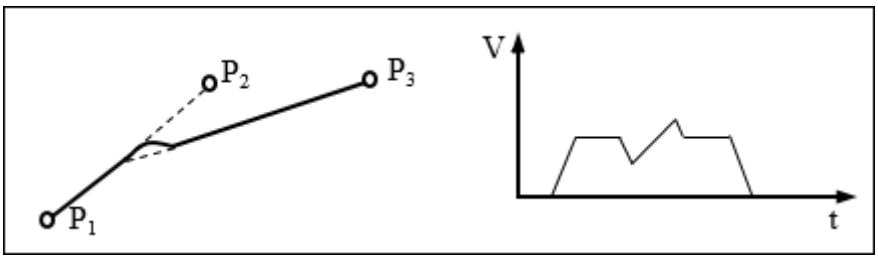
Maximum interpolation jerk = Maximum axis jerk limited by the software x JerkFactor.

- The trajectory planning curve type of AxesGroup is set according to requirements. If the planning curve type is a trapezoidal curve, the JerkFactor variable does not take effect and is treated as 0.
- For JerkFactor = 0 or JerkFactor ≠ 0, the velocity, acceleration, deceleration, and jerk curves are shown in the figure below.

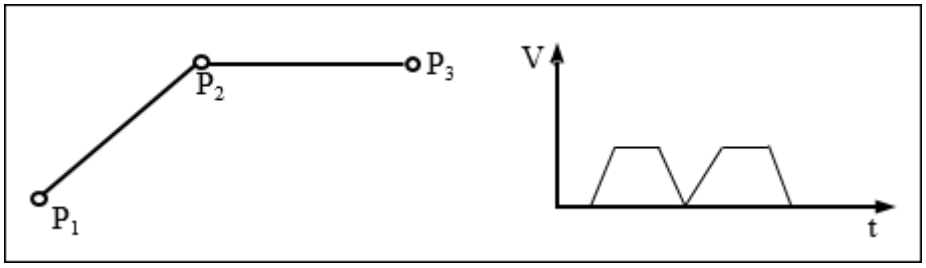
  For JerkFactor = 0, the axis group can reach the maximum interpolation velocity.



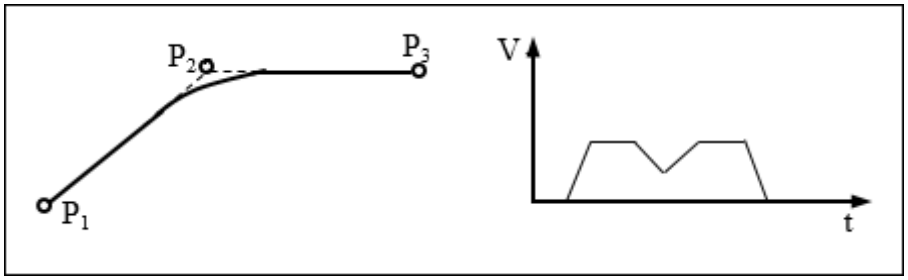
For JerkFactor = 0, the axis group cannot reach the maximum interpolation velocity due to too short travel distance.



For JerkFactor ≠ 0, the axis group can reach the maximum interpolation velocity. (Non-trapezoidal planning curve)

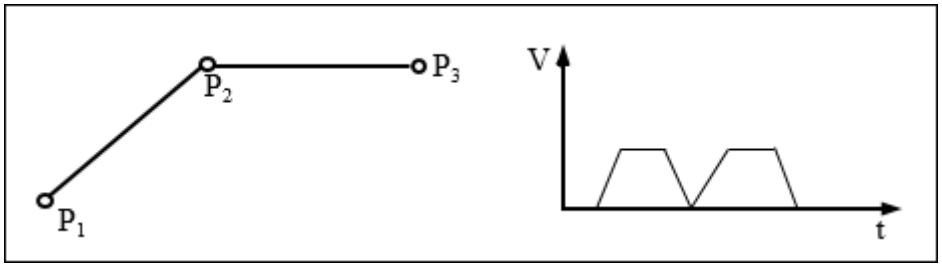


For JerkFactor ≠ 0, the axis group cannot reach the maximum interpolation velocity due to too short travel distance. (Non-trapezoidal planning curve)

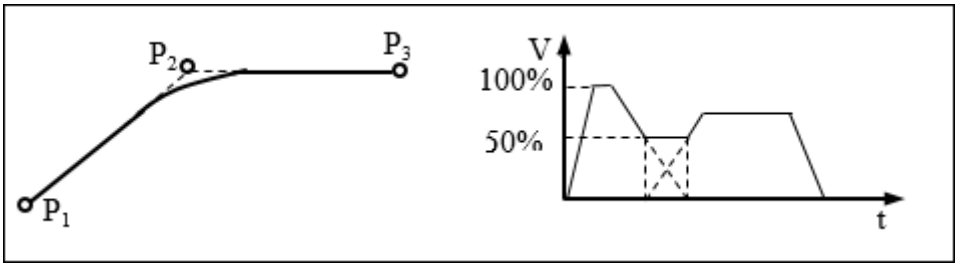


- **Re-triggering the instruction**
  - While the instruction is in motion, that is, when the instruction output parameters "Busy" and "Active" are both TRUE, this instruction cannot be re-triggered.
  - While the instruction is in buffer mode, that is, when Busy is TRUE and Active is FALSE, this instruction can be re-triggered after parameter modification. If the modified parameters are invalid, or if the buffered instruction data has already been used in motion calculations, retriggering the buffered instruction will cause an error. Then, the axis group will enter the GroupStop state, and the currently executing instruction will also report an error.
- **Multiple execution of motion instructions**
  - When this instruction is issued while another motion instruction is being executed, the new instruction can either be switched to immediately or buffered for later execution. Each axis group can buffer up to 8 instructions. In the case of multiple executions, the behavior of this instruction is determined by BufferMode.
  - BufferMode
    - Aborting: MC_ABORTING aborts the currently executing instruction and begins executing this instruction. The abort operation supports three modes, configurable via TransitionMode: TMNone, TMResetAbort, and TMDecAbort. For the meanings of these modes, see the MC_MoveLinearXX instruction description. The following figure illustrates the TMResetAbort mode:

    - Buffer: MC_BUFFERED, this instruction is buffered and executed after the current instruction is completed.

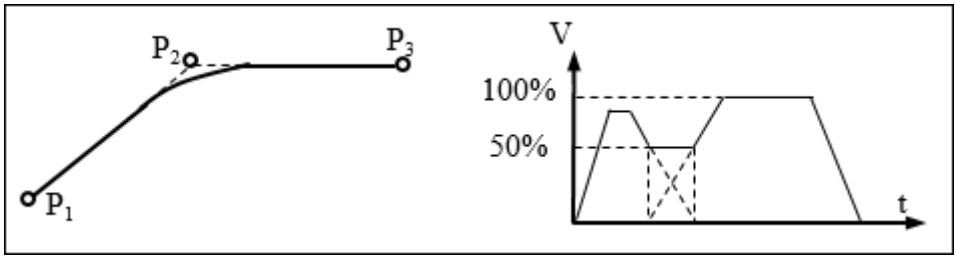


- Blending: MC_BLEND, the velocities of the two adjacent instructions are blended in the specified manner. This manner is specified in TransitionMode.



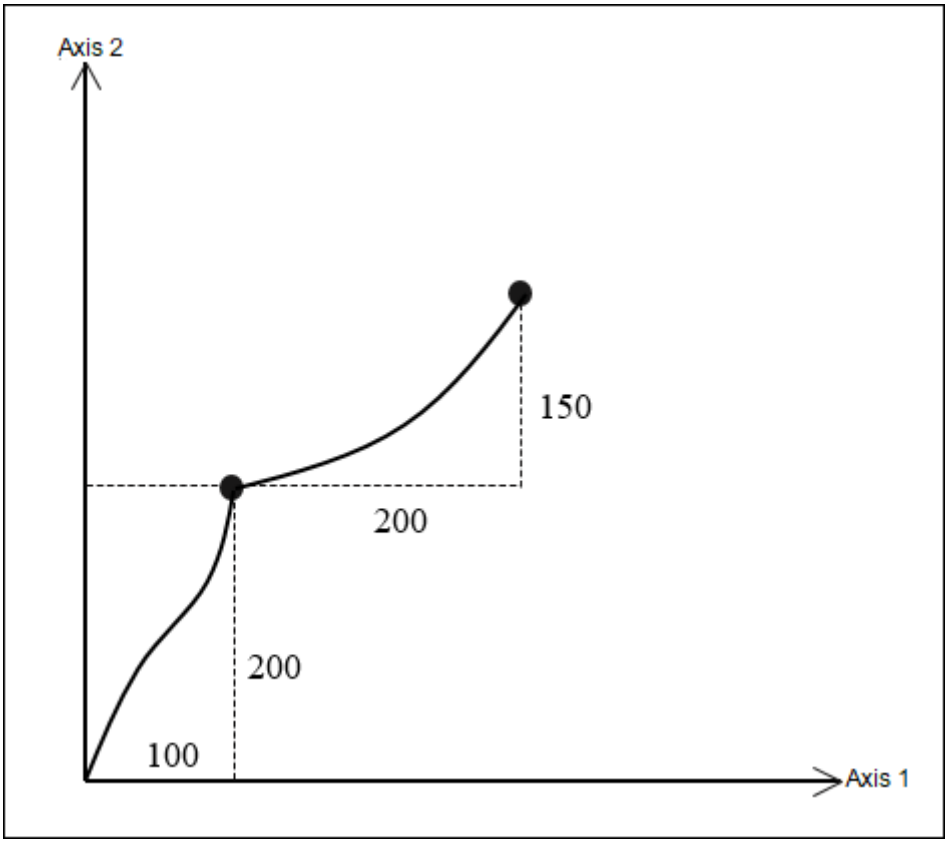
◦ TransitionMode

When BufferMode is set to blend, this instruction uses the TransitionMode input variable to specify the blending method for the velocity profiles of the two instructions.



- TMNone: Insert no transition curve. If TMNone is selected in a blending mode, the result is consistent with the transition between the velocities of the two instructions in buffered mode.

- TMStartVelocity: Transition with given start velocity. Blending transition at a certain ratio (0, 1] of the actual maximum velocity of the current motion control instruction. Effective for transitions between any motion control instructions.

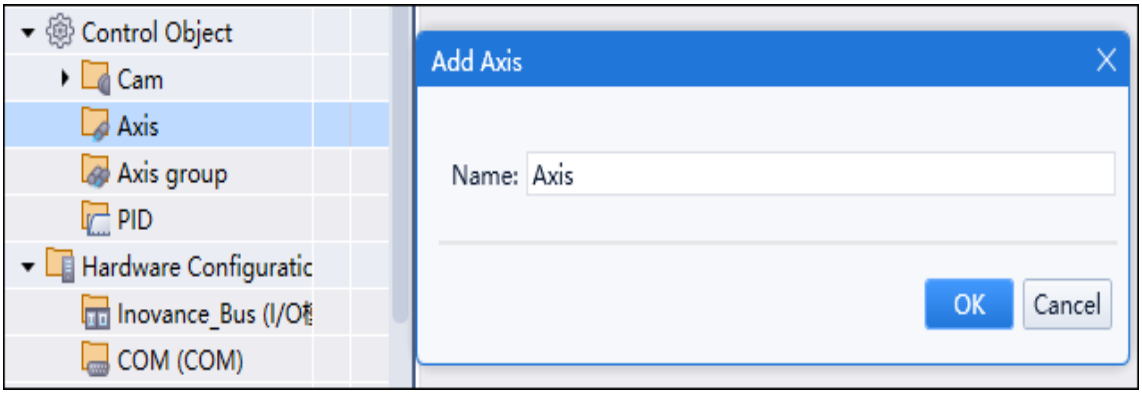


- TMDefinedVelocity: Transition with defined velocity. Blending transition at a certain ratio (0, 1] of the actual maximum velocity of the instruction following the current motion control instruction. Effective for transitions between any motion control instructions.

- **Precautions**
  - This instruction supports point-to-point relative motion in the ACS coordinate system and static PCS coordinates, but does not support point-to-point relative motion in the dynamic PCS coordinates. Motions in both coordinate systems are transformed into the ACS coordinate system for execution. If the target point exceeds any axis limit, an error is generated when this instruction is initiated.
  - When the current motion instruction is interrupted, Direct motion constructs a transition trajectory in joint space along the direction of the velocity at the breakpoint to ensure smooth connection with the subsequent trajectory. This ensures velocity continuity only. However, the acceleration continuity is not guaranteed. For details on the three transition modes supported for aborting, see the motion abort description.
  - The transition trajectory calculation for the aborting instruction is planned according to the acceleration segment parameters set in the instruction. The higher the acceleration segment parameter value, the shorter the transition trajectory and the faster the transition.
  - In dynamic coordinate system, the point-to-point motion is prohibited. Otherwise, the function block will report an error.
  - During the part coordinate system switching process, the point-to-point motion is prohibited before activation. Otherwise, the function block reports an error.
  - This instruction can only be initiated when the axis group is in the GroupMoving or GroupStandby state. Attempting to start this instruction in any other state will result in an error.
  - During the execution of this instruction, it can be interrupted by other motion instructions, MC_GroupStop, or MC_GroupHalt.
  - After the execution of this instruction, the axis group (AxesGroup) state is changed from GroupMoving to GroupStandby.
  - When this instruction is used in a dynamic coordinate system, the blending transition mode in the PCS coordinate system is not recommended. Due to the tracking of the synchronous belt movement, the execution of this instruction in such scenarios (blending transitions in the PCS) may introduce a dynamic deviation between the programmed point and the actual achieved point in absolute space.
- **Program example**

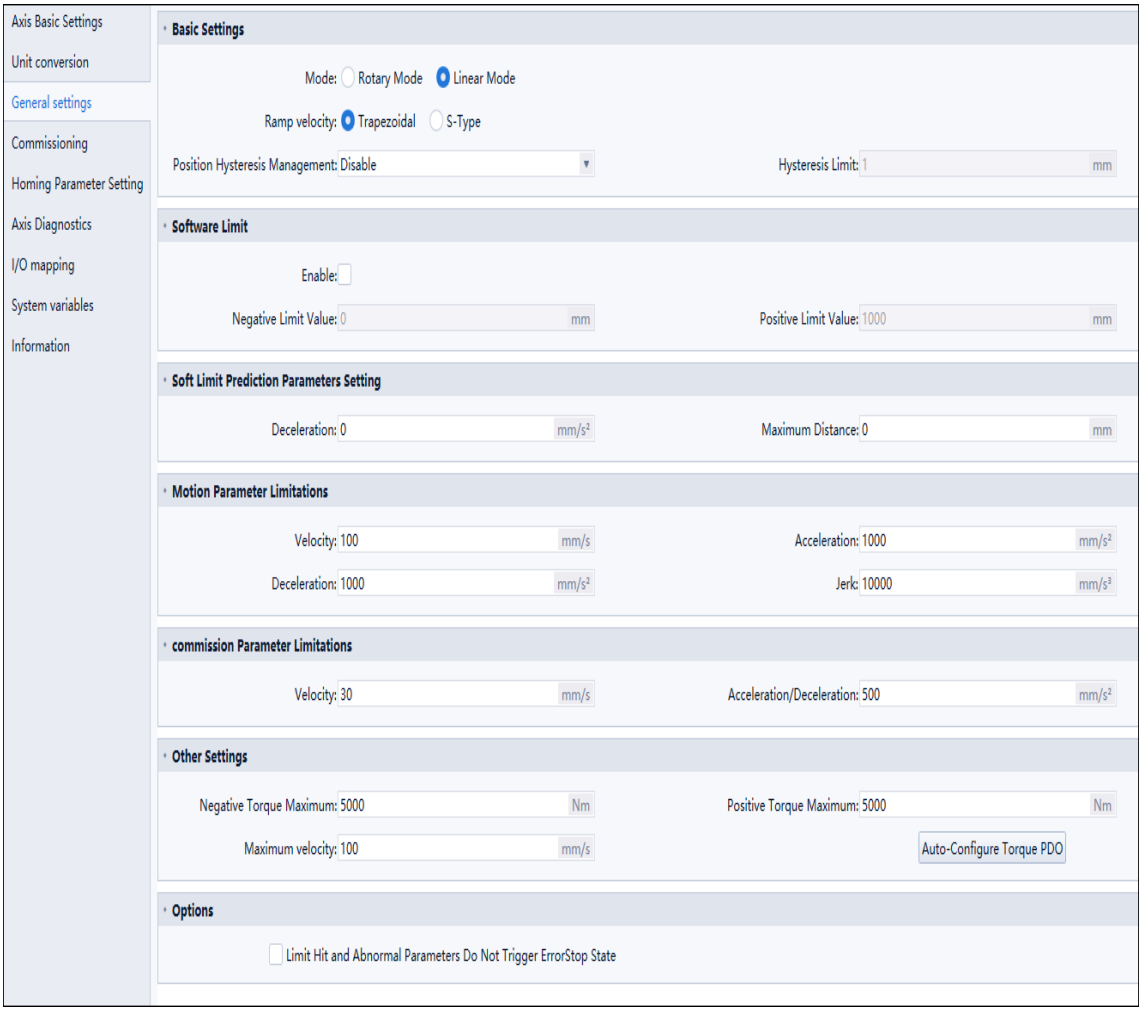
  This is an example of performing a point-to-point relative motion using a two-axis group. Starting point: (0,0); first relative displacement: (100,200); second relative displacement: (200,150)

  Two point-to-point relative motion instructions need to be executed sequentially, and the second instruction must be in MC_BUFFERED.



◦ Step

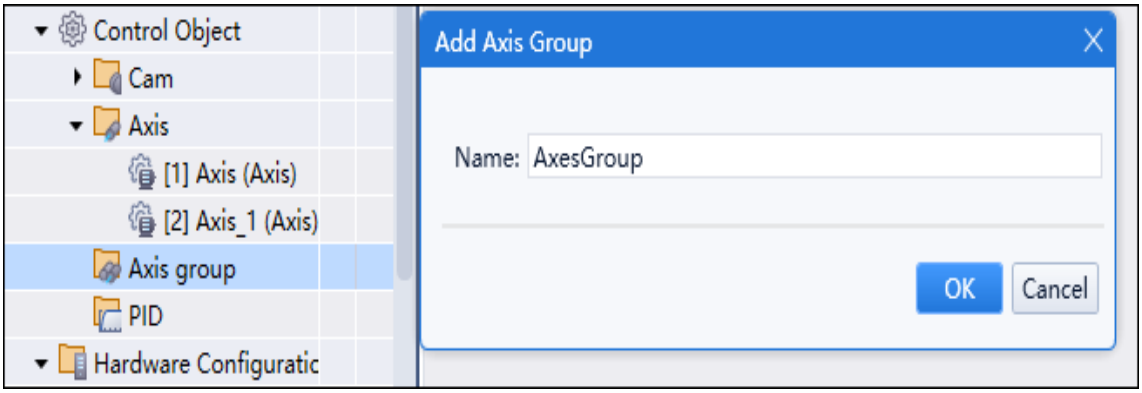
1. Determine the AxesGroup type and the Axis variable in the axis group in iFA.
2. Use the MC_Power instruction to enable the Axis variable in AxesGroup.
3. Use the MC_Home instruction to perform a homing operation on an Axis variable in AxesGroup.
4. Alternatively, use the MC_GroupHome instruction to perform a homing operation on an Axis variable in AxesGroup.
5. Use the MC_GroupEnable instruction to enable AxesGroup.
6. Set the parameters for the first point-to-point relative motion instruction.
7. Set the parameters for the second point-to-point relative motion instruction.
8. Start the two point-to-point relative motion instructions.



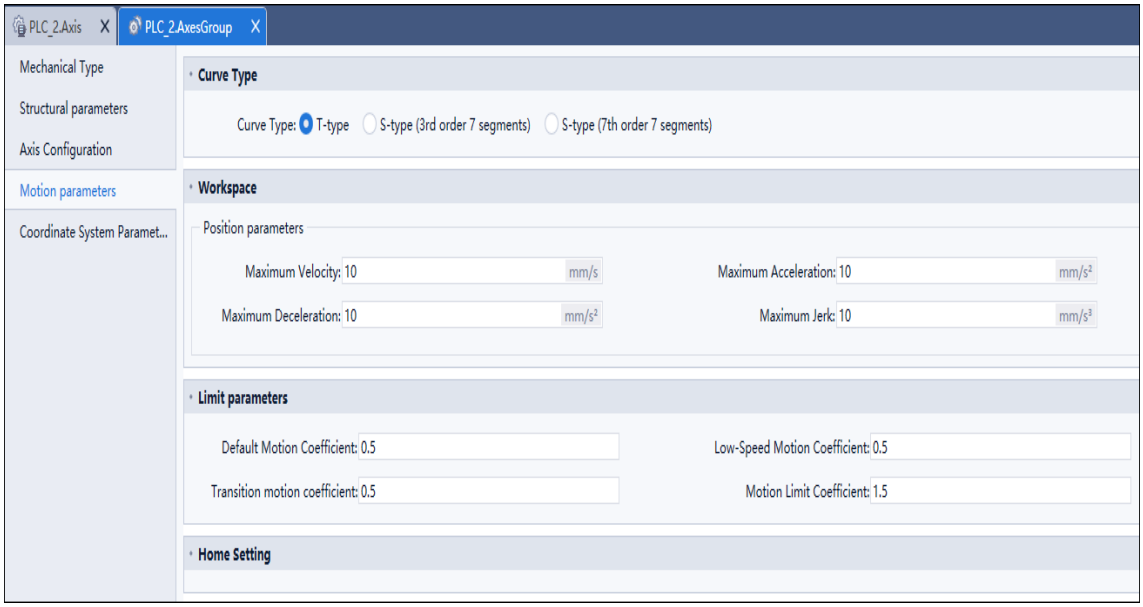
◦ Adding axes and axis groups

▪ Add axes (two axes) in FA and set the relevant axis parameters.

1. Click "Control Object > Axis" on the left project tree to add an axis.



2. After adding the axes, double-click the axis to be set, enter the setting interface, and perform the corresponding configuration.

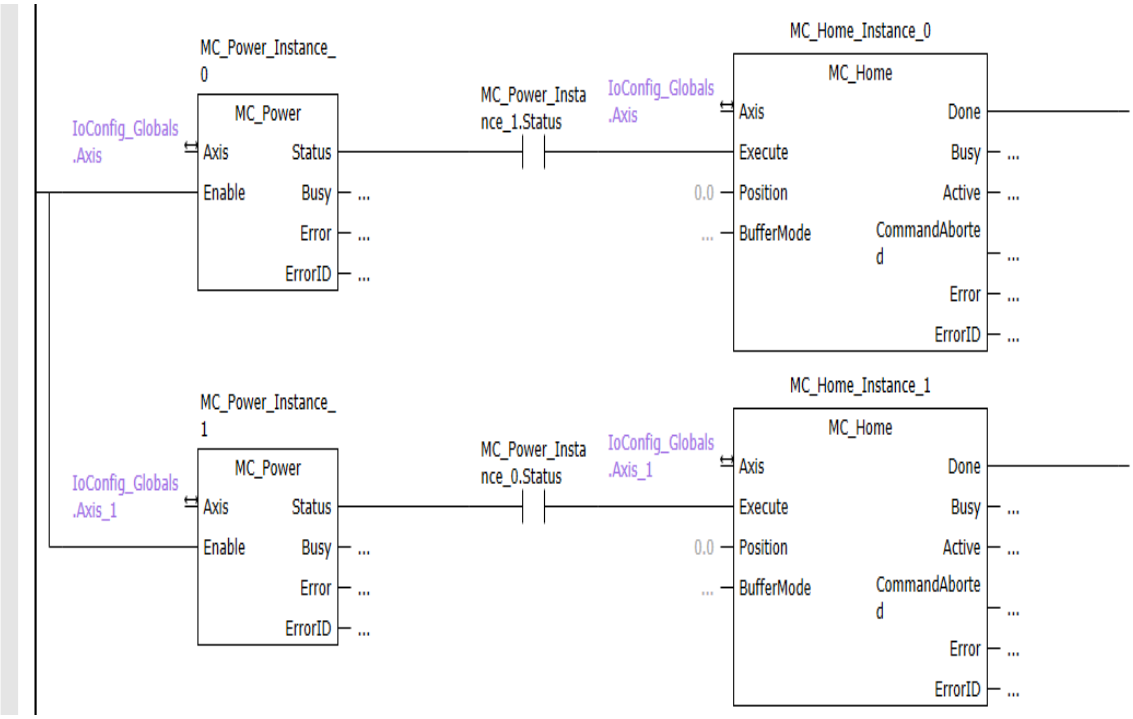


Note: The planning curve type of the axis is only valid in the axis motion instruction. When the axis is added to the axis group, the planning curve type of the axis is specified by the axis group.

- Add an axis group and set the axis group parameters.

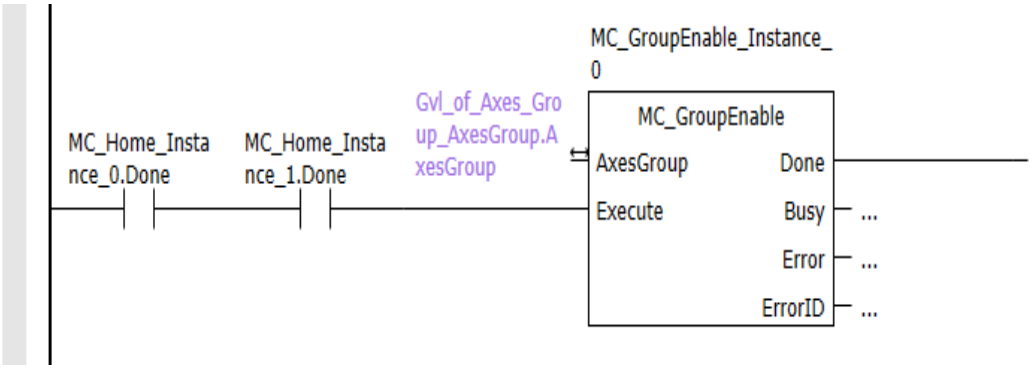
1. Click "Control Object > Axis group" on the left project tree to add an axis group.

2. After adding the axis group, double-click the axis group to be set, enter the setting interface, and perform the corresponding configuration.



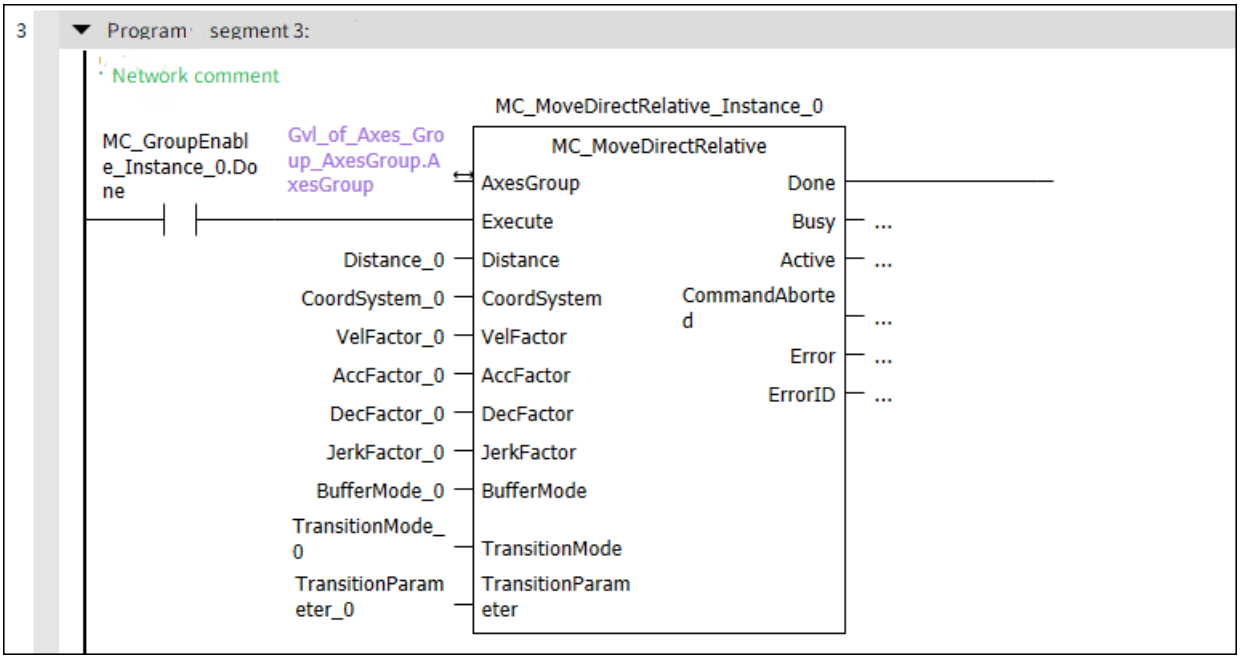
Note: The planning curve type of the axis group must be specified in the axis group structure. By default, the profile type is trapezoidal, and the jerk settings do not take effect.

◦ Ladder diagram

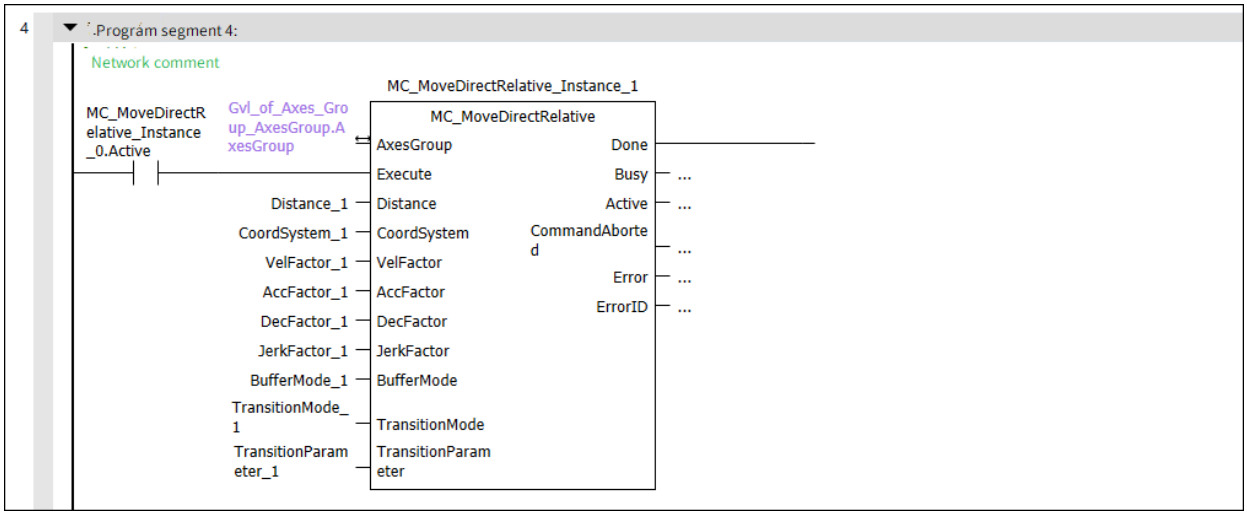


MC_Power_Instance_0 and MC_Power_Instance_1 are two instances of the MC_Power instruction, which perform enable operations on Axis and Axis_1 respectively. When MC_Power_Instance_0.Status and MC_Power_Instance_1.Status are set to TRUE, the two axes have completed the enable operation respectively. Then, the axis homing instruction is executed.

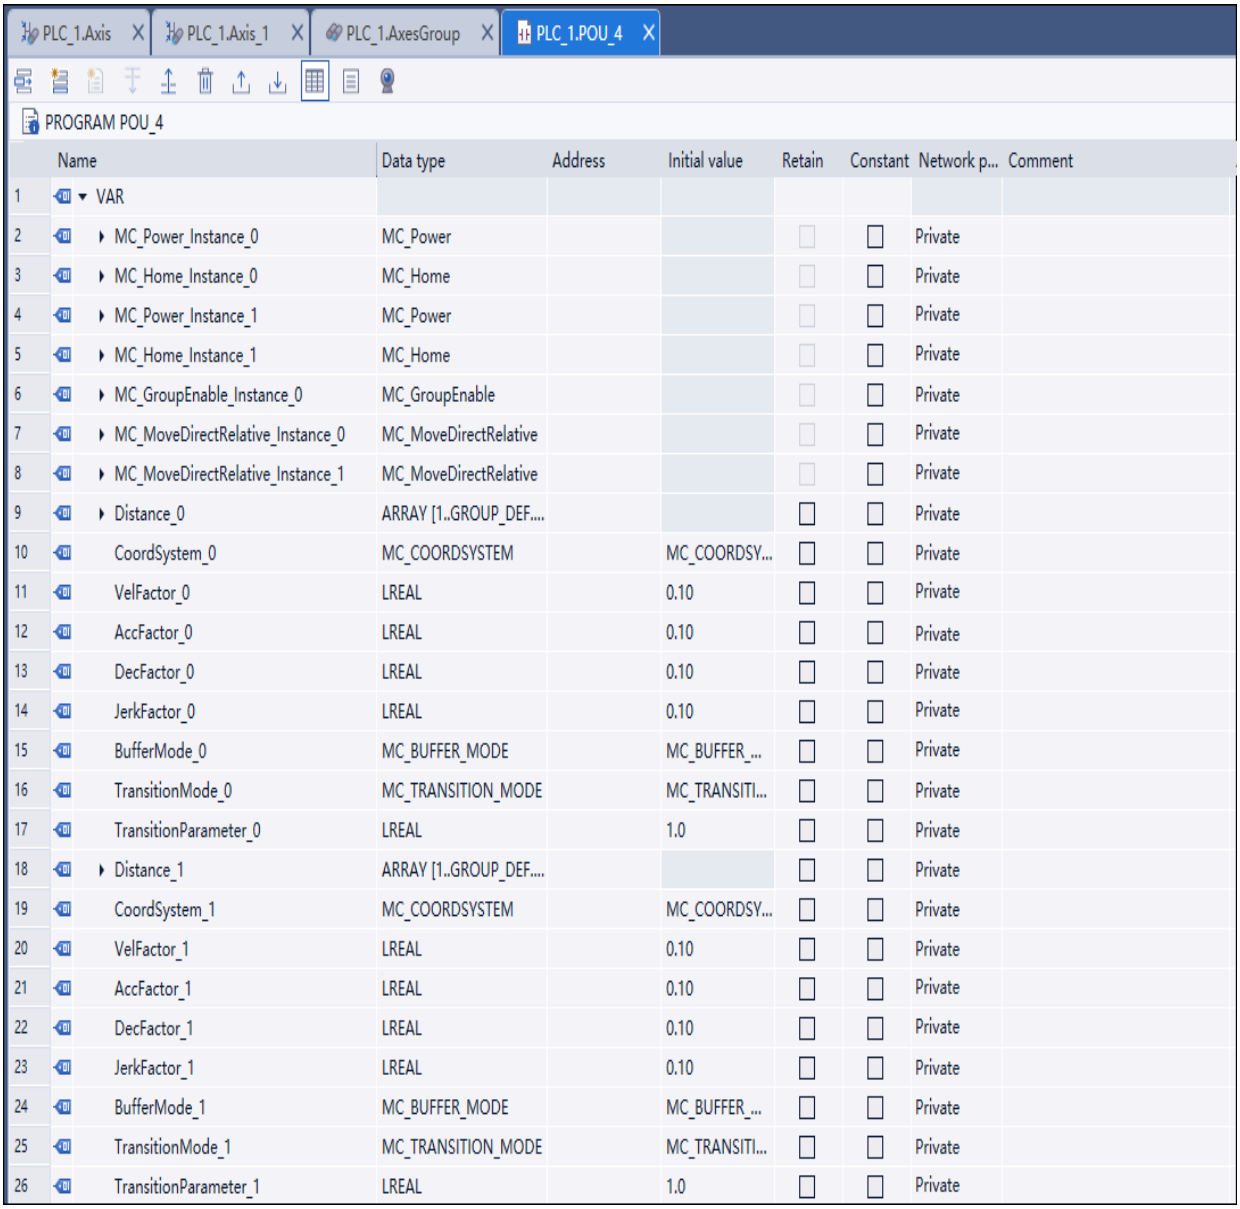
MC_Home_Instance_0 and MC_Home_Instance_1 are two instances of the MC_Home instruction, which return Axis and Axis_1 to the mechanical zero point respectively.



MC_Home_Instance_0.Done and MC_Home_Instance_1.Done indicate that the two axes have completed the homing instruction. Only when both axes have completed the homing instruction, the MC_GroupEnable instruction is executed for AxesGroup.



MC_GroupEnable_Instance_0 is an instance of the MC_GroupEnable instruction.



After the axis group is enabled, start the first point-to-point relative motion. MC_MoveDirectRelative_Instance_0 and MC_MoveDirectRelative_Instance_1 are two instances of the MC_MoveDirectRelative instruction.

When the first instruction MC_MoveDirectRelative_Instance_0.Active is set to TRUE, the second point-to-point relative motion instruction is initiated.

The types and parameter settings for each instruction are shown in the figure below.

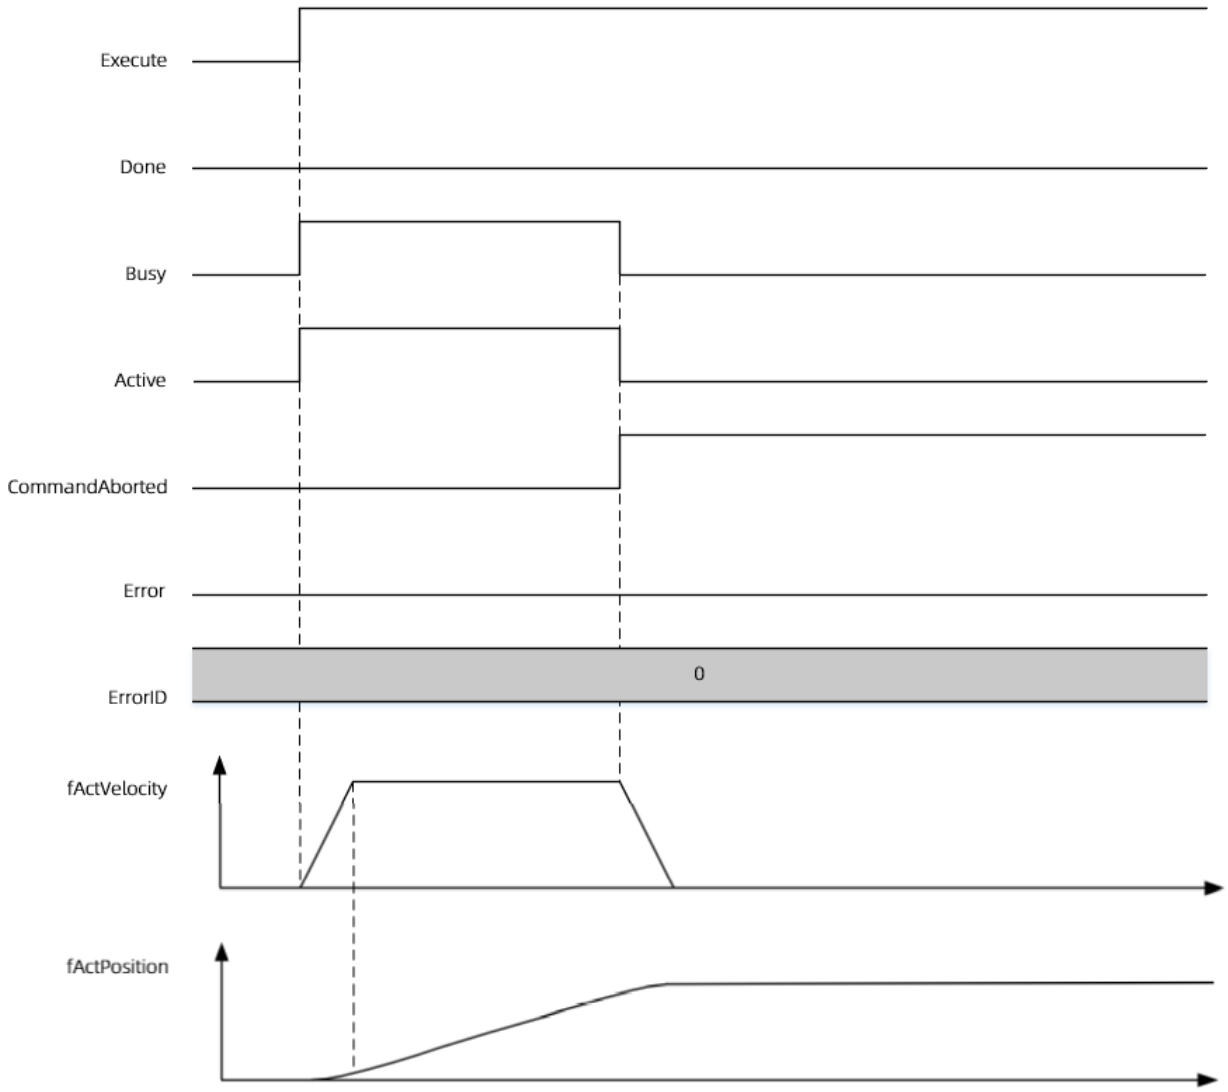
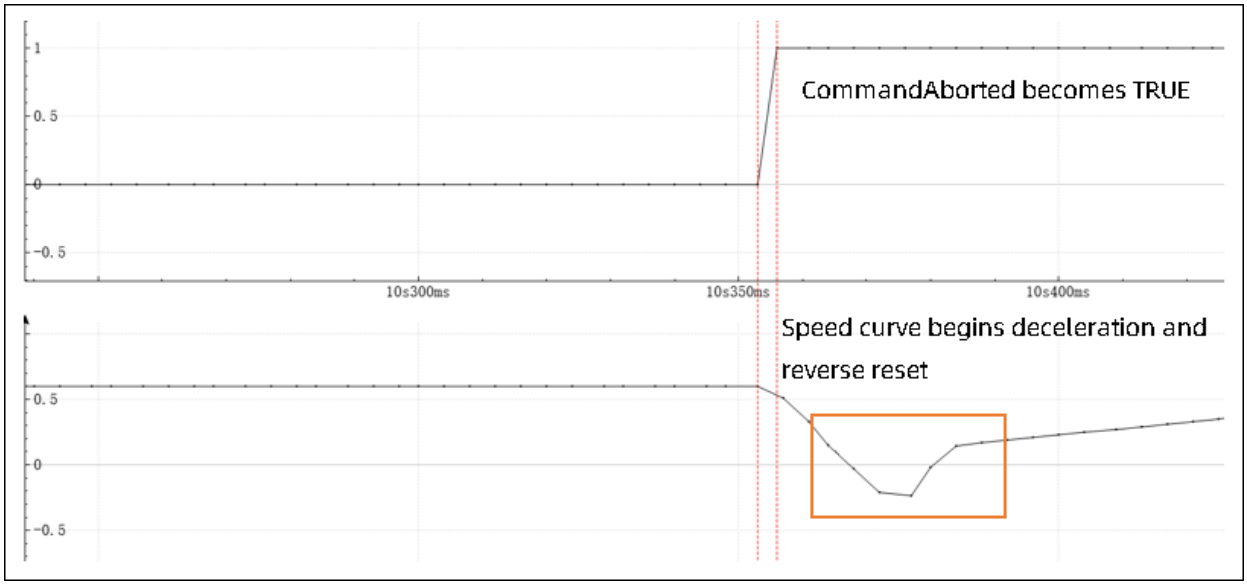
The position profiles and velocity profiles of axes in AxesGroup are shown below.



- **Sequence diagram**
  - The instruction runs normally.

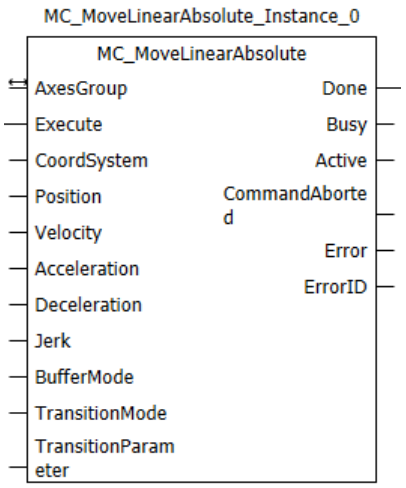
    When Execute is triggered, the Busy and Active output become TRUE. When the target position is reached, the axis group velocity changes to 0, Done becomes TRUE, and Busy and Active become FALSE.



◦ The instruction is interrupted by another instruction.

When Execute is triggered, the Busy and Active output become TRUE. When this instruction is aborted by another instruction, CommandAborted becomes TRUE, and Busy and Active become FALSE.

As noted in the precautions, when a motion instruction is aborted, the point-to-point relative motion immediately replans from the interruption point. In joint space, a deceleration-reversal transition trajectory is generated along the velocity direction at that point, ensuring smooth blending with the subsequent trajectory segment.



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.5.21 MC_MoveLinearAbsolute

This instruction enables the linear interpolation motion of the axis group from the current TCP point to the absolute position point under the given coordinate system.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
MC_MoveLinearAbsolute	Linear absolute motion		MC_MoveLinearAbsolute_Instance_0(AxesGroup := , Execute := , CoordSystem := , Position := , Velocity := , Acceleration :=, Deceleration :=, Jerk := , BufferMode := , TransitionMode := , TransitionParameter := , Done => , Busy => , Active =>, CommandAborted =>, Error =>, ErrorID =>);

- **Related variables**

In-out variables

In-out Variable	Name	Data Type	Valid Range	Default Value	Description
AxesGroup	Axis group	18.3.3.2.4.1 AXES_GROUP_REF: Axis Group Structure	-	-	Mapped to an axis group, which is an instance of AXES_GROUP_REF.

Input variable

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Execute	Execute	BOOL	TRUE, FALSE	FALSE	Execute the instruction on a rising edge.
CoordSystem	Coordinate system type	18.3.3.2.4.19 MC_COORDSYSTEM: Coordinate System Enumeration	ACS, PCS	PCS	Currently only supports PCS.
Position	Position	ARRAY [1..GROUP_DEF.AXIS_NUM] OF LREAL	-	0	For the absolute position coordinate for each dimension in the specified coordinate system, see Axis group type description.
Velocity	Velocity	LREAL	> 0	-	Maximum main velocity. This value may not necessarily be reached.
Acceleration	Acceleration	LREAL	> 0	-	Maximum main acceleration. This value may not necessarily be reached.
Deceleration	Deceleration	LREAL	> 0	-	Maximum main deceleration. This value may not necessarily be reached.
Jerk	Jerk	LREAL	>=0	-	Maximum main jerk. This value may not necessarily be reached.
BufferMode	Buffer mode	18.3.3.2.2.6 MC_BUFFER_MODE: Buffer Mode Enumeration	0: mcAborting 1: mcBuffered 2: mcBlendingLow 3: mcBlendingPrevious 4: mcBlendingNext 5: mcBlendingHigh	0	0: mcAborting (Aborting). 1: mcBuffered (Buffered). 2: mcBlendingLow (Blending with the lowest velocity of both FBs). 3: mcBlendingPrevious (Blending with the velocity of the first FB). 4: mcBlendingNext (Blending with velocity of the second FB). 5: mcBlendingHigh (Blending with the highest velocity of both FBs). Note: Buffer modes 2 to 5 currently have the same effect. All are blending modes. The behavior depends on the TransitionMode and TransitionParameter parameters.

Input Variable	Name	Data Type	Valid Range	Default Value	Description
TransitionMode	Transition mode	18.3.3.2.4.10 MC_TRANSITION_MODE: Transition Mode Enumeration	0: TMNone 1: TMStartVelocity 3: TMCornerDistance 4: TMMaxCornerDeviation 10: TMDefinedVelocity 11: TMResetAbort 12: TMDecAbort	0	Definition of the transition trajectory characteristic types. When BufferMode is set to MC_ABORTING, only the transition mode parameters TMNone, TMResetAbort, and TMDecAbort are allowed. When BufferMode is set to MC_BUFFERED, the transition mode is invalid. When BufferMode is a blending mode (2 to 5), TMResetAbort or TMDecAbort is not allowed.
TransitionParameter	Transition parameter	LREAL	Velocity [0.0,1.0] Distance [0.0,+∞)	1	Transition parameters vary with the transition mode.

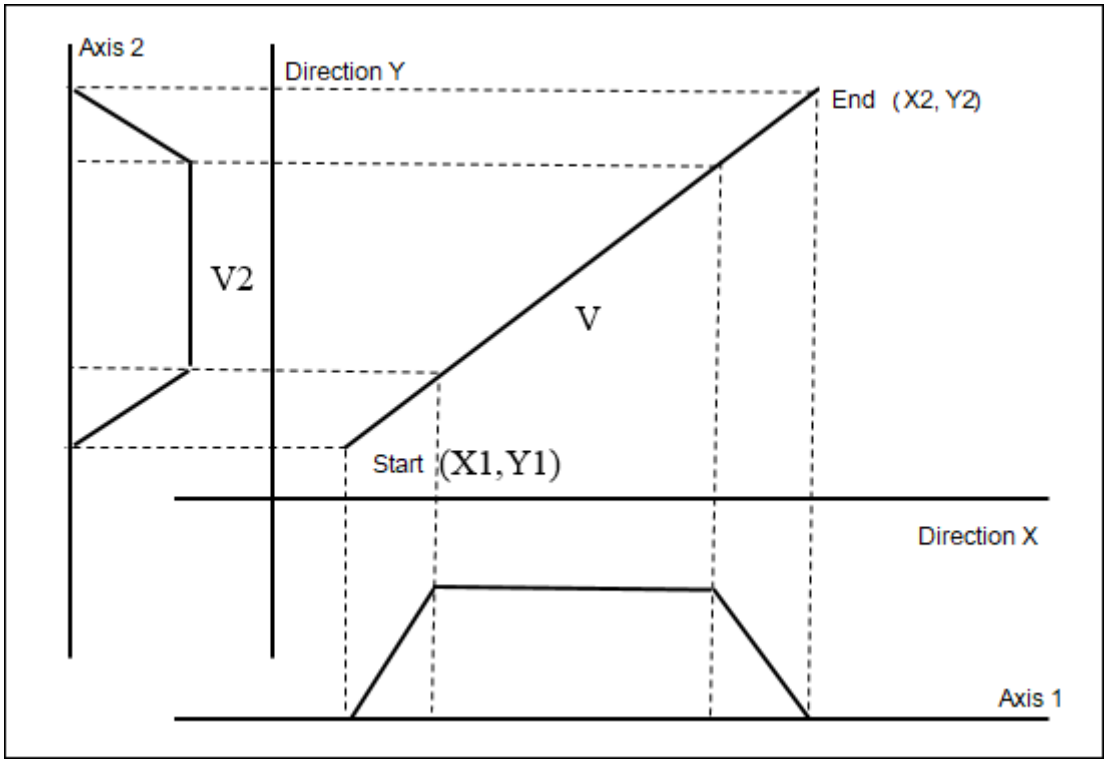
Output variable

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Done	Done	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is done.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is received.
Active	Instruction has controlled the axis group	BOOL	TRUE, FALSE	FALSE	TRUE when the axis is being controlled.
CommandAborted	Command aborted	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is aborted.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.

Output Variable	Name	Data Type	Valid Range	Default Value	Description
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs.

- **Parameter correction**

  Position dimension



Input Variable	Name	Correction Description for Parameter Value Greater than the Software Limit	Correction Description for Parameter Value Less than 0	Correction Description for Parameter Value Equal to 0
Velocity	Velocity	Any velocity that exceeds the motion parameter limit will be automatically corrected to the velocity limit.	Any velocity less than 0 will be automatically corrected to 1e-5.	The velocity equal to 0 will be automatically corrected to 1e-5.
Acceleration	Acceleration	Any acceleration that exceeds the motion parameter limit will be automatically corrected to the acceleration limit.	Any acceleration less than 0 will be automatically corrected to 10% of the acceleration limit.	Any acceleration equal to 0 will be automatically corrected to 10% of the acceleration limit.
Deceleration	Deceleration	Any deceleration that exceeds the motion parameter limit will be automatically corrected to the acceleration limit.	Any deceleration less than 0 will be automatically corrected to 10% of the acceleration limit.	Any deceleration equal to 0 will be automatically corrected to 10% of the acceleration limit.
Jerk	Jerk	For the non-trapezoidal motion profiling, any jerk that exceeds the software limit will be automatically corrected to the jerk limit.	For the non-trapezoidal motion profiling, any jerk that exceeds the software limit will be automatically corrected to 10% of the jerk limit.	For the non-trapezoidal motion profiling, any jerk that exceeds the software limit will be automatically corrected to 10% of the jerk limit.

  Percentage dimension

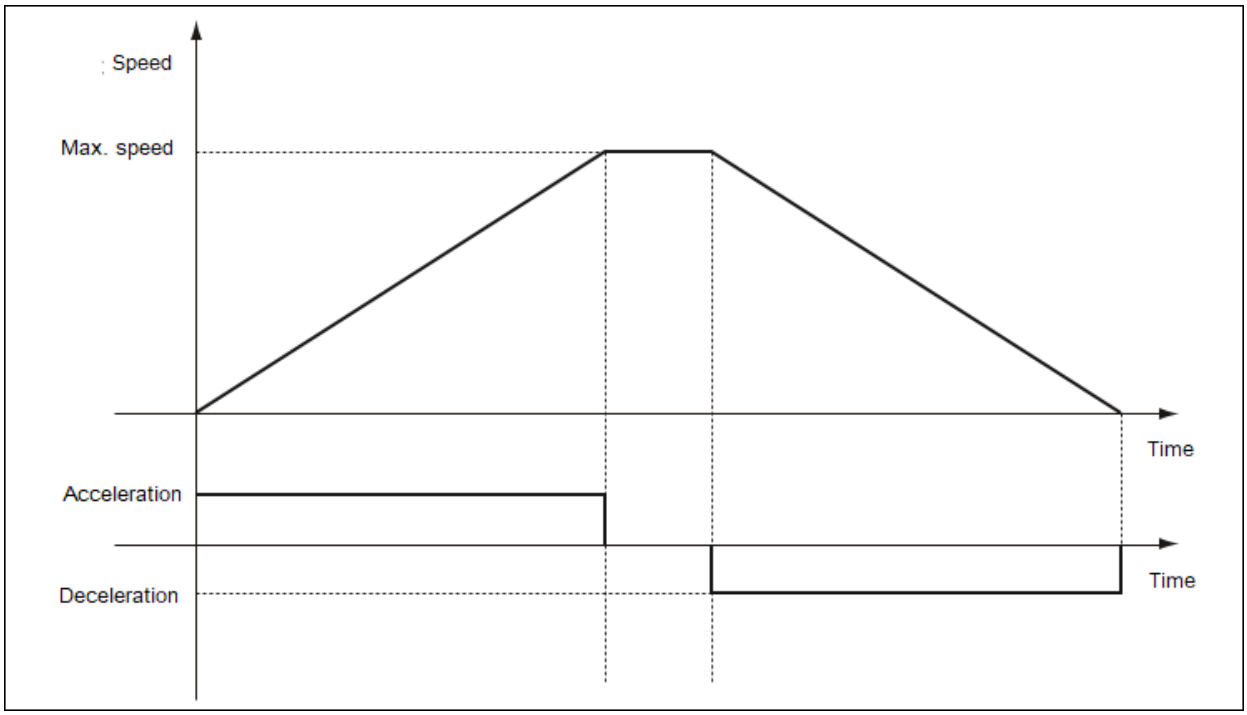
Input Variable	Name	Correction Description for Parameter Greater than 1	Correction Description for Parameter Value Less than 0	Correction Description for Parameter Value Equal to 0
Velocity	Velocity	Any velocity exceeding 1 is automatically corrected to 1.	Any velocity less than 0 will be automatically corrected to 1e-5.	The velocity equal to 0 will be automatically corrected to 1e-5.
Acceleration	Acceleration	Any acceleration exceeding 1 is automatically corrected to 1.	Any acceleration less than 0 will be automatically corrected to 10%.	Any acceleration equal to 0 will be automatically corrected to 10%.

Input Variable	Name	Correction Description for Parameter Greater than 1	Correction Description for Parameter Value Less than 0	Correction Description for Parameter Value Equal to 0
Deceleration	Deceleration	The value exceeding 1 is automatically corrected to 1.	Any deceleration less than 0 will be automatically corrected to 10%.	Any deceleration equal to 0 will be automatically corrected to 10%.
Jerk	Jerk	For the non-trapezoidal motion profiling, the value exceeding 1 is automatically corrected to 1.	For the non-trapezoidal motion profiling, the value exceeding 1 is automatically corrected to 10%.	For the non-trapezoidal motion profiling, the value exceeding 1 is automatically corrected to 10%.

- **Function**
  - This instruction is executed on the rising edge of Execute and performs linear absolute motion for two to four axes.
  - CoordSystem, Position, Velocity, Acceleration, Deceleration, Jerk, BufferMode, TransitionMode, and TransitionParameter can be specified in the input variables.
  - For the instruction, blending modes 2, 3, 4, and 5 for BufferMode have the same behavior. The transition effect depends on the TransitionMode and TransitionParameter settings.
  - Supports the same-cycle triggering of instructions. The Done output signal of the instruction serves as the trigger signal for Execute.
  - **CoordSystem**
    - Specify the coordinate system for linear relative motion.
  - **Position (Absolute position coordinate)**
    - For the axis type corresponding to each position vector in the Position array, see Axis group type description. Only PCS coordinates are supported.
    - In absolute motion mode, the axis group uses the set values in the Position array as the target position.
    - The ABC rotation axes of the coordinate system correspond sequentially to the ZYX-type Euler angles. If the configuration supports orientation motion, the configured ABC absolute positions must be within ±180°, otherwise an error will be generated.
    - If the target position would exceed any joint axis limit after kinematic transformation into joint space, starting this instruction will cause an error.
    - If the configuration supports orientation motion, the axis group will move to the target orientation along the shortest path.
  - **Velocity, Acceleration, Deceleration, Jerk**
    - If the velocity of any Axis variable in AxesGroup exceeds the maximum axis velocity limited by the software, it will trigger an error-stop condition.
    - The trajectory planning curve type of AxesGroup is set according to requirements. If the planning curve type is a trapezoidal curve, the Jerk variable does not take effect and is treated as 0. (The planning curve type of AxesGroup is specified in the axis group data structure.)
    - The linear motion is decomposed to each axis when linear absolute motion is performed.

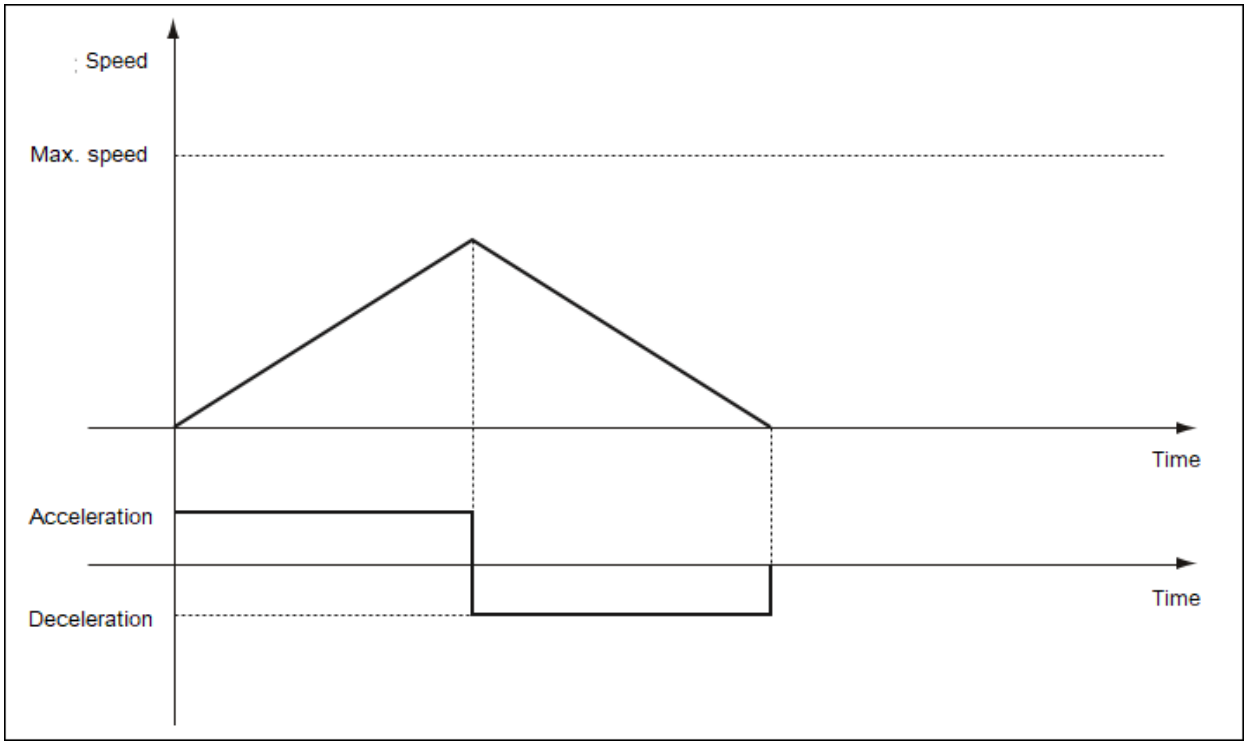
V: Target velocity for the axis group to perform linear motion

V1: The speed decomposed to Axis 1:



$$V1 = (X2 - X1) * V/\sqrt{(X2 - X1)^2 + (Y2 - Y1)^2}$$

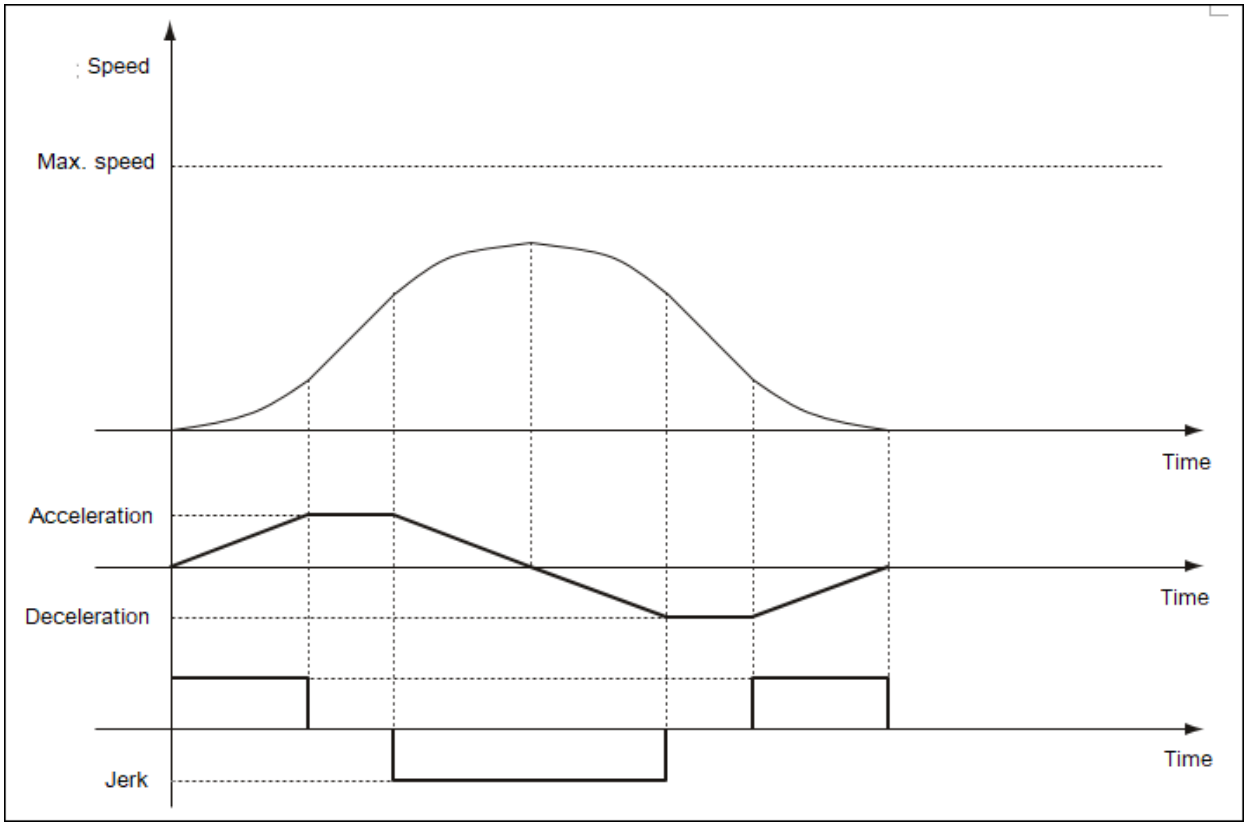
V2: The speed decomposed to Axis 2:



$$V2 = (Y2 - Y1) * V/\sqrt{(X2 - X1)^2 + (Y2 - Y1)^2}$$

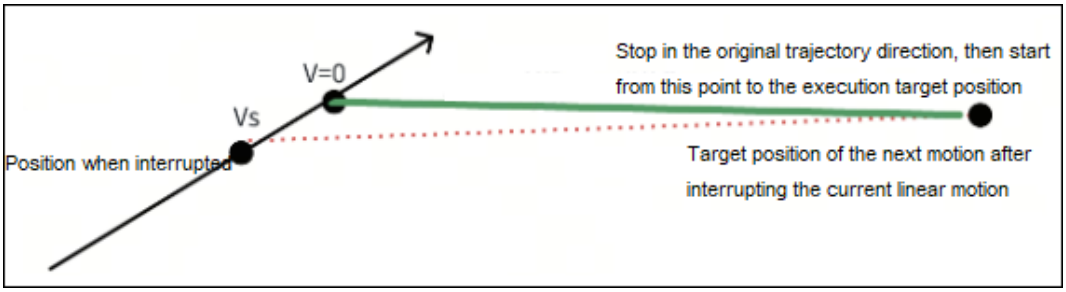
- For Jerk = 0 or Jerk ≠ 0, the velocity, acceleration, deceleration, and jerk curves are shown in the figure below.

  For Jerk = 0, the axis group can reach the maximum interpolation velocity.

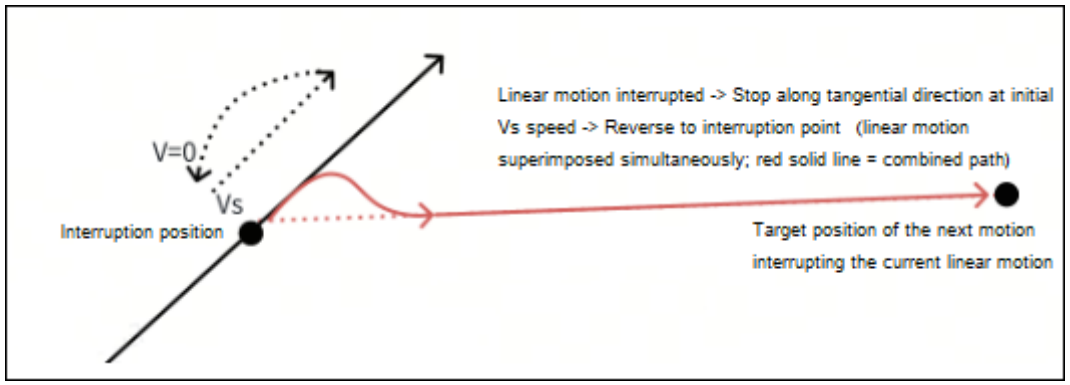


For Jerk = 0, the axis group cannot reach the maximum interpolation velocity due to too short travel distance.

For Jerk ≠ 0, the axis group can reach the maximum interpolation velocity. (Non-trapezoidal planning curve)

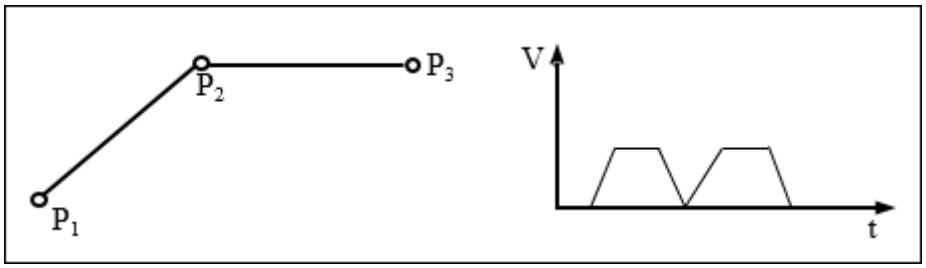


For Jerk ≠ 0, the axis group cannot reach the maximum interpolation velocity due to too short travel distance. (Non-trapezoidal planning curve)

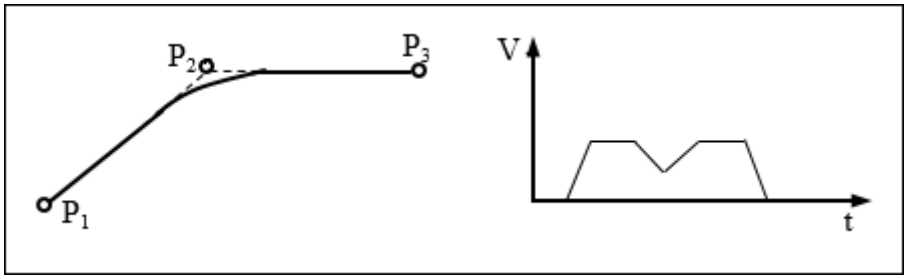


- **Re-triggering the instruction**
  - While the instruction is in motion, that is, when the instruction output parameters "Busy" and "Active" are both TRUE, this instruction cannot be re-triggered.
  - While the instruction is in buffer mode, that is, when Busy is TRUE and Active is FALSE, this instruction can be re-triggered after parameter modification. If the modified parameters are invalid, or if the buffered instruction data has already been used in motion calculations, retriggering the buffered instruction will cause an error. Then, the axis group will enter the GroupStop state, and the currently executing instruction will also report an error.
- **Multiple execution of motion instructions**
  - When this instruction is issued while another motion instruction is being executed, the new instruction can either be switched to immediately or buffered for later execution. Each axis group can buffer up to 8 instructions. In the case of multiple executions, the behavior of this instruction is determined by BufferMode.
  - BufferMode
    - Aborting: MC_ABORTING aborts the currently executing instruction and begins executing this instruction. The abort operation supports three modes, configurable via TransitionMode: TMNone, TMResetAbort, and TMDecAbort.

      TMNONE mode: During execution, the motion decelerates to a stop along the trajectory from the point of interruption. The next motion segment then starts from this stop point, as shown in the figure below.

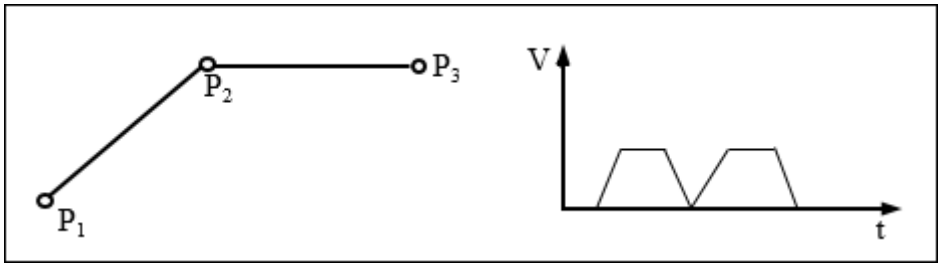


TMResetAbort mode: During execution, the axis decelerates along the straight line direction at the initial velocity of the interruption point, reverses its direction to return to that point, while simultaneously superimposing (blending) with the next motion segment, as shown in the figure below.

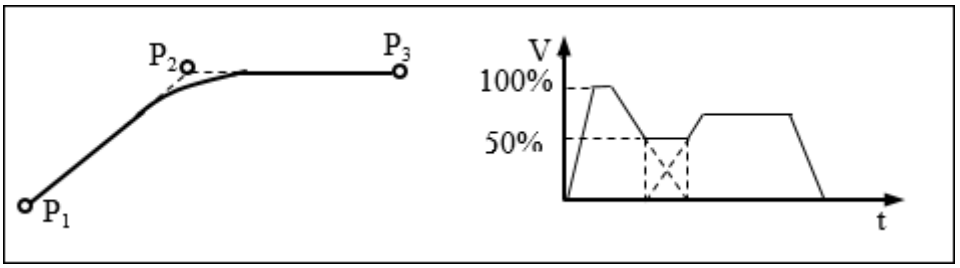


TMDecAbort mode: During execution, the axis decelerates to 0 along the straight line direction at the initial velocity of the interruption point, while simultaneously superimposing (blending) with the next motion segment, as shown in the figure below.

- Buffer: MC_BUFFERED, this instruction is buffered and executed after the current instruction is completed.



- Blending: MC_BLEND, the velocities of the two adjacent instructions are blended in the specified manner. This manner is specified in TransitionMode.

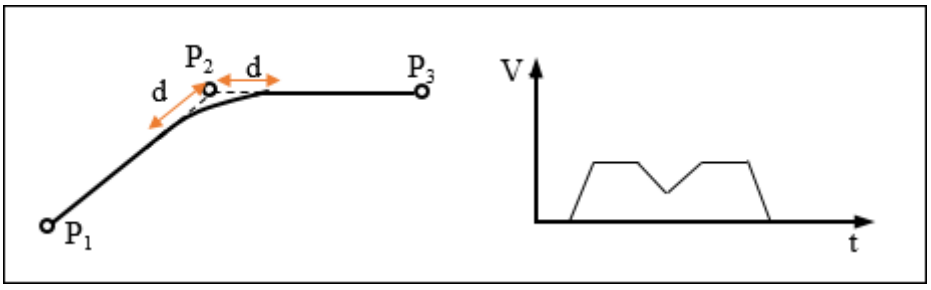


◦ TransitionMode

This variable specifies how to blend the velocities of two instructions when Blending is specified for the BufferMode.

- TMNone: Insert no transition curve. If TMNone is selected in a blending mode, the result is consistent with the transition between the velocities of the two instructions in buffered mode.

- TMStartVelocity: Transition with given start velocity. Blending transition at a certain ratio (0, 1] of the actual maximum velocity of the current motion control instruction. Effective for transitions between any motion control instructions.



- TMCornerDistance: Corner transition mode In Cartesian space, this parameter specifies the distance before the end of the previous instruction, measured in the main dimension space. The transition trajectory is initiated at this distance to connect with the adjacent trajectory. The distance here is a generalized distance, which depends on the main dimension type setting of the axis group.

  When the primary dimension is set to position: the parameter is the displacement from the transition point to the end point.

  When the primary dimension is set to orientation: the parameter is the orientation from the transition point to the end point.

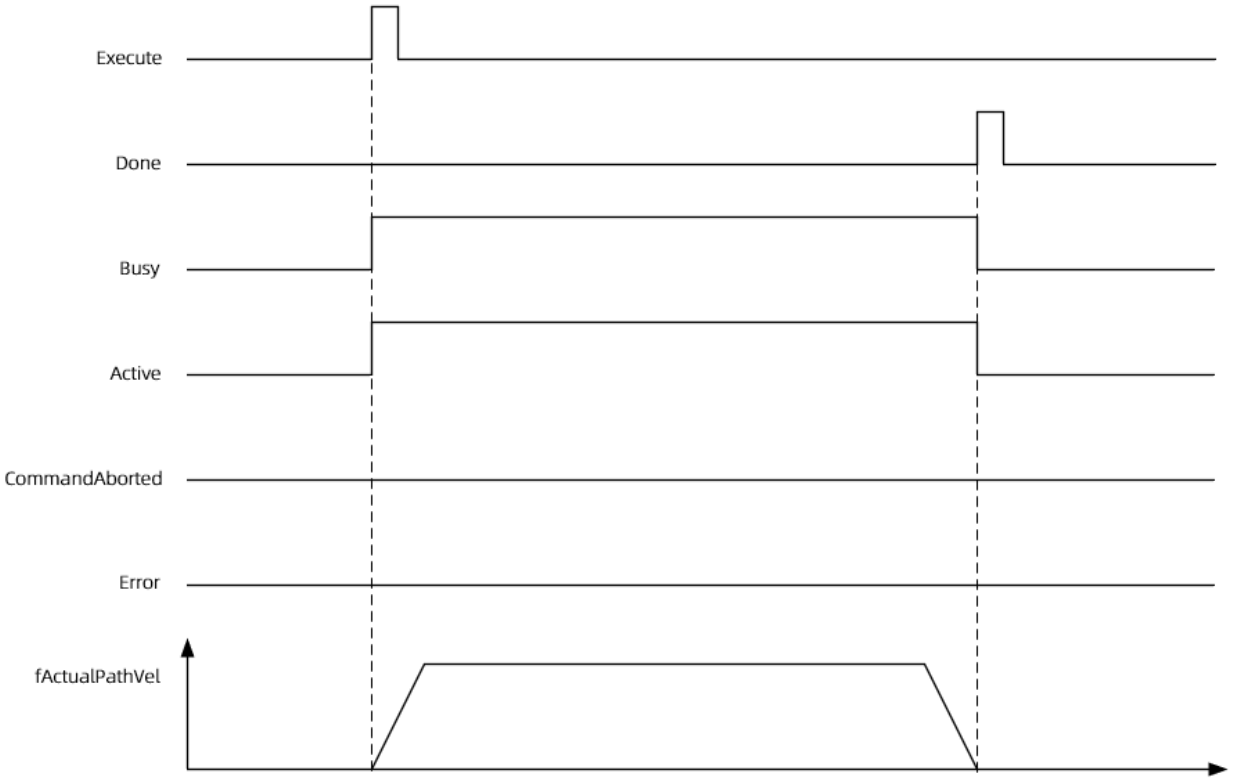
  When the primary dimension is set to ratio: The parameter is the ratio (0,1) of the resultant distance from the transition point to the endpoint to the total resultant displacement.

- TMMaxCornerDeviation: Transition mode using the maximum corner position deviation. In Cartesian space, this parameter specifies the maximum position deviation in the position subspace during the transition between adjacent instructions. An appropriate transition trajectory is constructed to connect the two adjacent paths, keeping the maximum position deviation within this limit. This is only the position deviation, independent of the main unit. Effective when both adjacent instructions are Cartesian space instructions (LIN/CIRC). Otherwise, they are processed with transition disabled.

- TMDefinedVelocity: Transition with defined velocity. Blending transition at a certain ratio (0, 1] of the actual maximum velocity of the instruction following the current motion control instruction. Effective for transitions between any motion control instructions.

- **Precautions**
  - This instruction only supports linear absolute motion in PCS coordinates.
  - The dimensions of the axis group planning parameters (velocity, acceleration, deceleration, and jerk) depend on the primary dimension set during axis group initialization. Different primary dimension types result in different dimensions and meanings for these parameters, and the parameter units are consistent with the axis group settings for the user.
    - UNIT_TRAJECT position. The input planning parameters are processed according to workspace position planning parameters.
    - UNIT_PERCENT maximum planning parameter ratio. The input planning parameters are processed as a combined ratio coefficient based on workspace pose planning parameters.
  - When the current motion instruction is interrupted, linear motion constructs a transition trajectory in working space along the direction of the velocity at the breakpoint to ensure smooth connection with the subsequent trajectory. This ensures velocity continuity only. However, the acceleration continuity is not guaranteed. For details on the three transition modes supported for aborting, see the motion abort description.
  - The transition trajectory calculation for the aborting instruction is planned according to the acceleration segment parameters set in the instruction. The higher the acceleration segment parameter value, the shorter the transition trajectory and the faster the transition.
  - **If the instruction motion mode is set to an interruption mode and the deceleration distance is insufficient, the function block reports an error. But the axis group does not enter the GroupErrorStop status; the original motion continues to execute.**
  - This instruction can only be initiated when the axis group is in the GroupMoving or GroupStandby state. Attempting to start this instruction in any other state will result in an error.
  - During the execution of this instruction, it can be interrupted by other motion instructions, MC_GroupStop, or MC_GroupHalt.

- After the execution of this instruction, the axis group (AxesGroup) state is changed from GroupMoving to GroupStandby, or remains in the GroupMoving state.
- If the current motion is in a static coordinate system, the axis group is changed from the GroupMoving state to the GroupStandby state. If the current motion is in a dynamic coordinate system, the axis group remains in the GroupMoving state.



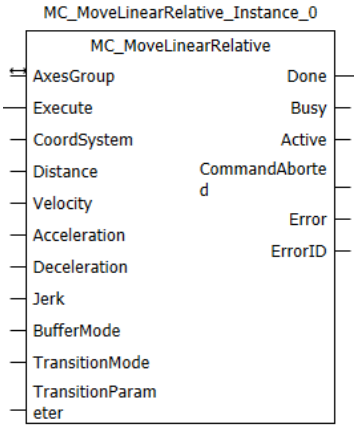
- **Program example**

  The example program for this instruction can refer to the MC_MoveDirectRelative instruction. This instruction can also be combined with other AxesGroup motion instructions.

- **Sequence diagram**

  When "Execute" is started, the output variables "Busy" and "Active" become TRUE. When the target position is reached, the axis group speed becomes 0, the output variable "Done" becomes TRUE, and the output variables "Busy" and "Active" become FALSE.

  A linear interpolation instruction is called to perform interpolation along the X-axis and Y-axis.



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.5.22 MC_MoveLinearRelative

Performs linear relative motion for an axis group, moving the axis group from the current TCP position to a relative target position via linear interpolation within the specified coordinate system.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
MC_MoveLinearRelative	Linear relative motion		MC_MoveLinearRelative_Instance_0(AxesGroup := , Execute := , CoordSystem := , Distance := , Velocity := , Acceleration :=, Deceleration :=, Jerk := , BufferMode := , TransitionMode := , TransitionParameter := , Done => , Busy => , Active =>, CommandAborted =>, Error =>, ErrorID =>);

- **Function**
  - This instruction is executed on the rising edge of Execute and performs linear relative motion for two to four axes.
  - CoordSystem, Distance, Velocity, Acceleration, Deceleration, Jerk, BufferMode, TransitionMode, TransitionParameter can be specified in the input variables.
  - When this instruction is initiated, the target position is determined by adding the input variable Distance (relative position) to the starting position of AxesGroup.
  - For the instruction, blending modes 2, 3, 4, and 5 for BufferMode have the same behavior. The transition effect depends on the TransitionMode and TransitionParameter settings.
  - Supports the same-cycle triggering of instructions. The Done output signal of the instruction serves as the trigger signal for Execute.
  - **CoordSystem**
    - Specify the coordinate system for linear relative motion. Currently, only linear relative motion under the PCS is supported.
  - **Distance (Relative position coordinate)**
    - For the axis type corresponding to each position vector in the Distance array, see Axis group type description. Only PCS coordinates are supported.
    - The ABC rotation axes of the coordinate system correspond sequentially to the ZYX-type Euler angles. If the configuration supports orientation motion, the configured ABC relative positions must be within ±180°, otherwise an error will be generated.
    - In relative motion mode, the rules for calculating the target position of the axis group are shown in the table below.

Coordinate system type (calculation of target positions for each axis in the existing axis group configuration)
PCS
X-axis target position = X-axis current position + Distance [1]
Y-axis target position = Y-axis current position + Distance [2]
Z-axis target position = Z-axis current position + Distance [3]
A-axis target position = A-axis current position + Distance [4]

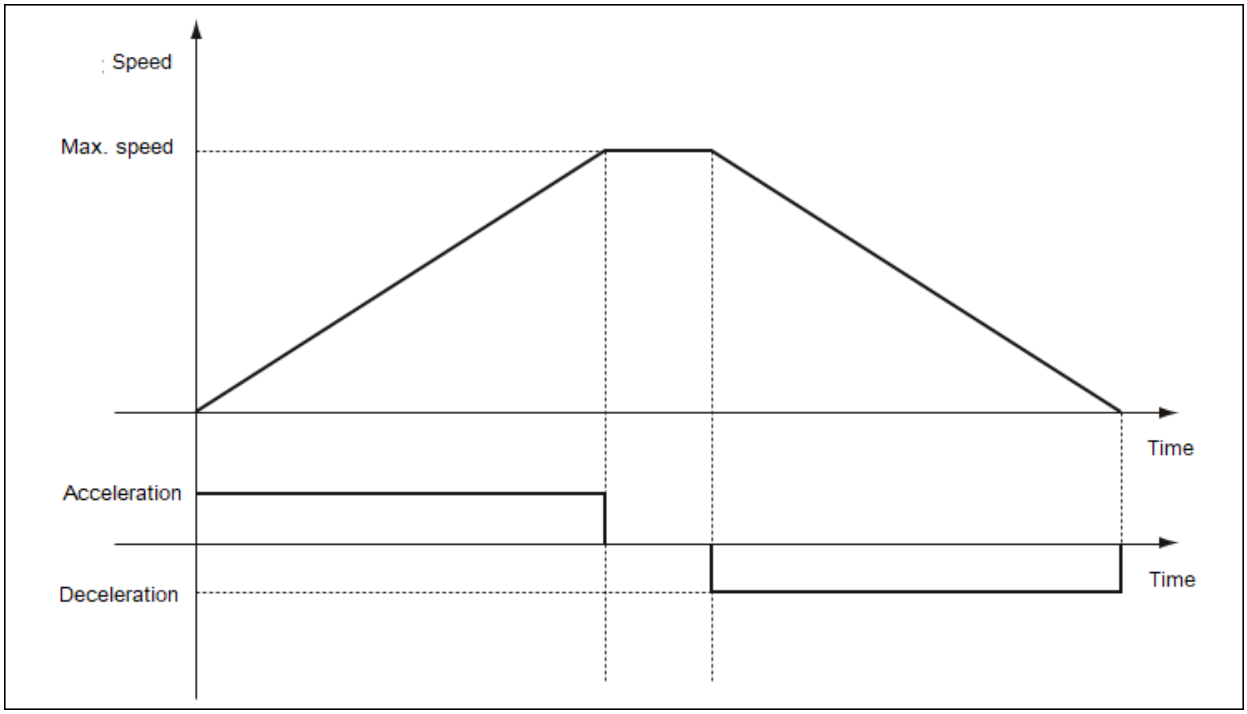
- If the A-axis target position is not within ±180°, the system will make the following adjustments: if the A-axis target position is greater than 180°, the system will subtract 360° until the result falls within ±180°; if the A-axis target position is less than -180°, the system will add 360° until the result falls within ±180°. Example: $A_{\text{calculated target position}}$ = 260°, $A_{\text{converted target position}}$ = -100°.
- If the target position would exceed any joint axis limit after kinematic transformation into joint space, starting this instruction will cause an error.
- If the configuration supports orientation motion, the axis group will move to the target orientation along the shortest path.

◦ **Velocity, Acceleration, Deceleration, Jerk**

- If the velocity of any Axis variable in AxesGroup exceeds the maximum axis velocity limited by the software, it will trigger an error-stop condition.
- The trajectory planning curve type of AxesGroup is set according to requirements. If the planning curve type is a trapezoidal curve, the Jerk variable does not take effect and is treated as 0. (The planning curve type of AxesGroup is specified in the axis group data structure.)
- The linear motion is decomposed to each axis when linear relative motion is performed.

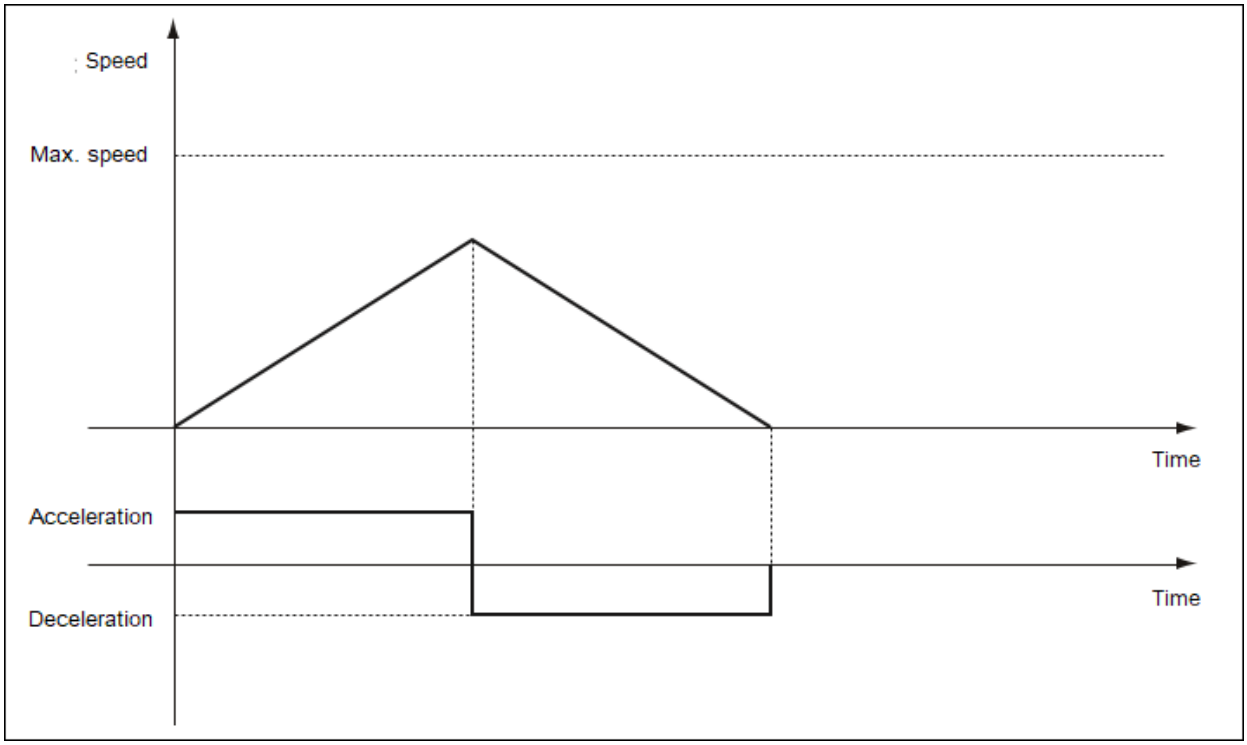
V: Target velocity for the axis group to perform linear motion

V1: The speed decomposed to Axis 1:



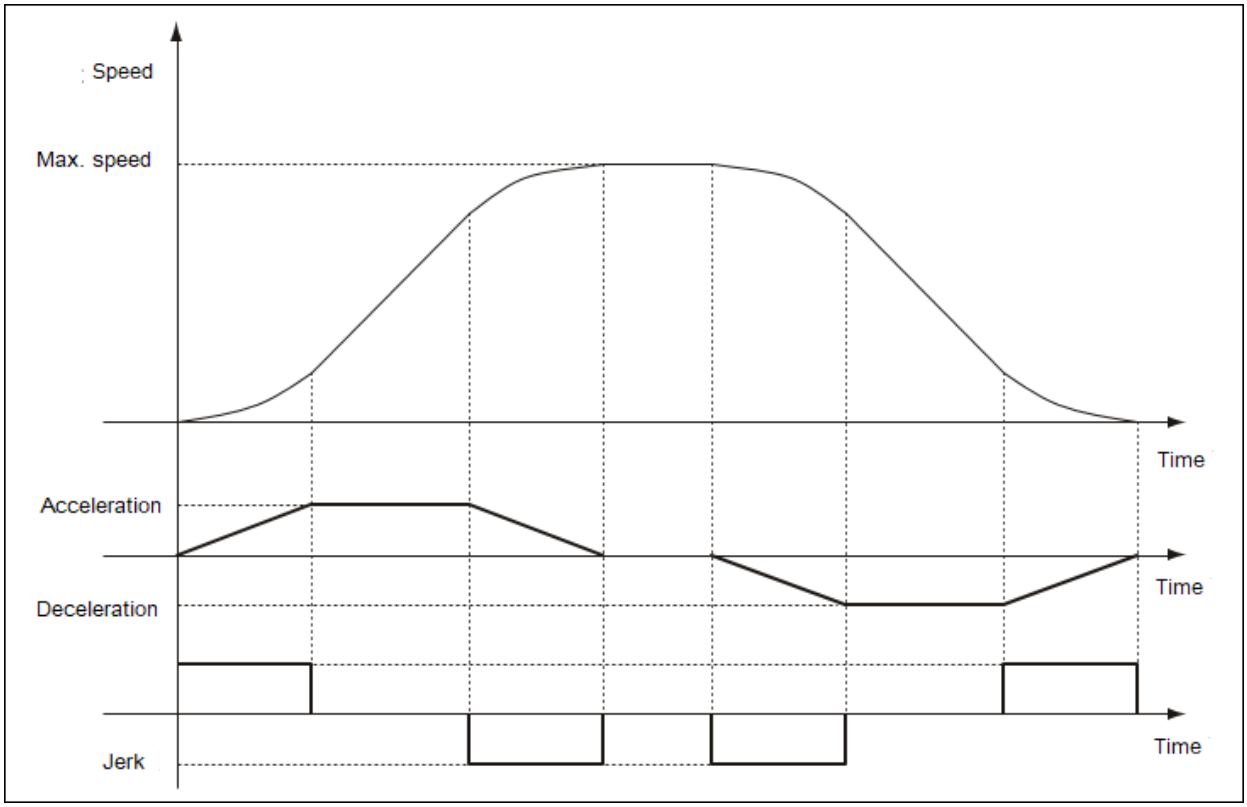
$$V1 = (X2 - X1) * V/\sqrt{(X2 - X1)^2 + (Y2 - Y1)^2}$$

V2: The speed decomposed to Axis 2:

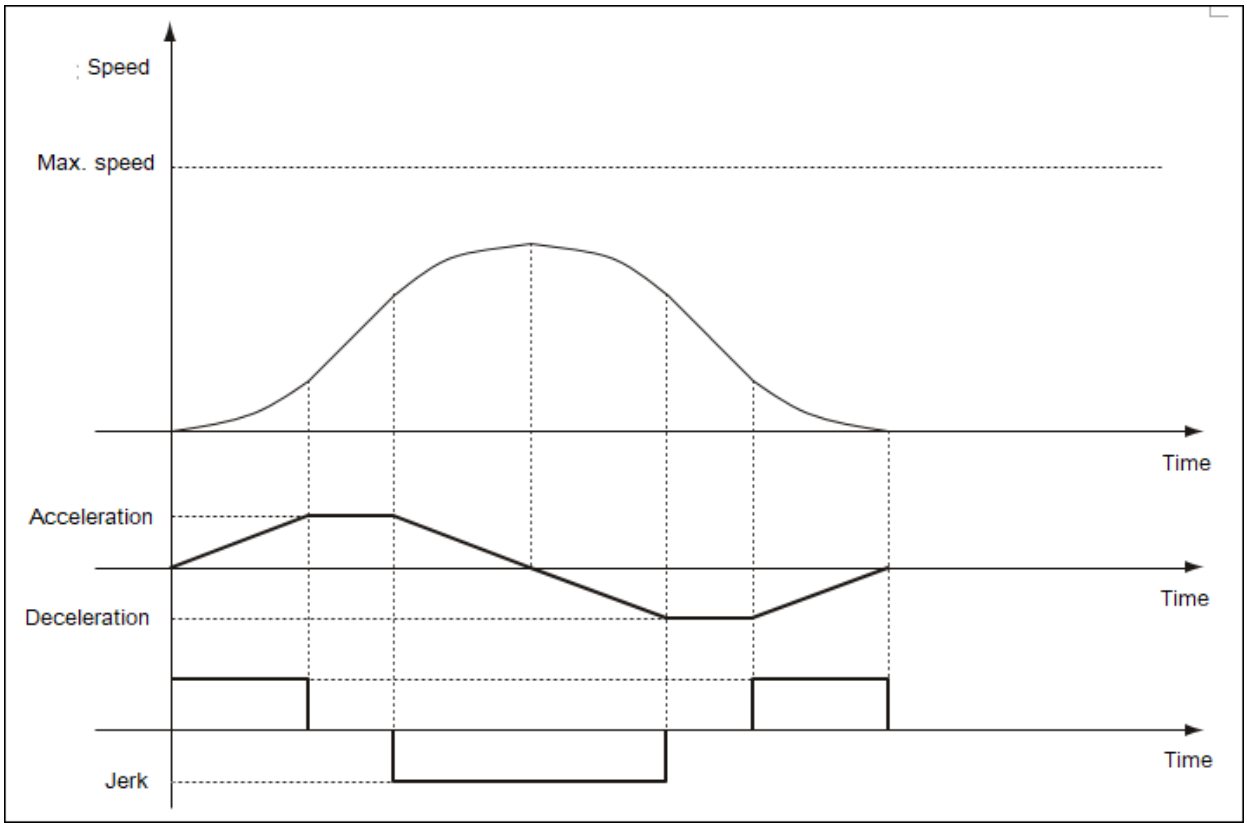


$$V2 = (Y2 - Y1) * V/\sqrt{(X2 - X1)^2 + (Y2 - Y1)^2}$$

- For Jerk = 0 or Jerk ≠ 0, the velocity, acceleration, deceleration, and jerk curves are shown in the figure below.

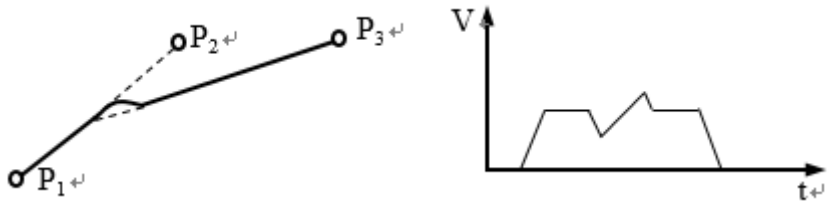


For Jerk = 0, the axis group can reach the maximum interpolation velocity.

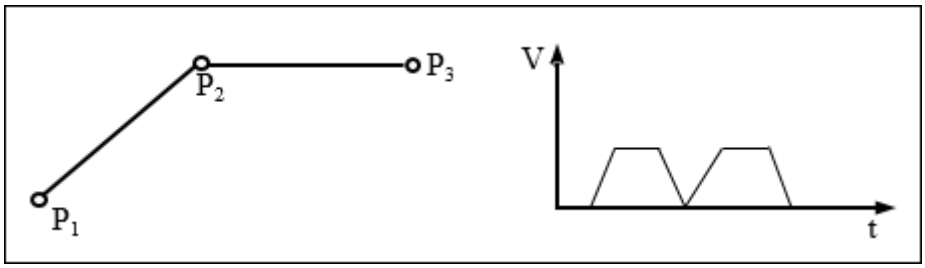


For Jerk = 0, the axis group cannot reach the maximum interpolation velocity due to too short travel distance.

For Jerk ≠ 0, the axis group can reach the maximum interpolation velocity. (Non-trapezoidal planning curve)

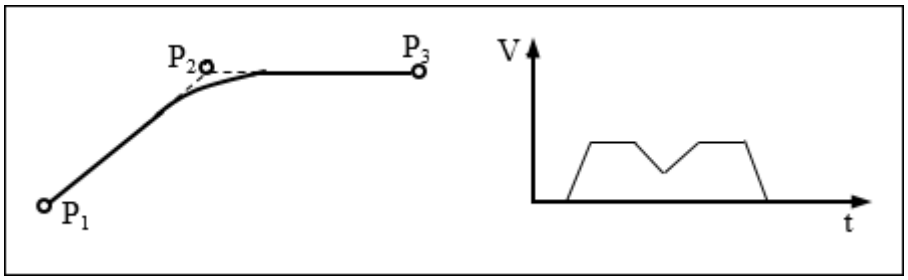


For Jerk ≠ 0, the axis group cannot reach the maximum interpolation velocity due to too short travel distance. (Non-trapezoidal planning curve)



- **Re-triggering the instruction**
  - While the instruction is in motion, that is, when the instruction output parameters "Busy" and "Active" are both TRUE, this instruction cannot be re-triggered.
  - While the instruction is in buffer mode, that is, when Busy is TRUE and Active is FALSE, this instruction can be re-triggered after parameter modification. If the modified parameters are invalid, or if the buffered instruction data has already been used in motion calculations, retriggering the buffered

instruction will cause an error. Then, the axis group will enter the GroupStop state, and the currently executing instruction will also report an error.



- **Multiple execution of motion instructions**
  - When this instruction is issued while another motion instruction is being executed, the new instruction can either be switched to immediately or buffered for later execution. Each axis group can buffer up to 8 instructions. In the case of multiple executions, the behavior of this instruction is determined by BufferMode.
  - BufferMode
    - Aborting: MC_ABORTING aborts the currently executing instruction and begins executing this instruction.

    - Buffer: MC_BUFFERED, this instruction is buffered and executed after the current instruction is completed.

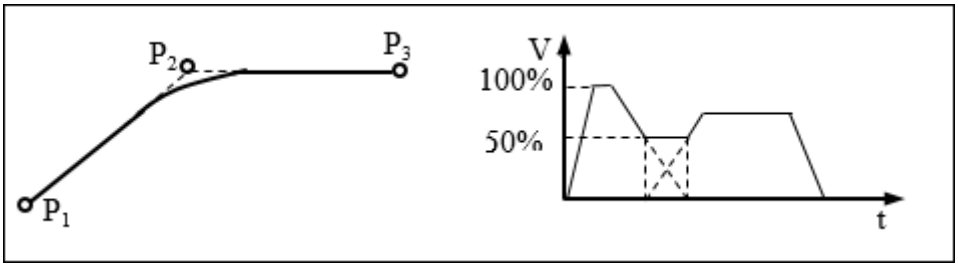
    - Blending: MC_BLEND, the velocities of the two adjacent instructions are blended in the specified manner. This manner is specified in TransitionMode.

  - TransitionMode

    This variable specifies how to blend the velocities of two instructions when Blending is specified for the BufferMode.

    - TMNone: Insert no transition curve. If TMNone is selected in a blending mode, the result is consistent with the transition between the velocities of the two instructions in buffered mode. The abort operation supports three modes, configurable via TransitionMode: TMNone, TMResetAbort, and TMDecAbort.

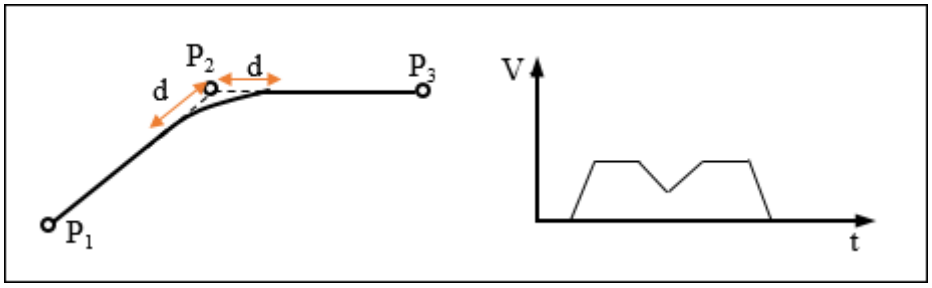
      TMNONE mode: During execution, the motion decelerates to a stop along the trajectory from the point of interruption. The next motion segment then starts from this stop point, as shown in the figure below.



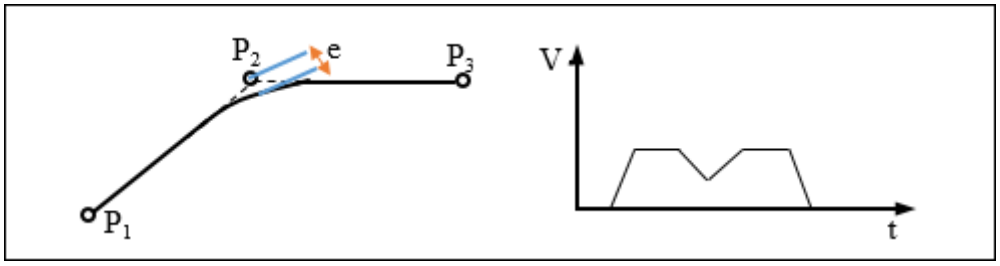
TMResetAbort mode: During execution, the axis decelerates along the straight line direction at the initial velocity of the interruption point, reverses its direction to return to that point, while simultaneously superimposing (blending) with the next motion segment, as shown in the figure below.

TMDecAbort mode: During execution, the axis decelerates to 0 along the straight line direction at the initial velocity of the interruption point, while simultaneously superimposing (blending) with the next motion segment, as shown in the figure below.

- TMStartVelocity: Transition with given start velocity. Blending transition at a certain ratio (0, 1] of the actual maximum velocity of the current motion control instruction. Effective for transitions between any motion control instructions.

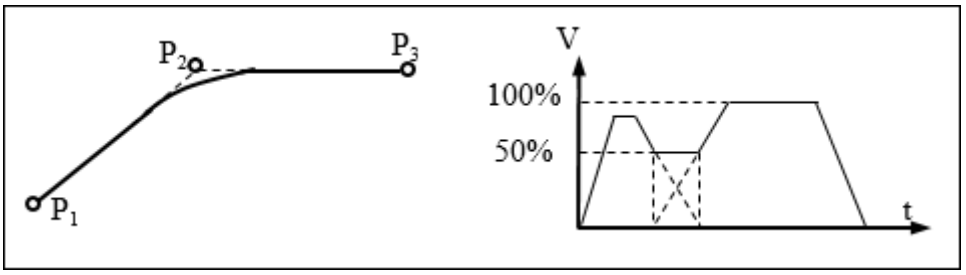


- TMCornerDistance: Corner transition mode In Cartesian space, this parameter specifies the distance before the end of the previous instruction, measured in the main dimension space. The transition trajectory is initiated at this distance to connect with the adjacent trajectory. The distance here is a generalized distance, which depends on the main dimension type setting of the axis group.



When the primary dimension is set to position: the parameter is the displacement from the transition point to the end point.

When the primary dimension is set to orientation: the parameter is the orientation from the transition point to the end point.



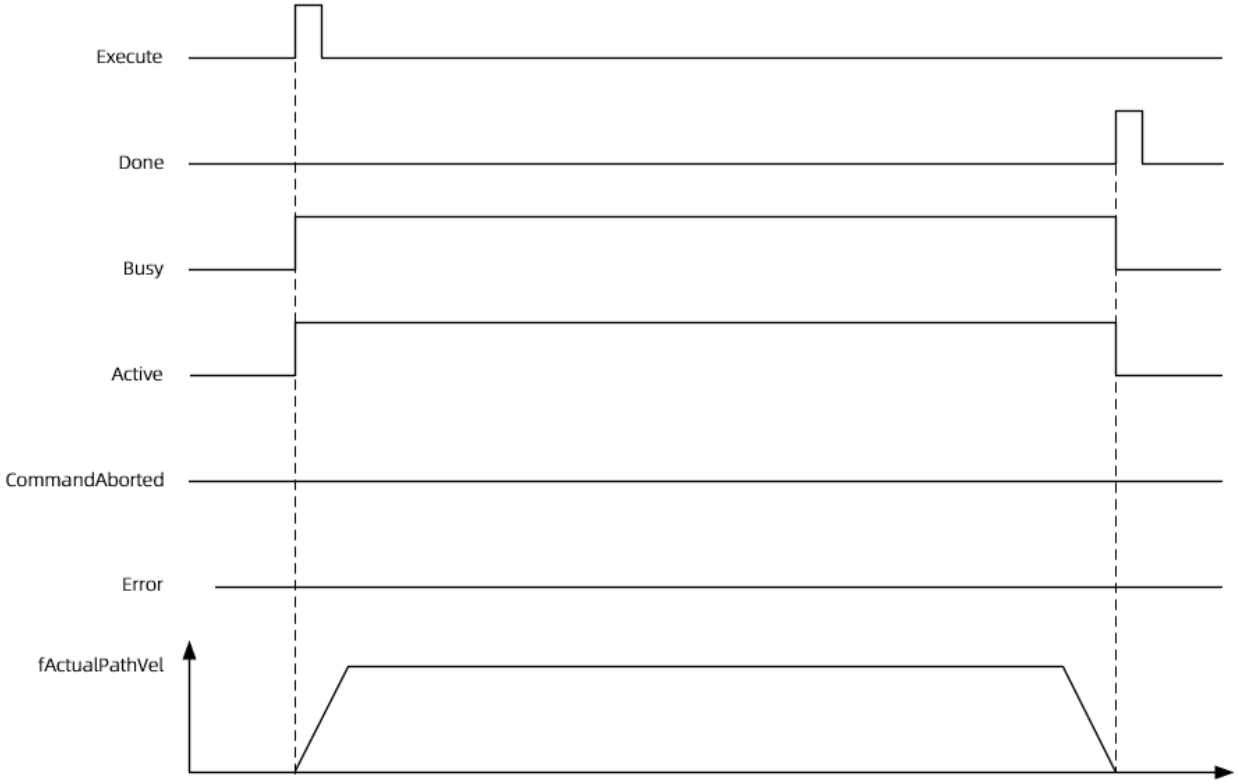
When the primary dimension is set to ratio: The parameter is the ratio (0 to 1) of the resultant distance from the transition point to the endpoint to the total resultant displacement.

- TMMaxCornerDeviation: Transition mode using the maximum corner position deviation. In Cartesian space, this parameter specifies the maximum position deviation in the position subspace during the transition between adjacent instructions. An appropriate transition trajectory is constructed to connect the two adjacent paths, keeping the maximum position deviation within this limit. This is only the position deviation, independent of the main unit. Effective when both adjacent instructions are Cartesian space instructions (LIN/CIRC). Otherwise, they are processed with transition disabled.

- TMDefinedVelocity: Transition with defined velocity. Blending transition at a certain ratio (0, 1] of the actual maximum velocity of the instruction following the current motion control instruction. Effective for transitions between any motion control instructions.

- **Precautions**
  - This instruction only supports linear absolute motion in PCS coordinates.
  - The dimensions of the axis group planning parameters (velocity, acceleration, deceleration, and jerk) depend on the primary dimension set during axis group initialization. Different primary dimension types result in different dimensions and meanings for these parameters, and the parameter units are consistent with the axis group settings for the user.
    - UNIT_TRAJECT position. The input planning parameters are processed according to workspace position planning parameters.
    - UNIT_PERCENT maximum planning parameter ratio. The input planning parameters are processed as a combined ratio coefficient based on workspace pose planning parameters.

- When the current motion instruction is interrupted, linear motion constructs a transition trajectory in working space along the direction of the velocity at the breakpoint to ensure smooth connection with the subsequent trajectory. This ensures velocity continuity only. However, the acceleration continuity is not guaranteed. For details on the three transition modes supported for aborting, see the motion abort description.
- The transition trajectory calculation for the aborting instruction is planned according to the acceleration segment parameters set in the instruction. The higher the acceleration segment parameter value, the shorter the transition trajectory and the faster the transition.
- **If the instruction motion mode is set to an interruption mode and the deceleration distance is insufficient, the function block reports an error. But the axis group does not enter the GroupErrorStop status; the original motion continues to execute.**
- This instruction can only be initiated when the axis group is in the GroupMoving or GroupStandby state. Attempting to start this instruction in any other state will result in an error.
- During the execution of this instruction, it can be interrupted by other motion instructions, MC_GroupStop, or MC_GroupHalt.
- After the execution of this instruction, the axis group (AxesGroup) state is changed from GroupMoving to GroupStandby, or remains in the GroupMoving state.
- If the current motion is in a static coordinate system, the axis group is changed from the GroupMoving state to the GroupStandby state. If the current motion is in a dynamic coordinate system, the axis group remains in the GroupMoving state.



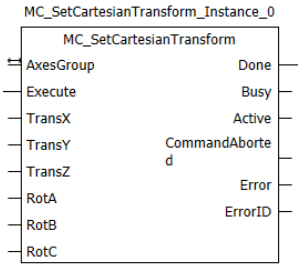
- **Program example**

  The example program for this instruction can refer to the MC_MoveDirectRelative instruction. This instruction can also be combined with other AxesGroup motion instructions.

- **Sequence diagram**

  When "Execute" is started, the output variables "Busy" and "Active" become TRUE. When the target position is reached, the axis group speed becomes 0, the output variable "Done" becomes TRUE, and the output variables "Busy" and "Active" become FALSE.

  A linear interpolation instruction is called to perform interpolation along the X-axis and Y-axis.



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.5.23 MC_SetCartesianTransform

This instruction is used to set the basic static part coordinate system (PART_BASE_MCS), which defines the transformation between the machine coordinate system (MCS) and the part coordinate system (PCS).

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
MC_SetCartesianTransform	Set transformation between part coordinate system and machine coordinate system		MC_SetCartesianTransform_Instance_0(AxesGroup := , Execute := , TransX := , TransY := , TransZ := , RotA := , RotB := , RotC := , Done => , Busy => , Active =>, CommandAborted =>, Error =>, ErrorID =>);

- **Related variables**

In-out variables

In-out Variable	Name	Data Type	Valid Range	Default Value	Description
AxesGroup	Axis group	18.3.3.2.4.1 AXES_GROUP_REF: Axis Group Structure	-	-	Mapped to an axis group, which is an instance of AXES_GROUP_REF.

Input variable

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Execute	Execute	BOOL	TRUE, FALSE	FALSE	Execute the instruction on a rising edge.
TransX	X-axis	LREAL	-	0	X-axis component in the Cartesian transformation coordinate system.

Input Variable	Name	Data Type	Valid Range	Default Value	Description
TransY	Y-axis	LREAL	-	0	Y-axis component in the Cartesian transformation coordinate system.
TransZ	Z-axis	LREAL	-	0	Cartesian transformation coordinate system Z-axis component.
RotA	A-axis	LREAL	-	0	A-axis component in the Cartesian transformation coordinate system.
RotB	B-axis	LREAL	-	0	B-axis component in the Cartesian transformation coordinate system.
RotC	C-axis	LREAL	-	0	C-axis component in the Cartesian transformation coordinate system.

Output variable

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Done	Done	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is done.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	Static coordinate switch response.

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Active	Instruction has controlled the axis group	BOOL	TRUE, FALSE	FALSE	Static coordinate switching in progress.
CommandAborted	Command aborted	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is aborted.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs.

- **Function**
  - This instruction is executed on the rising edge of Execute, establishing the standard Cartesian part coordinate system for transformation between the machine coordinate system (MCS) and the part coordinate system (PCS).
  - The default initial value for each component of the Cartesian coordinate system is 0.0.
  - The order ABC of the rotation axes corresponds to ZYX Euler angles.
  - The part coordinate system can be defined multiple times within the same AxesGroup at the same time. The function block can be reset after successful static coordinate system setting, interruption, or error.
  - The part coordinate system can be set only under either of two conditions: the AxesGroup is in GroupStandby state, or in GroupMoving state with its motion idle (Idle = TRUE); the part coordinate system of the axis group is in the transformation process. All other axis group states will trigger an error. In addition, it is prohibited to set the part coordinate system when the mounting axis in the axis group is in the PowerOff state. Otherwise, an error will be reported.
  - When a new static part coordinate system is set: The function block responds with "Busy" and updates the axis group position, velocity, and acceleration data in the new coordinate system (ACS/PCS) within one cycle (Active). If the part coordinate system was in static mode before the switch, the function block completes the switch (Done). If the part coordinate system was in dynamic mode before the switch, the axis group starts decelerating from its current dynamic tracking state and performs zero-displacement planning (Active). Then, it decelerates to a stop, enters a stationary state, and completes the static coordinate system switch (Done).
  - Do not set the part coordinate system during continuous trajectory operation of the axis group; otherwise, the function block will report an error, but the current state of the axis group remains unchanged.
  - The set values of the input variables RotA, RotB, and RotC must be within ±180 degrees. Otherwise, the instruction will error.

- Due to mechanical configuration constraints, only the TransX and TransY coordinate axis values can be set for XY and Delta2 configurations. If a value is set for any other coordinate axis, the instruction will report an error.
- For XYZA, SCARA, and Delta3+1 configurations, only the A-axis orientation is available. Therefore, the spatial tilt orientations defined by RotB and RotC in the user coordinate system cannot be achieved. The actual orientation executed by the equipment is the orthogonal projection of the orientation defined in the specified conveyor belt coordinate system onto the XY plane of the base coordinate system.

- **Precautions**

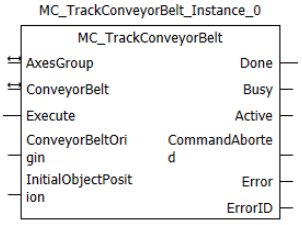
  Do not re-trigger the function block during the switching process. Otherwise, the function block reports an error.

- **Sequence diagram**

  The Execute input of the function block must be triggered on a rising edge. The Done output of the function block indicates the instruction is executed successfully. The Busy output of the function block indicates that the current function block is being executed. The CommandAborted output of the function block indicates that the instruction is aborted by another motion control instruction, at which point the flag is set to TRUE.

  On the rising edge of Execute, both Busy and Active outputs are set to TRUE.

  After the transformation between the machine coordinate system (MCS) and the part coordinate system (PCS) is completed, the output variable "Done" becomes TRUE.



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.5.24 MC_TrackConveyorBelt

This instruction enables the conveyor belt tracking by providing an abstraction layer for the conveyor belt to assist in tracking objects moving in a straight line in space. This instruction activates a dynamic coordinate transformation from the base frame to the selected axis group frame, thereby enabling dynamic tracking of a synchronous belt.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
MC_TrackConveyorBelt	Conveyor belt tracking		MC_TrackConveyorBelt_Instance_0(AxesGroup := , ConveyorBelt := , Execute := , ConveyorBeltOrigin := , InitialObjectPosition := , Done => , Busy => , Active =>, CommandAborted =>, Error =>, ErrorID =>);

- **Related variables**

In-out variables

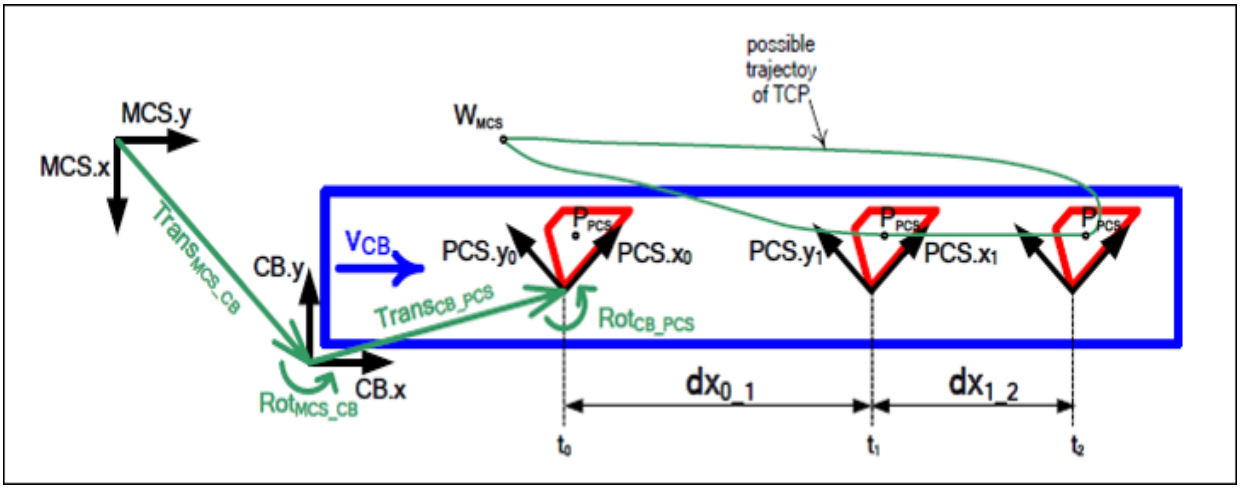
In-out Variable	Name	Data Type	Valid Range	Default Value	Description
AxesGroup	Axis group	18.3.3.2.4.1 AXES_GROUP_REF: Axis Group Structure	-	-	Mapped to an axis group, which is an instance of AXES_GROUP_REF.
ConveyorBelt	Conveyor belt	18.3.3.2.2.1 AXIS_REF: Axis Structure	-	-	Reference to the axis; an instance of AXIS_REF.

Input variables

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Execute	Execute	BOOL	TRUE, FALSE	FALSE	Execute the instruction on a rising edge.

Input Variable	Name	Data Type	Valid Range	Default Value	Description
ConveyorBeltOrigin	Conveyor belt initial pose	S_CARTESIAN	-	[0,0,…]	Pose of the conveyor belt relative to the base coordinate system. The X-axis of the conveyor belt coordinate system should point in the direction of conveyor belt movement.
InitialObjectPosition	Initial object pose	S_CARTESIAN	-	[0,0,…]	Pose of the object relative to the conveyor belt coordinate system at the initial moment.

Output variable



Output Variable	Name	Data Type	Valid Range	Default Value	Description
Done	Done	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the conveyor belt tracking is complete.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the coordinate following task has responded.
Active	Instruction has controlled the axis group	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the coordinate following is in progress.
CommandAborted	Command aborted	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the selected coordinate system transformation changes (The new part coordinate system is set).
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.

Output Variable	Name	Data Type	Valid Range	Default Value	Description
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs.

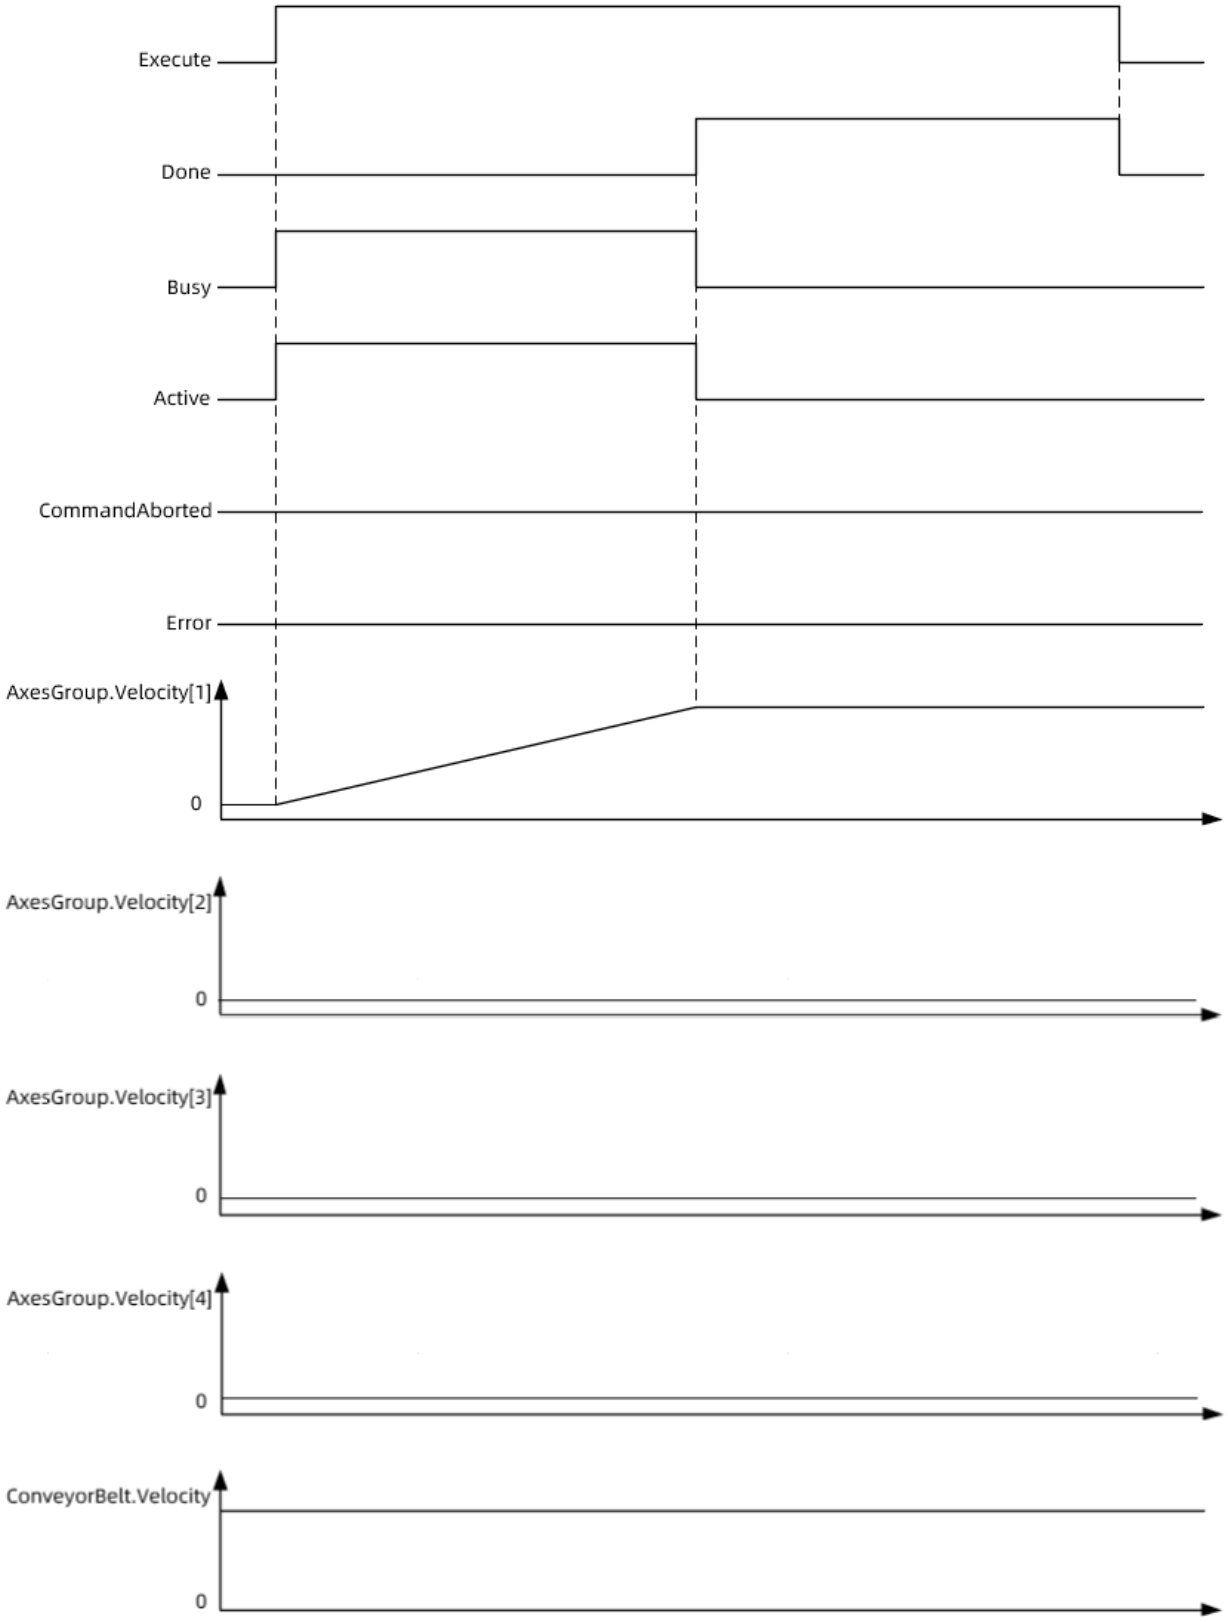
- **Function**
  - This instruction is executed on the rising edge of Execute.
  - The dynamic tracking of a synchronous belt is one of the dynamic part coordinate systems. By associating the current axis group with a known belt and its designated dynamic coordinate system attached to and moves with the belt, the axis group achieves synchronous tracking of the belt.
  - The orientation values (A, B, C) set for the input variables ConveyorBeltOrigin and InitialObjectPosition must be within ±180 degrees. Otherwise, the instruction will report an error.
  - Due to mechanical configuration constraints, for XY and Delta2 configurations, only the X- and Y-axis values can be set for the input variables ConveyorBeltOrigin and InitialObjectPosition. If a value is set for any other coordinate axis, the instruction will report an error.
  - For XYZA, SCARA, and Delta3+1 configurations, only the A-axis orientation is available. Therefore, the spatial tilt orientations defined by the conveyor coordinate systems B and C cannot be achieved. The actual orientation executed by the equipment is the orthogonal projection of the orientation defined in the specified conveyor belt coordinate system onto the XY plane of the base coordinate system.
- **Re-triggering the instruction**

  This instruction cannot be re-triggered; otherwise the function block will be rejected with an error. The axis group enters the GroupErrorStop status.
- **Example of the tracking process:**

  1. Set the position of the conveyor belt relative to the robot base coordinate system. When an object is detected on the conveyor belt, associate the coordinate values of the object-attached coordinate system(relative to the conveyor base coordinate system) with the conveyor, and activate the tracking of the conveyor belt in the dynamic part coordinate system (Busy).
  2. Once the conveyor tracking is activated (Active), the axis group initiates motion planning relative to the dynamic coordinate system. This planning allows the Tool Center Point (TCP) to gradually synchronize its velocity with the conveyor belt within the dynamic workpiece space. Once achieved, the TCP maintains synchronous motion with the rigidly attached moving frame, and the Done output is set to TRUE.
  3. After the target position has been reached, execute the operation program in the dynamic part coordinate system, and call the motion function block to move within the dynamic coordinate system.
  4. After the operation is completed, switch back to the static coordinate system, and the axis group state is changed from GroupMoving to GroupStandby.

- **Precautions**
  - After the dynamic coordinate system is set, the point-to-point motion is not supported. The point-to-point motion function block in the dynamic coordinate system will directly report an error. It is prohibited to switch the coordinate system while the axis group motion function block is in motion. Otherwise, the function block will report an error.
  - After completing the dynamic coordinate system motion, select method (b) to return to the waiting position. When calling point-to-point instructions, avoid using the specified PCS coordinates in blending transition mode. Blending mode may introduce deviations in the dynamic coordinate system (PCS coordinates); therefore, ACS-type coordinates must be used instead.
  - The in-out variable ConveyorBelt of this instruction cannot be configured as the Axis variable in AxesGroup, otherwise the instruction will return an error.
  - The in-out variable ConveyorBelt of this instruction cannot be a rotary axis, otherwise an error will be generated.
  - This instruction cannot be executed when the axis group (AxesGroup) is in the following states: GroupErrorStop, homing, GroupDisabled, GroupStopping, or GroupMoving, and it is not idle. Otherwise, an error will be generated.
  - After the continuous trajectory module is enabled, it is prohibited to switch the coordinate system regardless of whether the axis group is in motion.
  - If an axis bound to a conveyor belt rotates while disabled, the axis group will follow the axis.
  - If an axis is in the disabled status, do not set the coordinate system.
  - After the conveyor tracking is enabled by setting a dynamic workpiece coordinate system for the axis group, it is allowed to reset the coordinate positions of the slave axis group (GroupSetPosition). However, resetting the coordinate positions of the tracked conveyor belt axis (via SetPosition) may easily cause an overspeed error in the tracking axis group. No restrictions are applied. Exercise caution.
- **Sequence diagram**

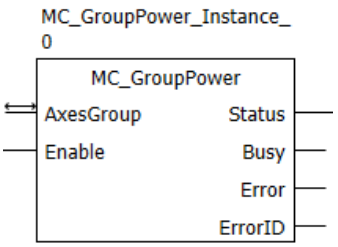
  Example sequence:



The Execute input of the function block must be triggered on a rising edge. The Done output of the function block indicates the instruction is executed successfully. The Busy output of the function block indicates that the current function block is being executed. The CommandAborted output of the function block indicates that the instruction is aborted by another motion control instruction, at which point the flag is set to TRUE.

On the rising edge of Execute, both Busy and Active outputs are set to TRUE.

The axis group initiates motion planning based on the dynamic coordinate system. This planning enables the Tool Center Point (TCP) to gradually synchronize its velocity with the synchronous belt within the dynamic workpiece space. Upon successful synchronization, the output variable "Done" is set to TRUE.



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.5.25 MC_GroupPower

This instruction switches the enable/disable state of a single axis within an axis group.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
MC_GroupPower	Enable/disable axes in axis group		MC_GroupPower_Instance_0(AxesGroup := , Enable := , Status =>, Busy =>, Error =>, ErrorID =>);

- **Related variables**

  In-out variables

In-out Variable	Name	Data Type	Valid Range	Default Value	Description
AxesGroup	Axis group	18.3.3.2.4.1 AXES_GROUP_REF: Axis Group Structure	-	-	Mapped to an axis group, which is an instance of AXES_GROUP_REF.

  Input variable

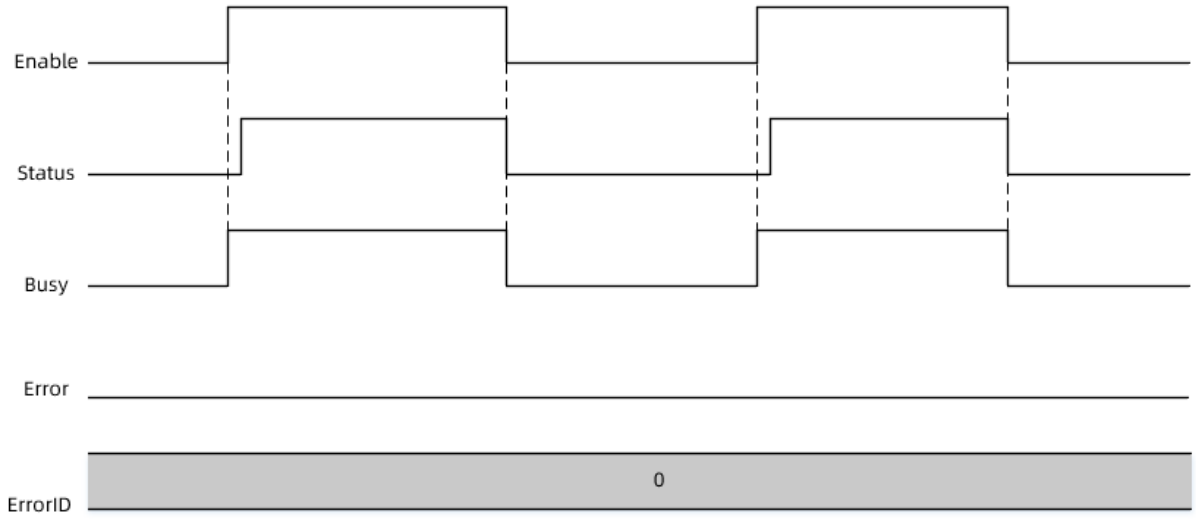
Input Variable	Name	Data Type	Valid Range	Default Value	Description
Enable	Enable	BOOL	TRUE, FALSE	FALSE	TRUE: The axes in the axis group are enabled. FALSE: The axes in the axis group are disabled.

  Output variables

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Status	Ready for operation	BOOL	TRUE, FALSE	FALSE	Set to TRUE when all axes in the axis group are enabled.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is received.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs.

- **Function**
  - This instruction can switch the enable state of the axis associated in AxesGroup.
  - When this instruction is triggered, it does not require the AxesGroup to be in any specific state.
  - When this instruction is executed normally, it does not change the axis group state. If you need to switch the axis group from GroupDisabled to GroupStandby, use the MC_GroupEnable instruction.

- If an error occurs during the instruction execution, the axis group state will switch to GroupErrorStop.



- **Precautions**
  - After the input parameter Enable is set to TRUE, the output parameter Status will not become TRUE until the servo operation on the axes bound to the axis group is complete. Perform any axis group operations only after the output parameter Status shows the value TRUE.
  - In field applications, it is recommended not to create multiple instances of the MC_GroupPower instruction for the same axis group. If this occurs, the enable state of the axes in the group is determined by the last instance of the MC_GroupPower instruction. The enable state of the axis is determined by the MC_GroupPower_Instance_1 function block, as shown in the following figure.

  - In field applications, it is recommended not to use the MC_Power instruction on an axis within an axis group where the MC_GroupPower instruction has already been used. Doing so may cause the enable state of that axis to become abnormal.

- **Sequence diagram**

  When the input parameter Enable is set to TRUE, the output parameter Busy shows the value TRUE; the axis bound to the axis group is ready for operation; the output parameter Status shows the value TRUE. When the input parameter Enable is set to FALSE, the output parameter Busy shows the value FALSE; the ready status for all axes bound to the axis group is cleared; the output parameter Status shows the value FALSE.

- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.6 High-Speed Axis

18.3.3.6.1 Instruction List

Instruction	Function	Library	Applicable Library Version	Supported encoder axis type
18.3.3.6.2 ENC_Counter	Encoder enable	MotionControl	Library version 1.1.0.0 and later	Bus, local
18.3.3.6.3 ENC_Reset	Reset encoder		Library version 1.1.0.0 and later	Bus, local
18.3.3.6.4 ENC_Preset	Encoder preset		Library version 1.1.0.0 and later	Bus, local
18.3.3.6.5 ENC_TouchProbe	Encoder probe		Library version 1.1.0.0 and later	Bus, local
18.3.3.6.6 ENC_ArrayCompare	Encoder one-dimensional array comparison		Library version 1.1.0.0 and later	Local
18.3.3.6.7 ENC_StepCompare	Encoder one-dimensional step comparison		Library version 1.1.0.0 and later	Local

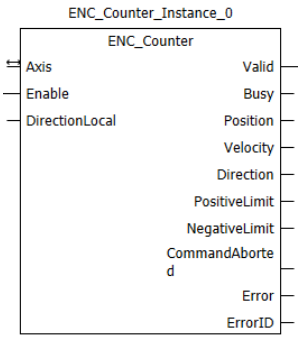
18.3.3.6.12 ENC_SetLineRotationMode	Set linear rotation mode for encoder axis		Library version 1.1.0.0 and later	Local



NOTE

Local encoder axis instructions and bus encoder axis instructions share the same instruction list.

18.3.3.6.2 ENC_Counter

This instruction is used to enable counting of the encoder axis.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
ENC_Counter	Encoder enable		ENC_Counter_Instance_0(Axis :=, Enable :=, DirectionLocal := , Valid => , Busy => , Position =>, Velocity => , Direction =>, PositiveLimit => , NegativeLimit => , CommandAborted => , Error =>, ErrorID =>);

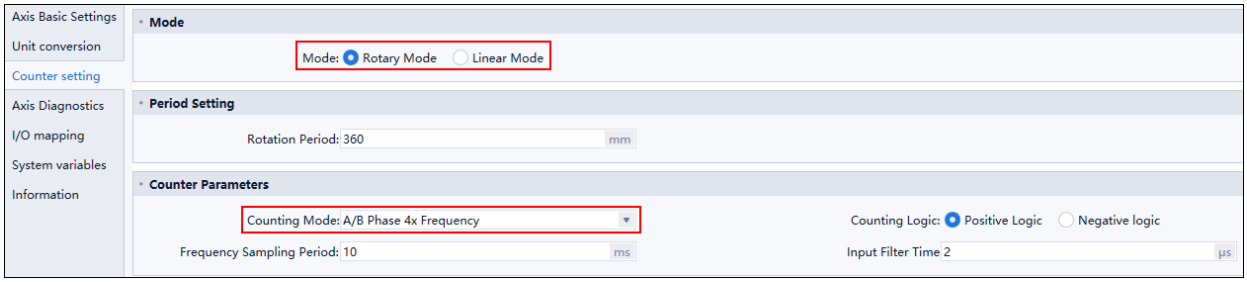
- **Related variables**

In-out variables

In-out Variable	Name	Data Type	Valid Range	Default Value	Description
Axis	Axis	18.3.3.2.2.1 AXIS_REF: Axis Structure	-	-	Reference to the axis; an instance of AXIS_REF.

Input variables

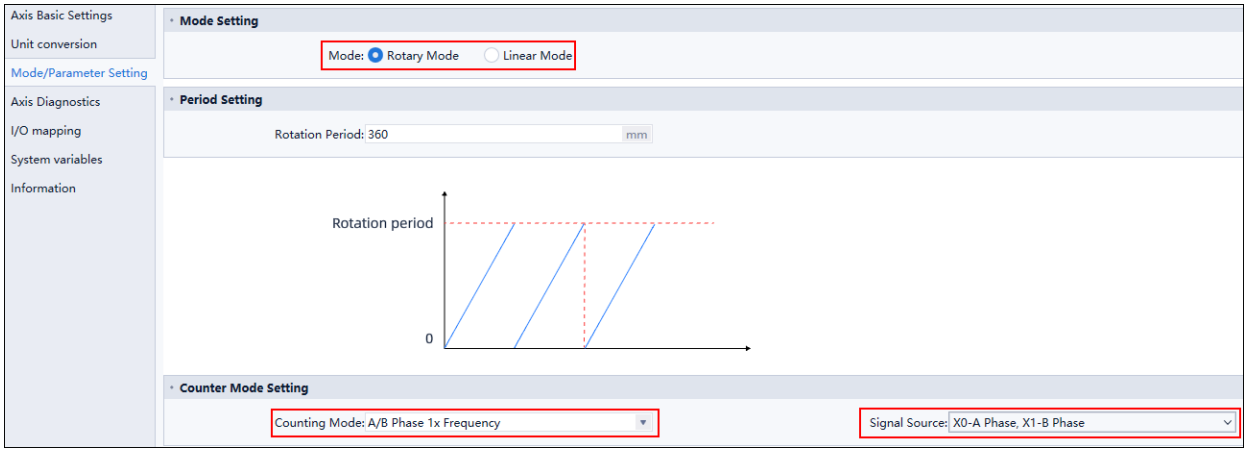
Input Variable	Name	Data Type	Valid Range	Default Value	Description
Enable	Enable	BOOL	TRUE, FALSE	FALSE	TRUE: The instruction is enabled. FALSE: The instruction is not enabled.
DirectionLocal	Direction	INT	0: Positive 1: Negative	0	0: Positive. 1: Negative. Valid only for the local encoder axis.



Output variable

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Valid	Valid status	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the status is valid.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is received.
Position	Current position	LREAL	-	0	Current position.
Velocity	Current velocity	LREAL	-	0	Current velocity.
Direction	Counting direction	BOOL	TRUE, FALSE	FALSE	Local encoder axis: TRUE indicates positive; FALSE indicates negative. Bus encoder axis: TRUE indicates positive; FALSE indicates negative.
PositiveLimit	Positive limit	BOOL	TRUE, FALSE	FALSE	The positive limit value reached in linear mode.
NegativeLimit	Negative limit	BOOL	TRUE, FALSE	FALSE	The negative limit value reached in linear mode.
CommandAborted	Command aborted	BOOL	TRUE, FALSE	FALSE	TRUE: The current instruction has been aborted by another instruction.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.

Output Variable	Name	Data Type	Valid Range	Default Value	Description
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs in the function block.

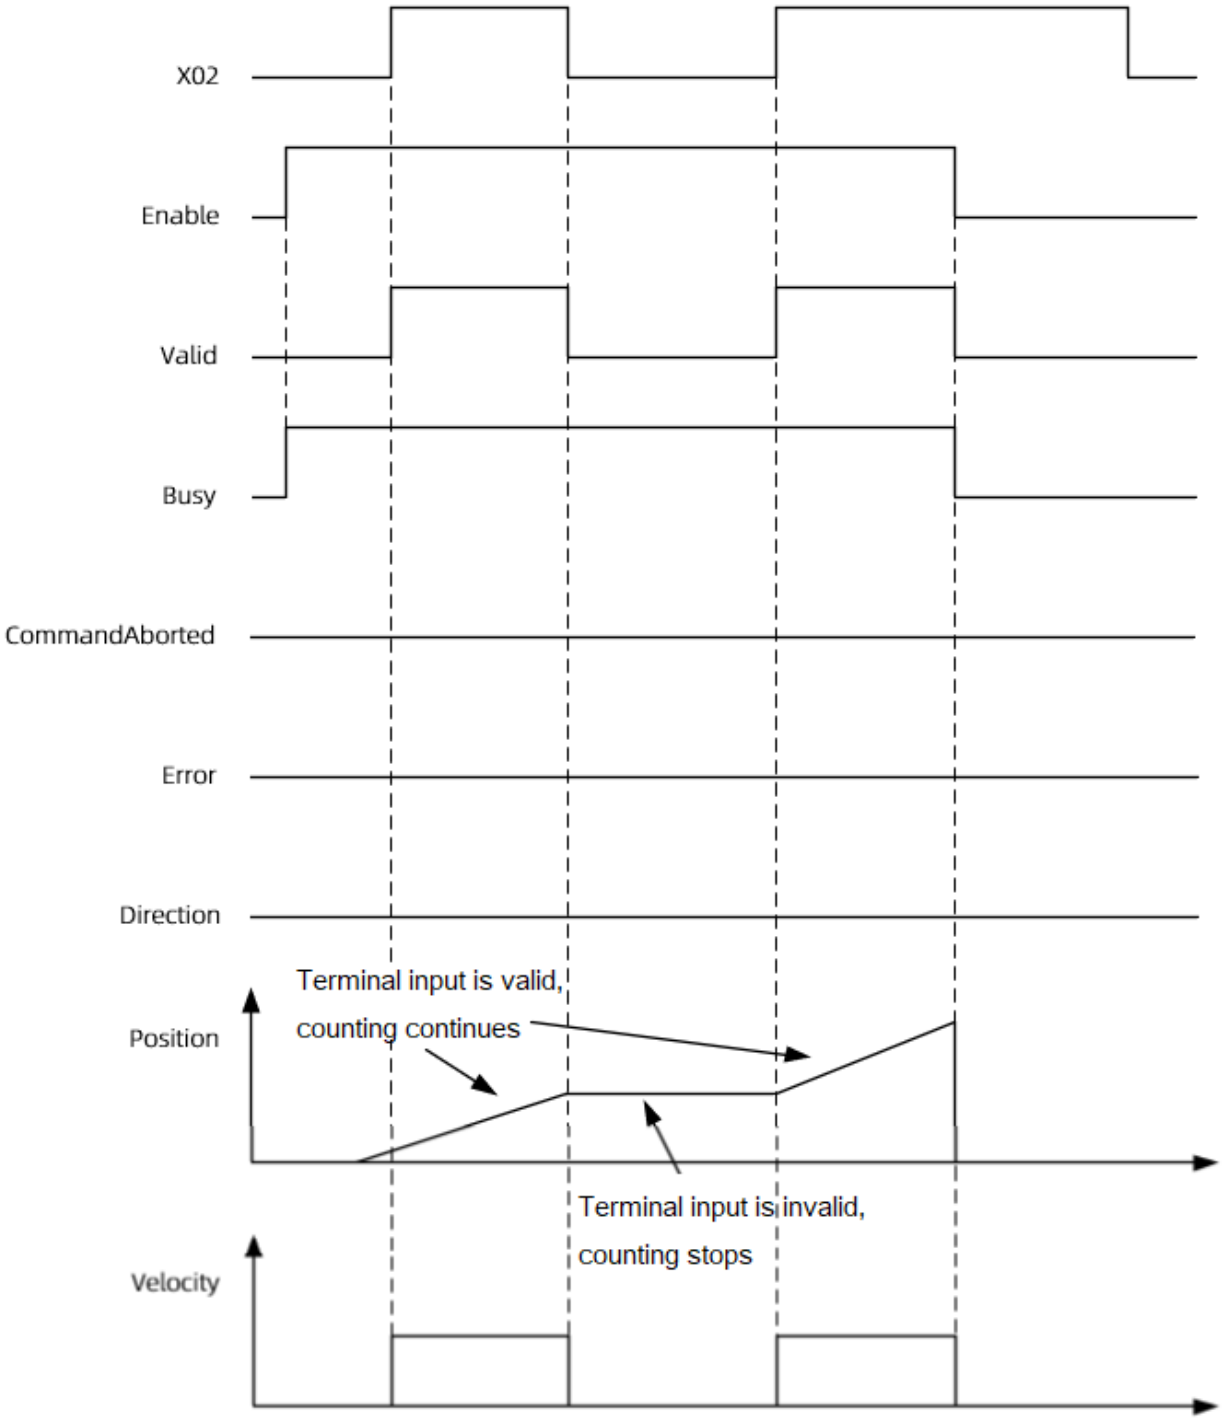


- **Function**

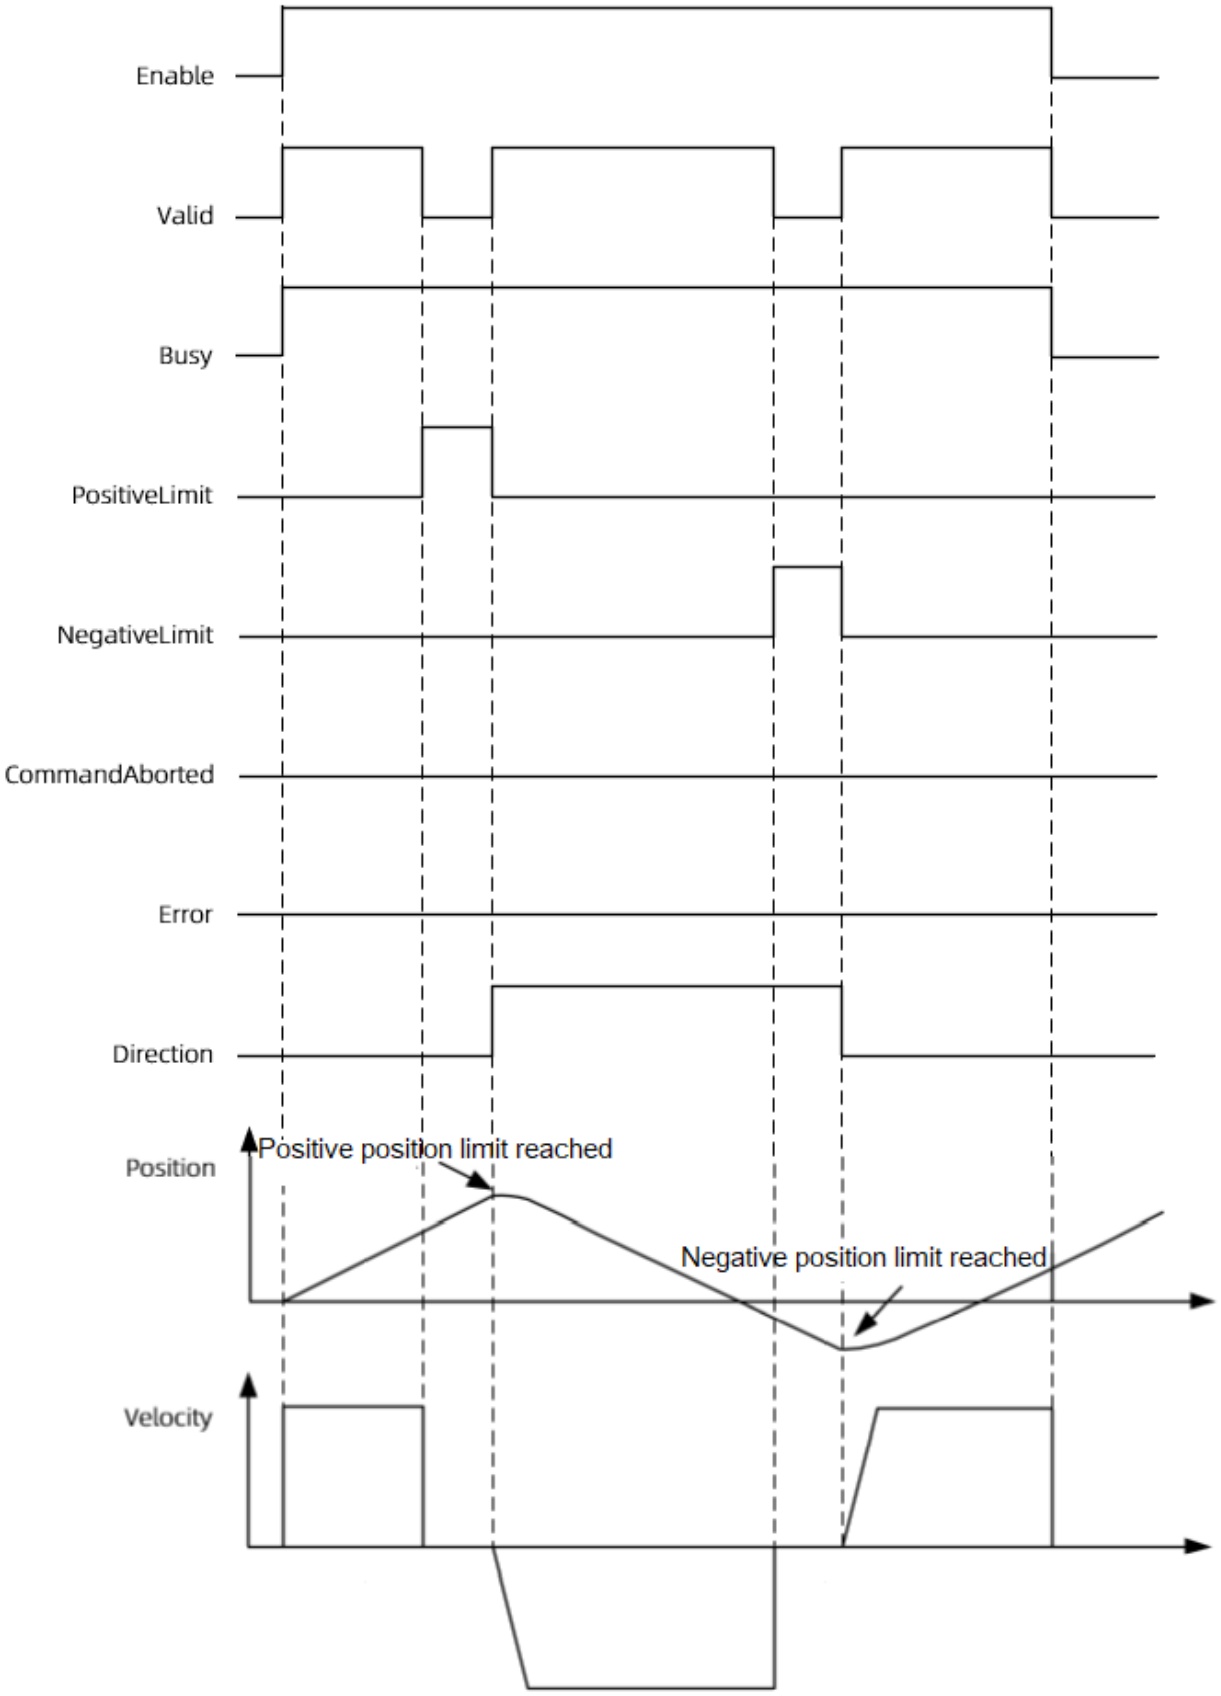
  Bus encoder axis:

  - If the encoder axis is used as the master axis for a synchronization instruction, at least one pulse position must be sampled within one task cycle. Otherwise, the slave axis speed of the synchronization instruction will fluctuate between 0 and the target speed, causing motor vibration.
  - After Enable is triggered, modifying input parameters has no effect. Then, re-trigger the instruction.
  - When using the bus encoder counter instruction, configure the mode parameters and counter parameters. The mode shown in the figure above is rotation mode, and the counting mode is phase A/B 4x frequency multiplication counting mode.
  - The input parameter DirectionLocal is invalid for a bus encoder axis.
  - An error occurs if another counter is re-triggered when a counter has already been triggered. This does not affect the normal operation of the first counter.
  - After the instruction reports an error, all output status parameters (except position) must be cleared.
  - After Enable is reset, all output parameters are cleared.
  - If multiple gating functions are configured, the count will be incremented only when multiple configured input terminals are active simultaneously.
  - When multiple instructions are triggered, and they are associated with the same axis, the subsequently triggered instruction is treated as an error.

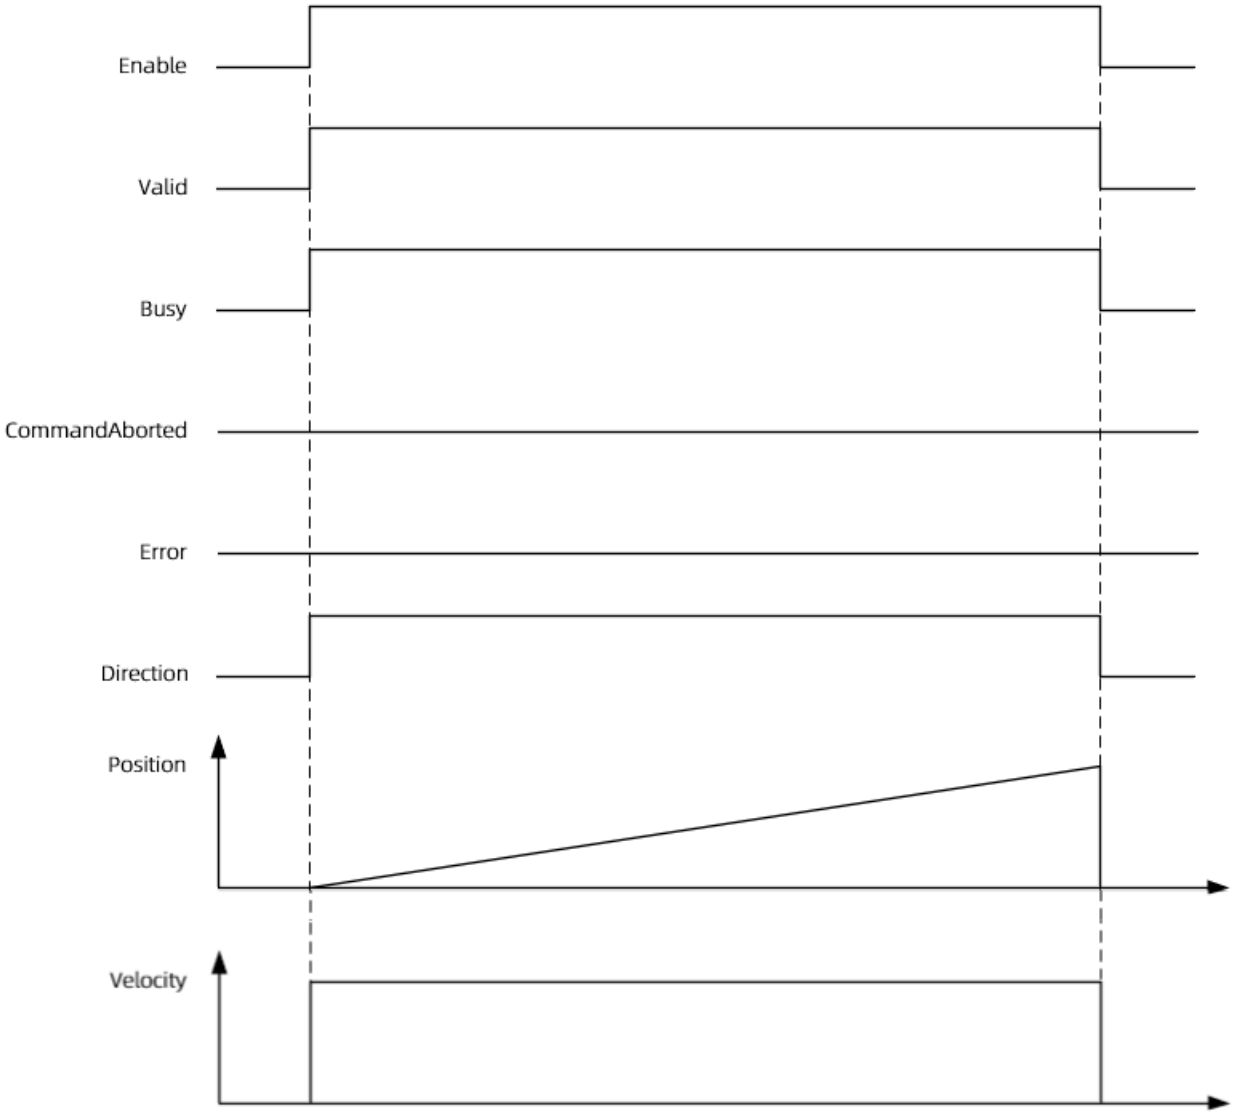
  Local encoder axis:



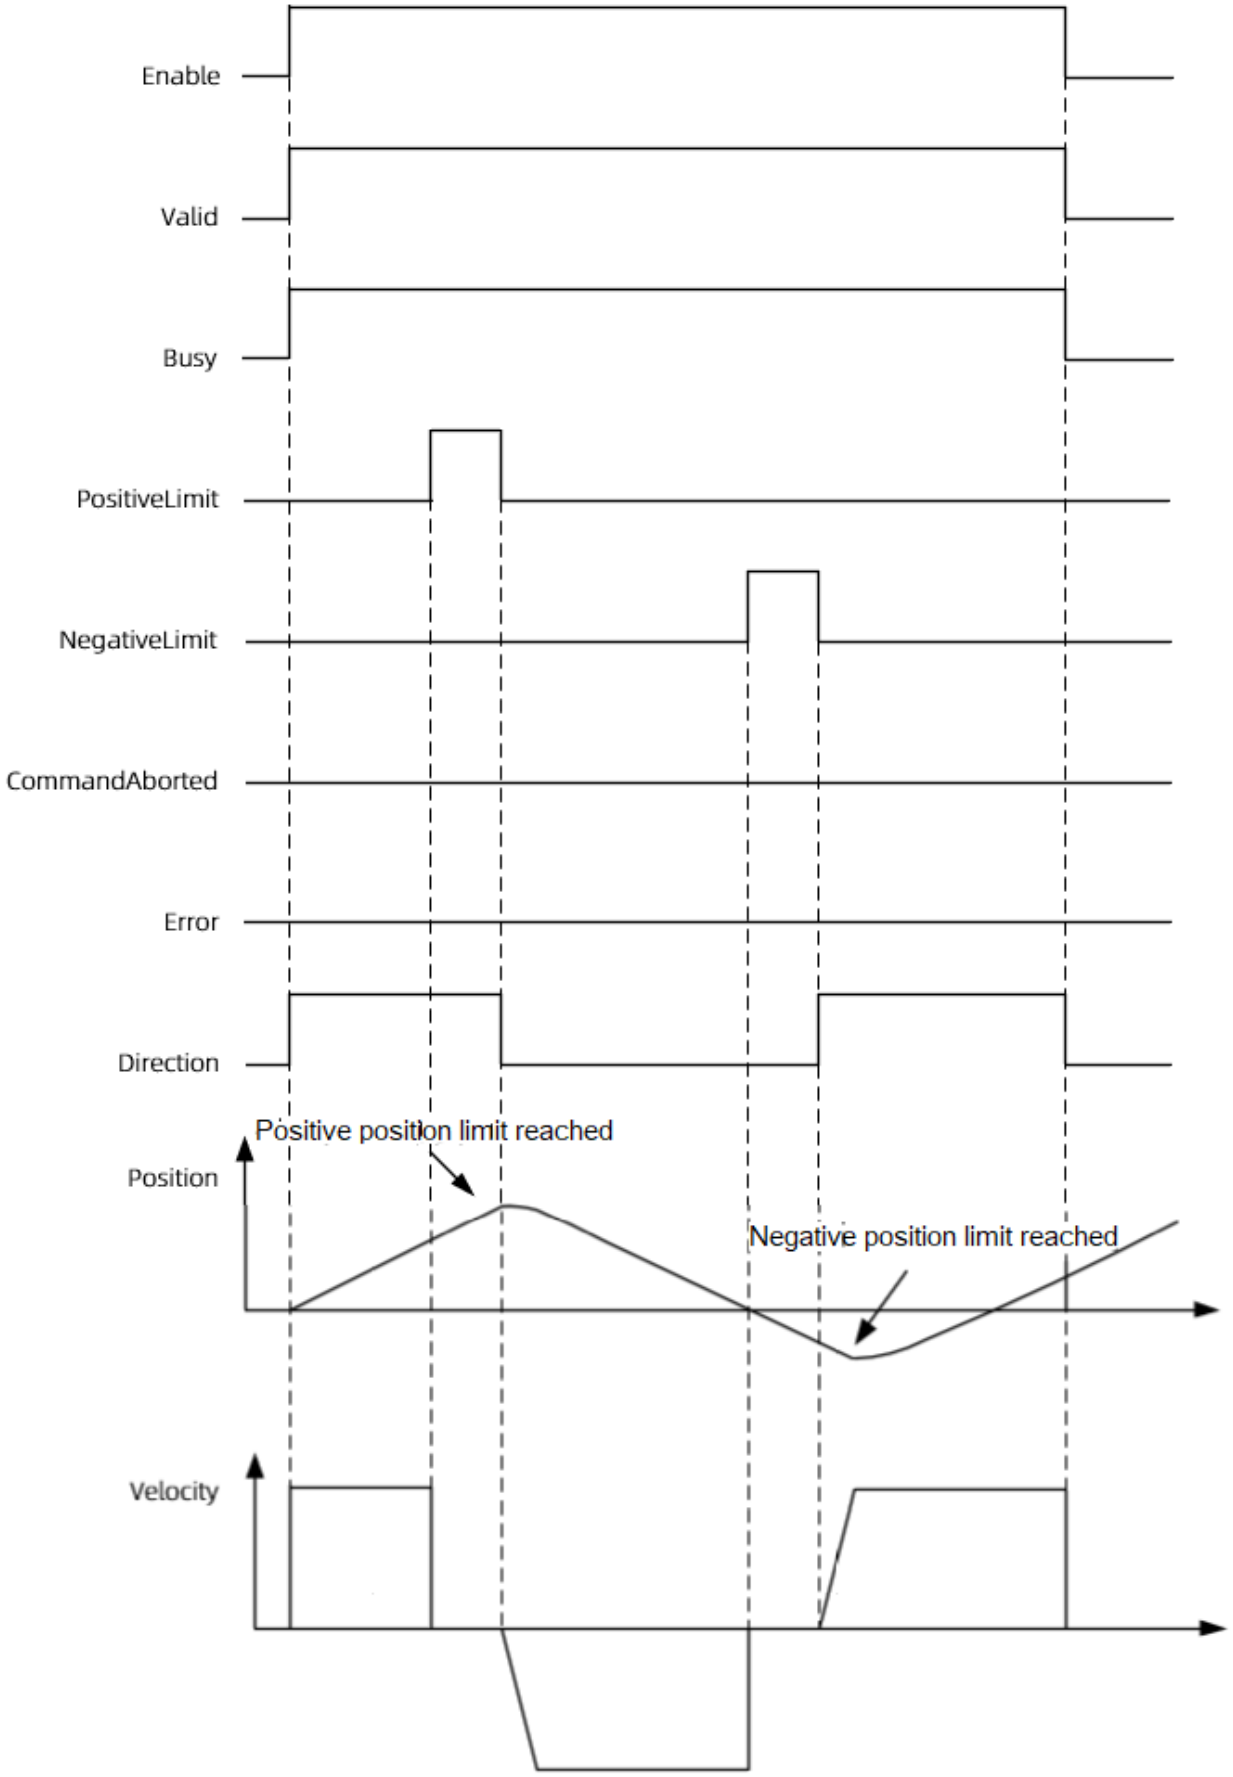
- The received pulse frequency must be greater than 1 Hz; if the frequency is less than 1, the displayed speed will be 0.
- When using the counter, configure related parameters such as mode, limits and counter mode. The above configuration is set to phase A/B 1x frequency multiplication counting mode, with signal sources X0 and X1. It operates in linear mode, with no upper or lower limit settings.



- **Sequence diagram**
  - **Bus encoder axis**
    - When the gating function of the digital terminal is not used, the encoder axis starts counting when the instruction input variable Enable is set to ON. The encoder axis stops counting when the instruction input variable Enable is set to OFF.



- When the gating function of the DI terminal is used: If the instruction input variable Enable is ON and the gating terminal signal is OFF, the instruction output variable Busy is ON, the variable Valid is OFF, and the bus encoder axis suspends counting. If the instruction input Enable is ON and the gating terminal signal is ON, the instruction output variables Busy and Valid are ON, and the bus encoder axis starts counting. If the instruction input Enable is OFF, the encoder axis stops counting.



- In linear mode, if software limits are enabled, the counter stops counting when it reaches the limit value and the limit signal becomes active. When the pulse input reverses direction, the limit signal is reset and the counter counts in the opposite direction.

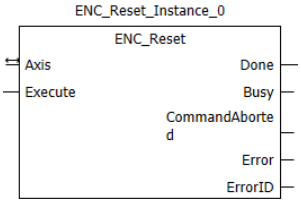
- **Local encoder axis**
  - When the instruction input variable Enable is ON, the output variables Busy and Valid are ON, and the encoder axis starts counting. When the instruction input variable Enable is OFF, the output variables Busy and Valid are OFF, and the encoder axis stops counting.

- In linear mode, if software limits are enabled, the counter stops counting when it reaches the limit value and the limit signal becomes active. When the pulse input reverses direction, the limit signal is reset and the counter counts in the opposite direction.

- **Precautions**

  When this instruction is used for a local encoder axis: If the variable Direction is set to TRUE, it indicates positive direction; if Direction is set to FALSE, it indicates negative direction. For a bus

encoder axis, if the variable Direction is set to TRUE, it indicates negative direction; if Direction is set to FALSE, it indicates positive direction.



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.6.3 ENC_Reset

The instruction resets the faults for both the bus encoder axis and the local encoder axis.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
ENC_Reset	Reset encoder		ENC_Reset_Instance_0(Axis := , Execute := , Done =>, Busy =>, CommandAborted =>, Error =>, ErrorID =>);

- **Related variables**

  In-out variables

In-out Variable	Name	Data Type	Valid Range	Default Value	Description
Axis	Axis	18.3.3.2.2.1 AXIS_REF: Axis Structure	-	-	Reference to the axis; an instance of AXIS_REF.

  Input variables

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Execute	Execute	BOOL	TRUE, FALSE	FALSE	Execute the instruction on a rising edge.

  Output variable

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Done	Done	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is done.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is received.

Output Variable	Name	Data Type	Valid Range	Default Value	Description
CommandAborted	Command aborted	BOOL	TRUE, FALSE	FALSE	TRUE when the current instruction is aborted.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs in the function block.

- **Function**

  Bus encoder:

  - The axis status can only be switched to normal after an error occurs on an axis. If the instruction is used in a non-error status, it does not affect the axis status, and the Done output of the instruction is directly set.
  - This instruction can reset communication errors of the bus module and clear the axis-side error information in the fbeFBError structure. If the module error cannot be cleared, the instruction will return an error.

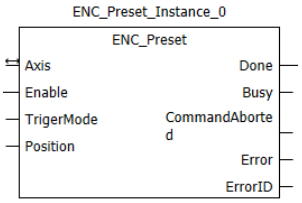
  Local encoder:

  - The error information in the fbeFBError structure on the local encoder axis can be cleared.

- **Sequence diagram**

  The parameter Execute of the function block must be triggered on a rising edge. The parameter Done of the function block indicates that the instruction has been executed successfully, and the parameter Busy indicates that the current function block is being executed.

  After this instruction is called, the output parameter Busy becomes TRUE on a rising edge of Execute. After successful reset, the output parameter Done is set to TRUE.



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.6.4 ENC_Preset

This instruction can be used to set the current position of the encoder axis as the value of the input parameter "Position".

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
ENC_Preset	Encoder preset		ENC_Preset_Instance_0(Axis :=, Enable :=, TrigerMode := , Position := , Done => , Busy =>, CommandAborted =>, Error =>, ErrorID =>);

- **Related variables**

In-out variables

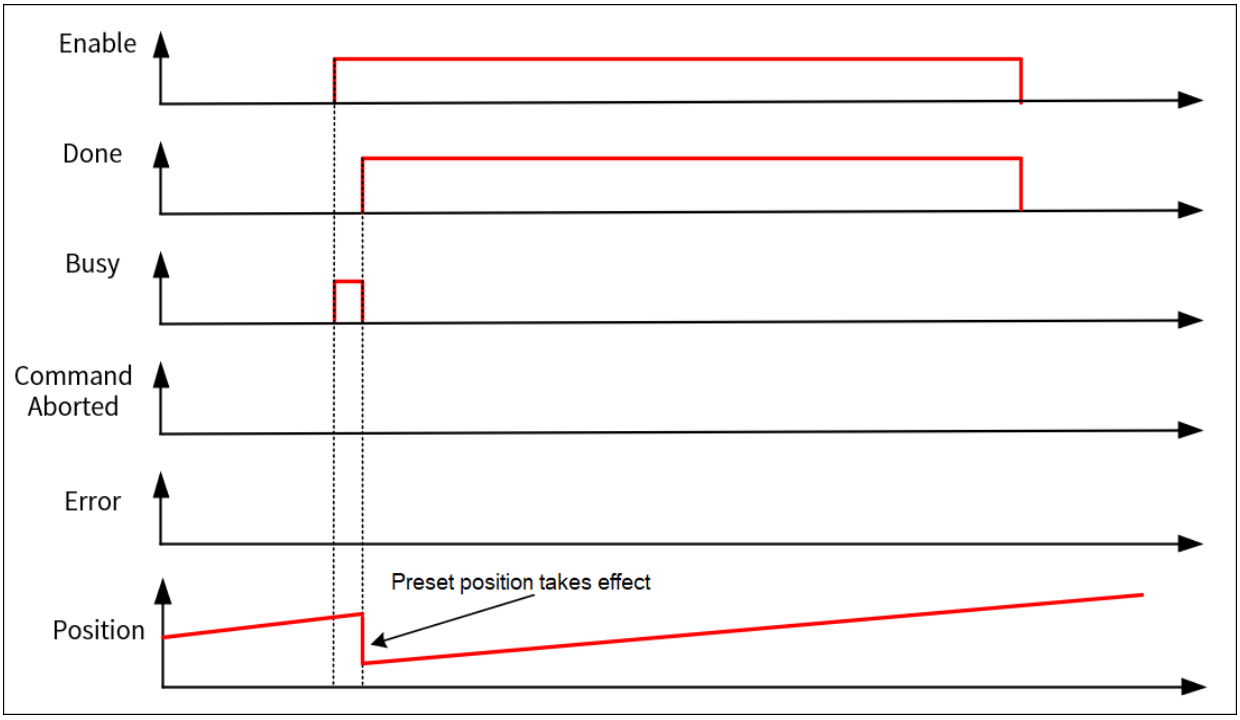
In-out Variable	Name	Data Type	Valid Range	Default Value	Description
Axis	Axis	18.3.3.2.2.1 AXIS_REF: Axis Structure	-	-	Reference to the axis; an instance of AXIS_REF.

Input variables

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Enable	Enable	BOOL	TRUE, FALSE	FALSE	TRUE: Enable the instruction; FALSE: Disable the instruction.

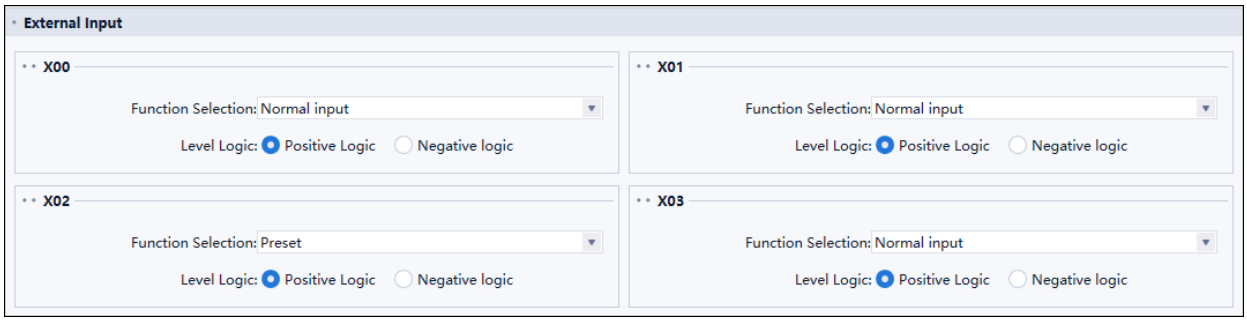
Input Variable	Name	Data Type	Valid Range	Default Value	Description
TrigerMode	Preset mode	INT	0 to 4	0	0: Triggered by the rising edge of the instruction (bus, local). 1: Triggered by the rising edge of the digital input terminal (bus, local). 2: Triggered by the falling edge of the digital input terminal (local). 3: Triggered by both rising and falling edges of the digital input terminal (local). 4: Triggered by the Z-phase signal (bus).
Position	Preset position	LREAL	-	0	Preset position.

Output variable



Output Variable	Name	Data Type	Valid Range	Default Value	Description
Done	Done	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is done.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is received.
CommandAborted	Command aborted	BOOL	TRUE, FALSE	FALSE	TRUE when the current instruction is aborted.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.

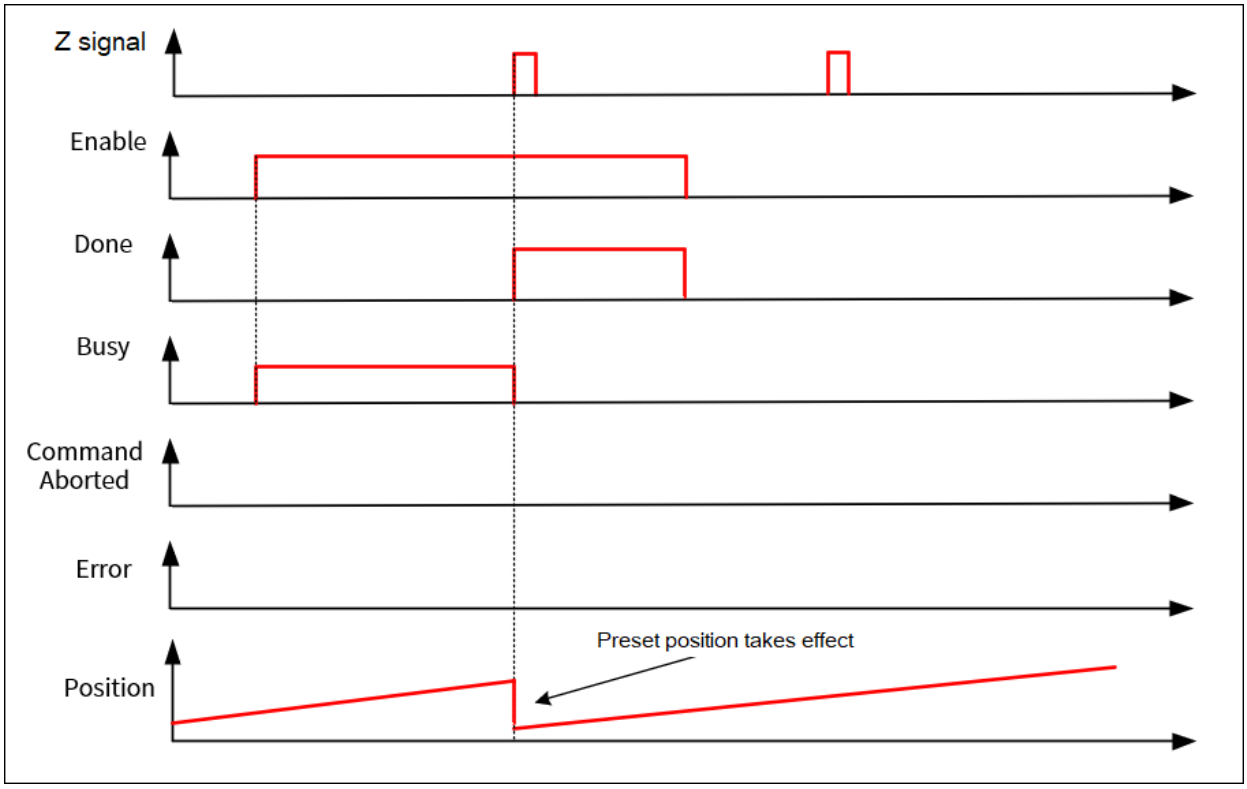
Output Variable	Name	Data Type	Valid Range	Default Value	Description
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs in the function block.



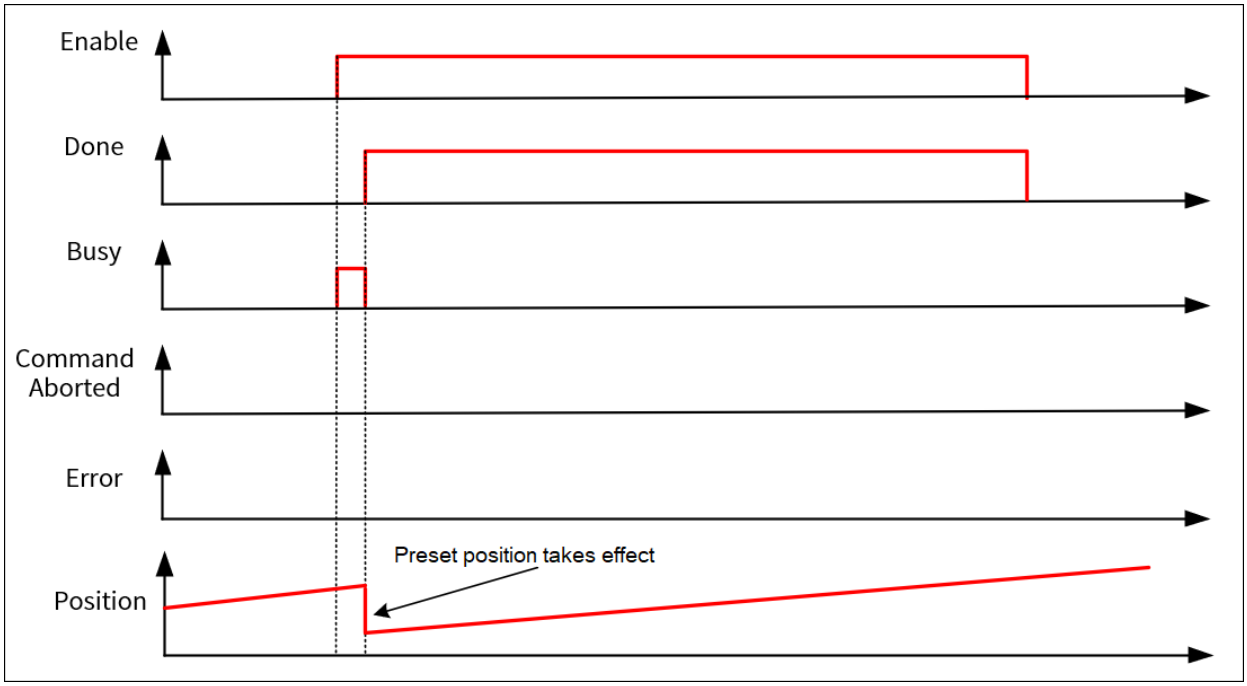
- **Function**
  - After Enable is triggered, the instruction sets the current position of the encoder axis to the preset position value specified by the input parameter Position if the condition is met according to the preset mode specified by the input parameter TrigerMode.
  - If the Enable input is active while any of the outputs (Done, Busy, CommandAborted, or Error) is active, changes to TrigerMode and Position will have no effect. Enable must be reset and then re-trigger the instruction.
  - If the axis controlled by this instruction is the master axis which is currently executing a synchronous motion instruction (such as MC_GearIn or MC_CamIn), triggering this instruction will result in an error.
  - When multiple instances of this instruction are triggered simultaneously, if TrigerMode is 0 (triggered on the rising edge of the instruction), the input parameter Position of the last triggered instance will be used as the reference.
  - When multiple instances of the function block for this instruction are triggered simultaneously, if TrigerMode is not 0, the first triggered function block takes effect, and the subsequent function blocks will return an error.
  - If TrigerMode is not 0 during the execution of the instruction, triggering another instance of it will cause the newly triggered function block to fault.

    Bus encoder axis:

    - When TrigerMode is set to 0, the position of the bus encoder axis is set when the Enable input is high. All output statuses are shown in the following figure:



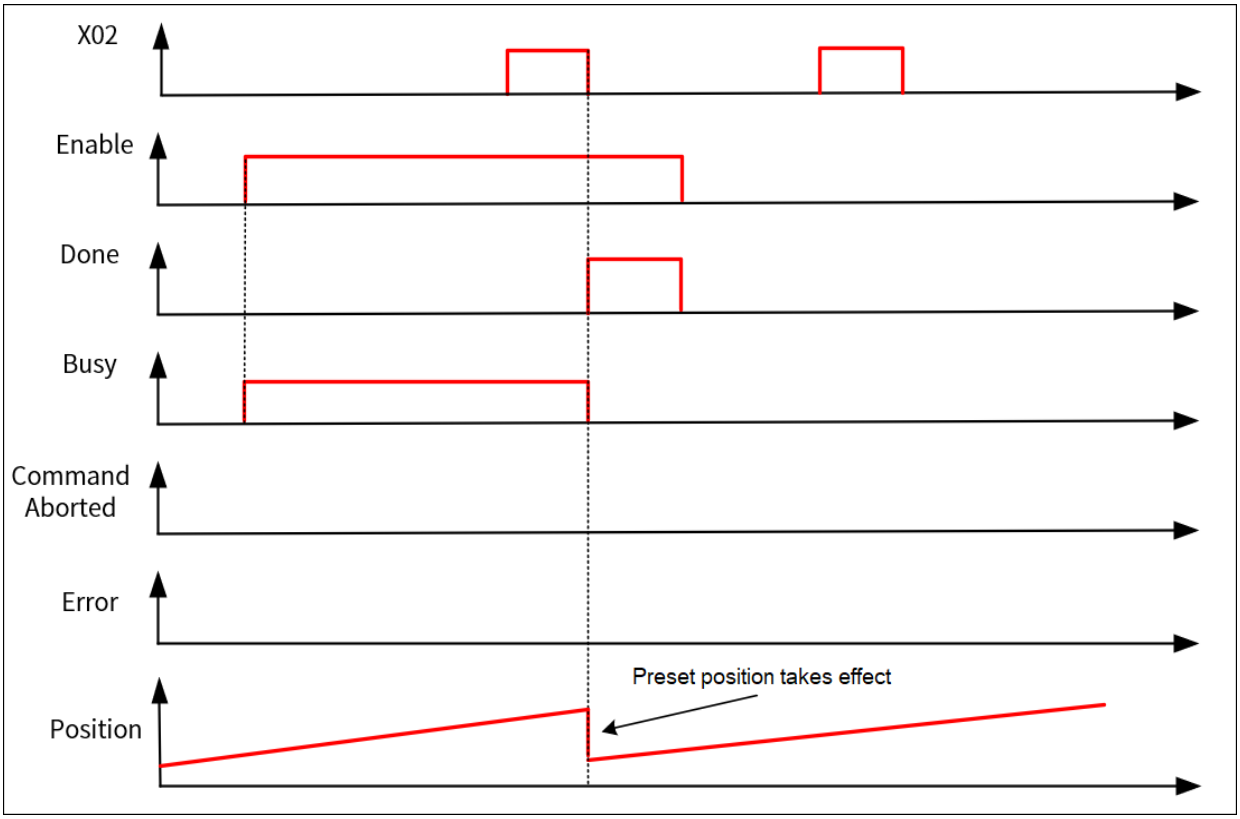
- When TrigerMode is set to 1, the position of the bus encoder axis is set on the rising edge of the digital input terminal. To select this mode, set the digital input terminal to preset function. If multiple digital terminals are set to preset function at the same time, the position setting can be completed when one of the inputs is valid.



- When TrigerMode is set to 4, the position of the bus encoder axis is set on the rising edge of the Z-phase signal detected. All output statuses are shown in the following figure:

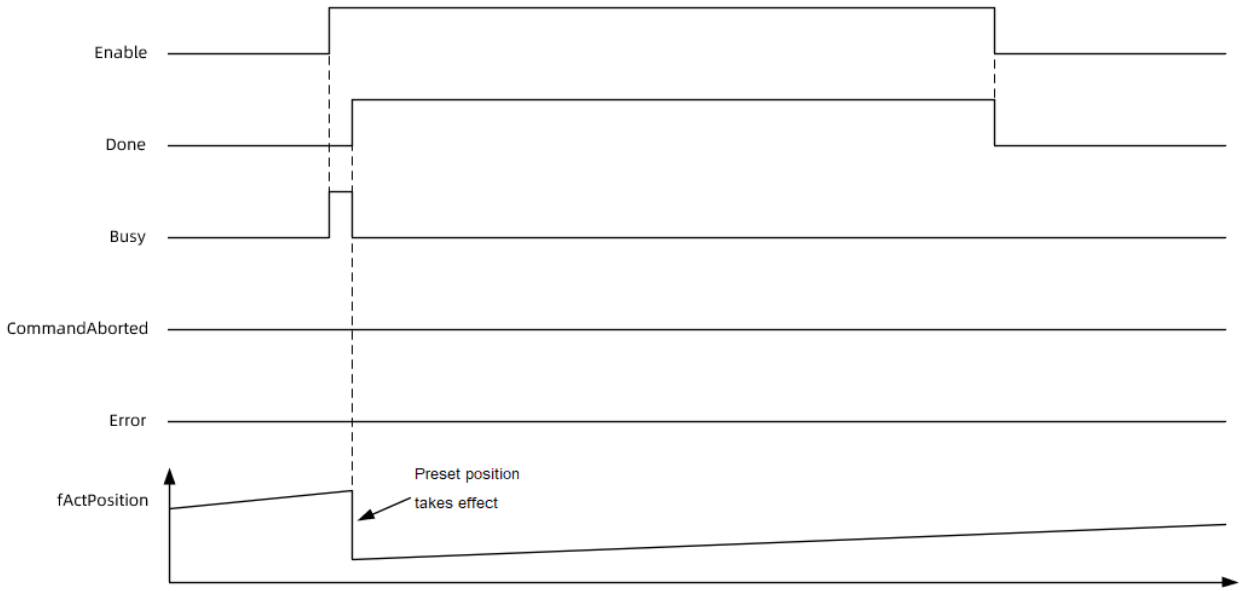
Local encoder axis:

- When TrigerMode is set to 0, the position of the local encoder axis is set when the Enable input is high. All output statuses are shown in the following figure:

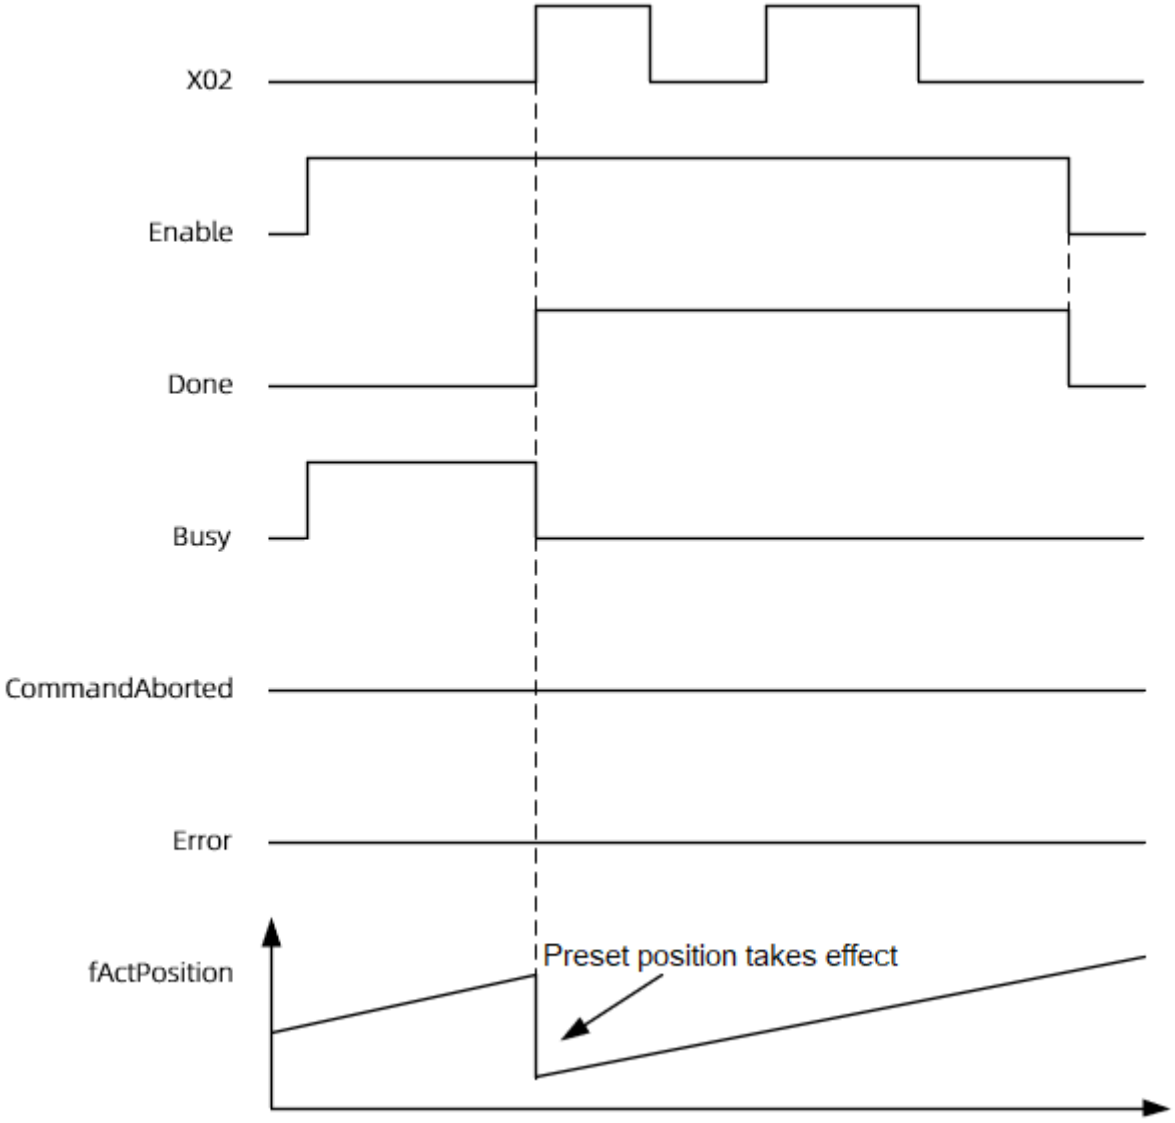


- The local encoder axis position is set on the rising edge, falling edge, or both edges (rising and falling edge) of the digital input terminal. To select this mode, the digital input terminal must be set to the preset function.

- When TrigerMode is set to 1, the position of the local encoder axis is set on the rising edge of the digital input terminal. When X02 rises after the instruction is triggered, the position preset function is completed.



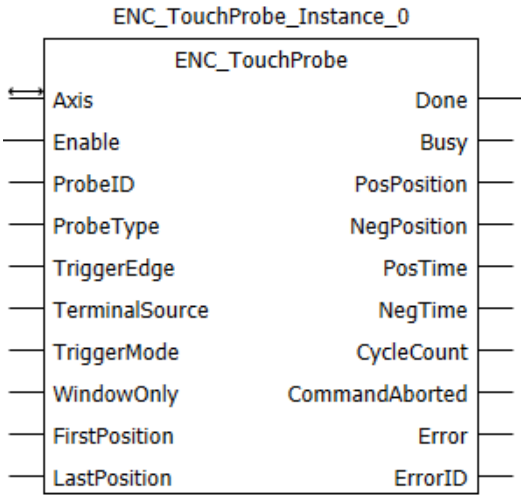
- When TriggerMode is set to 2, the position of the local encoder axis is set on the falling edge of the digital input terminal.



- When TrigerMode is set to 3, the position of the local encoder axis is set on the rising edge or the falling edge of the digital input terminal. When the instruction is active, whichever edge signal (rising or falling) that is generated first will trigger the process.

- **Sequence diagram**
  - When TrigerMode is set to 0, the position of the bus encoder axis is set when the Enable input is high.

  - When TrigerMode is set to 1, the position of the bus encoder axis is set on the rising edge of the digital input terminal X02.



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.6.5 ENC_TouchProbe

This instruction records an axis position when a trigger signal occurs.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
ENC_TouchProbe	Encoder probe function		ENC_TouchProbe_Instance_0(Axis := , Enable := , ProbeID := , ProbeType := , TriggerEdge := , TerminalSource := , TriggerMode := , WindowOnly := , FirstPosition := , LastPosition := , Done => , Busy => , PosPosition => , NegPosition => , PosTime => , NegTime => , CycleCount => , CommandAborted =>, Error =>, ErrorID =>);

- **Related variables**

In-out variables

In-out Variable	Name	Data Type	Valid Range	Default Value	Description
Axis	Axis	18.3.3.2.2.1 AXIS_REF: Axis Structure	-	-	Reference to the axis; an instance of AXIS_REF.

Input variables

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Enable	Enable	BOOL	TRUE, FALSE	FALSE	TRUE: Enable the instruction; FALSE: Disable the instruction.

Input Variable	Name	Data Type	Valid Range	Default Value	Description
ProbeID	Touch probe ID	INT	0 or 1	0	0: Touch probe 1. 1: Touch probe 2. Note: The local encoder axis only supports touch probe 1.
ProbeType	Probe type	WORD	-	0	0: Position probe. 1: Time probe. 2: Position-Time probe. Note: Only valid for bus encoder axes.
TriggerEdge	Trigger edge	INT	0, 1, 2	0	0: Rising edge. 1: Falling edge. 2: Rising edge and falling edge.
TerminalSource	Touch probe signal source	INT	0, 1	0	0: DI terminal. 1: Encoder Z-phase signal. Note: The local encoder axis only supports DI terminals.
TriggerMode	Trigger mode	INT	0, 1	0	0: Single trigger. 1: Continuous trigger.

Input Variable	Name	Data Type	Valid Range	Default Value	Description
WindowOnly	Specify whether to enable the window to detect touch probe signals	BOOL	TRUE, FALSE	FALSE	0: Disabled. Probe signals are detected at all positions. 1: Probe signals are detected only when the current position is within the window.
FirstPosition	First Position	LREAL	-	0	Start position [u] from where the touch probe signals are detected.
LastPosition	Last Position	LREAL	-	0	Stop position [u] of the window.

Output variables

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Done	Done	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is done.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is received.
PosPosition	Rising edge position	LREAL	-	0	The touch probe signals are detected on a rising edge.
NegPosition	Falling edge position	LREAL	-	0	The touch probe signals are detected on a falling edge.
PosTime	Rising edge latch time	ULINT	-	0	Rising edge latch time, in ns.
NegTime	Falling edge latch time	ULINT	-	0	Falling edge latch time, in ns.
CycleCount	Continuous mode trigger count	WORD	-	0	In continuous trigger mode, this value represents the valid count of the probe. CycleCount increments by 1 upon each probe trigger and cycles between 0 and 3.

Output Variable	Name	Data Type	Valid Range	Default Value	Description
CommandAborted	Command aborted	BOOL	TRUE, FALSE	FALSE	TRUE: The instruction has been aborted.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs.

- **Function**
  - In continuous trigger mode, Busy remains set, and Done is set for one cycle after successful latching.
  - After Enable is triggered, changes to input parameters have no effect. The instruction must be re-triggered for changes to take effect.

Bus encoder axis:

  - When the bus encoder axis is associated with the channel CH0 of the GR10_2HCE module, there are three cases depending on the selected probe type:
    - When ProbeType is set to position probe, PDO parameters 1B01 and 1B02 must be configured in the PDO configuration interface. At this time, the X00 and X01 terminals of the GR10_2HCE module can be used as probe terminals.

Name	Input/Output	Index	Subindex	Length (byte)	Type	Flag

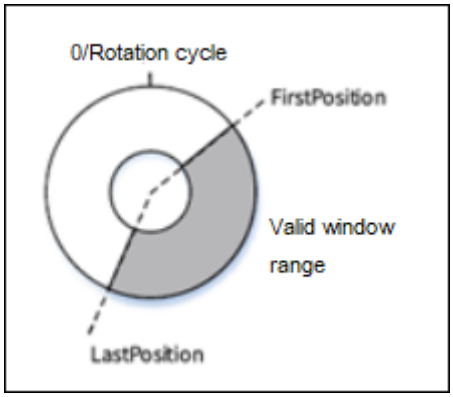
- The instruction records the latched input parameters on the rising edge. Modification to the output parameters after latching is not effective. A new trigger is required to take effect.
- When WindowOnly is OFF, the window detection function is disabled. The axis position can be latched as long as the probe input signal is active.
- When WindowOnly = ON, the window detection function is active, and location is recorded only within the window.
  - In linear mode, the instruction can only detect the probe signal when the current position of the axis is within the interval set by FirstPosition and LastPosition.
  - In rotation mode:

    When FirstPosition is less than LastPosition, the valid window range is as follows:

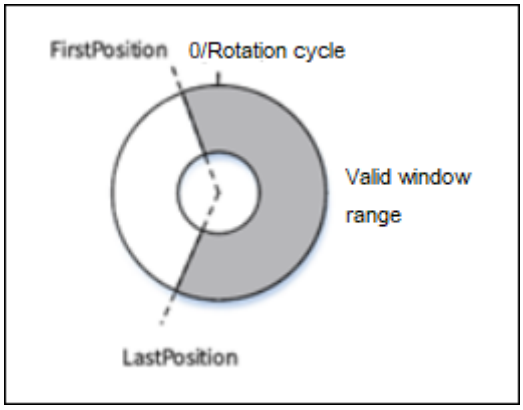
    When FirstPosition is greater than LastPosition, the valid window range is as follows:

- After a single successful trigger, Done is set immediately. In continuous trigger mode (rising edge, falling edge, or both edges), Busy remains set. Upon a successful trigger, the captured value is updated to the PosPosition or NegPosition output parameter, and the Done flag is set for one cycle.



- Interruption relationship: On the same axis, if the probe IDs are the same, the subsequent instruction reports an error while the preceding instruction continues normal execution. If the probe IDs are different on the same axis, they can operate independently.
- When the window function is enabled, probe signal loss or out-of-range detection may occur near the window area. For example, in linear mode with a window range of 10 to 100, an ETC task cycle of 8 ms, and an instruction speed of 100, the position increments by 0.8 per cycle. If the starting position is 9.9, the probe signal is not responded to in this cycle. In the next cycle, the current position becomes 10.7, and position data between 10 and 10.7 will be lost. Similarly, if the current position is 99.9, the probe signal is detected within the window range during this cycle. In the next cycle, the current position becomes 100.7, and a probe signal can be output within the range 100 to 100.7.
- The window detection specifications are the same as those of MC_TouchProbe.

Local encoder axis:



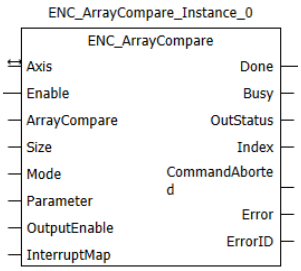
- The instruction records the latched input parameters on the rising edge. Modification to the output parameters after latching is not effective. A new trigger is required to take effect. The local encoder supports only one touch probe.
- When Enable = TRUE, if the instruction detects that the probe input specified by ProbeID is valid and meets the probe detection conditions, the current position of the axis will be latched.
- When WindowsOnly is FALSE, the window detection function is disabled. The current position of the axis can be latched as long as the probe input signal is active.
- When WindowsOnly = TRUE, the window detection function is active, and location is recorded only within the window.
  - In linear mode, the instruction can only detect the probe signal when the current position of the axis is within the interval set by FirstPosition and LastPosition.
  - In rotation mode:

    When FirstPosition is less than LastPosition, the valid window range is as follows:

    When FirstPosition is greater than LastPosition, the valid window range is as follows.

- You can define the input parameter TriggerEdge of this instruction to confirm the detection of the rising edge, falling edge, or both rising edge and falling edge of the probe signal.
  - When the TriggerMode is set to "Single trigger" and the TriggerEdge is set to "Rising edge (Falling edge)", the instruction writes the detected value of a rising edge (falling edge) to "PosPosition"("NegPosition"), with the output parameter Done being set when one detection cycle is finished.
  - When the TriggerMode is set to "Continuous trigger" and the TriggerEdge is set to "Rising edge (Falling edge)", the instruction writes the detected value of a rising edge (falling edge) to "PosPosition"("NegPosition"), with the output parameter Done being reset one cycle after being set. The instruction continues to detect the signal of next rising edge (falling edge).
  - When the TriggerMode is set to "Single trigger" and the TriggerEdge is set to "Rising edge and falling edge", the instruction immediately writes the detected value of a rising edge to "PosPosition" and the detected value of a falling edge to "NegPosition", with the output parameter Done being set when one detection cycle is finished.
  - When the TriggerMode is set to "Continuous trigger" and the TriggerEdge is set to "Rising edge and falling edge", the instruction immediately writes the detected value of a rising edge to "PosPosition", with the output parameter Done being reset one cycle after being set; the instruction immediately writes the detected value of a falling edge to "NegPosition", with the output parameter Done being reset one cycle after being set. This instruction is executed repeatedly.
- When the window function is enabled, probe signal loss or out-of-range detection can occur near the window area. For example, in linear mode with a window range of 10 to 100, an ETC task cycle of 8 ms, and an instruction speed of 100, the position increments by 0.8 per cycle. If the starting position is 9.9, the probe signal is not responded to in this cycle. In the next cycle, the current position becomes 10.7, and position data between 10 and 10.7 will be lost. Similarly, if the current position is 99.9, the probe signal is detected within the window range during this cycle. In the next cycle, the current position becomes 100.7, and a probe signal can be output within the range 100 to 100.7.
- Only counter 0 supports both time and position latching, while other counters only support position latching.
- There is only one time probe register, so the same channel can be occupied by only one instruction of one axis at a time.
  - Configure the virtual probe with the local encoder 0 at the same time. If the probe function of the local encoder 0 is not used, the virtual probe will be not affected; conversely, the requirement must also be met.
  - Configure the virtual probe with the local encoder 0 at the same time. If the same probe channel is used for different instructions, an error will be reported. Use different probe channels to ensure normal operation.

- **Sequence diagram**



- **Precautions**
  - This instruction is only applicable to local encoder axes or bus encoder axes. For bus control axes, virtual axes, and local pulse axes using the probe function, use the MC_TouchProbe instruction.
  - In continuous trigger mode (TriggerMode set to 1), the Done pin has no output, and CycleCount increases by one after the latching is completed.
  - In rising and falling edge mode (TriggerEdge set to 2), the latching completes upon detection of one rising edge and one falling edge, and CycleCount increases by one.
- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.6.6 ENC_ArrayCompare

This instruction compares one-dimensional arrays for the encoder.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
ENC_ArrayCompare	Encoder one-dimensional array comparison		ENC_ArrayCompare_Instance_0(Axis :=, Enable :=, ArrayCompare := , Size := , Mode := , Parameter := , OutputEnable := , InterruptMap := , Done => , Busy => , OutStatus =>, Index =>, CommandAborted => , Error =>, ErrorID =>);

Input variables

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Enable	Enable	BOOL	TRUE, FALSE	FALSE	TRUE: The instruction is enabled. FALSE: The instruction is not enabled.

Input Variable	Name	Data Type	Valid Range	Default Value	Description
ArrayCompare	First element of the comparison point array.	ANY	-	0	Stores the first element of the comparison point array.
Size	Number of comparison values	INT	1 to 1000	1	Number of comparison values.
Mode	Comparison mode	INT	0 to 3	0	0: Reserved. 1: Time control 2: Pulse control 3: Level control
Parameter	Control parameters	LREAL	-	0	Time control: output active duration, in 100 μs. Pulse control: number of output valid pulses, in Unit. Level control: initial level; 0 indicates low level and non-zero indicates high level.
OutputEnable	Hardware output	INT	-	0	Hardware output enable (Valid only for local encoder axes) 0: The hardware terminal does not output. Non-zero: The hardware terminal outputs.

Input Variable	Name	Data Type	Valid Range	Default Value	Description
InterruptMap	Interrupt number	INT	0 to 16	0	0: No interrupt is generated. 1: Mapped to external event Cmp1InterruptEvent. 2: Mapped to external event Cmp2InterruptEvent. ... 16: Mapped to external event Cmp16InterruptEvent.

Output variable

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Done	Done	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is done.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is received.
OutStatus	Port output	BOOL	TRUE, FALSE	FALSE	Port output status (reserved parameter).
Index	Compare value index	INT	0 to 999	0	Compare value index.
CommandAborted	Command aborted	BOOL	TRUE, FALSE	FALSE	TRUE: The instruction has been aborted. Aborted only by MC_AbortTrigger.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs.

- **Function**

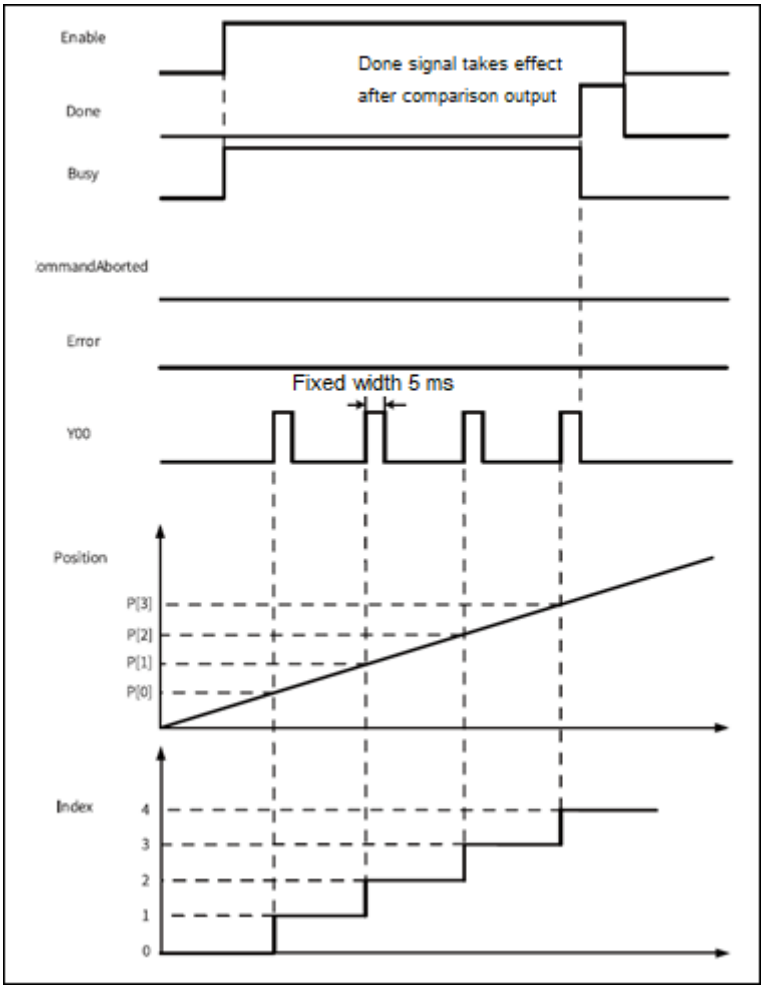
  Bus encoder axis:

  This instruction does not support bus encoder axes.

  Local encoder axis:

  ◦ On the rising edge of the Enable input, check if all input parameters are valid. Enter ArrayCompare to compare arrays. If the number of comparison points is 2, the points must not overlap. If the number of

comparison points exceeds 2, neither overlapping points nor out-of-order arrangement is allowed. For example: [0,10,20,30,40,50,40,60...], which is an out-of-order sequence. The input parameter Size indicates the number of comparison points, which must not be less than 0 or greater than 1000. During instruction execution, modifying Size will not take effect. Modifying data in ArrayCompare will take effect, but the modified data will not be checked for validity. When modifying data in ArrayCompare, do so in ascending or descending order.



- The input parameter ArrayCompare defines the array of comparison points, and Size defines the number of points to compare. If the Size value exceeds the array length, the instruction will detect out-of-order or duplicate points when the rising edge check is triggered. When configuring Size, ensure it matches the actual number of comparison points in ArrayCompare.
- If the axis is a linear axis with soft limits, the points in ArrayCompare must not exceed the soft limit boundaries. If the axis is a rotary axis, the points in ArrayCompare must not exceed the rotation cycle or be less than 0.
- In the comparison output setting interface for the local encoder axis, enable "Comparison output enable", select the comparison output terminal, and choose whether to output based on time or user units of pulses. If the option "Comparison output enable" to download the program is not selected in the IDE, or if this option is selected, but no comparison output terminal is assigned, the instruction will return an error after it is triggered with the OutputEnable parameter set to a non-zero value.
- The basic principle of hardware output is that when the encoder axis reaches the set position, the digital output terminal is set to a high level. The duration or the number of pulses for which the output remains high can be configured in the IDE interface.

- Set the mode to keep the output terminal at a high level in the IDE interface:
  - Time mode: unit in ms.

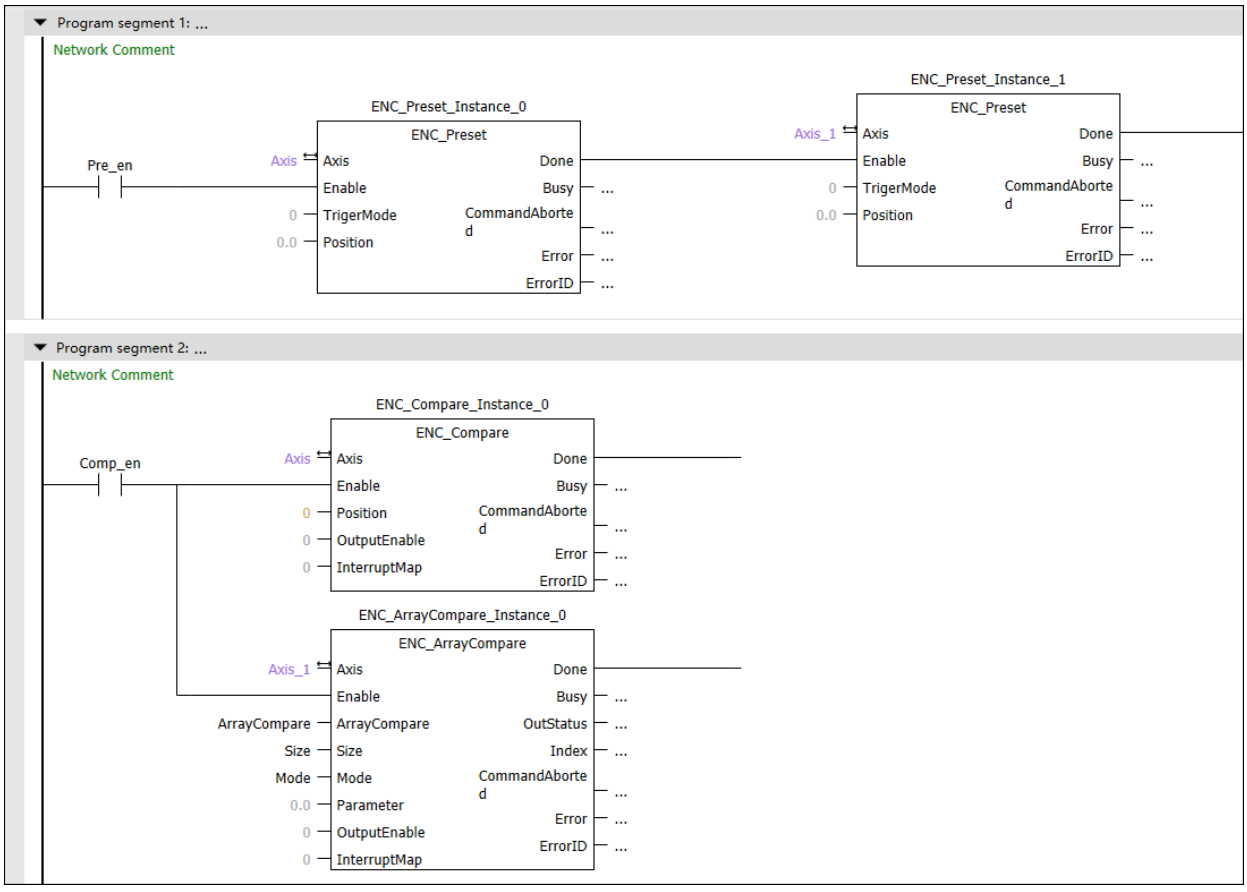
    The digital output terminal outputs high level after the local encoder axis reaches the comparison point. The time duration during which the output terminal remains high level is determined by the parameter set in the background interface. Size specifies the number of comparison points and ArrayCompare specifies the comparison point array.

    Example of time mode: Set the comparison point array P[4], with an output time of 5ms at each comparison point, and the instruction starts running after Enable is enabled.

- Pulse mode: specifies the number of pulses.

  The digital output terminal outputs high level after the local encoder axis reaches the comparison point. The high level will remain for the number of encoder pulses specified by the user. Size specifies the number of comparison points and ArrayCompare specifies the comparison point array.

  Example of pulse mode: Set the comparison point array P[4], with a duration of 2Unit at each comparison point, and the instruction starts running after Enable is enabled.



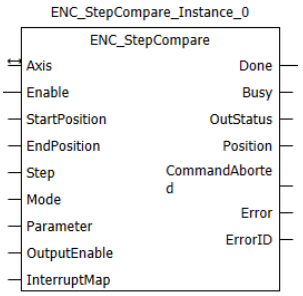
- If Enable is reset to FALSE during instruction execution, the remaining comparison points in ArrayCompare will not be compared.
- When OutputEnable is set to 0, the hardware terminal does not generate a comparison output signal. When OutputEnable is set to a non-zero value, the hardware terminal generates a comparison output signal.
- The InterruptMap parameter is temporarily retained and has no effect on the instruction blocks.

- **Sequence diagram**

- **Precautions**

  When using the comparison instruction and ENC_Preset instruction, pay attention to the order of the instructions in the project configuration. The following situations will prevent the comparison instruction from generating an output.

In the above project configuration, after ENC_Compare_Instance_0 and ENC_ArrayCompare_Instance_1 are executed for the first time, that is, when ENC_Compare_Instance_0.Done and ENC_ArrayCompare_Instance_1.Done are both TRUE, the comparison instruction will not generate an output if you reset Pre_en and Comp_en after triggering Pre_en and Comp_en simultaneously. That is, when the encoder axis is counting, if ENC_Preset_Instance_0 and ENC_Preset_Instance_1 are all triggered simultaneously, the comparison instruction is activated only after the axis position has already passed comparison point. Therefore, the comparison instruction assumes that the encoder axis has never passed comparison point, and thus does not generate any corresponding output.



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.6.7 ENC_StepCompare

This instruction is used for encoder one-dimensional step comparison.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
ENC_StepCompare	Encoder one-dimensional step comparison		ENC_StepCompare_Instance_0(Axis :=, Enable :=, StartPosition := , EndPosition := , Step := , Mode := , Parameter := , OutputEnable := , InterruptMap := , Done => , Busy => , OutStatus =>, Position =>, CommandAborted => , Error =>, ErrorID =>);

- **Related variables**

  In-out variables

In-out Variable	Name	Data Type	Valid Range	Default Value	Description
Axis	Axis	18.3.3.2.2.1 AXIS_REF: Axis Structure	-	-	Reference to the axis; an instance of AXIS_REF.

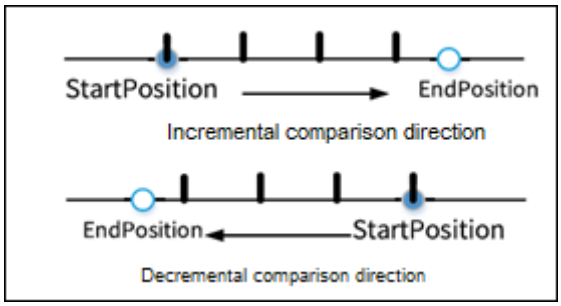
Input variables

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Enable	Enable	BOOL	TRUE, FALSE	FALSE	TRUE: The instruction is enabled. FALSE: The instruction is not enabled.
StartPosition	Comparison start position	LREAL	-	0	Start position for comparison.
EndPosition	Comparison end position	LREAL	-	0	End position for comparison.
Step	Step	LREAL	-	0	Step size.
Mode	Comparison mode	INT	0 to 3	0	0: Reserved. 1: Time control 2: Pulse control 3: Level control
Parameter	Control parameters	LREAL	-	0	Time control: output active duration, in 100 μs. Pulse control: number of output valid pulses, in Unit. Level control: initial level; 0 indicates low level and non-zero indicates high level.
OutputEnable	Hardware terminal output enable	INT	0 to 1	0	Hardware output enable (Valid only for local encoder axes). 0: The hardware terminal does not output. Non-zero: The hardware terminal outputs.

Input Variable	Name	Data Type	Valid Range	Default Value	Description
InterruptMap	Interrupt number	INT	0 to 16	0	0: No interrupt is generated. 1: Mapped to external event Cmp1InterruptEvent. 2: Mapped to external event Cmp2InterruptEvent. ... 16: Mapped to external event Cmp16InterruptEvent.

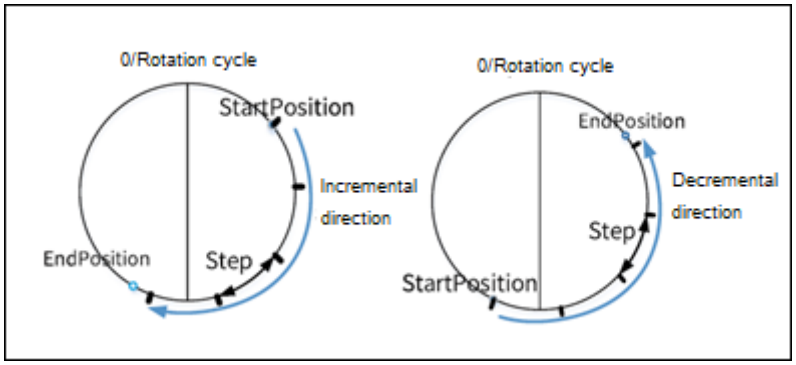
Output variable

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Done	Done	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the axis instruction is done.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE after the instruction is received.
OutStatus	Port output	BOOL	TRUE, FALSE	FALSE	Port output status (reserved parameter).
Position	Comparison value	LREAL	-	0	Comparison value
CommandAborted	Command aborted	BOOL	TRUE, FALSE	FALSE	TRUE: The instruction has been aborted. Aborted only by MC_AbortTrigger.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs.



- **Function**

Bus encoder axis:

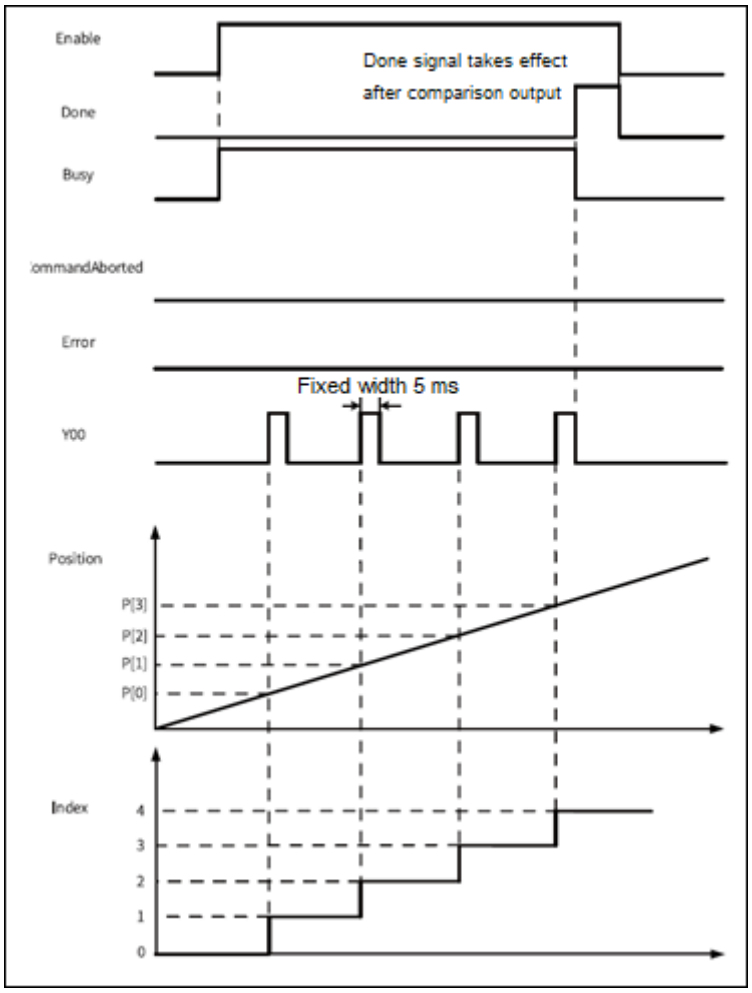


This instruction does not support bus encoder axes.

Local encoder axis:

- On the rising edge of the Enable input, check if all input parameters are valid. If the axis is defined as a linear axis and software limits are set, the input parameters StartPosition and EndPosition must not exceed the soft limit boundaries. If it is defined as a rotary axis, the input parameters StartPosition and EndPosition must not be less than 0 or greater than the rotation cycle.
- In this instruction, StartPosition is used to set the start position of the comparison point, and EndPosition is used to set the output of the comparison point. After Enable is triggered, changes to input parameters have no effect. The instruction must be re-triggered for changes to take effect.
- In linear mode, the rules for setting comparison points are as follows: When StartPosition is less than EndPosition, Step must be set to a positive number, indicating an increment counting comparison method. When StartPosition is greater than EndPosition, Step must be set to a negative number, indicating a decrement counting comparison method.

- In rotation mode, the rules for setting comparison points are as follows: When StartPosition is less than EndPosition, Step must be set to a positive number, indicating an increment counting comparison method. When StartPosition is greater than EndPosition, Step must be set to a negative number, indicating a decrement counting comparison method.



- The first comparison point must be the point specified by StartPosition, but the last comparison point is not necessarily the one specified by EndPosition. When StartPosition is 10, EndPosition is 25. When Step is 10, the comparison points are 10 and 20.
- This instruction supports both time and pulse modes, which are configured via the backend configuration interface.
- In the comparison output setting interface for the local encoder axis, enable "Comparison output enable", select the comparison output terminal, and choose whether to output based on time or user units of pulses. If the option "Comparison output enable" to download the program is not selected in the IDE, or if this option is selected, but no comparison output terminal is assigned, the instruction will return an error after it is triggered with the OutputEnable parameter set to a non-zero value.

- The basic principle of hardware output is that when the encoder axis reaches the set position, the digital output terminal is set to a high level. The duration or the number of pulses for which the output remains high can be configured in the IDE interface.
- Set the mode to keep the output terminal at a high level in the IDE interface:
  - Time mode: unit in ms.

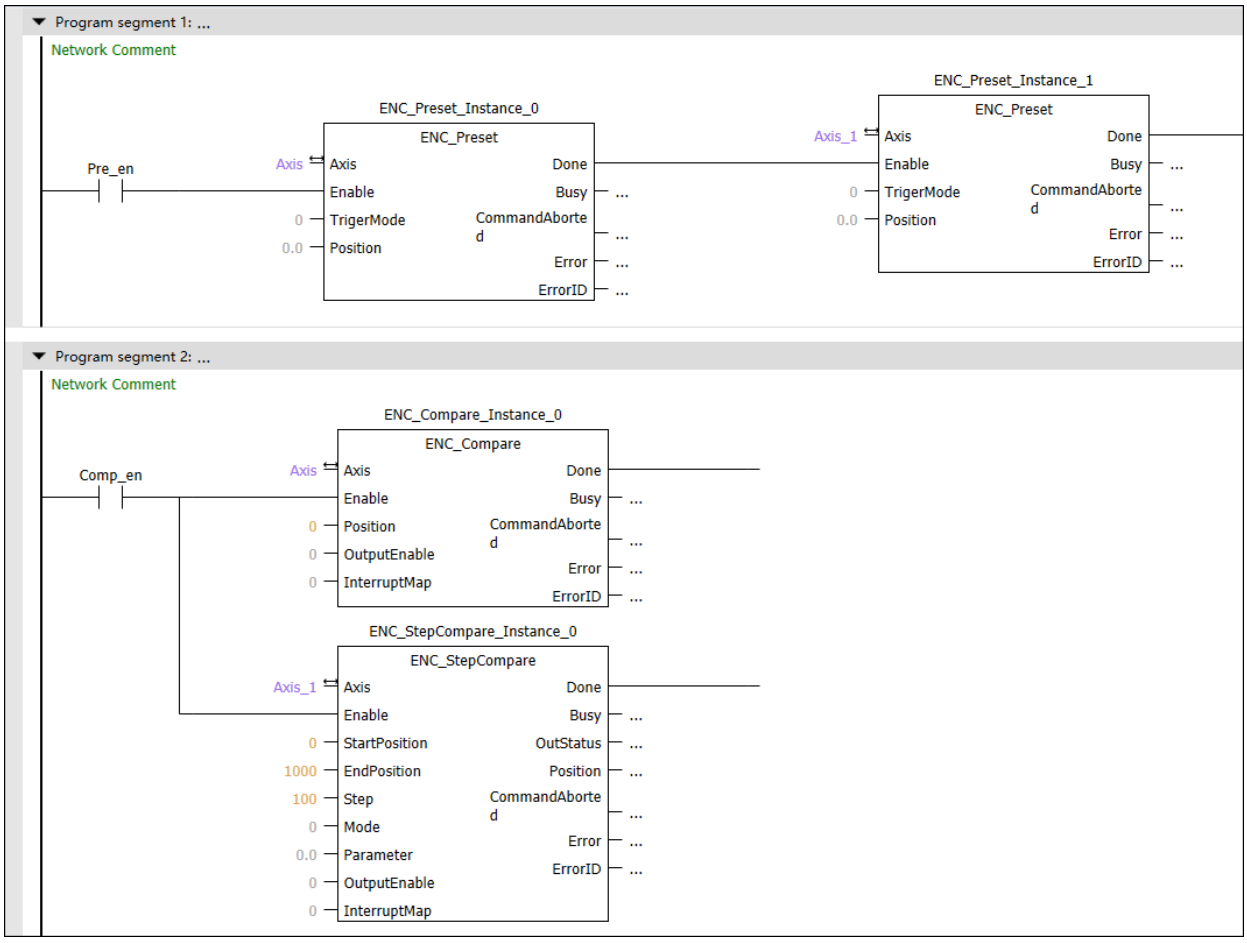
    The digital output terminal outputs high level after the local encoder axis reaches the comparison point. The time duration during which the output terminal remains high level is determined by the parameter set in the background interface. The number of comparison points is specified by |(StartPos-EndPosition)/Step|. The comparison points are generated by incrementing StartPos by Step until it does not exceed EndPosition.

    Example of time mode: Set the comparison point array P[4], with an output time of 5 ms at each comparison point. The instruction starts running after Enable is enabled.

  - Pulse mode: specifies the number of pulses.

    The digital output terminal outputs high level after the local encoder axis reaches the comparison point. The high level will remain for the number of encoder pulses specified by the user. The number of comparison points is specified by |(StartPos-EndPosition)/Step|. The comparison points are generated by incrementing StartPos by Step until it does not exceed EndPosition.

Example of pulse mode: Set the comparison point array P[4], with a duration of 2Unit at each comparison point. The instruction starts running after Enable is enabled.



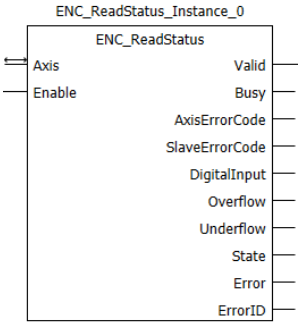
- If Enable is reset to FALSE during instruction execution, the remaining comparison points in ArrayCompare will not be compared.
- When OutputEnable is set to 0, the hardware terminal does not generate a comparison output signal. When OutputEnable is set to a non-zero value, the hardware terminal generates a comparison output signal.

- **Sequence diagram**

- **Precautions**

  When using the comparison instruction and ENC_Preset instruction, pay attention to the order of the instructions in the project configuration. The following situations will prevent the comparison instruction from generating an output.

In the above project configuration, after ENC_Compare_Instance_0 and ENC_StepCompare_Instance_0 are executed for the first time, that is, when ENC_Compare_Instance_0.Done and ENC_StepCompare_Instance_0.Done are both TRUE, the comparison instruction will not generate an output if you reset Pre_en and Comp_en after triggering Pre_en and Comp_en simultaneously. That is, when the encoder axis is counting, if ENC_Preset_Instance_0 and ENC_Preset_Instance_1 are all triggered simultaneously, the comparison instruction is activated only after the axis position has already passed comparison point 0. Therefore, the comparison instruction assumes that the encoder axis has never passed comparison point 0, and thus does not generate any corresponding output.



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.6.8 ENC_ReadStatus

Obtain the encoder status.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
ENC_ReadStatus	Encoder state read		ENC_ReadStatus_Instance_0(Axis :=, Enable :=, Valid =>, Busy => , AxisErrorCode => , SlaveErrorCode => , DigitalInput => , Overflow => , Underflow => , State => , Error =>, ErrorID =>);

- **Related variables**

  In-out variables

In-out Variable	Name	Data Type	Valid Range	Default Value	Description
Axis	Axis	18.3.3.2.2.1 AXIS_REF: Axis Structure	-	-	Reference to the axis; an instance of AXIS_REF.

  Input variables

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Enable	Enable	BOOL	TRUE, FALSE	FALSE	TRUE: The instruction is enabled. FALSE: The instruction is not enabled.

Output variable

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Valid	Active	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the read status is valid.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is received.
AxisErrorCode	Axis fault code	INT	-	0	Axis error code.
SlaveErrorCode	Driver error code	INT	-	0	Driver error code.
DigitalInput	DI terminal state	INT	-	0	Bit0: CHn-X0 terminal state. Bit1: CHn-X1 terminal state. Bit2: CHn-X2 terminal state. Bit3: CHn-X3 terminal state. Others: Reserved.
Overflow	Count overflow flag	BOOL	TRUE, FALSE	FALSE	Counter overflow flag.
Underflow	Count underflow flag	BOOL	TRUE, FALSE	FALSE	Counter underflow flag.

Output Variable	Name	Data Type	Valid Range	Default Value	Description
State	Counter enable status	18.3.3.2.2.5 MC_AXIS_STATE: Axis State Machine Enumeration	0: AXIS_POWER_OFF 1: AXIS_ERRORSTOP 2: AXIS_STOPPING 3: AXIS_STANDSTILL 4: AXIS_DISCRETE_MOTION 5: AXIS_CONTINUOUS_MOTION 6: AXIS_SYNCHRONIZED_MOTION 7: AXIS_HOMING	0	Axis state. 0: Axis power off state. 1: Axis error stop state. 2: Axis decelerate-to-stop state. 3: Axis standstill state. 4: Axis discrete motion state. 5: Axis continuous motion state. 6: Axis synchronized motion state. 7: Axis homing state.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs.

- **Function**

  Bus encoder axis:

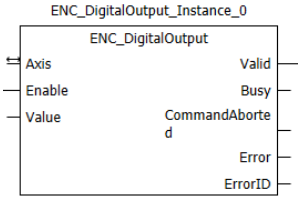
  - This instruction is used to read the status of the bus encoder axis.
  - The output parameter AxisErrorCode displays the axis error of the bus encoder axis, while the output parameter SlaveErrorCode displays the fault code of the GR10_2HCE module.
  - The output parameter DigitalInput indicates the status of the digital input terminals on the GR10_2HCE module. When the axis is bound to channel CH0, it shows the status of terminals X00, X01, X02, and X03. When the axis is bound to channel CH1, it shows the status of terminals X10, X11, X12, and X13.

  Local encoder axis:

  This instruction can be used to read the counter overflow/underflow flags and the counter status of the local encoder axes.

- **Sequence diagram**

When the input variable "Enable" is on the rising edge, it reads the status of the bus encoder axis. The output variable "Valid" indicates that the read status of the instruction is valid, and the output variable "Busy" indicates that the current function block is executing.



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.6.9 ENC_DigitalOutput

This instruction controls the encoder digital output.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
ENC_DigitalOutput	Encoder digital output control.		ENC_DigitalOutput_Instance_0(Axis :=, Enable :=, Value :=, Valid => , Busy => , CommandAborted =>, Error =>, ErrorID =>);

- **Related variables**

  In-out variables

In-out Variable	Name	Data Type	Valid Range	Default Value	Description
Axis	Axis	AXIS_REF: Axis Structure	-	-	Reference to the axis; an instance of AXIS_REF.

Input variables

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Enable	Enable	BOOL	TRUE, FALSE	FALSE	TRUE: The instruction is enabled. FALSE: The instruction is not enabled.
Value	Set value for the digital output terminal	INT	-	0	Bit0: CHn-Y0 terminal status. Bit1: CHn-Y1 terminal status. Bit2: CHn-Y2 terminal status. Others: Reserved.

Output variable

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Valid	Active	BOOL	TRUE, FALSE	FALSE	TRUE when the output terminal status is set to valid.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is received.
CommandAborted	Command aborted	BOOL	TRUE, FALSE	FALSE	TRUE when the current instruction is aborted.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.

Output Variable	Name	Data Type	Valid Range	Default Value	Description
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs.

- **Function**

  Bus encoder axis:

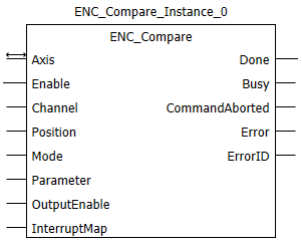
  - This instruction is used to set the DO terminal state of the GR10-2HCE module.
  - After the input parameter Enable is triggered, modifying the input parameter Value takes effect in real time.
  - During the execution of the instruction, if another instance of the function block for this instruction is triggered, the later-triggered instruction will return an error. If multiple instances of the function block for this instruction are triggered simultaneously, the first triggered function block will take effect, and the subsequent function blocks will return an error.
  - When the axis is bound to CH0 channel, it is used to set the status of terminals Y00, Y01, and Y02. When the axis is bound to CH1 channel, it is used to set the status of terminals Y10, Y11, and Y12.
  - During the instruction execution, if the Enable input is reset to FALSE, the value of the Value input will no longer be effective, and the corresponding terminal states will also be reset.

  Local encoder axis:

  This instruction does not support local encoder axes.

- **Sequence diagram**

  When the input variable "Enable" is on the rising edge, the status of the digital output terminal of the GR10_2HCE module is set. The output variable "Valid" indicates that the set status of the output terminal is valid, and the output variable "Busy" indicates that the current function block is executing.



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.6.10 ENC_Compare

This instruction outputs a single-point comparison.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
ENC_Compare	Encoder single-point comparison output		ENC_Compare_Instance_0(Axis :=, Enable :=, Channel := , Position := , Mode := , Parameter := , OutputEnable := , InterruptMap := , Done => , Busy =>, CommandAborted =>, Error =>, ErrorID =>);

- **Related variables**

In-out variables

In-out Variable	Name	Data Type	Valid Range	Default Value	Description
Axis	Axis	18.3.3.2.2.1 AXIS_REF: Axis Structure	-	-	Reference to the axis; an instance of AXIS_REF.

Input variables

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Enable	Enable	BOOL	TRUE, FALSE	FALSE	TRUE: The instruction is enabled. FALSE: The instruction is not enabled.

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Channel	Channel	BYTE	1~2	1	Comparison channel, valid only for bus encoder axes.
Position	Comparison position	LREAL	Positive number	0	Comparison position.
Mode	Comparison mode	INT	0 to 3	0	Valid only for local encoder axes. The bus encoder axes only support time control. The Mode parameter is invalid. 0: Reserved. 1: Time control 2: Pulse control 3: Level control
Parameter	Control parameters	LREAL	-	0	The local encoder axis level control is invalid. The bus encoder axes only support time control. Time control: output active duration, in 100 μs. Pulse control: number of output valid pulses, in Unit. Level control: initial level; 0 indicates low level and non-zero indicates high level.

Input Variable	Name	Data Type	Valid Range	Default Value	Description
OutputEnable	Hardware output enable	INT	-	0	Valid only for the local encoder axis. 0: Disabled Non-zero: Enabled
InterruptMap	Interrupt number	INT	0 to 16	0	Valid only for the local encoder axis. 0: No interrupt is generated. 1: Mapped to external event Cmp1InterruptEvent. 2: Mapped to external event Cmp2InterruptEvent. ... 16: Mapped to external event Cmp16InterruptEvent.

Output variable

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Done	Done	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is done.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is received.
CommandAborted	Command aborted	BOOL	TRUE, FALSE	FALSE	TRUE when the current instruction is aborted.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.

Output Variable	Name	Data Type	Valid Range	Default Value	Description
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs.

- **Function**

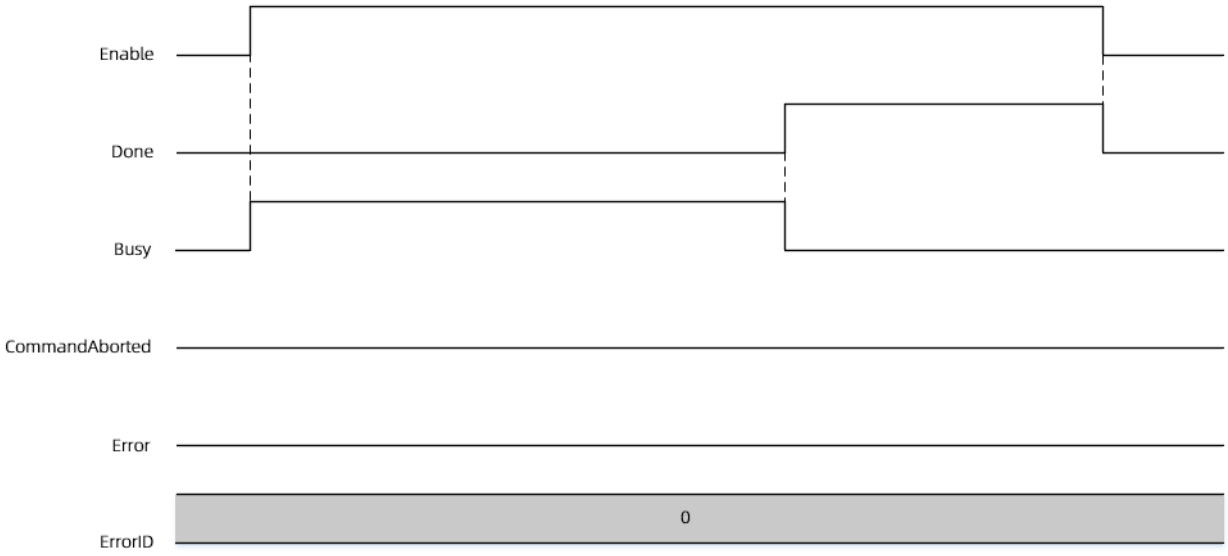
  Bus encoder axis:

  - Supports only comparison function of the GR10-2HCE module.
  - After Enable is triggered, changes to input parameters have no effect. The instruction must be re-triggered for changes to take effect.
  - After the instruction is reset, the hardware output port will not be affected.
  - Configure the corresponding PDO before using the instruction. Otherwise, the instruction will report an error:
    Channel 1 corresponds to PDO: 7003h, 7004h, 7006h (The comparison output function needs to be configured.), 600Eh.
    Channel 2 corresponds to PDO: 7003h, 7005h, 7007h (The comparison output function needs to be configured.), 600Eh.
  - For the comparison output, you must configure the corresponding port as the comparison output port in the background. For configuration details, refer to Counter Settings > External output.
  - Set the comparison output time via the Parameter input of ENC_Compare. Only the comparison output time can be set on the 2HCE module.

  Local encoder axis:

  - After Enable is triggered, changes to input parameters have no effect. The instruction must be re-triggered for changes to take effect.
  - After the instruction is reset, the hardware output port will not be affected.
  - In the comparison output setting interface for the local encoder axis, enable Comparison Output Enable, select the comparison output terminal, and choose whether to output based on time or user units of pulses. When time mode is selected, the parameter range is 0.1 to 6553.5 ms; when pulse mode is selected, the parameter range is 1 to 65535 units.

  - After the instruction is enabled, when the encoder axis reaches the position specified by Position, the comparison output becomes active. If OutputEnable is set to 1, the configured comparison output terminal generates a comparison output signal. If OutputEnable is set to 0, no comparison output signal is generated.
  - If the "Comparison output enable" option is not enabled or if the "Comparison output enable" option is enabled while no output terminal is assigned, the instruction will return an error.
  - When using the comparison instruction and ENC_Preset instruction, pay attention to the order of the instructions in the project configuration. The following situations will prevent the comparison instruction from generating an output.



In the above project configuration, after ENC_Compare_Instance_0 and ENC_StepCompare_Instance_0 are executed for the first time, that is, when ENC_Compare_Instance_0.Done and ENC_StepCompare_Instance_0.Done are both TRUE, the comparison instruction will not generate an output if you reset Pre_en and Comp_en after triggering Pre_en and Comp_en simultaneously. That is, when the encoder axis is counting, if ENC_Preset_Instance_0 and ENC_Preset_Instance_1 are all triggered simultaneously, the comparison instruction is activated only after the axis position has already passed comparison point 0. Therefore, the comparison instruction assumes that the encoder axis has never passed comparison point 0, and thus does not generate any corresponding output.

- **Sequence diagram**

  After the ENC_Compare instruction is enabled, the output parameter "Busy" is set to TRUE when the input parameter "Enable" is set to TRUE.

  When the encoder axis reaches the position specified by Position, the output parameter "Done" is set to TRUE.

- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.6.11 ENC_SetUnit

This instruction sets the gear ratio.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
ENC_SetUnit	Set the gear ratio	ENC_SetUnit_Instance_0 ENC_SetUnit Axis Enable PlusePerCycle DisPerCycle Numerator Denominator Done Busy CommandAborted Error ErrorID	ENC_SetUnit_Instance_0(Axis :=, Enable :=, PlusePerCycle := , DisPerCycle := , Numerator := , Denominator := , Done => , Busy =>, CommandAborted =>, Error =>, ErrorID =>);

- **Related variables**

  In-out variables

In-out Variable	Name	Data Type	Valid Range	Default Value	Description
Axis	Axis	18.3.3.2.2.1 AXIS_REF: Axis Structure	-	-	Reference to the axis; an instance of AXIS_REF.

Input variables

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Enable	Enable	BOOL	TRUE, FALSE	FALSE	TRUE: The instruction is enabled. FALSE: The instruction is not enabled.
PlusePerCycle	Number of encoder pulses per revolution	DINT	Positive values	0	Number of pulses per revolution of the encoder.
DisPerCycle	Distance per revolution of the worktable	LREAL	-	0	Distance traveled by the worktable per revolution.
Numerator	Gear ratio numerator	LREAL	Positive number	0	Numerator of the gear ratio.
Denotinator	Gear ratio denominator	DWORD	Positive values	-	Denominator of the gear ratio.

Output variable

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Done	Done	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is done.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is received.
CommandAborted	Command aborted	BOOL	TRUE, FALSE	FALSE	TRUE when the current instruction is aborted.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.

Output Variable	Name	Data Type	Valid Range	Default Value	Description
ErrorID	Fault code	DWORD	-	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs.

- **Function**

  Bus encoder axis:

  This instruction does not support bus encoder axes.

  Local encoder axis:

  - This instruction is used to set the gear ratio of the local encoder axis via input parameters.
  - After the Enable input parameter is triggered, changes to input parameters have no effect until Enable is reset and the instruction is re-triggered.
  - The input parameter PlusePerCycle must not be less than or equal to 0. The input parameter DisPerCycle must not be less than or equal to 0.
  - The input parameters Numerator and Denominator cannot be set to 0.
  - The gear ratio of the local encoder axis is calculated as follows:

$$\text{Gear ratio} = \frac{\text{PlusePreCycle} * \text{Numerator}}{\text{DisPreCycle} * \text{Denotinator}}$$

  - If this instruction is triggered during program execution, the gear ratio of the local encoder axis changes immediately, resulting in an abrupt change in the feedback position or velocity of local encoder axis.
  - For a linear axis with the specified soft limit, the upper and lower limit values will be recalculated after the gear ratio is set. For a rotary axis, the rotation cycle will be recalculated after the gear ratio is set.

- **Sequence diagram**

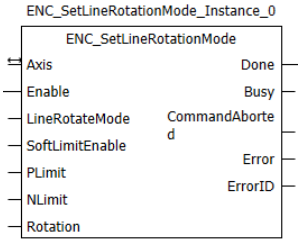
  This example describes how to set the local encoder axis parameters as shown in the following table automatically after power-on of the PLC.

Description	Value
Number of encoder pulses per revolution	10000
Distance per revolution of the worktable	30
Gear ratio numerator	3
Gear ratio denominator	2

  When the input parameter "Enable" is set to TRUE, the output parameter "Busy" is set to TRUE. After the gear ratio has been set, the output parameter "Done" is set to TRUE.

  The axis structure variable "fRatioTechUnitsNum" is the gear ratio numerator, and the axis structure variable "dwRatioTechUnitsDenom" is the gear ratio denominator. After modifying the parameters in

the above table using the ENC_SetUnit instruction, the value of variable "fRatioTechUnitsNum" becomes "60", and the value of variable "dwRatioTechUnitsDenom" becomes "30000".



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.6.12 ENC_SetLineRotationMode

This instruction is used to set the axis operation mode.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
ENC_SetLineRotationMode	This instruction is used to set the axis operation mode.		ENC_SetLineRotationMode_Instance_0(Axis :=, Enable :=, LineRotateMode := , SoftLimitEnable := , PLimit := , NLimit := , Rotation := , Done => , Busy =>, CommandAborted =>, Error =>, ErrorID =>);

- **Related variables**

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Enable	Enable	BOOL	TRUE, FALSE	FALSE	TRUE: The instruction is enabled. FALSE: The instruction is not enabled.
LineRotateMode	Linear/Rotation mode: 0: Linear mode. 1: Rotation mode	INT	0 to 1	0	Linear/Rotation mode: 0: Linear mode. 1: Rotation mode.

Input Variable	Name	Data Type	Valid Range	Default Value	Description
SoftLimitEnable	Limit enable in linear mode: ON: Enabled. OFF: Disabled.	BOOL	-	0	Limit enable in linear mode: ON: Enabled. OFF: Disabled.
PLimit	Positive limit value in linear mode	LREAL	-	0	Positive limit value in linear mode.
NLimit	Negative limit value in linear mode	LREAL	-	-	Negative limit value in linear mode.
Rotation	Rotation cycle in rotation mode.	LREAL	-	-	Rotation cycle in rotation mode.

Output variable

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Done	Done	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is done.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	TRUE when the instruction is received.
CommandAborted	Command aborted	BOOL	TRUE, FALSE	FALSE	TRUE when the current instruction is aborted.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
ErrorID	Fault code	DWORD	_	0	A fault code (18.3.3.8 Fault Codes) is output when a fault occurs.

- **Function**

  Bus encoder axis:

  This instruction does not support bus encoder axes.

  Local encoder axis:

  ◦ This instruction is used to set the operation mode of the local encoder axis. It includes linear mode and rotation mode.

- After the Enable input parameter is triggered, changes to input parameters have no effect until Enable is reset and the instruction is re-triggered.
- When the LineRotateMode input parameter is set to 0, the local encoder axis is in linear mode.
- In linear mode, the input parameter SoftLimitEnable is set to OFF, indicating that soft limits are disabled.
- SoftLimitEnable = ON indicates that soft limits are enabled. In this case, the input parameter PLimit represents the positive soft limit value, and NLimit represents the negative soft limit value. The input parameter PLimit must not be less than or equal to NLimit. PLimit must be greater than 0, and NLimit must be less than 0. If the pulse count corresponding to PLimit exceeds 2147483647 or the pulse count corresponding to NLimit is less than -2147483648, the instruction reports an error.
- When LineRotateMode is set to 1, the local encoder axis is in rotation mode. In this case, the Rotation input parameter represents the rotation cycle, which must not be 0.
- This instruction can only be used in the POWER_OFF status. If the ENC_Counter instruction is running, triggering the instruction will cause an error.

- **Sequence diagram**

  When the input parameter "Enable" is set to TRUE, the output parameter "Busy" is set to TRUE. After the axis operation mode has been configured, the output parameter "Done" is set to TRUE.

  When the input parameter "LineRotateMode" is set to "1", the axis is set to rotation mode. The axis structure variable "iMovementType" indicates the axis type. (0: periodic rotation mode, 1: linear mode)

- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.7 Drive

18.3.3.7.1 Instruction List

Instruction	Function	Library	Applicable Library Version	Supported Axis Type
18.3.3.7.2 MC_BackupServoParameter	Backup servo parameter	MotionControl	Library version 1.1.0.0 and later	Bus servo axis
18.3.3.7.3 MC_RestoreServoParameter	Restore servo parameters		Library version 1.1.0.0 and later	Bus servo axis
18.3.3.7.4 MC_BackupServoParameter2	Backup servo parameter		Library version 2.1.0.0 and later	Bus servo axis
18.3.3.7.5 MC_RestoreServoParameter2	Restore servo parameters		Library version 2.1.0.0 and later	Bus servo axis

18.3.3.7.2 MC_BackupServoParameter

This instruction can obtain the corresponding servo parameter values from the servo drive according to the servo parameter template, and save the values as a binary file to the SD card.

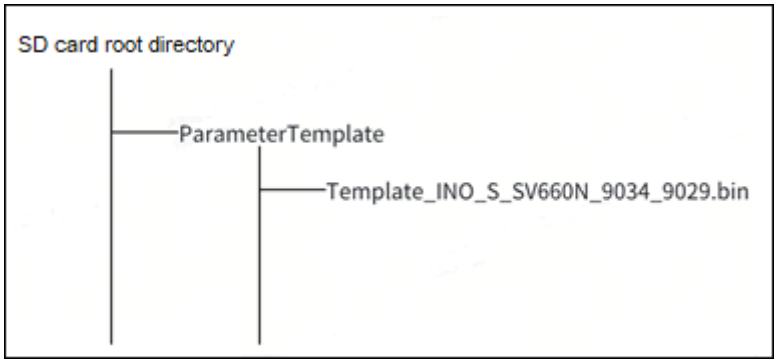
> NOTE
>
> This instruction is only applicable to a part of servo drive models. It is recommended to use the 18.3.3.7.4 MC_BackupServoParameter2 instruction, which has been adapted for more device models.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
MC_BackupServoParameter	Backup servo parameter	MC_BackupServoParameter_Instance_0 MC_BackupServoParameter Execute / Done SlaveID / Busy FileName / Error OverWrite / ErrorID	MC_BackupServoParameter_Instance_1(Execute := , SlaveID := , FileName := , OverWrite := , Done => , Busy =>, Error =>, ErrorID =>);

- **Related variables**

  Input variables



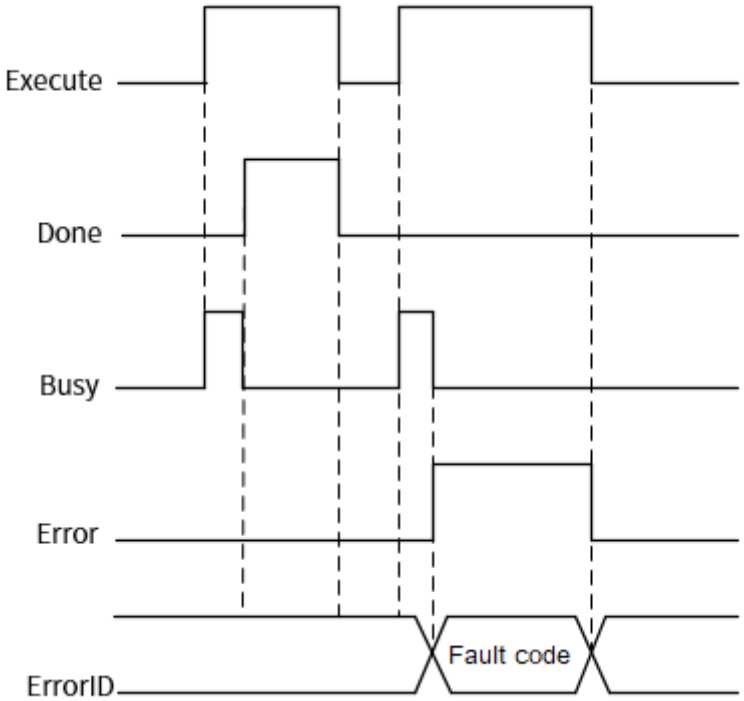
Input Variable	Name	Data Type	Valid Range	Default Value	Description
Execute	Execute	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered execute enable flag
SlaveID	ID number of the slave address	DINT	[1,65535]	1	The specified slave address where the servo parameters need to be backed up.
FileName	File name	STRING	Maximum 255 characters	''	The name of the file saving the servo parameters on the SD card.
OverWrite	File overwrite mode	BOOL	TRUE, FALSE	FALSE	TRUE: Enable overwrite.

Output variable

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Done	Done	BOOL	TRUE, FALSE	FALSE	TRUE indicates that the servo parameters for the servo drive have been backed up.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	TRUE indicates that the servo parameters for the servo drive are being backed up.
Error	Error occurred	BOOL	TRUE, FALSE	FALSE	TRUE indicates that an error has occurred during the servo parameter backup.
ErrorID	Fault code	DWORD	-	0	Fault code (18.3.3.8 Fault Codes) recorded when a fault occurred.

- **Function**
  - On the rising edge of "Execute", the servo parameter backup process is initiated. According to the servo parameter backup template, the instruction retrieves the corresponding parameter values from the servo drive and stores them as a binary file in the root directory of the SD card. The file name is defined by the input variable FileName.

- The servo parameter backup template must be stored in the ParameterTemplate folder in the root directory of the SD card. If the ParameterTemplate folder does not exist, the user must create it manually.



- The servo parameter backup template contains the following information: vendor ID, device type, customized number, MCU software version, FPGA software version, servo parameter main index, servo parameter sub-index, and servo parameter length. The file is binary with a .bin extension.
- The file name of the servo parameter backup template must not be changed arbitrarily.
- For different servo types or different versions of the same servo type, the corresponding servo parameter backup templates may vary. Therefore, before use, verify that the servo parameter backup template matches the actual servo in terms of device type, MCU software version, and FPGA software version.
- For a given servo type and version, only one corresponding servo parameter backup template is allowed in the ParameterTemplate folder on the SD card.
- If the user does not set the FileName parameter for the servo parameter backup file, the default file name ServoParameter is used.
- The user-configured name FileName for the servo parameter backup file can only contain numbers, letters, and underscores.
- If a file with the same name as the input variable FileName exists in the root directory of the SD card, and the OverWrite mode is set to FALSE, the function block will report an error.
- If the servo parameter backup file specified by FileName on the SD card is open for writing or reading when the function block is triggered, the function block will report an error.
- When Execute is set, the servo parameter backup function is activated. After Execute is reset, the servo parameter backup function continues until all servo parameters in the servo parameter backup template are backed up or an error occurs.
- Before using this function block, ensure that the SD card is inserted into the controller and that EtherCAT communication is in the OP status.
- After inserting or removing the SD card, the controller must be power-cycled before executing this function block.
- Multiple instances of the servo parameter backup function block are not permitted to operate simultaneously on the same servo parameter backup file within the SD card.
- When a servo parameter restoration function block instance is operating on a servo parameter backup file on the SD card, the servo parameter backup function block is not permitted to perform operations on the same file simultaneously.
- If multiple servo parameter backup instructions MC_BackupServoParameter are executed simultaneously for the same slave, or if the servo parameter backup instruction

MC_BackupServoParameter and the restoration instruction MC_RestoreServoParameter are executed at the same time, one of these instructions will return an error.

- Before triggering the function block, ensure that the program is running and the slave is in the OP status.

- **Sequence diagram**

- **Precautions**
  - Only Inovance EtherCAT servo slaves are supported. (Currently, only the SV660N standard series servos are supported. Their MCU and FPGA software versions must be 903.4 and 902.9, respectively.)
  - Do not execute two identical MC_BackupServoParameter instances in the same project.
  - It is recommended to execute this function block in a non-real-time task.
- **Restarting the motion instruction**

  This function block does not support re-triggering.
- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.7.3 MC_RestoreServoParameter

This instruction reads the servo parameters backed up on the SD card and sends them to the servo drive via SDO communication.

> **NOTE**
>
> This instruction is only applicable to a part of servo drive models. It is recommended to use the 18.3.3.7.5 MC_RestoreServoParameter2 instruction, which has been adapted for more device models.

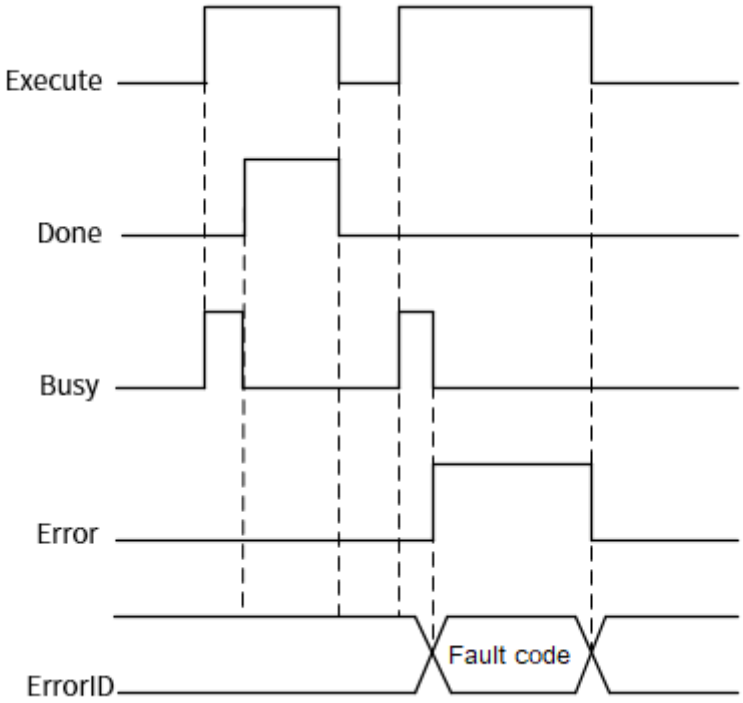
- **Instruction format**

Instruction	Name	LD Representation	ST Representation
MC_RestoreServoParameter	Restore servo parameters		MC_RestoreServoParameter_Instance_0(Execute := , SlaveID := , FileName := , Done =>, Busy =>, Error =>, ErrorID =>);

- **Related variables**

Input variables

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Execute	Execute	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered execute enable flag
SlaveID	ID number of the slave address	DINT	[1,65535]	1	The specified slave address where the servo parameters need to be restored.
FileName	File name	STRING	Maximum 255 characters	''	The name of the file containing the servo parameters on the SD card.



Output variable

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Done	Done	BOOL	TRUE, FALSE	FALSE	TRUE indicates that the servo parameters for the servo driver have been configured.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	TRUE indicates that the servo parameters for the servo drive are being configured.
Error	Error occurred	BOOL	TRUE, FALSE	FALSE	TRUE indicates that an error has occurred during the servo parameter configuration.
ErrorID	Fault code	DWORD	-	0	Fault code (18.3.3.8 Fault Codes) recorded when a fault occurred.

- **Function**
  - On the rising edge of the "Execute", the servo parameter restoration starts. The instruction retrieves the corresponding servo parameter values from the specified servo parameter backup file and writes them into the servo slave. The name of the servo parameter backup file is specified by the input variable FileName.
  - The servo parameter backup file is stored in the root directory of the SD card. It contains the following information: vendor ID, device type, customized number, MCU software version, FPGA software version, servo parameter main index, servo parameter sub-index, servo parameter length, and the corresponding servo parameter values. The file format is binary with a .bin extension.
  - If the user has not configured the file name FileName for the servo parameter backup file, the function block will report an error.
  - The user-configured name FileName for the servo parameter backup file can only contain numbers, letters, and underscores.
  - If the file specified in the input variable FileName does not exist in the SD card root directory, the function block will report an error.
  - When Execute is set, the servo parameter restoration function is activated. After Execute is reset, the servo parameter restoration function continues until all servo parameters in the backup file are set or an error occurs.

- Before using this function block, ensure that the SD card is inserted into the controller and that EtherCAT communication is in the OP status.
- After inserting or removing the SD card, the controller must be power-cycled before executing this function block.
- Before using this function block, the servo must be in one of the following statuses: "No fault", "Servo ready", "Waiting for the S-ON signal", or "Fault".
- If the slave requiring servo parameter restoration is assigned to an axis, the MC_Power instruction must not be triggered to enable the axis before using this function block.
- If the servo parameter backup file specified by FileName on the SD card is open for writing when the function block is triggered, the function block will report an error.
- If the servo parameter file does not match the vendor ID, device type, customized number, MCU software version or FPGA software version of the servo drive, the function block will report an error.
- When a servo parameter backup function block instance is operating on a servo parameter restoration file on the SD card, the servo parameter restoration function block is not permitted to perform operations on the same file simultaneously.
- If multiple servo parameter restoration instructions MC_RestoreServoParameter are executed simultaneously for the same slave, or if the servo parameter backup instruction MC_BackupServoParameter and the restoration instruction MC_RestoreServoParameter are executed at the same time, one of these instructions will return an error.
- Before triggering the function block, ensure that the program is running and the slave is in the OP status.

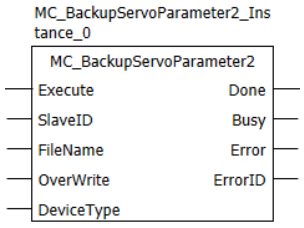
- **Sequence diagram**

- **Precautions**
  - Only Inovance EtherCAT servo slaves are supported. (Currently, only the SV660N standard series servos are supported. Their MCU and FPGA software versions must be 903.4 and 902.9, respectively.)
  - It is recommended to execute this function block in a non-real-time task.

- Do not execute two identical instances of MC_RestoreServoParameter in the same project.
- After the function block has been executed successfully, the servo must be power-cycled for all written servo parameters to take full effect.

- **Restarting the motion instruction**

  This function block does not support re-triggering.



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.3.7.4 MC_BackupServoParameter2

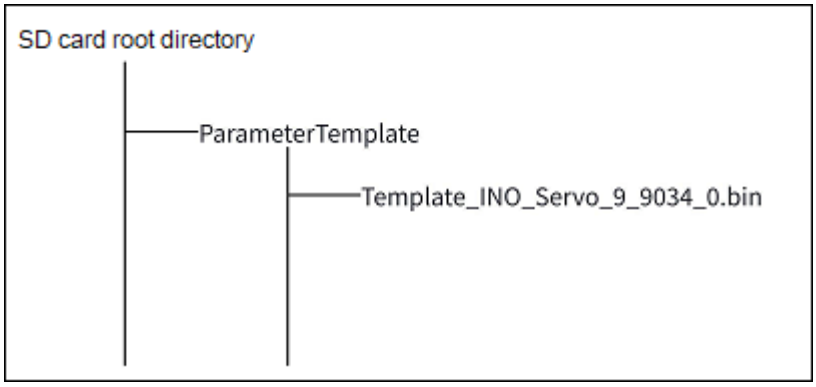
This instruction can obtain the corresponding servo parameter values from the servo drive according to the servo parameter template, and save the values as a binary file to the SD card.

- **Instruction format**

Instruction	Name	LD Representation	ST Representation
MC_BackupServoParameter2	Backup servo parameter		MC_BackupServoParameter2_Instance_0(Execute := , SlaveID := , FileName := , OverWrite := , DeviceType := , Done => , Busy => , Error => , ErrorID =>);

- **Related variables**

  Input variables

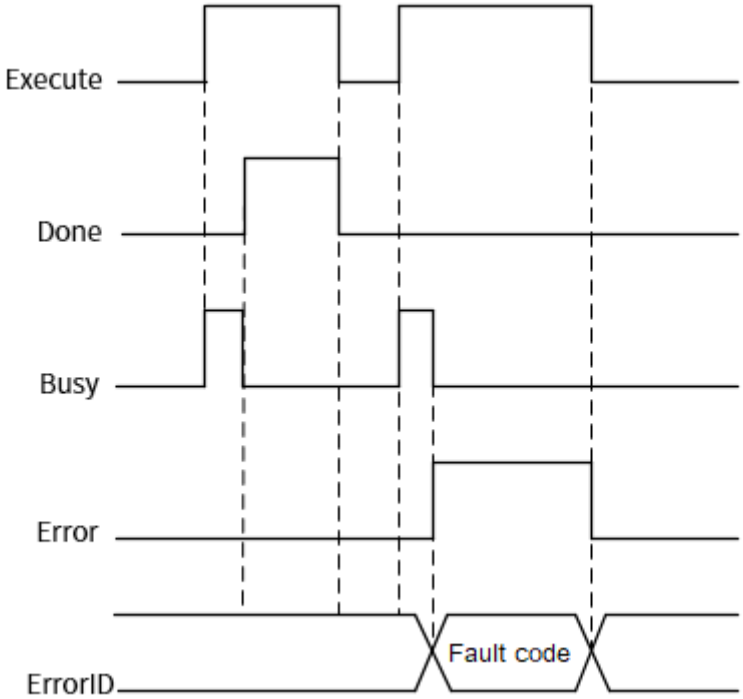


Input Variable	Name	Data Type	Valid Range	Default Value	Description
Execute	Execute	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered execute enable flag
SlaveID	ID number of the slave address	DINT	[1,65535]	1	The specified slave address where the servo parameters need to be backed up.
FileName	File name	STRING	Maximum 255 characters	''	The name of the file saving the servo parameters on the SD card.
OverWrite	File overwrite mode	BOOL	TRUE, FALSE	FALSE	TRUE: Enable overwrite.

Input Variable	Name	Data Type	Valid Range	Default Value	Description
DeviceType	Device type	INT	-	0	Type of the connected device. Reserved parameter.

Output variable

Output Variable	Name	Data Type	Valid Range	Default Value	Description
Done	Done	BOOL	TRUE, FALSE	FALSE	TRUE indicates that the servo parameters for the servo drive have been backed up.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	TRUE indicates that the servo parameters for the servo drive are being backed up.
Error	Error occurred	BOOL	TRUE, FALSE	FALSE	TRUE indicates that an error has occurred during the servo parameter backup.
ErrorID	Fault code	DWORD	-	0	Fault code (18.3.3.8 Fault Codes) recorded when a fault occurred.



- **Function**
  - On the rising edge of "Execute", the servo parameter backup process is initiated. According to the servo parameter backup template, the instruction retrieves the corresponding parameter values from the servo drive and stores them as a binary file in the root directory of the SD card. The file name is defined by the input variable FileName.
  - The servo parameter backup template must be stored in the ParameterTemplate folder in the root directory of the SD card. If the ParameterTemplate folder does not exist, the user must create it manually.

  - The servo parameter backup template contains the following information: vendor ID, device type, customized number, MCU software version, servo parameter main index, servo parameter sub-index, and servo parameter length. The file is binary with a .bin extension.
  - The file name of the servo parameter backup template must not be changed arbitrarily.

18.3.3.8 Fault Codes

The following figure shows an example of the fault code display for the related function:

Take 0x100007D0 as an example:

Instruction code

Instruction Code (hexadecimal)	Name	Function
1000	MC_Power	Enable axis
1001	MC_ReadActualPosition	Read actual position
1002	MC_ReadAxisError	Read axis error
1003	MC_ReadStatus	Read axis status
1004	MC_Reset	Axis error reset
1005	MC_ReadActualTorque	Read actual axis torque
1006	MC_ReadActualVelocity	Read actual axis velocity
1007	MC_SetPosition	Set current axis position
1008	MC_TouchProbe	Touch probe function
1009	MC_ReadBoolParameter	Read BOOL parameter
100A	MC_ReadParameter	Read REAL parameter
100B	MC_WriteBoolParameter	Write BOOL parameter
100C	MC_WriteParameter	Write REAL parameter
100D	MC_AbortTrigger	Abort a triggered motion sequence.
100E	MC_ReadSetPosition	Read the current set target position of the axis.
100F	MC_InPosition	Determine if in position
1011	MC_ChangeGearingRatio	Set or change the electronic gear ratio and the axis type.
1012	MC_SetSoftwareLimits	Set software limits
1013	MC_ReadDigitalInput	Read digital input

Instruction Code (hexadecimal)	Name	Function
1014	MC_SetControllerMode	Set the current operation mode of the servo
1015	MC_CheckLimits	Check if the current driver settings are within the limits.
1016	MC_SetTorqueLimit	Set maximum torque
1017	MC_GetMaxSetAccDec	Read the maximum acceleration and deceleration of the axis.
1018	MC_GetMaxSetVelocity	Read the maximum velocity of the axis.
1019	MC_GetTrackingError	Measure tracking error (current/maximum).
101A	MC_Halt	Axis halt function
101B	MC_Stop	Axis stop function
101C	MC_Home	Drive homing
101D	MC_MoveAbsolute	Point-to-point axis movement to absolute position
101E	MC_MoveRelative	Point-to-point axis movement by relative distance
101F	MC_FollowPosition	Set axis position directly without any check.
1020	MC_FollowVelocity	Set axis velocity directly without any check.
1021	MC_MoveVelocity	Axis velocity instruction
1022	MC_Jog	Axis teach-in jogging
1023	MC_TorqueControl	Torque control function
1024	MC_ImmediateStop	Axis servo emergency stop
1025	MC_MoveFeed	Interrupting feed
1026	MC_SetOverride	Change the axis motion parameter ratio.
1027	MC_ResetFollowingError	Reset following error
1028	MC_HaltSuperImposed	Terminate superimposed motion
1029	MC_MoveSuperImposed	Superimposed motion
102A	MC_MoveContinuousAbsolute	Move to absolute position and continue at the end-of-motion velocity.
102B	MC_MoveContinuousRelative	Move to relative position and continue at the end-of-motion velocity.

Instruction Code (hexadecimal)	Name	Function
102C	MC_CheckAxisCommunication	Check the communication status of the current drive.
102D	MC_Inch	Single-step motion control
102E	MC_Homing	Host controller homing
102F	MC_HomingWithParameter	Set controller homing parameters.
1030	MC_SyncMoveVelocityCSV	Velocity instruction with adjustable pulse width
1031	MC_BacklashCompensate	Backlash compensation function
1032	MC_LeadScrewCompensate	Lead screw pitch error compensation instruction
1033	MC_BackupServoParameter/ MC_BackupServoParameter2	Servo parameter backup instruction
1034	MC_RestoreServoParameter/ MC_RestoreServoParameter2	Servo parameter restoration instruction
1035	MC_VibrationShapping	Write axis variable parameters
1036	MC_FollowPositionVelocity	Set axis position or axis velocity directly without any check.
1037	MC_SDORead	Read from SDO
1038	MC_SDOWrite	Write to SDO
1039	MC_PositionFilter	Position filter
1044	MC_MoveAdditive	Add a distance to the last specified target position
1045	MC_MoveModulo	Rotary axis modulo positioning
2000	MC_GearIn	Start gearing synchronization.
2001	MC_GearOut	Stop gearing synchronization.
2002	MC_Phasing	Master axis phase shifting
2003	MC_StopPhasing	Stop master axis phase shifting
2004	MC_GearInPos	Start synchronization upon reaching a specified master axis position.
2005	MC_GetCamTablePhase	Get phase value in the cam table.
2006	MC_GetCamTableDistance	Get displacement value in the cam table.

Instruction Code (hexadecimal)	Name	Function
2007	MC_DigitalCamSwitch	Tappet control
2008	MC_GenerateCamTable	Update the cam table with defined cam data
2009	MC_WriteCAM	Store the edited cam table as a file
200A	MC_ReadCAM	Read the cam data file and load it into the cam table.
200B	MC_CAMBounds	Calculate maximum position, velocity, and acceleration of the slave axis
200D	MC_CamIn	Start cam synchronization.
200E	MC_CamOut	Stop cam synchronization.
200F	MC_CombineAxes	Output the sum or difference of the instruction positions of two axes as a combined instruction position.
2010	MC_AxesObserve	Observe the position deviation between master and slave axes.
2011	MC_MoveLink	Synchronous positioning
2012	MC_PhasingEx	Complete phase compensation within specified master axis travel distance.
2013	MC_CamInV2	Start cam synchronization.
2014	MC_CheckCamTable	Check the cam table node data.
2015	MC_CamNodeBinding	Binds custom cam nodes to a custom cam table.
3003	MC_GroupEnable	Enable axis group
3004	MC_GroupDisable	Disable axis group
3005	MC_GroupHome	Axis group homing
3006	MC_GroupSetPosition	Set axis group current position
3007	MC_GroupReadActualPosition	Read axis group actual position
3008	MC_GroupReadActualVelocity	Read axis group actual velocity
3009	MC_GroupReadActualAcceleration	Read axis group actual acceleration
300A	MC_GroupStop	Axis group emergency stop
300B	MC_GroupHalt	Stop axis group

Instruction Code (hexadecimal)	Name	Function
300C	MC_GroupSetOverride	Axis group override setting
300D	MC_MoveDirectRelative	Point-to-point relative motion
300E	MC_MoveDirectAbsolute	Point-to-point absolute motion
300F	MC_MoveCircularRelative	Circular relative motion
3010	MC_MoveCircularAbsolute	Circular absolute motion
3011	MC_MoveLinearRelative	Linear relative motion
3012	MC_MoveLinearAbsolute	Linear absolute motion
3013	MC_GroupReset	Reset axis group
3014	MC_GroupReadError	Axis group error reading
3015	MC_GroupReadStatus	Axis group status reading
3016	MC_TrackConveyorBelt	Conveyor belt tracking
3017	MC_SetCartesianTransform	Set transformation between part coordinate system and machine coordinate system
3018	MC_GroupInterrupt	Axis group pause
3019	MC_GroupContinue	Continue axis group motion
3030	MC_GroupPower	Enable/disable axes in axis group
4000	ENC_Counter	Enable encoder (local, bus)
4001	ENC_Reset	Reset encoder (local, bus)
4002	ENC_Preset	Preset encoder (local, bus)
4003	ENC_TouchProbe	Encoder touch probe (local, bus)
4004	ENC_ArrayCompare	Encoder one-dimensional array comparison (local, bus)
4005	ENC_StepCompare	Encoder one-dimensional step comparison (local, bus)
4007	ENC_ReadStatus	Read encoder status (bus)
4008	ENC_DigitalOutput	Encoder digital output control (bus)
400A	ENC_Compare	Encoder axis comparison output (local, bus)
400B	ENC_SetUnit	Set encoder scaling (local, pulse-to-unit ratio)

Instruction Code (hexadecimal)	Name	Function
400C	ENC_SetLineRotationMode	Set linear rotation mode for encoder axis (local)

Fault code

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
0100	0064	The slave address ID exceeds the specified range.	1. The input variable SlaveID of the instruction MC_BackupServoParameter2 exceeded the range [1,65535]. 2. The input variable SlaveID of the instruction MC_RestoreServoParameter2 exceeded the range [1,65535].	1. Set the input variable SlaveID of the instruction MC_BackupServoParameter2 within the range [1,65535]. 2. Set the input variable SlaveID of the instruction MC_RestoreServoParameter2 within the range [1,65535].
0101	0065	The mount path for the SD card does not exist, or the SD card is not inserted.	1. The SD card was not inserted into the controller. 2. The mount path for the SD card in the controller did not exist.	1. Insert the SD card into the controller and power cycle the controller. 2. Check if the mount path for the SD card in the controller is /mnt/sdcard/.
0102	0066	The file name specified by the instruction is null.	1. The input variable FileName of the instruction MC_RestoreServoParameter2 was NULL, meaning the user has not specified a servo parameter backup file for the instruction MC_RestoreServoParameter2.	1. The input variable FileName of the instruction MC_RestoreServoParameter2 must be set to the name of the servo parameter backup file to be restored to the servo.
0103	0067	The file name specified by the instruction exceeds 255 characters.	1. The input variable FileName of the instruction MC_BackupServoParameter2 exceeded 255 characters. 2. The input variable FileName of the instruction MC_RestoreServoParameter2 exceeded 255 characters.	1. The input variable FileName of the instruction MC_BackupServoParameter2 must be limited to 255 characters or fewer. 2. The input variable FileName of the instruction MC_RestoreServoParameter2 must be limited to 255 characters or fewer.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
0104	0068	The file name specified by the instruction contains illegal characters.	1. The input variable FileName of the instruction MC_BackupServoParameter2 contained characters other than numbers, letters, and underscores. 2. The input variable FileName of the instruction MC_RestoreServoParameter2 contained characters other than numbers, letters, and underscores.	1. Set the input variable FileName of the instruction MC_BackupServoParameter2 to a combination of numbers, letters, and underscores. 2. Set the input variable FileName of the instruction MC_RestoreServoParameter2 to a combination of numbers, letters, and underscores.
0105	0069	The servo backup file specified by the instruction already exists in the path, and overwriting the file is prohibited.	1. The servo parameter backup file specified by the input variable FileName of the instruction MC_BackupServoParameter2 already existed in the SD card root directory, while the input variable OverWrite was set to FALSE.	1. Manually delete the servo parameter backup file specified by FileName in the SD card root directory, and then trigger the instruction. 2. Set the input variable OverWrite of the instruction MC_BackupServoParameter2 to TRUE.
0106	006A	The path to the servo parameter backup file does not exist.	1. The SD card was not inserted into the controller. 2. The mount path for the SD card in the controller did not exist.	1. Insert the SD card into the controller and restart the controller. 2. Verify if the mount path for the SD card in the controller is /mnt/sdcard/. If not, modify the mount path.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
0107	006B	The servo parameter backup file to be operated on by the instruction is in write status.	1. When triggering the instruction MC_BackupServoParameter2, the servo parameter backup file to be operated on by the instruction was being written to by another instruction (such as another instance of the instruction MC_BackupServoParameter2). 2. When triggering the instruction MC_RestoreServoParameter2, the servo parameter backup file to be operated on by the instruction was being written to by another instruction (such as the instruction MC_BackupServoParameter2).	1. Before triggering the instruction MC_BackupServoParameter2, check if the servo parameter backup file to be operated on is being written to by another instruction. If so, wait for the other instruction to complete writing before triggering the instruction MC_BackupServoParameter2. 2. Before triggering the instruction MC_RestoreServoParameter2, check if the servo parameter backup file to be operated on is being written to by another instruction. If so, wait for the other instruction to complete writing before triggering the instruction MC_RestoreServoParameter2.
0108	006C	The servo parameter backup file to be operated on by the instruction is in read-only status.	1. When triggering the instruction MC_BackupServoParameter2, the servo parameter backup file to be operated on was being read by another instruction (such as the instruction MC_RestoreServoParameter2).	1. Before triggering the instruction MC_BackupServoParameter2, check if the servo parameter backup file to be operated on is being read by another instruction. If so, wait for the other instruction to complete reading before triggering the instruction MC_BackupServoParameter2.
0109	006D	The servo parameter file specified by the instruction cannot be created or opened.	1. The SD card was not inserted. 2. The mount path for the SD card in the controller did not exist. 3. Check if the servo parameter backup file name contains illegal characters. 4. Check if the specified servo parameter backup file is corrupted.	1. Insert the SD card into the controller and restart the controller. 2. Verify if the mount path for the SD card in the controller is /mnt/sdcard/. If not, modify the mount path. 3. Rename the servo parameter backup file to contain only numbers, letters, and underscores. 4. Import the intact servo parameter backup file to the root directory of the SD card.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
0110	006E	The write-status file (with the .w suffix) for the servo parameter file cannot be created.	1. The SD card was not inserted. 2. The mount path for the SD card in the controller did not exist. 3. Check if the servo parameter backup file name contains illegal characters.	1. Insert the SD card into the controller and restart the controller. 2. Verify if the mount path for the SD card in the controller is /mnt/sdcard/. If not, modify the mount path. 3. Rename the servo parameter backup file to contain only numbers, letters, and underscores.
0111	006F	The read-only file (with the .r suffix) for the servo parameter file cannot be created.	1. The SD card was not inserted. 2. The mount path for the SD card in the controller did not exist. 3. Check if the servo parameter backup file name contains illegal characters.	1. Insert the SD card into the controller and restart the controller. 2. Verify if the mount path for the SD card in the controller is /mnt/sdcard/. If not, modify the mount path. 3. Rename the servo parameter backup file to contain only numbers, letters, and underscores.
0112	0070	The servo parameter backup and restore instruction cannot find the slave specified by the input variable SlaveID of the instruction.	1. The slave specified by SlaveID was not configured.	1. Configure the slave specified by SlaveID.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
0113	0071	The slave specified by the SlaveID in the servo parameter backup and restore instruction is not in the OP status.	1. The communication cables between the controller and the servo slave were improperly connected. 2. The EtherCAT communication of the servo slave was not in the OP status.	1. Check if the controller and the servo slave are powered on and if their communication cables are properly connected. 2. Verify the EtherCAT communication status of the servo slave, and trigger the instruction once the slave is in the OP status.
0114	0072	SDO read operation failed	1. The controller cannot read the specified servo parameters from the servo via SDO communication.	1. Verify whether the servo parameters to be read exist in the servo. 2. Verify whether the servo parameters to be read are readable.
0115	0073	SDO write operation failed	1. The controller cannot write the specified servo parameters to the servo via SDO communication.	1. Verify whether the servo parameters to be written exist in the servo. 2. Verify whether the servo parameters to be written are writable. 3. Verify whether the data length of the servo parameters to be written is correct.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
0116	0074	No matching servo parameter backup template found.	1. The ParameterTemplate folder did not exist in the root directory of the SD card. 2. The ParameterTemplate folder on the SD card did not contain a matching servo parameter backup template for the servo.	1. Verify whether the ParameterTemplate folder exists in the root directory of the SD card; if it does not, manually create it and place the matching servo parameter backup template in the ParameterTemplate folder. 2. Verify whether the corresponding servo parameter backup template exists in the ParameterTemplate folder on the SD card. Verify whether the corresponding servo parameter backup template matches the actual servo model. (For example, the servo parameter backup template for 660N servo corresponds to the 680N servo.)
0117	0075	The version of the servo parameter backup template does not match the version of the servo.	1. The vendor ID, device type, customized number, and MCU software version recorded in the servo parameter backup template did not match the actual servo.	1. Verify whether the servo parameter backup template matches the actual servo; if it does not, replace or modify the template.
0118	0076	The slave is not an Inovance product.	1. The slave specified by SlaveID was a third-party product.	1. The servo parameter backup and restore instructions only support Inovance EtherCAT servos. Third-party products are not supported and must be replaced with Inovance EtherCAT servos.
0119	0077	The slave is not a servo product.	1. The slave specified by SlaveID was a non-servo device.	1. The servo parameter backup and restore instructions only support Inovance EtherCAT servos. Non-servo devices are not supported and must be replaced with Inovance EtherCAT servos.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
0120	0078	The version of the servo parameter backup file does not match the version of the servo.	1. The vendor ID, device type, customized number, and MCU software version recorded in the servo parameter backup file did not match the actual servo.	1. Verify if the servo parameter backup file matches the actual servo. If it does not match, replace the servo parameter backup file.
0121	0079	SD card read operation failed	1. The SD card was not inserted. 2. The mount path for the SD card in the controller did not exist. 3. The servo parameter backup template or the servo parameter backup file to be read did not exist or is damaged. 4. The servo parameter backup template to be read contained servo parameters that do not exist on the current servo or are not accessible via SDO.	1. Insert the SD card into the controller and restart the controller. 2. Verify if the mount path for the SD card in the controller is /mnt/sdcard/. If not, modify the mount path. 3. Verify if the servo parameter backup template or servo parameter backup file exists in its corresponding location and is intact. 4. Verify if the servo parameter backup template contains servo parameters that do not exist on the current servo or are not accessible via SDO.
0122	007A	SD card write operation failed	1. The SD card was not inserted. 2. The mount path for the SD card in the controller did not exist. 3. The servo parameter backup file to be written was damaged.	1. Insert the SD card into the controller and restart the controller. 2. Verify if the mount path for the SD card in the controller is /mnt/sdcard/. If not, modify the mount path. 3. Verify if the servo parameter backup file is intact.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
0123	007B	The current servo status does not meet the requirements for executing the MC_RestoreServoParameter2 instruction.	1. When triggering the MC_RestoreServoParameter2 instruction, the state machine of the servo slave was in any status other than "No fault", "Servo ready", "Waiting for the S-ON signal", or "Fault".	1. Adjust the state machine of the servo slave to one of the following statuses: "No fault", "Servo ready", "Waiting for the S-ON signal", or "Fault". Then, trigger the MC_RestoreServoParameter2 instruction.
0124	007C	The servo parameter backup instruction MC_BackupServoParameter2 cannot be re-triggered.	1. After triggering an instance of the servo parameter backup instruction MC_BackupServoParameter2, the same instance was re-triggered while it was in the Busy status.	1. After triggering an instance of the servo parameter backup instruction MC_BackupServoParameter2, wait for the same instance to complete execution before triggering it again.
0125	007D	The servo parameter restoration instruction MC_RestoreServoParameter2 cannot be re-triggered.	1. After an instance of the servo parameter restoration instruction MC_RestoreServoParameter2 had been triggered, the same instance was re-triggered while it was in the Busy status.	1. After triggering an instance of the servo parameter restore instruction MC_RestoreServoParameter2, wait for the same instance to complete execution before triggering it again.
0126	007E	The SlaveID specified for the servo parameter backup or restore instruction is in a busy status.	1. When triggering the servo parameter backup or restore instruction, another instruction was already occupying the SDO channel of the slave specified by SlaveID for communication.	1. After all other instructions have finished using the SDO channel of the slave specified by SlaveID, trigger the servo parameter backup or restore instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
0127	007F	Servo parameter length mismatch	1. The servo parameter length was wrong in the servo parameter backup template, so the backup file generated from the template by the servo parameter backup instruction would also contain the wrong parameter length. If this corrupted data was restored with the wrong parameter length by triggering the servo restore instruction MC_RestoreServoParameter2, it would cause an instruction failure.	1. Check if the length data of the servo parameters is correct in the servo parameter backup template. If not, correct the template. 2. Check if the length data of the servo parameters is correct in the servo parameter backup file. If not, replace the file.
1001	03E9	Invalid position parameter	1. When the software limits were enabled, the value of the "Position" input parameter in the MC_FollowPosition instruction exceeded the positive or negative limit. 2. The value of the "PosWindow" input parameter in the MC_InPosition instruction was less than 0. 3. For linear axes, the value of the "FirstPosition" input parameter in the MC_TouchProbe and MC_MoveFeed instructions was greater than or equal to the value of "LastPosition". 4. For a rotary axis, the value of the "FirstPosition" input parameter in the MC_TouchProbe and MC_MoveFeed instructions was equal to the value of "LastPosition".	1. Adjust the input parameter of the corresponding instructions to the value within the valid range as required.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
1002	03EA	Invalid velocity parameter	1. The value of the "Velocity" input parameter in the MC_Phasing instruction was less than or equal to 0. 2. For the MC_CamIn, MC_GearIn, MC_GearInPos, MC_MoveLink, MC_TorqueControl, MC_HomingWithParameter, MC_MoveAbsolute, MC_MoveRelative, MC_MoveContinuousAbsolute, MC_MoveContinuousRelative, MC_MoveVelocity, MC_SyncMoveVelocityCSV, and MC_MoveFeed instructions, the value of the "Velocity" input parameter was less than or equal to 0, or greater than the maximum velocity specified by the software. 3. For the MC_Jog and MC_Inch instructions, the value of the input parameter "Velocity" was less than or equal to 0, or greater than the maximum commissioning velocity specified by the software. 4. For the MC_FollowVelocity instruction, the absolute value of the input parameter "Velocity" was greater than the maximum velocity specified by the software. 5. The value of the input parameter "VelocityDiff" for the MC_MoveSuperImposed instruction was less than or equal to 0, or greater than the maximum velocity specified by the software.	1. Adjust the input parameter of the corresponding instructions to the value within the valid range as required.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
1003	03EB	Invalid acceleration parameter	1. The value of the input parameter "Acceleration" for the MC_Phasing instruction was less than or equal to 0. 2. For the MC_CamIn, MC_GearIn, MC_GearInPos, MC_MoveLink, MC_TorqueControl, MC_HomingWithParameter, MC_MoveAbsolute, MC_MoveRelative, MC_MoveContinuousAbsolute, MC_MoveContinuousRelative, MC_MoveVelocity, MC_SyncMoveVelocityCSV, and MC_MoveFeed instructions, the value of the "Acceleration" input parameter was less than or equal to 0, or greater than the maximum acceleration specified by the software. 3. For the MC_Jog and MC_Inch instructions, the value of the input parameter "Acceleration" was less than or equal to 0, or greater than the maximum commissioning acceleration specified by the software. 4. The value of the input parameter "Acceleration" for the MC_MoveSuperImposed instruction was less than or equal to 0, or greater than the maximum acceleration specified by the software.	1. Adjust the input parameter of the corresponding instructions to the value within the valid range as required.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
1004	03EC	Invalid deceleration parameter	1. The value of the input parameter "Deceleration" for the MC_Phasing and MC_StopPing instructions was less than or equal to 0. 2. For the MC_CamIn, MC_GearIn, MC_GearInPos, MC_MoveLink, MC_TorqueControl, MC_HomingWithParameter, MC_MoveAbsolute, MC_MoveRelative, MC_MoveContinuousAbsolute, MC_MoveContinuousRelative, MC_MoveVelocity, MC_SyncMoveVelocityCSV, MC_MoveFeed, MC_Stop, MC_Halt instructions, the value of the "Deceleration" input parameter was less than or equal to 0, or greater than the maximum deceleration specified by the software. 3. For the MC_Jog and MC_Inch instructions, the value of the input parameter "Deceleration" was less than or equal to 0, or greater than the maximum commissioning deceleration specified by the software. 4. The value of the input parameter "Deceleration" for the MC_MoveSuperImposed and MC_HaltSuperImposed instructions was less than or equal to 0, or greater than the maximum deceleration specified by the software.	1. Adjust the input parameter of the corresponding instructions to the value within the valid range as required.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
1005	03ED	Invalid jerk parameter	When using an S-curve motion profile: 1. The value of the input parameter "Jerk" for the MC_Phasing and MC_StopPing instructions was less than or equal to 0. 2. For the MC_CamIn, MC_GearIn, MC_GearInPos, MC_MoveLink, MC_TorqueControl, MC_HomingWithParameter, MC_MoveAbsolute, MC_MoveRelative, MC_MoveContinuousAbsolute, MC_MoveContinuousRelative, MC_MoveVelocity, MC_SyncMoveVelocityCSV, MC_MoveFeed, MC_Stop, MC_Halt instructions, the value of the "Jerk" input parameter was less than or equal to 0, or greater than the maximum jerk specified by the software. 3. For the MC_Jog and MC_Inch instructions, the value of the input parameter "Jerk" was less than or equal to 0, or greater than the maximum jerk specified by the software. 4. The value of the input parameter "Jerk" for the MC_MoveSuperImposed and MC_HaltSuperImposed instructions was less than or equal to 0, or greater than the maximum jerk specified by the software.	1. Adjust the input parameter of the corresponding instructions to the value within the valid range as required.

1007	03EF	Invalid motion direction parameter	1. The input parameter "Direction" for the MC_CamIn instruction has the following value range: DIR_POSITIVE(1), DIR_NEGATIVE(2), DIR_NODIRECTION(4). 2. The input parameter "DirectionLocal" for the ENC_Counter instruction has the following value range: DIR_SHORTEST(0), DIR_POSITIVE(1). 3. The input parameter "Direction" for the MC_MoveAbsolute and MC_MoveContinuousAbsolute instructions has the following value range: DIR_SHORTEST(0), DIR_POSITIVE(1), DIR_NEGATIVE(2), DIR_CURRENT(3), DIR_NODIRECTION(4), DIR_FASTEST(5). 4. The input parameter "Direction" for the MC_MoveVelocity and MC_SyncMoveVelocityCSV instructions has the following value range: DIR_POSITIVE(1), DIR_NEGATIVE(2), DIR_CURRENT(3). 5. When the MC_MoveFeed instruction operates in velocity mode, the input parameter "Direction" has the following value range: DIR_POSITIVE(1), DIR_NEGATIVE(2), DIR_CURRENT(3). 6. For the MC_MoveFeed instruction in absolute mode on a rotary axis, the input parameter "Direction" has the following value range: DIR_SHORTEST(0), DIR_POSITIVE(1), DIR_NEGATIVE(2), DIR_CURRENT(3), DIR_NODIRECTION(4). 7. The input parameter "DirectionLocal" for the ENC_Counter instruction has the following value range: positive direction (0), negative direction (1).	1. Adjust the input parameter of the corresponding instructions to the value within the valid range as required.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
1010	03F2	Invalid torque parameter	1. The absolute value of the input parameter "Torque" for the MC_TorqueControl instruction cannot be greater than fMaxPositiveTorque or fMaxNegativeTorque of the axis structure.	1. Adjust the input parameter of the corresponding instructions to the value within the valid range as required.
1011	03F3	Invalid torque ramp parameter	1. The value of the input parameter "TorqueRamp" for the MC_TorqueControl instruction was less than 0.	1. Adjust the input parameter of the corresponding instructions to the value within the valid range as required.
1012	03F4	Invalid control mode parameter	1. The input parameter "ControllerMode" for the MC_SetControllerMode instruction has the following value range. 10: MC_TORQUE; 9: MC_VELOCITY; 8: MC_POSITION.	1. Adjust the input parameter of the corresponding instructions to the value within the valid range as required.
1013	03F5	The probe ID number is not within the supported range.	1. The input parameter "ProbeID" for the MC_MoveLink, MC_TouchProbe, MC_AbortTrigger, and MC_MoveFeed instructions has the following value range: 0 (probe 1), 1 (probe 2).	1. Adjust the input parameter of the corresponding instructions to the value within the valid range as required.
1014	03F6	The edge trigger parameter is not within the supported range.	1. The input parameter "TriggerEdge" for the MC_MoveLink and MC_MoveFeed instructions has the following value range: 0 (Only rising edge-triggered), 1 (Only falling edge-triggered). 1. The input parameter "TriggerEdge" for the MC_TouchProbe instruction has the following value range: 0 (Only rising edge-triggered), 1 (Only falling edge-triggered), 2 (Both rising and falling edges triggered).	1. Adjust the input parameter of the corresponding instructions to the value within the valid range as required.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
1015	03F7	The trigger source parameter is not within the supported range.	1. When the axis is a virtual axis or a local pulse axis, the input parameter "TerminalSource" for the MC_MoveLink, MC_TouchProbe, and MC_MoveFeed instructions is set to 1 (encoder Z signal). 2. When the axis is a bus-controlled axis, the input parameter "TerminalSource" for the MC_MoveLink, MC_TouchProbe, and MC_MoveFeed instructions is set to a value other than 0 (DI terminal) or a value other than 1 (encoder Z signal).	1. Adjust the input parameter of the corresponding instructions to the value within the valid range as required.
1016	03F8	The trigger mode parameter is not within the supported range.	1. When the input parameter "LinkMode" for the MC_MoveLink instruction is 2 (Active when the TriggerValue is detected to be TRUE), "TriggerMode" has the following value range: 0 (drive mode), 1 (controller mode). 2. The input parameter "TriggerMode" for the MC_TouchProbe instruction has the following value range: 0 (single trigger), 1 (continuous trigger)	1. Adjust the input parameter of the corresponding instructions to the value within the valid range as required.
1017	03F9	Invalid time parameter	1. The input parameter "PosTime" or "TimeOutValue" for the MC_InPosition instruction was less than 0.	1. For the MC_InPosition instruction, the input parameter "PosTime" or "TimeOut Value" must be greater than 0.
1018	03FA	Invalid electronic gear ratio denominator setting	1. The user input parameter "RatioTechUnitsDenom" on the instruction side was set to 0.	1. Modify the set value of the user input parameter "RatioTechUnitsDenom" on the instruction side.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
1019	03FB	Invalid electronic gear ratio numerator setting	1. The user input parameter "RatioTechUnitsNum" on the instruction side was set to 0. 2. ENC_SetUnit: The user input parameter "Numerator" on the instruction side was set to a value less than or equal to 0.	1. Modify the set value of the user input parameter "RatioTechUnitsNum" on the instruction side. 2. Modify the set value of the user input parameter "Numerator" on the instruction side.
1020	03FC	Invalid cycle length setting for the rotation mode	1. MC_ChangeGearingRatio: When the user input parameter "MovementType" on the instruction side was set to 0 (rotary axis), the set value of the user input parameter "PositionPeriod" on the instruction side was less than or equal to 0. 2. ENC_SetLineRotationMode: When the user input parameter "MovementType" on the instruction side was set to 1 (rotary axis), the set value of the user input parameter "PositionPeriod" on the instruction side was less than or equal to 0, or the pulse unit corresponding to "PositionPeriod" was greater than 2147483647. 3. ENC_SetLineRotationMode: When the user input parameter "MovementType" on the instruction side was set to 1 (rotary axis), the product of the "PositionPeriod" set value on the instruction side and the axis gear ratio was greater than 2147483647.	1. Modify the set value of the input parameter "PositionPeriod" on the instruction side.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
1021	03FD	Axis motion type error	1. MC_ChangeGearingRatio: The user input parameter "MovementType" on the instruction side has the following value range: 0 (rotary axis), 1 (linear axis). 2. ENC_SetLineRotationMode: The user input parameter "MovementType" on the instruction side has the following value range: 0 (linear axis), 1 (rotational axis).	1. Modify the set value of the input parameter "MovementType" on the instruction side.
1022	03FE	The positive limit position is less than or equal to negative limit position.	1. The set value of the user input parameter "PositiveLimitPos" on the instruction side was less than or equal to that of the user input parameter "NegativeLimitPos" on the instruction side.	1. Modify the set value of the user input parameter "PositiveLimitPos" on the instruction side. 2. Modify the set value of the user input parameter "NegativeLimitPos" on the instruction side.
1023	03FF	Invalid deceleration distance parameter setting	1. The user input parameter "MaxDistance" on the instruction side was set to a value less than 0.	1. Modify the set value of the input parameter "MaxDistance" on the instruction side.
1025	0401	Emergency stop mode parameter error in emergency stop	1. The user input parameter "StopMode" on the instruction side was not set to 0 (immediate stop) or 1 (immediate stop with servo disable).	1. Modify the set value of the user input parameter "StopMode" on the instruction side.
1026	0402	The motion mode parameter is not within the supported range.	1. The user input parameter "MoveMode" on the instruction side has the following value range: AbsoluteMode(0), RelativeMode(1), VelocityMode(2).	1. Modify the set value of the user input parameter "MoveMode" on the instruction side.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
1027	0403	Buffer mode out of range	1. The input parameter "BufferMode" for the instructions MC_CamIn, MC_GearIn, MC_MoveLink, MC_MoveContinuousAbsolute, MC_MoveContinuousRelative, MC_MoveVelocity, MC_Halt, MC_TorqueControl, and MC_MoveFeed has a value range: mcAbort (0), mcBuffered (1). 2. The input parameter "BufferMode" for the instruction MC_GearInPos must be set to mcAbort (0). 3. The input parameter "BufferMode" for the instructions MC_MoveAbsolute and MC_MoveRelative has the following value range: mcAbort (0), mcBuffered (1), mcBlendingLow (2), mcBlendingPrevious (3), mcBlendingNext (4), and mcBlendingHigh (5). 4. For the instructions MC_PhasingEx, MC_CombineAxes, and MC_Phasing, the input parameter "BufferMode" must be set to mcAbort (0).	1. Modify the set value of the user input parameter "BufferMode" on the instruction side.
1028	0404	Gear parameter modification not allowed after axis is enabled	1. The instruction was triggered once the axis was enabled.	1. Disable the axis before triggering this instruction.
1029	0405	Feed velocity parameter out of range	1. The user input parameter "FeedVelocity" on the instruction side was set to a value less than or equal to 0, or exceeded the set value of "Velocity" in the "Motion parameter limit" on the FA side.	1. Modify the set value of the user input parameter "FeedVelocity" on the instruction side. 2. Modify the set value of "Velocity" in the "Motion parameter limit" on the FA side.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
1030	0406	Set position exceeds software limits	1. When the "Enable" checkbox in "Axis - General settings - Basic settings - Software limit" on the FA side was checked, the set value of the input parameter "FirstPosition" on the instruction side was less than that of "Negative limit" in the "Software limit" on the FA side. 2. When the "Enable" checkbox in "Axis - General settings - Basic settings - Software limit" on the FA side was checked, the set value of the user input parameter "LastPosition" on the instruction side was greater than that of "Positive limit" in "Software limit" on the FA side.	1. Modify "Negative limit" or "Positive limit" in "Software limit" on the FA side. 2. Modify the set value of the user input parameter "FirstPosition" or "LastPosition" on the instruction side.
1031	0407	Incorrect homing direction setting	1. The "StartDirection" member in the user input parameter "HomingParameter" of type structure on the instruction side was set to a value that is neither "DIR_POSITIVE" nor "DIR_NEGATIVE".	1. Modify the set value of "StartDirection" in the structured user input parameter "HomingParameter" on the instruction side.
1032	0408	Creeping speed greater than homing speed	1. The set value of "ApproachVel" in the structured user input parameter "HomingParameter" on the instruction side was greater than that of "Vel".	1. Modify the set value of "ApproachVel" in the structured user input parameter "HomingParameter" on the instruction side. 2. Modify the set value of "Vel" in the structured user input parameter "HomingParameter" on the instruction side.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
1034	040A	Incorrect homing detection direction configuration	1. The "EndDirection" member in the structured user input parameter "HomingParameter" on the instruction side was set to a value that is neither "DIR_POSITIVE" nor "DIR_NEGATIVE". 2. The "ZeroSignal" member in the structured user input parameter "HomingParameter" on the instruction side was set to a value that is neither "HOME_INPUT_SIGNAL_EXTERNALSIGNAL" nor "HOME_INPUT_SIGNAL_ZPHASE".	1. Modify the set value of "EndDirection" in the structured user input parameter "HomingParameter" on the instruction side. 2. Modify the set value of "ZeroSignal" in the structured user input parameter "HomingParameter" on the instruction side.
1036	040C	Invalid ending velocity parameter	1. The user input parameter "EndVelocity" on the instruction side was set to a value less than or equal to 0, or exceeded the set value of "Velocity" in the "Motion parameter limits" on the FA side.	1. Modify the set value of the user input parameter "EndVelocity" on the instruction side. 2. Modify the set value of "Velocity" in the "Motion parameter limit" on the FA side.
1037	040D	Invalid end motion direction parameter	1. The user input parameter "EndVelocityDirection" on the instruction side was not set to "DIR_POSITIVE", "DIR_NEGATIVE", or "DIR_CURRENT".	1. Modify the set value of the user input parameter "EndVelocityDirection" on the instruction side.
1038	040E	Invalid creeping speed parameter setting	1. The set value of "ApproachVel" in the structured user input parameter "HomingParameter" on the instruction side was greater than that of "Velocity" in the "Motion parameter limit" on the FA side, or the set value of "ApproachVel" was less than or equal to 0.	1. Modify the set value of "ApproachVel" in the structured user input parameter "HomingParameter" on the instruction side. 2. Modify the set value of "Velocity" in the "Motion parameter limit" on the FA side.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
1039	040F	Invalid mask distance setting in the host controller homing mode	1. When the value of "HomingMode" in the structured input user parameter "HomingParameter" on the instruction side was set to "HOMING_METHOD_HOMESWMASKDISTANCEHOMESWTURN", the set value of "MaskDistance" in the structured "HomingParameter" was less than or equal to 0.	1. If the value of "HomingMode" in the structured input user parameter "HomingParameter" on the instruction side is set to "HOMING_METHOD_HOMESWMASKDISTANCEHOMESWTURN", modify the set value of "MaskDistance" in the structured parameter "HomingParameter".
1040	0410	Invalid value range for the user input parameter "Distance" on the instruction side	1. The value of the user input parameter "Distance" on the instruction side was less than 0.	1. Modify the value of the user input parameter "Distance" on the instruction side.
1043	0413	Phase superimposition mode parameter error	1. The set value of the user input parameter "Mode" on the instruction side was invalid.	1. The user input parameter "Mode" on the instruction side has the following value range: 0 (Phase compensation continues when master velocity is 0) or 1 (Phase compensation stops when master velocity is 0). Set the appropriate phase compensation mode according to your requirements.
1044	0414	Phase superimposition shift type parameter error	1. The set value of the user input parameter "RelativeMode" on the instruction side was invalid.	1. The user input parameter "RelativeMode" on the instruction side has the following value range: 0 (Specify PhaseShift as an absolute phase offset relative to the master reference, overwriting any existing offset) or 1 (Specify PhaseShift as a relative phase offset, adding to the current offset between the master and slave axes). Set the appropriate phase compensation mode as required.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
1046	0416	Probe 1 terminal not configured	1. The probe 1 of the axis corresponding to the instruction was not configured.	1. Enable the required probe channel in the Axis - Probe settings on the FA side. Select the required terminal.
1047	0417	Probe 2 terminal not configured	1. The probe 2 of the axis corresponding to the instruction was not configured.	1. Enable the required probe channel in the Axis - Probe settings on the FA side. Select the required terminal.
1048	0418	Filter time parameter out of range	1. The input parameter "FilterTime" of the instruction exceeded the valid range of 2 to 100.	1. Adjust the input parameter "FilterTime" to the value within the valid range.
1049	0419	Unsupported filter mode for local encoder axis	1. The filter modes 0, 3, 5, 6, 8, and 10 were incompatible with local encoder axes.	1. If using a local encoder axis, select a compatible filter mode.
1050	041A	Filter type out of range	1. The input parameter "FilterType" of the instruction exceeded the range of 0 to 11.	1. Adjust the input parameter "FilterType" to the value within the valid range.
1051	041B	The motion filtering has been applied.	1. There was already an ongoing filtering function, when the current instruction was triggered.	1. Stop the ongoing filtering function, and then re-trigger the current instruction.
1052	041C	The signal source for the synchronization instruction is set to mcPositionFilter but the position filtering function is disabled.	1. When the synchronization instruction was triggered, the signal source was set to mcPositionFilter, but the position filtering function was not enabled. 2. When the synchronization instruction was executed, the signal source was set to mcPositionFilter, and the position filtering function was disabled.	1. When selecting mcPositionFilter for synchronization instruction, the position filtering function must be activated before startup.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
1053	041D	The input SDO parameter length is invalid.	The value "DataLength" was invalid.	Adjust DataLength to a value within the range of 1 to 4.
1054	041E	For the filter mode 6 or 7, the low-pass filter parameter is less than or equal to 0.	1. When the filter mode 6 or 7 was selected, the value of the low-pass filter parameter was invalid.	1. When the filter mode 6 or 7 is selected, the value of the low-pass filter parameter must be greater than 0. Set a proper low-pass filter parameter based on the actual conditions.
2000	07D0	Timeout while clearing error	1. The communication status of the servo or slave was faulty.	1. Check the status of the slave. 2. Check the fault code on the servo. 3. See the servo manual.
2001	07D1	Shut Down waiting timeout	1. The communication status of the servo or slave was faulty.	1. Check the status of the slave. 2. Check the fault code on the servo. 3. See the servo manual.
2002	07D2	Switch On waiting timeout	1. The communication status of the servo or slave was faulty.	1. Check the status of the slave. 2. Check the fault code on the servo. 3. See the servo manual.
2003	07D3	Enable switchover timeout	1. The communication status of the servo or slave was faulty.	1. Check the status of the slave. 2. Check the fault code on the servo. 3. See the servo manual.
2004	07D4	Servo enable loss during operation	1. The communication status of the servo or slave was faulty.	1. Check the status of the slave. 2. Check the fault code on the servo. 3. See the servo manual.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3000	0BB8	Incorrect control mode for the current axis	1. The axis control mode corresponding to the MC_SetPosition instruction was not MC_CSP. This instruction can only be triggered in the above axis control mode. 2. During the execution of the MC_TorqueControl instruction, the axis control mode has been switched to a non-CST mode. 3. The axis control mode corresponding to the instruction was neither MC_CSP nor MC_CSV. The instruction can only be triggered in the above two modes.	1. Modify the current axis control mode.
3001	0BB9	Instruction not permitted in the axis state	The instruction was initiated while the axis was in the STOPPING or HOMING state.	1. Reset the input parameter Execute of the MC_Stop or MC_Homing instruction. Only after the axis has come to a complete standstill may you switch states and restart the instruction.
3003	0BBB	Motion planning parameter solver failed	1. The user input motion parameters on the instruction side caused the motion planning solver to fail.	1. Modify the user input motion parameters on the instruction side. 2. Adjust the trigger point of the instruction.
3004	0BBC	Buffer data full	1. When the user input parameter "BufferMode" was set to a value other than "MC_ABORTING" on the instruction side, the buffer data was out of limit.	1. Modify the user program to ensure that no more than one instruction has the parameter "BufferMode" set to a value other than "MC_ABORTING".
3008	0BC0	Axis not enabled	1. The axis was not enabled. 2. The MC_Power instruction was executed, but the servo had an unresolvable error, causing the enabling failure. 3. The axis was disabled during the instruction execution.	1. Check if the user program executes the MC_Power instruction. 2. Check and resolve the servo error. 3. Check if the axis is disabled when executing the user program.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3009	0BC1	The axis to execute the instruction is a non-control axis.	1. The instruction was triggered using the non-control axis.	1. The instruction is only applicable to bus-controlled axes and local pulse axes.
3010	0BC2	The axis is in the homing process and does not meet the execution conditions.	1. The instruction was triggered when the axis was in the AXIS_HOMING status (The axis is in the homing process).	1. Modify the user program to prevent triggering the instruction when the axis in the AXIS_HOMING status.
3011	0BC3	Axis homing interrupted or not started	1. The axis homing has been interrupted or has not been started.	1. See the servo manual.
3012	0BC4	Axis homing completed but the target position not reached	1. The axis has completed the homing, but did not reach the target position.	1. See the servo manual.
3013	0BC5	Axis homing error with non-zero speed	1. The error occurred during the axis homing and the speed was not 0. 2. The positive and negative limits were activated simultaneously during the homing process.	1. See the servo manual. 2. Trigger the limit and home signals correctly during the homing process according to the homing method.
3014	0BC6	Axis homing error with the speed at zero	1. The error occurred during the axis homing and the speed was 0.	1. See the servo manual.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3017	0BC9	Probe trigger position out of defined range	1. For a linear axis, the value of the current instruction position was less than the set value of the input parameter "firstPosition" or greater than the set value of the input parameter "lastPosition". 2. For a rotary axis, when the input parameter "firstPosition" was greater than "lastPosition", the current instruction position was greater than "lastPosition" and less than "firstPosition"; when the input parameter "firstPosition" was less than "lastPosition", the current instruction position was greater than "lastPosition" and less than 360°, or the current instruction position was greater than 0 and less than "firstPosition".	1. Modify the set value of the input parameter "firstPosition" or of the input parameter "lastPosition".
3018	0BCA	Probe trigger interrupted	1. While waiting for a probe trigger, the process was interrupted by a new MC_TouchProbe instruction.	1. Check if a new MC_TouchProbe instruction is triggered while waiting for a probe trigger.
3019	0BCB	Waiting timeout	1. The running time for the MC_InPosition instruction exceeded the set value of the input parameter "TimeOutValue" on the instruction side. 2. After the MC_TorqueControl instruction ran for over 5 seconds, the control mode of the current axis still has not been switched to MC_CST.	1. Modify the set value of the input parameter "TimeOutValue" on the instruction side. 2. Check if any error occurred on the servo side.
3020	0BCC	Virtual axis mode not supported	1. This instruction did not support triggering in virtual axis mode.	1. Modify the axis type in "Axis - Axis basic settings - Axis type" on the FA side. 2. Modify the user program.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3021	0BCD	Position type parameter error (planning or feedback)	1. The value of the input parameter "ReferenceType" on the instruction side was neither 0 (Value calculated in the previous task period) nor 1 (Value obtained in the same task period).	1. Modify the set value of the input parameter "ReferenceType" on the instruction side.
3022	0BCE	Interrupting feed motion completed (absolute/ relative)	1. When the input parameter "ErrorDetect" of the MC_MoveFeed instruction was set to TRUE, the set signal source was not triggered upon completion of the absolute/relative interrupting feed motion.	1. Check if the corresponding signal source is triggered normally. 2. Modify the value of the input parameter "ErrorDetect" to FALSE. Do not check if the signal source is triggered during the instruction execution.
3023	0BCF	Duplicate setting of probe trigger function	1. The probe channel enabled by the instruction was occupied.	1. Do not enable the same probe channel from different instruction instances.
3024	0BD0	The axis is in the AXIS_STOPPING status.	1. The instruction was initiated while the axis was in the AXIS_STOPPING status.	1. Do not trigger the instruction when the axis is in the AXIS_STOPPING status.
3025	0BD1	Rotary axis type not supported	1. The instruction did not support triggering in rotary axis mode.	1. Change the motion mode to "Linear mode" in "Axis - General settings - Basic settings - Software limit" on the FA side. 2. Modify the user program.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3026	0BD2	When executing the same function block of the instruction, the function block is re-triggered after changing the buffer mode to a mode other than mcAborting.	1. During the instruction execution, the buffer mode was changed to a mode other than mcAborting, and then the same function block was re-triggered.	1. Do not re-trigger the same function block after changing the buffer mode to a mode other than mcAborting during the instruction execution.
3028	0BD4	Axis under planning	1. When triggering the instruction, the axis was in motion.	1. Do not trigger the instruction when the axis is in motion.
3029	0BD5	Limit triggered while the planning speed direction matches the limit trigger direction.	1. During the instruction execution, the current instruction position exceeded the value of the positive or negative software limits, and the speed direction was consistent with the limit trigger direction. 2. During the instruction execution, the positive or negative hardware limit switches were triggered, and the speed direction was consistent with the limit trigger direction. 3. The motion instruction drove the axis into the limit.	1. Modify the set value of "Positive limit" or "Negative limit" in "Software Limit" on the FA side. 2. Change the speed direction and re-trigger the instruction.
3031	0BD7	Invalid input PN parameter	1. The set value of the input parameter "ParameterNumber" on the instruction side was incorrect.	1. Modify the set value of the input parameter "ParameterNumber" on the instruction side.
3032	0BD8	Invalid input value	1. "Value" corresponding to the set value of the input parameter "ParameterNumber" on the instruction side was not within a valid range.	1. Modify "Value" associated with the set value of the input parameter "ParameterNumber" on the instruction side.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3033	0BD9	Invalid input PDO parameter	1. The set value of the input parameter "ParameterNumber" on the instruction side was incorrect.	1. Modify the set value of the input parameter "ParameterNumber" on the instruction side.
3034	0BDA	Buffer overflow	1. The file write buffer for the MC_AxisDiagnosticLog instruction has exceeded its limit.	1. Change the logging mode. 2. Rename the file and re-trigger the instruction.
3035	0BDB	Failed to open file	1. The file cannot be opened by the MC_AxisDiagnosticLog or MC_WriteCAM instruction.	1. Check if the file path is correct. 2. Check if the file is already in use.
3036	0BDC	The value of "ParameterNumber" cannot be modified while the axis parameters are being read.	1. The set value of the input parameter "ParameterNumber" on the instruction side was modified by the instruction while Enable was active.	1. The set value of the input parameter "ParameterNumber" cannot be modified while Enable was active. To modify the value of "ParameterNumber," re-trigger the instruction after making the change.
3037	0BDD	Log mode parameter error	1. The set value of the input parameter "Mode" on the instruction side was neither 0 (log_continuous: continuous logging to the file) nor 1 (log_at_close: continuous logging to the buffer (10kbyte)).	1. Modify the set value of the input parameter "Mode" on the instruction side.
3038	0BDE	Reverse motion disallowed: zero displacement with non-zero velocity and acceleration	1. The InverseFlag in the function block was set false to disallow the reverse motion. The given speed and acceleration with the instruction displacement at zero would cause reverse motion.	1. Set the InverseFlag to TRUE to allow reverse motion based on actual requirements. 2. Adjust the target position to achieve a non-zero instruction displacement. This displacement must be greater than the stopping distance calculated from the current speed and acceleration.
3039	0BDF	Following error reset in progress	1. When the current instruction was executing, another instance of the same instruction has been triggered.	1. When the instruction is still running, do not trigger another instance of the same instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3040	0BE0	Servo error cannot be cleared	1. The number of cycles executed for the instruction has exceeded the maximum waiting period for clearing servo errors.	1. If the critical error that the instruction cannot clear has occurred in the servo, see the servo manual.
3041	0BE1	MC_ResetFollowingError already active	1. The MC_ResetFollowingError instruction was re-triggered while the instruction was active.	1. Modify the user program. Do not re-trigger the MC_ResetFollowingError instruction while the instruction is active.
3042	0BE2	Current axis status not in POWER_OFF status	1. The axis status for the MC_ChangeGeaingRatio instruction was not in the POWER_OFF status.	1. Disable the axis to be operated before triggering this instruction.
3043	0BE3	Current axis status not in AXIS_STANDSTILL	1. The axis status was not AXIS_STANDSTILL when triggering the instruction.	1. Do not trigger the instruction when the axis status is not AXIS_STANDSTILL.
3044	0BE4	Feedback control mode not switched to the set mode during switching	1. The current MC_SetControllerMode instruction was re-triggered, when the instruction was running and switching modes. 2. The current MC_SetControllerMode instruction was triggered again, when another MC_SetControllerMode instruction was running and switching modes.	1. Do not re-trigger the current instruction, when the instruction is running and switching modes. 2. Do not trigger a new MC_SetControllerMode instruction, when another MC_SetControllerMode instruction is running and switching modes.
3045	0BE5	Do not re-trigger the function block when it is executing.	1. The current MC_TouchProbe instruction was re-triggered when the instruction was running.	1. Do not re-trigger the current instruction MC_TouchProbe when the instruction is running.
3046	0BE6	Do not re-trigger the function block when it is executing.	1. The current MC_MoveFeed instruction was re-triggered when the instruction was running.	1. Do not re-trigger the current instruction MC_MoveFeed when the instruction is running.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3047	0BE7	Unconfigured PDO object 607A for target position	1. When the control mode of the axis operated by this instruction was MC_CSP, "Target position" was not configured in "Process data (PDO configuration)" on the FA side.	1. Configure "Target position" in "Process data (PDO configuration)" on the FA side.
3048	0BE8	Unconfigured PDO object 60FF for target velocity	1. When the control mode of the axis operated by this instruction was MC_CSV, "Target velocity" was not configured in "Process data (PDO configuration)" on the FA side.	1. Configure "Target velocity" in "Process data (PDO configuration)" on the FA side.
3049	0BE9	Unconfigured PDO object 6071 for target torque	1. When the control mode of the axis operated by this instruction was MC_CST, "Target torque" was not configured in "Process data (PDO configuration)" on the FA side.	1. Configure "Target torque" in "Process data (PDO configuration)" on the FA side.
3050	0BEA	Unconfigured PDO object 6060 for modes of operation	1. "Modes of operation" was not configured in "Process data (PDO configuration)" on the FA side.	1. Configure "Modes of operation" in "Process data (PDO configuration)" on the FA side.
3051	0BEB	Unconfigured PDO object 6061 for modes of operation display	1. "Modes of operation display" was not configured in "Process data (PDO configuration)" on the FA side.	1. Configure "Modes of operation display" in "Process data (PDO configuration)" on the FA side.
3052	0BEC	Unconfigured PDO object 60B8 for touch probe function	1. "Touch probe function" was not configured in "Process data (PDO configuration)" on the FA side.	1. Configure "Touch probe function" in "Process data (PDO configuration)" on the FA side.
3053	0BED	Unconfigured PDO object 60B9 for touch probe status	1. "Touch probe status" was not configured in "Process data (PDO configuration)" on the FA side.	1. Configure "Touch probe status" in "Process data (PDO configuration)" on the FA side.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3054	0BEE	Unconfigured PDO object 60BA for touch probe pos1 pos value	1. "Touch probe pos1 pos value" was not configured in "Process data (PDO configuration)" on the FA side.	1. Configure "Touch probe pos1 pos value" in "Process data (PDO configuration)" on the FA side.
3055	0BEF	Unconfigured PDO object 60BB for touch probe pos1 neg value	1. "Touch probe pos1 neg value" was not configured in "Process data (PDO configuration)" on the FA side.	1. Configure "Touch probe pos1 neg value" in "Process data (PDO configuration)" on the FA side.
3056	0BF0	Unconfigured PDO object 60BC for touch probe pos2 pos value	1. "Touch probe pos2 pos value" was not configured in "Process data (PDO configuration)" on the FA side.	1. Configure "Touch probe pos2 pos value" in "Process data (PDO configuration)" on the FA side.
3057	0BF1	Unconfigured PDO object 60BD for touch probe pos2 neg value	1. "Touch probe pos2 neg value" was not configured in "Process data (PDO configuration)" on the FA side.	1. Configure "Touch probe pos2 neg value" in "Process data (PDO configuration)" on the FA side.
3058	0BF2	Unconfigured PDO object 6077 for torque actual value	1. "Torque actual value" was not configured in "Process data (PDO configuration)" on the FA side.	1. Configure "Torque actual value" in "Process data (PDO configuration)" on the FA side.
3059	0BF3	Unconfigured PDO object 60FD for digital inputs	1. "Digital inputs" was not configured in "Process data (PDO configuration)" on the FA side.	1. Configure "Digital inputs" in "Process data (PDO configuration)" on the FA side.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3060	0BF4	Unconfigured PDO object 60E0 for positive torque limit value	1. "Positive torque limit value" was not configured in "Process data (PDO configuration)" on the FA side.	1. Configure "Positive torque limit value" in "Process data (PDO configuration)" on the FA side.
3061	0BF5	Unconfigured PDO object 60E1 for negative torque limit value	1. "Negative torque limit value" was not configured in "Process data (PDO configuration)" on the FA side.	1. Configure "Negative torque limit value" in "Process data (PDO configuration)" on the FA side.
3062	0BF6	SDO operation failed	1. The communication was abnormal.	1. Check if the communication status of the slave is normal.
3063	0BF7	The MC_MoveSuperImposed instruction cannot be called before the main motion instruction.	1. Before triggering the main motion instruction, the MC_MoveSuperImposed instruction was located above the motion instruction in the program logic and was already triggered.	1. Place and trigger the MC_MoveSuperImposed instruction only after the main motion instruction in the program logic. The MC_MoveSuperImposed instruction must be located below the motion instruction.
3064	0BF8	Multiple instances of the instruction are not allowed to run simultaneously while the current instruction is executing.	1. When an instance of the instruction function block was already running, another instance of the same instruction was triggered again.	1. Do not trigger additional instances of the same instruction while an instance of the instruction function block is running.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3065	0BF9	Homing mode re-trigger error	1. The instruction was re-triggered during its execution.	1. During the instruction execution, do not re-trigger the same instruction.
3067	0BFB	The action upon contacting the positive limit switch during homing is set to immediate fault.	1. When "Positive limit mode" in the "Homing parameter settings" was set to "No reverse/Axis fault stop" on the FA side, the axis contacted the positive limit switch during homing.	1. Set the homing motion parameters correctly. 2. Set the limit switch positions correctly.
3068	0BFC	The action upon contacting the negative limit switch during homing is set to immediate fault.	1. When "Negative limit mode" in the "Homing parameter settings" was set to "No reverse/Axis fault stop" on the FA side, the axis contacted the negative limit switch during homing.	1. Set the homing motion parameters correctly. 2. Set the limit switch positions correctly.
3069	0BFD	Failed to find origin after triggering the positive limit switch twice during homing	1. The positive limit switch was not installed or was installed in the incorrect position.	1. Check the status of the positive and negative limit switches.
3070	0BFE	Failed to find origin after triggering the negative limit switch twice during homing	1. The negative limit switch was not installed or was installed in the incorrect position.	1. Check the status of the positive and negative limit switches.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3076	0C04	During initial check in "Limit Switch Only" homing mode, both positive and negative limit switches are active simultaneously.	1. Both positive and negative limits were activated simultaneously.	1. Check the status of the positive and negative limit switches.
3077	0C05	Host controller homing timeout	1. The actual homing time from the host controller exceeded the set value of "HomeTimeOut" in the structured user input parameter "HomingParameter" on the instruction side.	1. Set the value of "HomeTimeOut" in the structured user input parameter "HomingParameter" on the instruction side to 0 (Ignore the time limit at this time). 2. Increase the set value of "HomeTimeOut" in the structured user input parameter "HomingParameter" on the instruction side.
3080	0C08	Triggering the zero point switch during deceleration within the home switch masking distance	1. When the host controller executed the homing instruction, the zero point switch was triggered during the deceleration phase within the home switch masking distance.	1. Check the status of the zero point switch.
3081	0C09	Position cannot be set during superimposed motion.	1. During the execution of the MC_MoveSuperImposed and MC_HaltSuperImposed instructions, the MC_SetPosition instruction was triggered.	1. Do not trigger the MC_SetPosition instruction during the execution of the MC_MoveSuperImposed and MC_HaltSuperImposed instructions.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3082	0C0A	Axis state condition not met during the host controller homing process	1. The instruction cannot be triggered because the current axis state is not AXIS_STANDSTILL.	1. Before triggering this instruction, ensure the axis state is AXIS_STANDSTILL.
3083	0C0B	Control mode not met during the host controller homing process	1. The current axis control mode was not MC_CSP. This instruction can only be triggered in the above axis control mode.	1. Modify the current axis control mode.
3084	0C0C	Home signal not found	1. In homing modes HOMING_METHOD_PASSHOMESWHOMESWTURN or HOME_METHOD_INHOMESWHOMESWTURN, if the start direction does not match the end direction, and both the positive and negative limit switches have been triggered once, the system concludes that no valid home signal was detected.	1. Set the zero point signal, positive and negative limit switches, and home signal correctly.
3085	0C0D	Positive limit triggered during low-speed creeping or compensation motion	1. The positive limit was triggered during low-speed creeping or compensation motion.	1. Modify the set value of "Positive limit" in "Software limit" on the FA side. 2. Modify the set value of "Compensation" in the structured user input parameter "HomingParameter" on the instruction side.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3086	0C0E	Negative limit triggered during low-speed creeping or compensation motion	1. The negative limit was triggered during low-speed creeping or compensation motion.	1. Modify the set value of "Negative limit" in "Software limit" on the FA side. 2. Modify the set value of "Compensation" in the structured user input parameter "HomingParameter" on the instruction side.
3087	0C0F	The instruction was re-triggered during execution.	1. The current instruction was re-triggered while it is running. 2. Another instance of the current instruction function block was triggered while the instruction was running.	1. Do not re-trigger the instruction during execution. 2. Do not re-trigger another instance of the instruction function block during execution.
3088	0C10	Input PDO parameters not configured	1. The PDO corresponding to the set value of the input parameter "ParameterNumber" on the instruction side was not configured in "EtherCAT I/O mapping" on the FA side.	1. In "EtherCAT I/O mapping" on the FA side, configure the PDO parameters corresponding to the set value of the input parameter "ParameterNumber" on the instruction side.
3089	0C11	The instruction does not support superimposed motion.	1. The MC_MoveSuperImposed instruction was triggered while the main instruction is executing.	1. Modify the user program to avoid triggering the MC_MoveSuperImposed instruction while the main instruction is executing.
3091	0C13	An axis already assigned to a group. Operation not permitted.	1. The axis variable operated by the instruction was already assigned to an axis group. 2. Using the MC_ChangeGearingRatio instruction, the axis in the group was switched to rotation mode.	1. Modify the user program. 2. Modify the axis group configuration on the FA side to remove the axis variable operated by the instruction from the axis group. 3. Do not use the MC_ChangeGearingRatio instruction to switch the axis in the axis group to rotation mode.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3092	0C14	Cannot set position of the master axis during synchronized motion	1. The axis targeted for position preset was the master axis during synchronized motion.	1. Do not set the master axis to a position during synchronized motion. Re-trigger the instruction only after the axis completed the synchronized motion.
3093	0C15	Home switch dwell time too short to reach creeping speed	1. After the home switch signal was triggered, the actual homing time exceeded the set value of "PushTime" in the structured user input parameter "HomingParameter" on the instruction side, while the actual speed has not yet decelerated to the value set for "ApproachVel" in "HomingParameter".	1. Modify the set values of "Vel", "ApproachVel", "Acc", "Dec", "Jerk", and "PushTime" in the structured user input parameter "HomingParameter" on the instruction side.
3094	0C16	The instruction does not support superimposed motion during execution.	1. The MC_MoveSuperImposed instruction was triggered when the MC_Halt, MC_GearOut, or MC_CamOut instruction was running.	1. Modify the user program to ensure that the MC_MoveSuperImposed instruction is not triggered when the MC_Halt, MC_GearOut, or MC_CamOut instruction is running.
3095	0C17	The MC_Inch /MC_Jog instruction cannot be called when the axis is in the STOP state.	1. When the current axis status was AXIS_STOPPING, the instruction was triggered.	1. Do not trigger the instruction when the axis status is AXIS_STOPPING.
3096	0C18	Pulse axes are not supported.	1. This instruction did not support pulse axes.	1. Select the appropriate axis to execute the instruction based on requirements.
3097	0C19	Only servo axes are supported.	1. The instruction only supported servo axes.	1. Use a servo axis to execute the instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3098	0C1A	The axis is in a faulty state when homing is triggered.	1. When the MC_Home instruction is initiated, the axis is in a faulty state.	1. Check if the axis type is a module axis. If so, verify whether its limit switch signals are active-low. If they are, adjust the trigger level of the limit switch signals as required.
3099	0C1B	Incorrect backlash compensation mode	1. The value of the input parameter "Mode" in the MC_BacklashCompensate instruction was out of the valid range.	1. The value of the input parameter "Mode" in the MC_BacklashCompensate instruction must be 0.
3100	0C1C	Incorrect backlash compensation velocity parameter	1. The value of the input parameter "BacklashVelocity" in the MC_BacklashCompensate instruction was out of the valid range.	1. The value of the input parameter "BacklashVelocity" in the MC_BacklashCompensate instruction must be greater than or equal to 0 and less than or equal to the maximum velocity specified by the software.
3101	0C1D	Incorrect parameter for lead screw pitch compensation mode	1. The "Mode" value of the structured input parameter "ScrewPara" in the MC_LeadScrewCompensate instruction was out of the valid range.	1. The "Mode" value of the structured input parameter "ScrewPara" in the MC_LeadScrewCompensate instruction must be 0 or 1. (Currently it only supports 0, linear compensation)
3102	0C1E	The first compensation value in the negative lead screw compensation table must be 0.	1. For the MC_LeadScrewCompensate instruction, the first compensation value in the input "crewCompNegTable" was not set to 0.	1. For the MC_LeadScrewCompensate instruction, the first compensation value in the input parameter "crewCompNegTable" must be set to 0.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3103	0C1F	The first compensation value in the positive lead screw pitch compensation table must be 0.	1. For the MC_LeadScrewCompensate instruction, the first compensation value in the input "crewCompPosTable" was not set to 0.	1. For the MC_LeadScrewCompensate instruction, the first compensation value in the input parameter "crewCompPosTable" must be set to 0.
3104	0C20	Start and end positions within the screw pitch compensation parameter structure cannot be identical.	1. "StartPos" and "EndPos" in the structured input parameter "ScrewPara" of the MC_LeadScrewCompensate instruction must not be the same.	1. Modify "StartPos" and "EndPos" in the structured input parameter "ScrewPara" of the MC_LeadScrewCompensate instruction.
3105	0C21	The backlash compensation value is less than 0.	1. The value of the input parameter "Backlash" in the MC_BacklashCompensate instruction was not within the valid range.	1. The value of the input parameter "Backlash" in the MC_BacklashCompensate instruction must be greater than 0.
3106	0C22	Start position for pitch compensation on rotary axis exceeds limit.	1. The value "StartPos" in the structured input parameter "ScrewPara" of the MC_LeadScrewCompensate instruction was less than 0.	1. The value "StartPos" in the structured input parameter "ScrewPara" of the MC_LeadScrewCompensate instruction must be greater than 0.
3107	0C23	End position for pitch compensation on rotary axis exceeds limit.	1. The value "EndPos" in the structured input parameter "ScrewPara" of the MC_LeadScrewCompensate instruction was less than 0.	1. The value "EndPos" in the structured input parameter "ScrewPara" of the MC_LeadScrewCompensate instruction must be greater than 0.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3108	0C24	The MC_SetPosition instruction is not allowed while the axis is in lead screw pitch compensation.	1. The MC_SetPosition instruction is not allowed while the axis is in lead screw pitch compensation.	1. The MC_SetPosition instruction is not allowed while the axis is in lead screw pitch compensation.
3109	0C25	Backlash compensation reset not complete	1. The MC_BacklashCompensate instruction was re-triggered while the compensation values were being cleared after an error reset.	1. Do not re-trigger the MC_BacklashCompensate instruction during the compensation clearance process that follows an error reset. The instruction can only be triggered again after all the compensation values have been fully cleared.
3110	0C26	Lead screw pitch compensation not complete	1. The MC_LeadScrewCompensate instruction was re-triggered while the compensation values were being cleared after an error reset.	1. Do not re-trigger the MC_LeadScrewCompensate instruction during the compensation clearance process that follows an error reset. The instruction can only be triggered again after all the compensation values have been fully cleared.
3111	0C27	Lead screw pitch compensation is in progress.	1. Another instance of the MC_LeadScrewCompensate instruction was already running when the current one was triggered.	1. Do not trigger another MC_LeadScrewCompensate instruction when an MC_LeadScrewCompensate instruction is already executing.
3112	0C28	Backlash compensation is in progress.	1. Another instance of the MC_BacklashCompensate instruction was already running when the current one was triggered.	1. Do not trigger another MC_BacklashCompensate instruction when an MC_BacklashCompensate instruction is already executing.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3113	0C29	Homing position out of range	1. The pulse value corresponding to the input parameter "Position" of the MC_Home instruction has exceeded the value range of PDO object 607C [-2147483648~2147483647].	1. Set an appropriate value for the input parameter "Position" in MC_Home so that its pulse value is within the value range of PDO object 607C [-2147483648~2147483647].
3114	0C2A	Vibration shaping mode out of range	1. The value of the input parameter "Mode" in the MC_VibrationShapping instruction must be set to either 0 (ZV) or 1 (ZVD).	1. Select an appropriate vibration shaping mode.
3115	0C2B	Vibration shaping frequency parameter error	1. The set value of the input parameter "Frequence" in the MC_VibrationShapping instruction was less than or equal to 0.	1. The set value of the input parameter "Frequence" in the MC_VibrationShapping instruction must be greater than 0.
3116	0C2C	Vibration shaping damping ratio parameter error	1. The set value of the input parameter "DampingRatio" in the MC_VibrationShapping instruction was less than or equal to 0, or greater than or equal to 1.	1. The set value of the input parameter "DampingRatio" in the MC_VibrationShapping instruction must be greater than 0 and less than 1.
3117	0C2D	Insufficient memory for vibration shaping	1. There is insufficient memory in the PLC to support the execution of the MC_VibrationShapping instruction.	1. Release the memory in the PLC to support the execution of the MC_VibrationShapping instruction.
3118	0C2E	Vibration shaping is not allowed during homing or while the axis is stopping.	1. The MC_VibrationShapping instruction was triggered when the axis was in the AXIS_HOMING or AXIS_STOPPING state.	1. Trigger the MC_VibrationShapping instruction when the axis is already in the AXIS_STANDSTILL state.
3119	0C2F	Position cannot be set during vibration shaping.	1. The MC_SetPosition instruction was triggered while MC_VibrationShapping was running.	1. Do not trigger the MC_SetPosition instruction while MC_VibrationShapping is running.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3120	0C30	Internal error due to too low vibration shaping frequency parameter	1. The input parameter "Frequency" of the MC_VibrationShapping instruction was set so low that the length of the buffer data was out of range.	1. Set an appropriate value for the input parameter "Frequency" of the MC_VibrationShapping instruction as required.
3121	0C31	Vibration shaping is in progress.	1. Another instance of the MC_VibrationShapping instruction was already running, when the current one was triggered.	1. Do not trigger another MC_VibrationShapping instruction when an MC_VibrationShapping instruction is already running.
3122	0C32	The instruction is not allowed for the axis type and encoder configuration.	1. An MC_SetPosition, MC_Homing, or MC_HomingWithParameter instruction was used on a rotary axis whose absolute encoder was configured for position restoration on the PLC side.	1. Do not use the MC_SetPosition, MC_Homing, or MC_HomingWithParameter instruction on a rotary axis whose absolute encoder is configured for position restoration on the PLC side.
3123	0C33	The current control mode does not match the executed instruction.	1. The executed instruction did not match the current control mode.	1. When the current control mode does not match the executed instruction, use MC_SetControllerMode to switch the axis to the appropriate mode.
3124	0C34	Re-triggering is not allowed.	1. Another instance of the instruction was already executing when an instance of the same instruction was called again.	1. Do not call the instance of the same instruction again when another instance of the instruction was already executing.
3125	0C35	The homing instructions for host controller cannot be used with absolute encoders in servo-side retention mode.	The MC_Homing or MC_HomingWithParameter instruction was issued to an axis whose absolute encoder was configured for position retention on the servo side.	Do not use the MC_Homing or MC_HomingWithParameter instruction to an axis whose absolute encoder was configured for position retention on the servo side.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
3126	0C36	Unsupported instruction	The current PLC device does not support this instruction.	Modify the user program to remove this instruction.
3127	0C37	Axis type error	MC_MoveModulo only supports local pulse axes and bus servo axes, and the axes must be in rotary mode.	Change the motion type of the control axis to rotary mode.
3128	0C38	ModuloWindow parameter out of range	The ModuloWindow input for the MC_MoveModulo instruction is outside the allowed range.	Set the ModuloWindow input to a value greater than 0 and less than or equal to half the rotation period of the input axis.
3129	0C39	Exceeded in-position check time	Within the in-position check time, the axis tracking error exceeds the in-position width.	1. Increase the in-position width or in-position check time. 2. Adjust the drive's three-loop gain.
4000	0FA0	The slave axis position cannot be modified during electronic gear engagement.	1. The instruction was re-triggered during the execution of the synchronization instruction.	1. Modify the user program to avoid re-triggering the instruction during the execution of the synchronization instruction.
4001	0FA1	The instruction cannot be executed while the master axis is in homing mode.	1. The master axis was executing a homing instruction when the instruction was triggered.	1. Do not trigger the homing instruction when the master axis is executing.
4002	0FA2	Incorrect axis planning configuration	1. When the MC_CamOut instruction was triggered, the slave axis controlled by the instruction was not in cam motion. 2. When the MC_GearOut instruction was triggered, the slave axis controlled by the instruction was not in gear motion.	1. When the MC_CamOut instruction is triggered, the slave axis controlled by the instruction must be in cam motion. 2. When the MC_GearOut instruction is triggered, the slave axis controlled by the instruction must be in gear motion.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4003	0FA3	The cam table node pointer is null.	1. The input/output parameter CamNote of the instruction referenced a manually created cam table whose node pointer was null.	1. Before using a manually created cam table, a value must be assigned to the cam table node pointer.
4004	0FA4	OUTMODE cannot be switched during the instruction execution.	1. The MC_CamOut and MC_GearOut instructions were re-triggered after the modification of the input parameter "OutMode" while the instructions were executing.	1. Do not re-trigger the instruction after modifying the input parameter "OutMode", while the instruction is executing.
4005	0FA5	FileName file name error	1. The file name of the cam table contained an absolute path.	1. Check if the file name of the cam table contains an absolute path; if so, rename the cam table file.
4007	0FA7	MC_GearInPos cannot be re-triggered	1. The MC_GearInPos instruction was re-triggered while it was executing.	1. Do not re-trigger the MC_GearInPos instruction while it is executing.
4009	0FA9	The phase or displacement of the first point is not 0.	1. The phase or displacement of the first point in the input/output parameter "CamTable" of the MC_GenerateCamTable instruction was not 0.	1. Modify the value of the first point in the input/output parameter "CamTable" of the MC_GenerateCamTable instruction.
4010	0FAA	The number of dense nodes is less than the minimum 2.	1. When the cam table was configured to use dense nodes, the number of dense nodes was less than 2.	1. When the cam table is configured to use dense nodes, the minimum number of dense nodes must be 2.
4011	0FAB	The number of dense nodes exceeds the maximum 65535.	1. When the cam table was configured to use dense nodes, the number of dense nodes was greater than 65535.	1. When the cam table is configured to use dense nodes, the maximum number of dense nodes must be 65535.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4012	0FAC	Phases of dense nodes are not in ascending order.	1. The phase points in dense node type in the cam table were not in ascending order.	1. The phases of dense nodes in the cam table must be in ascending order.
4013	0FAD	Phase overlap of dense nodes in the cam table, threshold 0.0001	1. The interval between adjacent phases of dense nodes in the cam table was less than 0.001.	1. The interval between adjacent phases of dense nodes in the cam table must be greater than or equal to 0.001.
4014	0FAE	The phase or displacement of the first point is not 0.	1. The phase or displacement of the first point in the cam table was not 0.	1. The phase and displacement of the first point in the cam table must be 0.
4015	0FAF	The number of key nodes is less than the minimum 2	1. When the cam table was configured to use key nodes, the number of key nodes was less than 2.	1. When the cam table is configured to use key nodes, the minimum number of key nodes must be 2.
4016	0FB0	The number of key nodes exceeds the maximum 20000.	1. When the cam table was configured to use key nodes, the number of key nodes was greater than 20000.	1. When the cam table is configured to use key nodes, the maximum number of key nodes must be 20000.
4017	0FB1	Phases of key nodes are not in ascending order.	1. In the MC_GetCamTableDistance or MC_GetCamTablePhase instruction, the phase of the input variable "StartPoint" was greater than that of the input variable "EndPoint". 2. In the input parameter CamNodes of the MC_GenerateCamTable instruction, the phases of key nodes are not in ascending order.	1. In the MC_GetCamTableDistance or MC_GetCamTablePhase instruction, the phase of the input variable "StartPoint" must be less than that of the input variable "EndPoint". 2. In the input variable CamNodes of the MC_GenerateCamTable instruction, the phases of key nodes must be in ascending order.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4018	0FB2	Phase overlap of key nodes in the cam table, threshold 0.0001	1. In the MC_GetCamTableDistance or MC_GetCamTablePhase instruction, the phase difference of the input variables "StartPoint" and "EndPoint" was less than 0.0001. 2. The cam table checked by the MC_GenerateCamTable instruction was invalid, and the phase difference between two points in the cam table was less than 0.0001.	1. In the MC_GetCamTableDistance or MC_GetCamTablePhase instruction, the phase of the input variable "StartPoint" cannot coincide with that of the input variable "EndPoint". 2. Check if the phase in the cam is valid and adjust the phase difference in the cam table.
4019	0FB3	The phase, displacement, speed ratio, acceleration, and jerk exceed the maximum limit (9,999,999).	1. One or more parameters (including phase, displacement, speed ratio, acceleration, and jerk) exceeded the maximum limit (9,999,999).	1. Adjust the cam table data as required.
4020	0FB4	The cam table is in read-write or update status.	1. When the instruction was started, the cam table was in the process of being read or updated.	1. Wait until the read-write or update instruction has been completed for the current cam table. Then, execute the instruction.
4021	0FB5	The number of nodes configured in the system is less than the input variable "NodeNum" of the instruction.	1. The number of the cam table nodes configured in the system was less than the value of the input variable "NodeNum" in the MC_GenerateCamTable instruction.	1. The number of the cam table nodes configured in the system must be greater than or equal to the value of the input variable "NodeNum" in the MC_GenerateCamTable instruction.
4022	0FB6	Updating dense node data is not supported.	1. When the cam table was configured to use dense nodes, the dense node data cannot be updated.	1. When the cam table was configured to use dense nodes, the dense node data cannot be updated.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4023	0FB7	Cam table data is not checked.	1. A user-defined cam table was imported without any check.	1. If a cam table is defined by the user, execute the MC_GenerateCamTable instruction again after using the MC_CheckCamTable instruction to check the validity of this cam table.
4024	0FB8	Failed to create the cam table file	1. The system failed to create the cam table file.	1. Check if there are any special characters in the input file name.
4027	0FBB	The file read is not a cam table file.	1. The file read by the MC_ReadCAM instruction is not a cam table file.	1. Check if the file type read by the MC_ReadCAM instruction is correct. If not, use the MC_ReadCAM instruction to read the correct cam table file as required.
4028	0FBC	The number of the cam table nodes on the FA side is less than that the number of nodes in the file.	1. The number of the cam table nodes on the FA side was less than that the number of nodes in the file.	1. The number of the cam table nodes on the FA side must be greater than or equal to the number of nodes in the file.
4029	0FBD	The slave axis speed exceeds the software limit speed.	1. The speed of the slave axis to execute the instruction was greater than the maximum axis speed specified by the software.	1. The speed of the slave axis to execute the instruction must be set according to the requirements and the maximum speed specified by the software.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4030	0FBE	Master axis data type error	1. The value set for the input variable "ReferenceTypeM1" or "ReferenceTypeM2" in the MC_CombineAxes instruction was invalid. 2. The value set for the input variable "ReferenceType" in the MC_AxesObserve instruction was invalid. 3. The value set for the input variable "MasterValueSource" was invalid.	1. The input variable "ReferenceTypeM1" or "ReferenceTypeM2" in the MC_CombineAxes instruction has the following value range: 0 (value calculated in the previous task period (fSavePosition)), 1 (value obtained in the same task period (fActPosition)), 2 (value calculated in the same task period (fSetPosition)). Select the appropriate position source type as required. 2. The input variable "ReferenceType" in the MC_AxesObserve instruction has the following value range: 0 (value calculated in the previous task period (fSavePosition)), 1 (value obtained in the same task period (fActPosition)), 2 (value calculated in the same task period (fSetPosition)). Select the appropriate position source type as required. 3. The input variable "MasterValueSource" has the following value range: 0 (value calculated in the previous task period (fSavePosition)), 1 (value obtained in the same task period (fActPosition)), 2 (value calculated in the same task period (fSetPosition)). Select the appropriate position source type as required.
4031	0FBF	Invalid parameter settings for master or slave axis	1. The input parameter InverseFlag in the MC_GearInPos instruction was set FALSE to disallow the reverse motion, but the master or slave axis parameters were set so that achieving the gear ratio at the specified synchronization position would require a reverse motion.	1. According to the requirements, adjust the input parameter InverseFlag of the MC_GearInPos instruction to allow reverse motion (TRUE), or modify the relevant parameters of the master/slave axis.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4032	0FC0	Slave axis reverse motion is disabled but is being forced to reverse by the master axis.	1. The input parameter InverseFlag in the MC_GearInPos instruction was set FALSE to disallow the reverse motion, but the slave axis was being forced to reverse by the master axis.	1. According to the requirements, adjust the input parameter InverseFlag of the MC_GearInPos instruction to allow reverse motion (TRUE), or modify the relevant parameters of the master/slave axis.
4033	0FC1	Error when opening cam table file	1. The cam table file to be opened did not exist.	1. Check if the file name "FileName" of the input variable in the MC_ReadCAM instruction matches that of the cam table to be read. If not, enter the correct "FileName".
4034	0FC2	The cam table node type on the FA side does not match the node type in the file.	1. The cam table node type on the FA side did not match the node type in the file.	1. Check if the cam table node type on the FA side matches the node type in the cam table file to be read. If not, correct the cam table node type on the FA side or the node type in the cam table file to be read.
4036	0FC4	Incorrect the cam table node type	1. The cam table node type corresponding to the MC_CAMBounds instruction was incorrect. 2. The cam table node type was out of range. Dense nodes or key nodes must be defined for the node type.	1. The node type in the cam table corresponding to the MC_CAMBounds instruction must be set to key nodes. 2. Check the cam table node type and select the appropriate node type as required.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4037	0FC5	OUTMODE mode out of range	1. The value of the input variable "OutMode" in the MC_GearOut instruction was out of range. 2. The value of the input variable "OutMode" in the MC_CamOut instruction was out of range.	1. The input variable "OutMode" in the MC_GearOut instruction has the following value range: 0 (decelerate to stop), 1 (maintain constant velocity before synchronization end). Set the appropriate synchronization end mode according to the requirements. 2. The input variable "OutMode" in the MC_CamOut instruction has the following value range: 0 (decelerate to stop), 1 (continue at the previous speed), 2 (Immediate stop (emergency stop) after performing the current cam table). Set the appropriate synchronization end mode as required.
4038	0FC6	The master and slave axes cannot be identical.	1. When the instruction was triggered, the master and slave axes are configured as the same axis.	1. Check if the master and slave axes in this instruction are configured as the same axis. If so, reconfigure the master and slave axes as required.
4039	0FC7	Error triggered by MC_DigitalCamSwitch due to ended cam cycle	1. When the input parameter "Reference Type" of the MC_DigitalCamSwitch instruction was set to mcMasterPhase (3, phase of the master axis when this axis is configured as a cam slave axis), the synchronous motion terminated during the execution of the instruction.	1. Check if the synchronous motion has been interrupted or if there are any error messages from the slave axis.
4041	0FC9	Periodic parameter input exceeds specified range.	1. The value set for the input variable "Periodic" in the MC_CamIn was invalid.	1. The value of the input variable "Periodic" in the MC_CamIn instruction must be greater than or equal to 0.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4042	0FCA	Slave axis displacement exceeds the maximum specification limit.	1. The value set for the input variable "SlaveDistance" for the MC_GetCamTablePhase instruction was invalid.	1. Set a valid value for the input variable "SlaveDistance" according to the requirements and specification limits.
4043	0FCB	The curve fitting type is out of range specified.	1. The fitting curve type of the input variable "StartPoint" or "EndPoint" in the MC_GetCamTableDistance instruction was outside the valid range. 2. The fitting curve type of the input variable "StartPoint" or "EndPoint" in the MC_GetCamTablePhase instruction was outside the valid range.	1. The fitting curve type of the input variables "StartPoint" and "EndPoint" in the MC_GetCamTableDistance instruction has the following value range. 1: Linear curve; 2: Parabolic curve; 3: Cubic curve; 4: Quintic curve; 5: Septic curve; 6: Cosine acceleration curve; 7: Sine acceleration curve; 8: Modified T-type acceleration curve. 2. The fitting curve type of the input variables "StartPoint" and "EndPoint" in the MC_GetCamTablePhase instruction has the following value range. 1: Linear curve; 2: Parabolic curve; 3: Cubic curve; 4: Quintic curve.
4044	0FCC	Invalid value for phase parameter	1. The value set for the input variable "Phase" for the MC_GetCamTableDistance instruction was invalid.	1. Check if the value of the input variable "Phase" is less than the phase value of the input variable "StartPoint" or greater than the phase value of the input variable "EndPoint". If so, set a valid phase value as required.
4046	0FCE	Multiple switches with the same position	1. Multiple switches were configured at the same position.	1. The switches with the identical position are not allowed in the input variable "Switches" of the MC_DigitalCamSwitch instruction.
4047	0FCF	Multiple switches with the same parameter	1. Multiple switches were configured with the same parameter.	1. The switches with the identical parameter are not allowed in the input variable "Switches" of the MC_DigitalCamSwitch instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4048	0FD0	The parameter "fParameter" is out of range when the tappet switch mode is set to 2.	1. When the switch mode "iMode" of the input variable "Switches" for the MC_DigitalCamSwitch instruction was set to 2, the value set for the parameter "fParameter" of the input variable "Switches" was invalid.	1. When the switch mode "iMode" of the input variable "Switches" for the MC_DigitalCamSwitch instruction was set to 2, the value of "fParameter" in "Switches" must be less than or equal to 10000 and greater than 0.
4049	0FD1	The number of master axis jump points exceeds the limit.	1. In a cam table with only two nodes, the cam table is executed within a single task cycle.	1. Increase the cam table phase length or decrease the master axis running velocity.
4050	0FD2	The specified parameter for the start position method is out of range.	1. The value set for the input variable "StartMode" in the MC_CamIn instruction was invalid.	1. The input variable "StartMode" in the MC_CamIn instruction has the following value range. 0: Absolute value; 1: Relative value; 2: Immediate start. Select the appropriate "StartMode" as required.
4051	0FD3	The tappet switch mode parameter is out of range.	1. The value set for the switch mode "iMode" in the input variable "Switches" of the MC_DigitalCamSwitch instruction was invalid.	1. The switch mode "iMode" in the input variable "Switches" of the MC_DigitalCamSwitch instruction has the following value range. 0: Disabled; 1: Position type; 2: Time type. Select the appropriate switch mode as required.
4052	0FD4	The master axis direction parameter is out of range.	1. The value for the master axis direction selection "fDirection" in the input variable "Switches" of the MC_DigitalCamSwitch instruction was invalid.	1. "fDirection" in the input variable "Switches" of the MC_DigitalCamSwitch instruction has the following value range: 0 (Positive); 1 (Negative); 2 (No direction). Select the appropriate master axis direction as required.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4054	0FD6	A file with the same name is being written.	1. When the current MC_WriteCAM instruction was started, the current cam table was already being written.	1. Wait until the ongoing write instruction has been completed for the current cam table. Then, execute the MC_WriteCAM instruction.
4055	0FD7	The MC_Phasing or MC_PhasingEX instruction are executed in single axis mode or during the execution of the MC_CombineAxes instruction.	1. The MC_Phasing or MC_PhasingEx instruction can only be started during synchronization instruction execution.	1. Start the MC_Phasing or MC_PhasingEx instruction after the appropriate synchronization control instruction as required.
4056	0FD8	Simultaneous execution of multiple instructions is not permitted during instruction planning.	1. Different instances of the current instruction function block were executed while the instruction was being executed.	1. Wait until the instruction has been completed. Then, execute the current MC_Phasing or MC_PhasingEx instruction again. 2. Stop the ongoing phase compensation using the MC_StopPhasing instruction. Then, execute the current MC_Phasing or MC_PhasingEx instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4057	0FD9	Invalid parameter settings for master axis position and motion direction	1. For a linear axis and StartMode set to 0 (Absolute value), the value of the master axis position was less than that of the cam table start position while the motion direction was set to forward, or the value of the master axis position was greater than that of the cam table start position while the motion direction was set to reverse. For a linear axis and StartMode set to 1 (Relative value), the value of the master axis position was less than 0 while the motion direction was set to forward, or the value of the master axis position was greater than 0 while the motion direction was set to reverse.	1. Set the valid input variables "MasterStartDistance" and "Direction" in the MC_CamIn instruction according to the requirements and the start position method.
4058	0FDA	The maximum input speed is less than or equal to 0	1. The value set for the input variable "MaxVel" in the MC_CAMBounds instruction was invalid.	1. Set a valid value for the input variable "MaxVel" in the MC_CAMBounds instruction as required.
4059	0FDB	The maximum input acceleration is less than or equal to 0	1. The value set for the input variable "MaxAccDec" in the MC_CAMBounds instruction was invalid.	1. Set a valid value for the input variable "MaxAccDec" in the MC_CAMBounds instruction as required.
4060	0FDC	The position type selection of the cam switch does match the associated axis.	1. When the input variable "ReferenceType" in the MC_DigitalCamSwitch instruction was set to MCAXISMASTERPHASE, the axis was not configured as a cam slave axis.	1. When the input variable "ReferenceType" in the MC_DigitalCamSwitch instruction is set to MCAXISMASTERPHASE, the axis must be set as a cam slave axis using the MC_CamIn instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4061	0FDD	FileName cannot contain Chinese characters.	1. The cam table file name contained Chinese characters.	1. Check if the file name of the cam table contains Chinese characters. If yes, modify the file name as required.
4062	0FDE	FileName is null.	1. The cam table file name was null.	1. The naming convention for the cam table file is 'FileName'. Name the cam table file according to this convention as required.
4063	0FDF	All cam cycles have been completed, but the engagement coupling process is not yet finished.	1. The values of the input variables "Velocity" and "Acceleration" for the MC_CamIn instruction were too low. 2. The values of the input variables "Velocity" and "Acceleration" for the MC_CamInV2 instruction were too low.	1. Set the valid values for the input variables "Velocity" and "Acceleration" in the MC_CamIn instruction as required. 2. Set the valid values for the input variables "Velocity" and "Acceleration" in the MC_CamInV2 instruction as required.
4064	0FE0	Different instances of the instruction function block were re-triggered during instruction execution.	1. Do not re-trigger the current MC_StopPhasing instruction when MC_StopPhasing is executing.	1. Wait until the MC_StopPhasing instruction have been completed. Then, execute the current MC_StopPhasing instruction.
4065	0FE1	The MC_CombineAxes instruction was re-triggered.	1. The MC_CombineAxes instruction was retriggered while it was executing.	1. Do not re-trigger the current MC_CombineAxes instruction while it is executing.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4066	0FE2	Switch number parameter out of range	1. The value set for the input variable "Number" of the MC_DigitalCamSwitch instruction was invalid.	1. Check if the value for the input variable "Number" of the MC_DigitalCamSwitch instruction is greater than 64 or less than or equal to 0. If yes, set the switch number properly as required.
4069	0FE5	The master axis is disabled during synchronization or engagement.	1. The master axis that has executed the synchronous motion instruction was disabled during the execution of the instruction.	1. Before other operations, the master axis that performs the cam action must be switched from the AXIS_POWEROFF state to the AXIS_STANDSTILL state using MC_Power.
4071	0FE7	Start position equals end position in the cam switch.	1. In the input variable "Switches" of the MC_DigitalCamSwitch instruction, the "fPosition" value was equal to the "fParameter" value.	1. In the input variable "Switches" of the MC_DigitalCamSwitch instruction, the "fPosition" value must not equal the "fParameter" value.
4073	0FE9	Invalid cam switch position parameters on a linear axis	1. When the axis to execute the MC_DigitalCamSwitch instruction was configured as a linear axis, the position parameter of the input variable "Switches" of MC_DigitalCamSwitch was set incorrectly.	1. Check if the axis type is configured correctly for the MC_DigitalCamSwitch instruction according to the requirements. If not, select an appropriate axis type under "PLC -> Motion control -> Axis -> Axis to execute MC_DigitalCamSwitch -> General setting -> Basic setting". 2. In the input variable "Switches" of the MC_DigitalCamSwitch instruction, the "fPosition" value must be less than the "fParameter" value, when the axis to execute the MC_DigitalCamSwitch instruction is configured as a linear axis.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4074	0FEA	Invalid cam switch position parameters on a rotary axis	1. When the axis to execute the MC_DigitalCamSwitch instruction was configured as a rotary axis, the position parameter of the input variable "Switches" of MC_DigitalCamSwitch was set incorrectly.	1. Check if the axis type is configured correctly for the MC_DigitalCamSwitch instruction according to the requirements. If not, select an appropriate axis type under "PLC -> Motion control -> Axis -> Axis to execute MC_DigitalCamSwitch -> General setting -> Basic setting". 2. In the input variable "Switches" of the MC_DigitalCamSwitch instruction, the "fPosition" value must be greater than 0, but less than or equal to the "fParameter" value, when the axis to execute the MC_DigitalCamSwitch instruction is configured as a rotary axis.
4076	0FEC	Permitted deviation value must be positive or 0.	1. The value set for the input variable "PermittedDeviation" of the MC_AxesObserve instruction was invalid.	1. The value set for the input variable "PermittedDeviation" of the MC_AxesObserve instruction must be greater than or equal to 0.
4077	0FED	The input parameter LinkMode of the MC_MoveLink instruction is out of range.	1. The input parameter LinkMode of the MC_MoveLink instruction was out of range.	1. The input parameter LinkMode of the MC_MoveLink instruction has the following range. 0: Immediate start; 1: Start when the master axis reaches the StartLinkPos position; 2: Active when the TriggerValue is detected to be TRUE.
4078	0FEE	The input parameter MasterDistance of the MC_MoveLink instruction is set to 0, but the SlaveDistance value is not 0.	1. The input parameter MasterDistance of the MC_MoveLink instruction was set to 0, but the SlaveDistance value was not 0.	1. Select the appropriate values for MasterDistance and SlaveDistance as required.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4079	0FEF	The input parameters of the MC_MoveLink instruction cause the subsequent running distance of the master axis to be less than 0.	1. The values of the input parameters MasterDistance, MasterDisInSlaveAccMotion, MasterDisInSlaveDecMotion of the MC_MoveLink instruction were less than 0.	1. Select the appropriate values for MasterDistance, MasterDisInSlaveAccMotion, and MasterDisInSlaveDecMotion as required.
4080	0FF0	The value set for the input parameter MasterDistance of the MC_MoveLink instruction is invalid.	1. The value set for the input parameter MasterDistance of the MC_MoveLink instruction was less than 0.	1. The value set for the input parameter MasterDistance of the MC_MoveLink instruction must be greater than or equal to 0.
4081	0FF1	The value set for the input parameter MasterDisInSlaveAccMotion of the MC_MoveLink instruction is less than 0.	1. The value set for the input parameter MasterDisInSlaveAccMotion of the MC_MoveLink instruction was less than 0.	1. The value set for the input parameter MasterDisInSlaveAccMotion of the MC_MoveLink instruction must be greater than or equal to 0.
4082	0FF2	The value set for the input parameter MasterDisInSlaveDecMotion of the MC_MoveLink instruction is less than 0.	1. The value set for the input parameter MasterDisInSlaveDecMotion of the MC_MoveLink instruction was less than 0.	1. The value set for the input parameter MasterDisInSlaveDecMotion of the MC_MoveLink instruction must be greater than or equal to 0.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4083	0FF3	The acceleration factor for the input parameter of the MC_PhasingEx instruction is less than 0 or greater than 1.	1. The acceleration factor set for the input parameter of the MC_PhasingEx instruction was less than 0 or greater than 1.	1. The acceleration factor set for the input parameter of the MC_PhasingEx instruction has the value range (0, 1).
4084	0FF4	The deceleration factor for the input parameter of the MC_PhasingEx instruction is less than 0 or greater than 1.	1. The deceleration factor set for the input parameter of the MC_PhasingEx instruction was less than 0 or greater than 1.	1. The deceleration factor set for the input parameter of the MC_PhasingEx instruction has the value range (0, 1).
4085	0FF5	The sum of the acceleration factor and deceleration factor for the input parameters in the MC_PhasingEx instruction is greater than 1.	1. The sum of the acceleration factor and deceleration factor for the input parameters in the MC_PhasingEx instruction was greater than 1.	1. The sum of the acceleration factor and deceleration factor for the input parameters in the MC_PhasingEx instruction has the value range (0, 1).

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4086	0FF6	Switching axis objects is not permitted during instruction execution.	1. The axis object was switched during the execution of the instruction.	1. Do not switch the axis object during the execution of the instruction.
4087	0FF7	Invalid cam switch position parameters on a cam slave axis	1. When the axis to execute the MC_DigitalCamSwitch instruction is configured as a cam slave axis, the position parameter set for the input variable "Switches" of the MC_DigitalCamSwitch instruction was invalid.	1. In the input variable "Switches" in the MC_DigitalCamSwitch instruction, the "fPosition" and "fParameter" values must be greater than 0, but less than or equal to the master axis phase of the cam, when the axis to execute the MC_DigitalCamSwitch instruction is configured as a cam slave axis.
4088	0FF8	The array size for the cam table nodes is less than the node number.	1. The allocated array size for the cam table nodes was less than the node number.	1. The allocated array size for the cam table nodes must be greater than or equal to the node number.
4089	0FF9	The value for the MasterDistance input parameter of the MC_PhasingEx instruction is invalid.	1. The value set for the MasterDistance input parameter of the MC_PhasingEx instruction was invalid.	1. The value set for the MasterDistance input parameter of the MC_PhasingEx instruction must be greater than 0.
4090	0FFA	The direction parameter input for the MC_PhasingEx instruction exceeds the range.	1. The direction parameter input for the MC_PhasingEx instruction was out of range.	1. The direction parameter input for the MC_PhasingEx instruction has the following value range. 1: DIR_POSITIVE: Valid for forward master motion. 2: DIR_NEGATIVE: Valid for reverse master motion.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4091	0FFB	The master axis has been replaced.	1. The master axis controlled by the instruction was replaced.	1. Check if multiple copies of the same instance for the instruction are running. If yes, assign a unique instance to each instruction.
4092	0FFC	The slave axis has been replaced.	1. The slave axis controlled by the instruction was replaced.	1. Check if multiple copies of the same instance for the instruction are running. If yes, assign a unique instance to each instruction.
4093	0FFD	MC_MoveLink cannot be re-triggered.	1. Do not re-trigger the current ongoing MC_MoveLink instruction.	1. Do not re-trigger the current ongoing MC_MoveLink instruction.
4094	0FFE	Master axis 1 has been replaced.	1. The master axis 1 controlled by the MC_CombineAxes instruction was replaced.	1. Check if multiple copies of the same instance for the MC_CombineAxes instruction is running. If yes, assign a corresponding instance to each MC_CombineAxes instruction.
4095	0FFF	Master axis 2 has been replaced.	1. The master axis 2 controlled by the MC_CombineAxes instruction was replaced.	1. Check if multiple copies of the same instance for the MC_CombineAxes instruction is running. If yes, assign a corresponding instance to each MC_CombineAxes instruction.
4096	1000	The master axis for the phase compensation instruction does not match the master axis when the slave axis is in synchronous motion.	1. The master axis for the phase compensation instruction did not match the master axis for the ongoing synchronous instruction.	1. Select the appropriate master axis for the MC_Phasing or MC_PhasingEx instruction based on the master and slave axes for the ongoing synchronous motion instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4097	1001	The displacement input for the MC_GetCamTablePhase instruction does not have any valid phase.	1. The displacement input for the MC_GetCamTablePhase instruction did not have any valid phase.	1. Modify the input displacement as required.
4098	1002	The node phase value is negative.	1. The node phase value for the MC_GetCamTableDistance instruction was negative.	1. The node phase value for the MC_GetCamTableDistance instruction must not be negative.
4099	1003	The cam table pointer is null.	1. The pointer of the cam table corresponding to the instruction was null.	1. Check if the pointer of the cam table corresponding to the instruction is null. If yes, select an appropriate cam table to execute the instruction as required.
4100	1004	The axis is in commissioning state.	1. The specified axis for the instruction was in commissioning state.	1. Exit the axis commissioning before executing the instruction.
4101	1005	Attempt to modify non-effective parameters upon re-trigger	1. When the MC_CamIn instruction was re-triggered, an attempt was made to modify parameters that will not be effective.	1. When the MC_CamIn instruction is re-triggered, only the parameters including Periodic, MasterScaling, SlaveScaling, Direction, and MasterValueSource can be modified.
4102	1006	Insufficient space to execute the instruction	1. There was insufficient space within the PLC to support the operation of the MC_CamIn or MC_VibrationShapping instruction.	1. Run the corresponding instruction(s) when there is sufficient space (greater than 5120KB) within the PLC.
4103	1007	CamNode pointer is null.	1. The pointer of the input and output parameter "CamNode" for the MC_GenerateCamTable instruction was null.	1. Check if the variable corresponding to the input and output parameter "CamNode" is null.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4104	1008	Switches pointer is null.	1. The pointer of the input parameter "Switches" for the MC_DigitalCamSwitch instruction was null.	1. Assign a valid value to the input parameter "Switches" for the MC_DigitalCamSwitch instruction.
4105	1009	The number of node data provided is less than the capacity of the cam table when the cam data was updated using MC GenerateCamTable.	1. When the cam data was updated using MC GenerateCamTable, the number of node data provided was less than the capacity of the cam table.	1. Set a correct node number.
4106	100A	The master axis synchronous position overlaps with the current master axis position.	1. The input parameter "MasterSyncPosition" of the MC_GearInPos instruction overlapped with the current master axis position.	1. The input parameter "MasterSyncPosition" of the MC_GearInPos instruction must not overlap with the current master axis position. Set the valid value for "MasterSyncPosition".
4107	100B	The slave axis synchronous position overlaps with the current slave axis position.	1. The input parameter "SlaveSyncPosition" of the MC_GearInPos instruction overlapped with the current slave axis position.	1. The input parameter "SlaveSyncPosition" of the MC_GearInPos instruction must not overlap with the current slave axis position. Set the valid value for "SlaveSyncPosition".
4108	100C	The master axis position of the first point in the cam table is less than 0.	1. The master axis position of the first point in the cam table must not be less than 0.	1. The master axis position of the first point in the cam table must be greater than or equal to 0.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
4109	100D	The NodeNum parameter exceeds the size of the CamNode array.	The array size of the cam nodes input for the MC_CamNodeBinding instruction was smaller than the input number of nodes to process.	1. Adjust NodeNum to a value less than the number of elements in the CamNode array. 2. Increase the size of the CamNode array so that the number of array elements is greater than or equal to the number of NodeNum elements input.
4110	100E	The cam node type does not match the data type of the cam node array.	The data type of the cam node array input in the MC_CamNodeBinding instruction did not match the specified cam node type.	1. Ensure NodeType and CamNode correspond correctly: When a key node cam is specified for NodeType, the data type of CamNode array must be set to MC_CAM_KEY_NODE. When a dense node cam is specified for NodeType, the data type of CamNode array must be set to MC_CAM_FITTING_NODE.
4111	100F	When the input parameter UpDateRightNow of the MC_CamIn or MC_CamInV2 instruction is set to FALSE, the number of cam table points exceeds the limit.	When the input parameter UpDateRightNow of the MC_CamIn or MC_CamInV2 instruction is set to FALSE, the number of cam table points exceeds the limit: The number of key nodes is greater than 4000, or the number of dense nodes is greater than 20000.	Adjust the number of points in the cam table according to the requirements.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
6000	1770	The axis is in error state.	1. The axis has entered an error state, but no specific fault code is available.	1. Check if the motion position has exceeded the software or hardware limits. 2. Check whether the enable signal was interrupted during execution. 3. Check if an emergency stop instruction was triggered. 4. Use the MC_Reset instruction to switch the axis state from AXIS_ERRORSTOP to AXIS_STANDSTILL before attempting any further operations.
6001	1771	The axis is in commissioning state.	1. The specified axis for the instruction was in commissioning state.	1. Exit the axis commissioning before executing the instruction.
6004	1774	The following error is too large.	1. The following error was greater than the value set for "Hysteresis limit" of "Position hysteresis management" on the FA side.	1. Disable the "Position hysteresis management" enable switch on the FA side. 2. Increase the set value of "Hysteresis limit". 3. If possible, increase the stiffness parameters of the servo drive.
6005	1775	ECAT communication error	1. The communication of the slave is abnormal.	1. Check if the physical network of the slave station is disconnected. 2. Check for external interference. 3. Check if there is a driver fault.
6006	1776	The axis cycle time is not correctly set.	1. The task cycle time was set to a value less than or equal to 0.	1. Check the task cycle parameter settings.
6007	1777	The unexpected emergency stop is triggered.	1. After the emergency stop instruction had been triggered, the motion instruction or synchronous motion instruction was also triggered.	1. After the emergency stop instruction has been triggered, the MC_Reset instruction must be first triggered. Then, trigger the motion instruction or synchronous motion instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
6008	1778	The planned speed exceeds the maximum speed set by the software.	1. When the local pulse axis executed the instruction, the value (speed x gear ratio denominator / gear ratio numerator) exceeded 200 kHz, causing an over-frequency.	1. Adjust the position parameters of the instruction or the gear ratio of the local pulse axis as required.
6009	1779	Axis driver alarm	1. An error occurred on the driver.	1. See the servo manual for troubleshooting. 2. If no fault code is displayed on the servo panel, check whether the network cable is intact and whether the connection of the network port is tight.
6010	177A	The path planning is interrupted abnormally, and the motion instruction stops.	1. The planned position was lost.	1. Ensure the program (PRG) containing the axis control function blocks is called within the task "EtherCAT_Master_Task". 2. If the program is written in ST, check whether the motion function block is being inhibited by an IF condition during execution. 3. If the program is written in LD language EN/ENO, check whether the motion function block is being inhibited by an EN during execution.
6011	177B	Faults occurred during homing.	1. One or more faults occurred during servo homing.	1. See the servo manual for troubleshooting.
6012	177C	SDO read data timeout	1. The SDO read operation in the current instruction timed out.	1. Check if there are any issues with the connection between the servo and PLC. 2. Configure the corresponding PDO object according to the instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
6013	177D	The servo absolute position system does not match the position restoration mode.	1. The absolute position system of the servo was incompatible with the position restoration mode.	1. Select an appropriate position restoration mode based on the absolute position system of the servo.
6014	177E	The area mapped to the axis and storing its key data is not found.	1. The area mapped to the axis and storing its key data was not found.	1. The position restoration cannot be performed because the data required for position restoration is missing.
6015	177F	The power failure retention variable, which stores the information required for the servo position restoration scheme, does not exist. Therefore, the position restoration operation cannot be performed.	1. The power failure retention variable, which stores the information required for the servo position restoration scheme, did not exist. Therefore, the position restoration operation cannot be performed.	1. The position restoration cannot be performed because the data required for position restoration is missing.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
6016	1780	The power failure retention variable, which stores the information required for the PLC position restoration scheme, does not exist. Therefore, the position restoration operation cannot be performed.	1. The power failure retention variable, which stores the information required for the servo position restoration scheme, did not exist. Therefore, the position restoration operation cannot be performed.	1. The position restoration cannot be performed because the data required for position restoration is missing.
6017	1781	The encoder revolution count after restoration exceeds the limited range of the data type.	1. After restoration, the encoder revolution count is outside the permissible range of the data type.	1. After restoration, the encoder revolution count was outside the permissible range of the data type.
6018	1782	The vibration shaping process terminated abnormally.	1. The MC_VibrationShapping instruction was reset during execution.	1. Do not reset the MC_VibrationShapping instruction during execution.
7001	1B59	The axis type of the axis group is not defined.	1. The axis type of the axis group controlled by this instruction was not defined.	1. In the IDE interface, select an appropriate axis type for the axis in the axis group under PLC -> Motion control -> Axis -> "Axis name in the axis group" -> General settings as required.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7002	1B5A	The instruction cannot be executed when the axis group is in an illegal state.	1. The axis group with the ratio to be set was in the GROUP_DISABLED or GROUP_HOMING state.	1. If the axis group with the ratio to be set is in GROUP_DISABLED, use the MC_GroupEnable instruction to switch the axis group from GROUP_DISABLED to GROUP_STANDBY before executing the instruction. 2. If the axis group with the ratio to be set is in the GROUP_HOMING state, wait until the axis group has completed the homing instruction. Then, execute the instruction when the axis group is in the GROUP_STANDBY state.
7003	1B5B	The axis group is in the GROUP_DISABLED state.	1. The axis group controlled by the instruction was in the GROUP_DISABLED state. The instruction can only be triggered and executed when the axis group is in the GROUP_MOVING or GROUP_STANDBY state.	1. Use the MC_GroupEnable instruction to switch the axis group to GROUP_STANDBY. Then, execute the instruction.
7004	1B5C	The axis group is in the GROUP_STOPPING state.	1. The axis group controlled by the instruction was in the GROUP_STOPPING state. The instruction can only be triggered and executed when the axis group is in the GROUP_MOVING or GROUP_STANDBY state.	1. Use the MC_GroupDisable instruction to switch the axis group from GROUP_STOPPING to GROUP_DISABLED. Then, use the MC_GroupEnable instruction to switch the axis group to GROUP_STANDBY before executing the instruction. 2. Check whether the output variable Done of the MC_GroupStop instruction (which placed axis group in GROUP_STOPPING) is activated. If so, reset the input variable Execute of the MC_GroupStop instruction. At this point, the axis group is in the GROUP_STANDBY state. Then, execute the instruction again.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7005	1B5D	The axis group in the GROUP_HOMING state.	1. The axis group controlled by the instruction was in the GROUP_HOMING state. The instruction can only be triggered and executed when the axis group is in the GROUP_MOVING or GROUP_STANDBY state.	1. Wait until the axis group has completed the homing instruction. Then, execute the instruction when the axis group is in the GROUP_STANDBY state.
7006	1B5E	The axis group is in the GROUP_ERRORSTOP state.	1. The axis group controlled by the instruction was in the GROUP_ERRORSTOP state. The instruction can only be triggered and executed when the axis group is in the GROUP_MOVING or GROUP_STANDBY state.	1. Use the MC_GroupReset instruction to switch the axis group to GROUP_STANDBY. Then, execute the instruction.
7007	1B5F	The axis group is in the process of GROUP_ERRORSTOP.	1. In the axis group to be reset, one or more axes were switched to AXIS_ERRORSTOP due to the MC_ImmediateStop instruction. 2. The axis group to be reset was in the GROUP_ERRORSTOP state and the stop action has not yet completed.	1. Check whether any axis has entered AXIS_ERRORSTOP due to the MC_ImmediateStop instruction in the axis group to be reset. If so, reset the corresponding axis using the MC_Reset instruction before executing the MC_GroupReset instruction. 2. Check if multiple copies for the instance of the MC_GroupReset instruction are executing simultaneously on the axis group to be reset. If yes, delete the duplicate instances of the MC_GroupReset instruction, and then execute the MC_GroupReset instruction again.
7008	1B60	The axis in the axis group are in the error state.	1. In the current axis group, one or more axes were in the AXIS_ERRORSTOP state.	1. Check whether the axis in the current axis group is in the AXIS_ERRORSTOP state. Use the MC_Reset instruction to switch the axis from AXIS_ERRORSTOP to AXIS_STANDSTILL or AXIS_POWER_OFF before executing the instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7009	1B61	The cycle time of the axis in the axis group has not been set correctly.	1. An axis within the axis group had the task cycle time set to a value less than or equal to 0.	1. Correct the parameter value set for the task cycle of the axis in the axis group.
7010	1B62	The axis group is controlled by the stop instruction.	1. The axis group was executing the MC_GroupHalt instruction.	1. Wait until the MC_GroupHalt instruction for the axis group has been completed. Then, execute the instruction.
7011	1B63	The axis group is controlled by the emergency stop instruction.	1. The axis group was executing the MC_GroupStop instruction.	1. Wait until the MC_GroupStop instruction for the axis group has been completed. Then, execute the instruction.
7012	1B64	The axis group is controlled by the pause instruction.	1. The axis group was controlled by the MC_GroupInterrupt instruction.	1. Use the MC_GroupContinue instruction to switch the instruction type of the axis group from GROUP_INTERRUPT to GROUP_SETOVERRIDE before executing the instruction.
7016	1B68	The axis is not configured in the axis group.	1. The axis was not configured into the axis group.	1. When the axis is not configured into the axis group, check if there are any unassigned axes in "Project tree" -> "Axis group" -> "Axis configuration".

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7017	1B69	The axis coordinate exceeds the positive limit.	1. For the relative motion, the input variable "Distance" would cause the axis group to exceed the positive limit of the axis group during the execution of the instruction. 2. For the absolute motion, the input variable "Position" would cause the axis group to exceed the positive limit of the axis group during the execution of the instruction.	1. Based on the positive limit, select an appropriate movement distance for the relative motion of the axis group before executing the instruction. 2. Based on the positive limit, select an appropriate target position for the absolute motion of the axis group before executing the instruction.
7018	1B6A	The axis coordinate exceeds the negative limit.	1. For the relative motion, the input variable "Distance" would cause the axis group to exceed the negative limit of the axis group during the execution of the instruction. 2. For the absolute motion, the input variable "Position" would cause the axis group to exceed the negative limit of the axis group during the execution of the instruction.	1. Based on the negative limit, select an appropriate movement distance for the relative motion of the axis group before executing the instruction. 2. Based on the negative limit, select an appropriate target position for the absolute motion of the axis group before executing the instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7019	1B6B	The axis coordinate speed exceeds the limit.	1. In the joint axes coordinate system (ACS), the absolute value of the axis speed was greater than that of the product of the warning planned factor and the axis planned speed in the axis group.	1. Adjust the speed parameters of the axis group motion as required. 2. If the axis group type is SCARA and the coupling setting has been checked, check if the coupling coefficient is set correctly. 3. If the axis group type is SCARA, use MC_SetPosition or MC_Home to set the position of the corresponding axis for each joint within the SCARA configuration range before using the MC_GroupEnable instruction. 4. If the axis group type is Delta2, Delta3 or Delta3+1, use MC_SetPosition or MC_Home to set the position of the corresponding axis for each joint within the corresponding Delta configuration range before using the MC_GroupEnable instruction.
7020	1B6C	The axis group is switching the part coordinate system.	1. When the axis group is switching the part coordinate system, some function blocks are triggered.	1. Wait until the switch has been completed, and then trigger the function blocks.
7021	1B6D	The axis group is referenced to a dynamic part coordinate system.	1. When the axis group was referenced to a dynamic part coordinate system, the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction has been started.	1. Do not start the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction, when the axis group was referenced to a dynamic part coordinate system.
7022	1B6E	The axis group is in motion.	1. During the interpolation motion of the axis group, it is prohibited to set the part coordinate system or trigger continuous trajectory function blocks and jog function blocks.	1. Do not trigger the related function blocks during the axis group motion. Trigger the function block after the interpolation motion has ended.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7023	1B6F	The coupling coefficient and transmission ratio are set incorrectly.	1. The coupling factor settings should be reversible. Otherwise, an error will be reported when the axis group is enabled or reset.	1. Check and modify the settings of the coupling coefficient and transmission ratio to ensure they are set correctly.
7024	1B70	The axis in the axis group is in the disabled state.	1. When the axis group was in motion or in a dynamic coordinate system, an axis in the axis group was in the disabled state.	1. Check and set the enable status of any axis in the axis group to meet the instruction requirements before the re-execution of the instruction.
7026	1B72	The axis in the axis group is in the stop state.	1. When the axis group was in motion or in a dynamic coordinate system, the axis in the axis group was in the stop state.	1. Check and set the enable status of any axis in the axis group to meet the instruction requirements before the re-execution of the instruction.
7040	1B80	The axis group velocity exceeds the minimum limit.	1. The input variable "VelFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction must be within the range (0.0,1.0]. 2. The value of the input variable "Velocity" was less than or equal to 0.	1. Correct the value of the input variable "VelFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction. 2. Correct the value of the input variable "Velocity" for the instruction.
7041	1B81	The axis group velocity exceeds the maximum limit.	1. The input variable "VelFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction must be within the range (0.0,1.0]. 2. The value of the input variable "Velocity" for the instruction was greater than the maximum value of the system motion parameters.	1. Correct the value of the input variable "VelFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction. 2. Correct the value of the input variable "Velocity" for the instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7042	1B82	The axis group acceleration exceeds the minimum limit.	1. The input variable "AccFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction must be within the range (0.0,1.0]. 2. The value of the input variable "Velocity" for the instruction was less than or equal to 0.	1. Correct the value of the input variable "AccFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction. 2. Correct the value of the input variable "Acceleration" for the instruction.
7043	1B83	The axis group acceleration exceeds the maximum limit.	1. The input variable "AccFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction must be within the range (0.0,1.0]. 2. The value of the input variable "Acceleration" for the instruction was greater than the maximum value of the system motion parameters.	1. Correct the value of the input variable "AccFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction. 2. Correct the value of the input variable "Acceleration" for the instruction.
7044	1B84	The axis group deceleration exceeds the minimum limit.	1. The input variable "AccFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction must be within the range (0.0, 1.0]. 2. The value of the input variable "Deceleration" for the instruction was less than or equal to 0.	1. Correct the value of the input variable "AccFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction. 2. Correct the value of the input variable "Deceleration" for the instruction.
7045	1B85	The axis group deceleration exceeds the maximum limit.	1. The input variable "AccFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction must be within the range (0.0, 1.0]. 2. The value of the input variable "Deceleration" for the instruction was greater than the maximum value of the system motion parameters.	1. Correct the value of the input variable "AccFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction. 2. Correct the value of the input variable "Deceleration" for the instruction.
7046	1B86	The axis group jerk exceeds the minimum limit.	1. The input variable "JerkFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction must be within the range [0.0,1.0]. 2. The value of the input variable "Jerk" was less than or equal to 0.	1. Correct the value of the input variable "JerkFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction. 2. Correct the value of the input variable "Jerk" for the instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7047	1B87	The axis group jerk exceeds the maximum limit.	1. The input variable "JerkFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction must be within the range [0.0,1.0]. 2. The value of the input variable "Jerk" for the instruction was greater than the maximum value of the system motion parameters.	1. Correct the value of the input variable "JerkFactor" for the MC_MoveDirectRelative or MC_MoveDirectAbsolute instruction. 2. Correct the value of the input variable "Jerk" for the instruction.
7048	1B88	The axis group velocity factor exceeds the minimum limit.	1. The value range of the input variable "VelFactor" for the MC_GroupSetOverride instruction must be within the range [0,100].	1. Correct the value of the input variable "VelFactor" for the instruction.
7049	1B89	The axis group velocity factor exceeds the maximum limit.	1. The value range of the input variable "VelFactor" for the MC_GroupSetOverride instruction must be within the range [0,100].	1. Correct the value of the input variable "VelFactor" for the instruction.
7050	1B8A	The axis group acceleration factor is below the minimum limit.	1. The input variable "AccFactor" of the MC_GroupSetOverride instruction must be within the range [1,100].	1. Correct the value of the input variable "AccFactor".
7051	1B8B	The axis group acceleration factor exceeds the maximum limit.	1. The input variable "AccFactor" of the MC_GroupSetOverride instruction must be within the range [1,100].	1. Correct the value of the input variable "AccFactor".

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7052	1B8C	The axis group jerk factor is below the minimum limit.	1. The input variable "JerkFactor" of the MC_GroupSetOverride instruction has a value range of [0,100].	1. Correct the value of the input variable "JerkFactor".
7053	1B8D	The axis group jerk factor exceeds the maximum limit.	1. The input variable "JerkFactor" of the MC_GroupSetOverride instruction has a value range of [0,100].	1. Correct the value of the input variable "JerkFactor".
7054	1B8E	The axis group transition parameter is below the minimum limit.	1. The value range of the input variable "TransitionParameter" varies depending on the input variable "TransitionMode". If "TransitionMode" is related to Velocity, the value range of "TransitionParameter" is [0,1]; if "TransitionMode" is related to Distance, the value range of "TransitionParameter" is [0,+∞).	1. Correct the value of the input variable "TransitionParameter" for the instruction.
7055	1B8F	The axis group transition parameter exceeds the maximum limit.	1. The value range of the input variable "TransitionParameter" varies depending on the input variable "TransitionMode". If "TransitionMode" is related to Velocity, the value range of "TransitionParameter" is [0,1]; if "TransitionMode" is related to Distance, the value range of "TransitionParameter" is [0,+∞).	1. Correct the value of the input variable "TransitionParameter" for the instruction.
7056	1B90	The axis group buffer mode is undefined.	1. The value of the input variable "BufferMode" for the instruction was out of range.	1. Select an appropriate buffer mode to enable the axis group motion as required.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7057	1B91	The axis group transition mode is undefined.	1. The value of the input variable "TransitionMode" for the instruction was out of range.	1. Select an appropriate transition mode to enable the axis group motion as required.
7058	1B92	The axis group transition mode is not allowed	1. When the input variable "BufferMode" of the MC_MoveXXXRelative or MC_MoveXXXAbsolute instruction is in blending mode, the input variable "TransitionMode" of this instruction must not be TMResetAbort or TMDecAbort. 2. When the input variable "BufferMode" of the MC_MoveXXXRelative or MC_MoveXXXAbsolute instruction is set to Aborting, the input variable "TransitionMode" of this instruction must be TMResetAbort, TMDecAbort or TMnone.	1. Select an appropriate transition mode to enable the axis group motion as required.
7059	1B93	The axis group circular mode is not defined.	1. The value of the input variable "CircMode" for the MC_MoveCircularRelative or MC_MoveCircularAbsolute instruction was outside the valid range.	1. Select an appropriate circular mode to enable the axis group motion as required.
7060	1B94	The axis group circular path selection is not defined.	1. The value of the input variable "PathChoice" for the MC_MoveCircularRelative or MC_MoveCircularAbsolute instruction was outside the valid range.	1. Select an appropriate path selection to enable the axis group motion as required.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7061	1B95	Failed to reset buffer motion	1. The instruction was re-triggered after the buffer mode of the buffered instruction had been changed to the MC_ABORTING mode. 2. The buffered instruction was triggered again after its parameters were modified, and the modified parameters were invalid. 3. The motion data of the buffered instruction has already been used in motion calculations.	1. Do not change the buffer mode for the buffered instruction to the MC_ABORTING mode before re-triggering. 2. Check whether the coordinate system of the buffered instruction is correct. 3. The motion data of the buffered instruction has already been used in motion calculations, but the time to re-trigger the instruction is not correct.
7063	1B97	The kinematic model does not exist.	1. The kinematic model of the axis group controlled by the instruction did not exist.	1. In the IDE interface, select an appropriate axis group type for the axis group under PLC -> Motion control -> Axis group -> "Axis group name" -> Basic settings -> Axis group type as required.
7065	1B99	The axis group instruction buffer is full.	1. The maximum number of buffered instructions currently allowed for the axis group is 8.	1. Wait for the executing and buffered instructions for the current axis group to complete before executing other motion-related buffered instructions.
7068	1B9C	Incorrect communication status of the axis in the axis group	1. The axis group to be enabled contained the axes with incorrect communication status.	1. Check the communication status of each axis in the axis group.
7069	1B9D	Pose space configuration error	1. The A, B, C orientation parameters of the stTool input parameter for the MC_SetToolTransform instruction did not match the axis group type.	1. Check the input parameter stTool of the MC_SetToolTransform instruction to match the axis group type.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7081	1BA9	The axis group motion could not be safely aborted due to insufficient deceleration time.	1. When a subsequent instruction aborted the current instruction, the deceleration time was greater than the motion time of the subsequent instruction.	1. When the axis group is in GroupErrorStop, perform the corresponding operations, after using the MC_GroupReset instruction.
7083	1BAB	The axis group path planning is interrupted abnormally, and the motion instruction stops.	1. EN/ENO of LD language was used, and the axis group motion instruction was inhibited by EN during execution.	1. Check whether EN/ENO in the LD language is used, and whether the axis group motion instruction is being inhibited by an EN during execution.
7091	1BB3	The kinematic model does not exist.	1. The kinematic model of the axis group controlled by the instruction did not exist.	1. In the IDE interface, select an appropriate axis group type for the axis group under PLC -> Motion control -> Axis group -> "Name of the axis group for the circular relative motion" -> Basic setting -> Axis group type as required.
7092	1BB4	Unknown motion instruction	1. The motion instruction was undefined.	1. Check if the motion instruction is correct.
7093	1BB5	Setting a dynamic coordinate system based on the same axis group is not permitted.	1. The follower axis group was identical to the master axis group.	1. When setting up a dynamic coordinate system, ensure that the follower and master axis groups are not identical.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7096	1BB8	The reference axis is identical to as the axis in the axis group.	1. The axis corresponding to the input/output parameter "ConveyorBelt" of the MC_TrackConveyorBelt instruction was identical to the axis in the axis group. 2. The axis corresponding to the input/output parameter "RotaryTable" of the MC_TrackRotaryTable instruction was identical to the axis in the axis group. 3. The axis corresponding to the input/output parameter "BaseAxis" of the MC_SetCoordinateTransform instruction was identical to the axis in the axis group.	1. Adjust the axis corresponding to the input/output parameter "ConveyorBelt" of the MC_TrackConveyorBelt instruction, or modify the axis mapped to the axis group. 2. Adjust the axis corresponding to the input/output parameter "RotaryTable" of the MC_TrackRotaryTable instruction, or modify the axis mapped to the axis group. 3. Adjust the axis corresponding to the input/output parameter "BaseAxis" of the MC_SetCoordinateTransform instruction, or modify the axis mapped to the axis group.
7100	1BBC	An axis identifier mapped to the axis group exceeds the specified range.	1. The axis identifier to be added has exceeded the maximum permitted number of physical axes.	1. Check if the axis identifier to be added is within the valid range.
7101	1BBD	The axis mapped to the axis group was assigned to the identical axis group.	1. The axis to be added has been assigned to this axis group.	1. The axis to be added has already been assigned to this axis group, so the axis does not need to be added repeatedly.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7102	1BBE	The current axis is already mapped to an axis object, so the axis needs to be unmapped and then remapped, or the axis has been added in the axis identifier.	1. The axis to be added has been already mapped to another axis group. 2. The axis was added into the axis identifier in the axis group. Do not add more axes into this axis identifier.	1. Check if the axis to be added is correct. 2. Remove the axis to be added from other axis groups before using this instruction.
7103	1BBF	The axis to be removed do not exist.	1. The axis to be removed was not in the axis group.	1. The axis to be removed is not in the axis group, so do not remove the axis repeatedly.
7106	1BC2	The number of the axes in the axis group does not match the axis group type.	1. The number of the axes in the axis group to be enabled did not match the axis group type.	1. Check if the axes in the axis group have been removed using the MC_UngroupAllAxes or MC_RemoveAxisFromGroup instructions. If so, use the MC_AddAxisToGroup instruction to add the axes back to the axis group.
7107	1BC3	This axis has already been enabled by another axis group.	1. The axis group to be enabled contained the axes that are already enabled by another axis group.	1. Check if any axes in the axis group to be enabled are mapped to another enabled axis group. If yes, disable the enabled axis group before using this instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7108	1BC4	The operation is prohibited due to the axis group state.	1. The instruction was executed in the current axis group state.	1. Do not execute the MC_GroupDisabled instruction if the axis group is in either the GROUPMOVING or GROUPHOMING state. 2. Do not execute the MC_GroupHome, MC_GroupSetPosition, MC_SetKinTransform, MC_GroupInterrupt, and MC_GroupContinue instructions if the axis group is not in the GROUPSTANDBY state. 3. Do not execute the MC_GroupReadXXX instructions if the axis group is in the GROUPDISABLED state.
7109	1BC5	The axis group is in the GROUP_STOPPING state.	1. The axis group was in the GROUP_STOPPING state.	1. Do not execute the MC_GroupHalt instruction if the axis group is in the GROUP_STOPPING state.
7110	1BC6	Invalid axis state for group addition	1. The axis to be added by the MC_AddAxisToGroup instruction was not in the StandStill state.	1. Switch the axis to be added to the StandStill or PowerOff state.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7111	1BC7	Do not add the axis to the axis group if this axis is set as a rotary axis.	1. The axis to be added by the MC_AddAxisToGroup instruction was set as a rotary axis. 2. The axis to be added by the MC_AddAxisToGroup instruction was set as an encoder axis. 3. The conveyor belt axis of the MC_TrackConveyorBelt instruction was set as a rotary axis. 4. The axis group to be enabled by the MC_GroupEnable instruction contained an axis that was set as a rotary axis. 5. The rotary table axis of the MC_TrackRotaryTable instruction was set as a rotary axis. 6. The reference axis of the MC_SetCoordinateTransform instruction was set as a rotary axis.	1. Check if the axis group of the faulty instruction includes any axis in the rotary type, or if the axis of the instruction is set as a rotary axis. If so, select an appropriate linear axis to use the instruction.
7112	1BC8	Do not use the instruction when an axis is not in CSP or CSV mode.	1. The axis to be added by the MC_AddAxisToGroup instruction was not in CSP or CSV mode. 2. The axis group to be enabled by the MC_GroupEnable instruction contained the axis that was not in CSP or CSV mode.	1. Use the MC_SetControllerMode instruction to switch the control mode of the axis to CSV mode or CSP mode; then execute the MC_AddAxisToGroup instruction. 2. Use the MC_SetControllerMode instruction to switch the control mode of the axis to CSV mode or CSP mode; then execute the MC_GroupEnable instruction.
7113	1BC9	Non-cyclic position update	1. The axes in the axis group space configuration were missing during the execution of the MC_GroupReadActualPosition, MC_GroupReadActualVelocity, or MC_GroupReadActualAcceleration instructions, or the forward kinematics calculation was incorrect.	1. Reconfigure the axis group. 2. Check if the kinematic parameters of the axis group are correct.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7114	1BCA	The axis group object does not exist.	1. The axis group object for the faulty instruction did not exist.	1. Check if the axis group corresponding to the faulty instruction is configured in the IDE interface. If not configured, reconfigure the axis group and then use the corresponding instruction again.
7115	1BCB	The axis object is null.	1. The axis to be added by the MC_AddAxisToGroup instruction did not exist.	1. If the axis to be added by the MC_AddAxisToGroup instruction did not exist, check whether the axis is configured in the IDE interface, if not, configure the axis and then execute the instruction again.
7116	1BCC	The communication status of the axis group is abnormal.	1. The status of the servo slave for the axis in the axis group of the faulty instruction was abnormal.	1. Check if the slave device mapped to the axis variable is a servo drive. 2. Check if there are any abnormal alarm information from the servo. 3. Check if the network cable connecting the slave is normal. 4. Replace the network cable. 5. Restart the servo drive.
7117	1BCD	Abnormal parameter input for COORDSYSTEM	1. The MC_GroupHome instruction only supports the homing process under the ACS coordinate system. 2. The MC_GroupSetPosition, MC_GroupReadActualPosition, MC_GroupReadActualVelocity, MC_GroupReadActualAcceleration, MC_MoveDirectRelative, and MC_MoveDirectAbsolute instructions can only be executed under the ACS or PCS coordinate systems. 3. The MC_MoveCircularRelative, MC_MoveCircularAbsolute, MC_MoveLinearRelative, and MC_MoveLinearAbsolute instructions currently only support the PCS mode.	1. Select the appropriate coordinate system parameter based on the faulty instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7119	1BCF	The axis group type is not defined.	1. The axis group type was undefined.	1. Check if the axis group type is selected in "Project tree" -> "Axis group" -> "Mechanical type".
7120	1BD0	The axis group motion cannot be re-triggered.	1. The instruction was executed repeatedly while the axis group was executing this instruction.	1. Check if multiple identical instruction instance are being executed in the PLC program. If so, delete the duplicated instruction instance and execute the instruction again. 2. The instruction cannot be re-triggered while the axis group is executing this instruction.
7121	1BD1	The axis variable in the axis group is not enabled	1. The axis group of the instruction contained a disabled axis.	1. Use the MC_Power instruction to switch the state of the axis from AXIS_POWER_OFF to AXIS_STANDSTILL, and then execute the instruction again.
7123	1BD3	The starting sequence in axis group homing procedure is invalid.	1. In the homing sequence of the axis group, the homing order of the starting axis must be set to 1.	1. In the homing sequence of the axis group, the homing order of the starting axis must be set to 1.
7124	1BD4	The axis group homing sequence is out of range.	1. In the homing sequence of the axis group, the homing order assigned to an axis was greater than the total number of axes in the group or less than 0.	1. Correct the homing order for the axes so that each value is greater than 0 and less than or equal to the total number of axes in the group.
7125	1BD5	Incorrect axis group homing method	1. The homing method of the axis group is not a servo homing method or a host controller homing method.	1. Adjust the homing method of the axis in the axis group to a servo homing method or a host controller homing method.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7126	1BD6	The axis group homing sequence is not in ascending order.	1. The axis group homing sequence must be in ascending order. The valid sequences include: 1, 1, 1, 1; 1, 2, 3, 4; 1, 2, 2, 2; 1, 2, 2, 3; 1, 2, 3, 3, and so on.	1. Correct the axis group homing sequence to ensure it is in ascending order.
7128	1BD8	A limit was triggered on an axis mapped to the axis group when its planned velocity matched the limit's direction.	1. A limit on an axis mapped to the axis group has been triggered. The planned velocity direction of the axis to trigger the limit matched the direction of the activated limit.	1. Check if the limits are configured for the axis mapped in the axis group. If yes, modify the positive and negative limit ranges as required, or disable the limits.
7129	1BD9	Switching the axis group instance during its operation is not permitted.	1. While the axis group was executing an instruction, the MC_GroupStop instruction was initiated by another axis group repeatedly.	1. Check if multiple axis groups are executing the identical instruction instance. If yes, create a separate instruction instance for each axis group and re-execute the corresponding instruction.
7131	1BDB	The distance between the start point and the end point is too long (greater than the given diameter)	1. When the input variable "CircMode" of either the MC_MoveCircularRelative or MC_MoveCircularAbsolute instruction was set to RADUS_ARC_TYPE, the invalid value of the input variable "EndPoint" resulted in a too long distance between the start point and the end point.	1. According to the requirements, select an appropriate end point for the circular motion of the axis group before the execution of the instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7132	1BDC	The distance between the start point and the end point is too short.	1. When the input variable "CircMode" of either the MC_MoveCircularRelative or MC_MoveCircularAbsolute instruction was set to RADUS_ARC_TYPE, the invalid value of the input variable "EndPoint" resulted in a too short distance between the start point and the end point.	1. According to the requirements, select an appropriate end point for the circular motion of the axis group before the execution of the instruction.
7133	1BDD	The radius is too short.	1. When the input variable "CircMode" of either the MC_MoveCircularRelative or MC_MoveCircularAbsolute instruction was set to RADUS_ARC_TYPE, the arc radius was too short.	1. According to the requirements, select an appropriate end point for the circular motion of the axis group before the execution of the instruction.
7134	1BDE	The normal vector is not perpendicular. (An error will be generated if the deviation exceeds 10°.)	1. When the input variable "CircMode" of either the MC_MoveCircularRelative or MC_MoveCircularAbsolute instruction was set to RADUS_ARC_TYPE, the normal vector is not perpendicular.	1. According to the requirements, select an appropriate end point for the circular motion of the axis group before the execution of the instruction.
7135	1BDF	The distance from the start point to the center is not equal to that from the end point to the center.	1. When the input variable "CircMode" of either the MC_MoveCircularRelative or MC_MoveCircularAbsolute instruction was set to ENTER_ARC_TYPE, the distance from the start point to the center was not equal to that from the end point to the center.	1. According to the requirements, select an appropriate end point for the circular motion of the axis group before the execution of the instruction.
7240	1C48	Inverse kinematics failure	1. The inverse kinematics calculation for the axis group pose has failed.	1. Check if the axis group type is correct. 2. Check if the target or via positions in the axis group motion path are at or near a kinematic singularity.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
7241	1C49	Forward solution failure	1. The forward kinematics calculation for the axis group pose has failed.	1. Check if the axis group type is correct. 2. Check if the target or via positions in the axis group motion path are at or near a kinematic singularity.
7243	1C4B	Euler angles are out of range.	The value of the A-axis position parameter set in the PCS space was out of range.	Adjust the A-axis value to within ±180°.
7246	1C4E	The degrees of freedom for the axis group do not match the configured coordinate system parameters.	Due to mechanical configuration constraints, only the X and Y coordinate axis values can be set for XY and Delta2 configurations.	Reconfigure the coordinate system parameters according to the instruction function description.
8002	1F42	The counter channel status (0x6000) is not configured.	1. The PDO object 6000 was not configured in the software backend.	1. Configure the PDO object 6000 in the software backend.
8003	1F43	The digital input terminal status (0x6001) is not configured.	1. The PDO object 6001 was not configured in the software backend.	1. Configure the PDO object 6001 in the software backend.
8006	1F46	The touch probe status (0x6004) is not configured.	1. The PDO object for touch probe status 6004 was not configured in the software backend.	1. Configure the touch probe control word 6004 in the software backend.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8007	1F47	The touch probe 1 rising edge position (0x6005) is not configured.	1. The PDO object for touch probe 1 rising edge position 6005 was not configured in the software backend.	1. Configure the PDO object for touch probe 1 rising edge position 6005 in the software backend.
8008	1F48	The touch probe 1 falling edge position (0x6006) is not configured.	1. The PDO object for touch probe 1 falling edge position 6006 was not configured in the software backend.	1. Configure the PDO object for touch probe 1 falling edge position 6006 in the software backend.
8009	1F49	The touch probe 2 rising edge position (0x6007) is not configured.	1. The PDO object for touch probe 2 rising edge position 6007 was not configured in the software backend.	1. Configure the PDO object for touch probe 2 rising edge position 6007 in the software backend.
8010	1F4A	The touch probe 2 falling edge position (0x6008) is not configured.	1. The PDO object for touch probe 2 falling edge position 6008 was not configured in the software backend.	1. Configure the PDO object for touch probe 2 falling edge position 6008 in the software backend.
8012	1F4C	The rising edge time PDO object for probe 1 (1B03/1B13) is not configured.	The ENC_TouchProbe instruction, which is used for a bus encoder axis, is configured to trigger on the rising edge of probe 1 time probe, but 1B03/1B13 PDO is not configured.	1. Configure 1B03/1B13 PDO in the software backend.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8013	1F4D	The falling edge time PDO object for probe 1 (1B04/1B14) is not configured.	The ENC_TouchProbe instruction, which is used for a bus encoder axis, is configured to trigger on the falling edge of probe 1 time probe, but 1B04/1B14 PDO is not configured.	1. Configure 1B04/1B14 PDO in the software backend.
8014	1F4E	The rising edge time PDO object for probe 2 (1B03/1B13) is not configured.	The ENC_TouchProbe instruction, which is used for a bus encoder axis, is configured to trigger on the rising edge of probe 2 time probe, but 1B03/1B13 PDO is not configured.	1. Configure 1B03/1B13 PDO in the software backend.
8015	1F4F	The falling edge time PDO object for probe 2 (1B04/1B14) is not configured.	The ENC_TouchProbe instruction, which is used for a bus encoder axis, is configured to trigger on the falling edge of probe 2 time probe, but 1B04/1B14 PDO is not configured.	1. Configure 1B04/1B14 PDO in the software backend.
8017	1F51	The channel control word (0x7000) is not configured.	1. The PDO object 7000 was not configured in the software backend.	1. Configure the PDO object 7000 in the software backend.
8019	1F53	The touch probe control word (0x7002) is not configured.	1. The PDO object for touch probe control word 7002 was not configured in the software backend.	1. Configure the touch probe control word 7002 in the software backend.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8020	1F54	The digital output terminal function selection (0x7003) is not configured.	1. The PDO object 7003 was not configured in the software backend.	1. Configure the PDO object 7003 in the software backend.
8028	1F5C	The axis type controlled by the instruction is incorrect.	1. The ENC_Counter, ENC_Reset, ENC_TouchProbe, ENC_Compare, ENC_StepCompare, ENC_ArrayCompare and ENC_Preset instructions only support local encoder axes and bus encoder axes. 2. The ENC_ReadStatus and ENC_DigitalOutput instructions only support bus encoder axis types.	1. Based on the axis types controlled by the instruction, configure the correct axis type in the software backend.
8029	1F5D	Bus encoder module failure	1. The bus encoder module has failed.	1. Power cycle the bus encoder module.
8030	1F5E	This instruction only supports bus encoder axes instead of local encoder axes.	1. This instruction only supports bus encoder axes and does not support local encoder axes.	1. This instruction only supports bus encoder axes and does not support local encoder axes. Correct the axis type in the software backend.
8031	1F5F	The ENC_Reset instruction is called on the bus encoder axis without an error occurring.	1. This instruction was triggered without an error occurring.	1. Check whether the axis is in an error state, and then trigger the instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8032	1F60	Bus encoder axis trigger mode selection error	1. When the axis type was set to a bus encoder axis, the set value of the input parameter TrigerMode was not 0, 1, or 4.	1. Modify the set value of the input parameter TrigerMode.
8033	1F61	The preset value is greater than 2147483647 or less than -2147483648.	1. When the set value of the input parameter Position was converted from user unit to pulse unit, it was greater than 2147483647 or less than -2147483648.	1. Modify the set value of the input parameter Position.
8034	1F62	Local encoder axis trigger mode selection error	1. When the axis type was set to a local encoder axis, the set value of the input parameter TrigerMode was not 0, 1, 2, 3.	1. Modify the set value of the input parameter TrigerMode.
8035	1F63	The preset value is greater than the positive software limit value.	1. In linear mode, the set value of the input parameter Position was greater than the positive limit value set in the software backend.	1. Modify the set value of the input parameter Position or the set value of the positive limit in the software backend. 2. Modify the set value of the negative limit in the software backend or disable the limit function.
8036	1F64	The preset value is less than the negative software limit value.	1. In linear mode, the set value of the input parameter Position was less than the negative limit value set in the software backend.	1. Modify the set value of the input parameter Position. 2. Modify the set value of the negative limit in the software backend or disable the limit function.
8037	1F65	In rotation mode, the preset value is greater than or equal to the cycle value.	1. In rotation mode, the set value of the input parameter Position is greater than or equal to the cycle value set in the backend.	1. Modify the set value of the input parameter Position or modify the cycle value set in the backend.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8038	1F66	The preset value is incorrect.	1. The value was out of the count value range.	1. Adjust the set value to within the valid range.
8039	1F67	The comparison value is incorrect.	1. The comparison value was invalid.	1. Adjust the comparison value to within the valid range.
8040	1F68	The preset function of X input terminal is set incorrectly.	1. The selected terminal has not been set to the preset function.	1. In the IDE interface, select an appropriate terminal in the preset settings.
8041	1F69	The preset function of Y input terminal is set incorrectly.	1. The selected terminal has not been set to the reset function.	1. In the IDE interface, select an appropriate terminal in the reset settings.
8042	1F6A	The touch probe function of X input terminal is set incorrectly.	1. The selected terminal has not been set to the touch probe function.	1. In the IDE interface, select an appropriate terminal in the probe settings.
8043	1F6B	The comparison function of Y input terminal is set incorrectly.	1. The selected terminal has not been set to the comparison function.	1. In the IDE interface, select an appropriate terminal in the comparison settings.
8044	1F6C	Input frequency overload	1. The input frequency exceeded its limit.	1. Modify the gear ratio or the target velocity of the axis.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8045	1F6D	Linear counter overflow	1. The linear counter reached the maximum count value.	1. Adjust the counting range as required, or use the ring counting mode.
8046	1F6E	Linear counter underflow	1. The linear counter reached the minimum count value.	1. Adjust the counting range as required, or use the ring counting mode.
8047	1F6F	Module ECAT communication error	1. A communication error has occurred in the module.	1. Check the communication status of the module.
8048	1F70	Bus encoder axis instruction does not support the virtual axis mode.	1. The axis to execute the instruction was configured a virtual axis.	1. Modify the axis type in the software backend.
8049	1F71	The probe ID number for the encoder axis is not within the supported range.	1. The set value of the input parameter ProbeID for the bus encoder axis was not 0 or 1. 2. The set value of the input parameter ProbeID for the local encoder axis was not 0.	1. Select an appropriate probe ID as required.
8050	1F72	The probe trigger function is configured repeatedly on the bus encoder axis.	1. When this instruction was triggered, the probe channel was occupied.	1. Modify the value of the input parameter ProbeID.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8051	1F73	The trigger edge parameter for the bus encoder axis is not within the supported range.	1. The set value of the input parameter TriggerEdge was not 0, 1, or 2.	1. Modify the set value of the input parameter TriggerEdge.
8052	1F74	The trigger source parameter is not within the supported range.	1. The set value of the input parameter TerminalSource was not 0 or 1. Note: The local encoder axis only supports a trigger source value of 0.	1. Modify the set value of the input parameter TerminalSource.
8053	1F75	The trigger mode parameter is not within the supported range.	1. The set value of the input parameter TrigerMode was not 0 or 1.	1. Modify the set value of the input parameter TrigerMode.
8054	1F76	The linear axis or rotary axis window position parameters are invalid.	1. In linear mode, the set value for the input parameter FirstPosition was greater than or equal to that for LastPosition. 2. In rotation mode, the set value for the input parameter FirstPosition was equal to that for LastPosition.	1. Modify the set value for the input parameter FirstPosition or LastPosition.
8055	1F77	The position set in the window parameters for the linear axis exceeds the limit range.	1. In linear mode, the set value of the input parameter FirstPosition was greater than the positive limit value set in the backend, or the set value of LastPosition was less than the negative limit value set in the backend.	1. Modify the set value for the input parameter FirstPosition or LastPosition.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8056	1F78	The probe trigger position is out of the set range.	1. For a linear axis, the value of the current instruction position was less than the set value of the input parameter "firstPosition" or greater than the set value of the input parameter "lastPosition". 2. For a rotary axis, when the input parameter "firstPosition" was greater than "lastPosition", the current instruction position was greater than "lastPosition" and less than "firstPosition"; when the input parameter "firstPosition" was less than "lastPosition", the current instruction position was greater than "lastPosition" and less than 360°, or the current instruction position was greater than 0 and less than "firstPosition".	1. Modify the set value of the input parameter "firstPosition" or of the input parameter "lastPosition".
8057	1F79	Probe trigger interrupted	1. While waiting for a probe trigger, the process was interrupted by a new ENC_TouchProbe instruction.	1. Check if a new ENC_TouchProbe instruction is triggered while waiting for a probe trigger.
8058	1F7A	Module error not cleared within timeout	1. After 200 task cycles of the instruction execution, the error has not been cleared yet.	1. Check the error status of the servo.
8059	1F7B	Switching axis objects is not permitted during encoder axis operation.	1. The axis object was switched during the execution of the instruction.	1. Do not switch axis objects during the execution of the instruction.
8060	1F7C	The counter is already running.	1. The counter was already running when a new counting instruction was triggered.	1. Modify the user program to avoid re-triggering this instruction.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8061	1F7D	The preset value was less than 0 in ring mode.	1. In rotation mode, the set value of the input parameter Position was less than 0.	1. Modify the set value of the input parameter Position.
8062	1F7E	The ENC_Preset instruction is re-triggered.	1. When the instruction was executing, another instance of the identical instruction has been triggered.	1. During the execution of the instruction, do not trigger another instance of this instruction.
8063	1F7F	The instruction is re-triggered.	1. When the instruction was executing, another instance of the identical instruction has been triggered.	1. During the execution of the instruction, do not trigger another instance of this instruction.
8064	1F80	The one-dimensional output comparison mode is out of range.	1. When the axis type was set to a local encoder axis, the set value of the input parameter Mode was not 0, 1, 2 or 3.	1. Modify the set value of the input parameter Mode.
8065	1F81	The local encoder axis preset enable function is not active.	1. When the axis type was set to a local encoder axis, the preset enable function was not active in the software backend before the instruction was triggered.	1. Enable the preset enable function in the software backend.
8066	1F82	The local encoder axis preset terminal is not selected.	1. When the axis type was set to a local encoder axis, the preset terminal in the software backend is not selected before the execution of the instruction.	1. Activate the preset enable function in the software backend and select the corresponding terminal.
8067	1F83	The one-dimensional comparison output nodes are out of order or overlapping.	1. The point values in the arrays used for one-dimensional array comparison were out of order or overlapping.	1. Check if the values in the arrays used for one-dimensional array comparison contained any out-of-order or overlapping points.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8070	1F86	The communication is in the non-operational state.	1. The axis was in a non-operational state.	1. Check the operation state of the axis.
8071	1F87	The axis pointer is null.	1. The axis pointer controlled by the instruction was null.	1. Check if the axis pointer controlled by the instruction is null. If yes, select an appropriate axis to execute the instruction as required.
8073	1F89	The input parameter PlusePerCycle for the instruction was set improperly.	1. The set value of the input parameter PlusePerCycle was less than or equal to 0.	1. Modify the set value of the input parameter PlusePerCycle.
8074	1F8A	Improper DisPerCycle setting	1. The set value of the input parameter DisPerCycle was invalid.	1. Adjust the DisPerCycle parameter to a value between 0.01 and 9999999.
8075	1F8B	Setting up the axis operation mode during counting is prohibited.	1. The instruction was triggered during the execution of ENC_Counter.	1. Do not trigger the instruction during the execution of ENC_Counter.
8076	1F8C	The input parameters of the comparison instruction are out of range.	1. The input parameter Size of the ENC_ArrayCompare instruction was out of range. 2. The input parameter Step of the ENC_StepCompare instruction was out of range.	1. The input parameter Size of the ENC_ArrayCompare instruction must be within the range of 1-1000. 2. The input parameter Step of the ENC_StepCompare instruction must be greater than 0.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8077	1F8D	The value of the start position is greater than that of the end position, and the step size can only be set to a negative value.	1. When the set value of the input parameter StartPosition was greater than that of EndPosition, the set value of the input parameter Step was greater than 0.	1. Modify the set value of the input parameter StartPosition or of the input parameter EndPosition. 2. Modify the set value of the input parameter Step.
8078	1F8E	The value of the start position is less than that of the end position, and the step size can only be set to a positive value.	1. When the set value of the input parameter StartPosition was less than that of EndPosition, the set value of the input parameter Step was less than 0.	1. Modify the set value of the input parameter StartPosition or of the input parameter EndPosition. 2. Modify the set value of the input parameter Step.
8079	1F8F	The start position is equal to the end position.	1. The set values of the input parameters StartPosition and EndPosition were equal.	1. Modify the set values of the input parameters StartPosition and EndPosition.
8080	1F90	The operation mode setting only supports local encoder axes.	1. The axis type set in the software backend was not a local encoder axis.	1. Set the axis type to a local encoder axis in the software backend.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8081	1F91	The probe channel is not enabled.	1. The probe channel corresponding to the axis was not enabled.	1. Enable the probe channel corresponding to the axis on the FA side. 2. There is no probe channel for the virtual axis in the PAC device. If the main axis is set to a virtual axis, the driver mode cannot be selected.
8082	1F92	Probe 1 terminal not configured	1. The corresponding terminal for touch probe 1 has not been configured.	1. Enable the probe channel corresponding to the axis on the FA side. Select the corresponding terminal.
8083	1F93	Probe 2 terminal not configured	1. The corresponding terminal for touch probe 2 has not been configured.	1. Enable the probe channel corresponding to the axis on the FA side. Select the corresponding terminal.
8084	1F94	The comparison output instruction is executing.	1. Another comparison output instruction is executing.	1. Wait for other comparison output instructions to complete before executing the current comparison output instruction.
8085	1F95	The "Comparison output enable" option is not enabled for the comparison output instruction.	1. The "Comparison output enable" option was not enabled on the FA side.	1. Enable the "Comparison output enable" option on the FA side.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8086	1F96	The comparison output terminal is not selected for the comparison output instruction.	1. The comparison output terminal was not selected on the FA side.	1. On the FA side, enable the "Comparison output enable" option and select the corresponding comparison output terminal.
8087	1F97	The comparison point of the comparison instruction exceeds the rotation cycle.	1. The input parameter Postion of the ENC_Compare instruction exceeded the range of the rotation cycle for the executing axis. 2. The input parameter ArrayCompare of the ENC_ArrayCompare instruction contained the points that exceeded the range of the rotation cycle for the executing axis. 3. The input parameters StartPosition or EndPosition of the ENC_StepCompare instruction exceeded the range of the rotation cycle for the executing axis.	1. The comparison point of the comparison instruction must not exceed the range of the rotation cycle for the executing axis.
8088	1F98	The comparison point of the comparison instruction is outside the position limits.	1. The input parameter Position of the ENC_Compare instruction was outside the axis position limits. 2. The input parameter ArrayCompare of the ENC_ArrayCompare instruction contained the points that were outside the axis position limits. 3. The input parameters StartPosition and EndPosition of the ENC_StepCompare instruction were outside the axis position limits.	1. The comparison points of the comparison instruction must not be outside the axis position limits.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8090	1F9A	Local pulse axis homing timeout	1. The homing process for the local pulse axis timed out. The actual duration exceeded the configured homing timeout value.	1. According to the requirements, set an appropriate homing timeout duration in Axis -> Homing Settings on the FA side.
8091	1F9B	Invalid limit triggered during homing	1. An unexpected limit signal was detected during the local pulse axis homing process.	1. Check if an invalid limit signal was triggered based on the local pulse axis homing mode and its limit signals.
8092	1F9C	The homing mode does not enable the negative limit switch.	1. The negative limit switch needs to be enabled in the selected homing mode for the local pulse axis.	1. On the FA side, enable the negative limit switch in the Axis -> Homing Settings interface.
8093	1F9D	The homing mode does not enable the positive limit switch.	1. The positive limit switch needs to be enabled in the selected homing mode for the local pulse axis.	1. On the FA side, enable the positive limit switch in the Axis -> Homing Settings interface.
8094	1F9E	The homing mode does not enable the homing switch.	1. The homing switch needs to be enabled in the selected homing mode for the local pulse axis.	1. On the FA side, enable the homing switch in the Axis -> Homing Settings interface.
8095	1F9F	The pulse width parameter is invalid.	1. The value of the parameter "PulseWidth" on the instruction side was less than or equal to 0 or greater than 9999.	1. Modify the value of the parameter "PulseWidth" on the instruction side.
8096	1FA0	When the axis is a pulse axis, the output device is neither Y0 nor Y1.	1. When the instruction for the pulse axis was executed, the dual terminals were selected for the output device.	1. Select the appropriate output device Y0 or Y1 as required.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8097	1FA1	There are no active overlay instruction or phase compensation instructions.	1. There were no active phase compensation instructions.	1. The MC_StopPhasing instruction is not required when no phase compensation instructions are active.
8098	1FA2	The touch probe function is not set for the Xn0 channel.	1. When the ENC_TouchProbe instruction was used for a bus encoder axis, the Xn0 channel has not been set to the touch probe function. (n represents the channel value.)	1. Set the Xn0 channel to the touch probe function as required.
8099	1FA3	The Xn1 channel is not set to the touch probe function.	1. When the ENC_TouchProbe instruction was used for a bus encoder axis, the Xn1 channel has not been set to probe function. (n represents the channel value.)	1. Set the Xn1 channel to the touch probe function as required.
8100	1FA4	The positive and negative limit settings for the local encoder axis are invalid.	1. After the limits of the local encoder were enabled, the set value of the positive limit must be greater than 0, and the set value of the negative limit must be less than or equal to 0.	1. Set the appropriate positive and negative limit parameters as required.
8101	1FA5	Interrupt parameter out of range	1. The input parameter InterruptMap of the ENC_Compare instruction was outside the range [0,16]. 2. The input parameter InterruptMap of the ENC_ArrayCompare instruction was outside the range [0,16]. 3. The input parameter InterruptMap of the ENC_StepCompare instruction was outside the range [0,16].	1. Set the input parameter InterruptMap of the ENC_Compare instruction within the range [0,16]. 2. Set the input parameter InterruptMap of the ENC_ArrayCompare instruction within the range [0,16]. 3. Set the input parameter InterruptMap of the ENC_StepCompare instruction within the range [0,16].

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8102	1FA6	The input parameter Channel for the ENC_Compare instruction is out of range.	The input parameter Channel of the ENC_Compare instruction only accepts the value 1 or 2, corresponding to 2HCE channels 1 and 2, respectively.	The input parameter Channel for ENC_Compare must be 1 or 2. Ensure that the Channel parameter is within this range.
8103	1FA7	When the comparison output is enabled using the ENC_Compare instruction, the comparison output time PDO is not configured.	When OutputEnable of the ENC_Compare instruction is TRUE, the corresponding PDO parameter must be configured so that the comparison output will take effect.	Confirm whether the corresponding PDO is configured: Configure 7006h.01h for comparison channel 1 of 2HCE channel 0. Configure 7007h.01h for comparison channel 2 of 2HCE channel 0. Configure 7006h.02h for comparison channel 1 of 2HCE channel 1. Configure 7007h.02h for comparison channel 2 of 2HCE channel 1.
8104	1FA8	No responding PDO is configured for the ENC_Compare instruction.	Before using the ENC_Compare instruction, configure the corresponding PDO mapping.	Confirm whether the corresponding PDO is configured: Configure 7003h.01h and 600E.01h for 2HCE channel 0. Configure 7004h.01h for compare channel 1. Configure 7005h.01h for compare channel 2. Configure 7003h.02h and 600E.02h for 2HCE channel 1. Configure 7004h.02h for compare channel 1. Configure 7005h.02h for compare channel 2.

Fault Code (decimal)	Fault Code (hexadecimal)	Error Message	Cause	Solution
8105	1FA9	The probe type parameter is not within the supported range.	The ENC_TouchProbe instruction is used for a bus encoder axis, but probetype is set to the value greater than 2.	The value of the probetype pin of the ENC_TouchProbe instruction must be limited to 2.
8106	1FAA	The array elements of the multi-dimension comparison output are empty.	The array elements of the multi-dimension comparison output cannot be empty.	1. Bind the input variables to the ENC_ArrayCompare and ArrayCompare pins.
8107	1FAB	The number of comparison values in the multi-dimension comparison output exceeds the array length.	The number of comparison values in the multi-dimension comparison output cannot exceed the array length.	1. Modify the number of comparison values in the multi-dimension comparison output to be less than the array length.
8108	1FAC	The element type of the multi-dimension comparison output array is incorrect.	The element type of the multi-dimension comparison output array must be LREAL.	1. Modify the array element type to LREAL.
8109	1FAD	The input Parameter of the ENC_Compare instruction is out of range.	The value of the Parameter input for the ENC_Compare instruction is out of the allowed range (0-65535).	Set the Parameter input of the ENC_Compare instruction to a value between 0 and 65535.

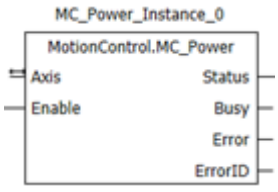
18.3.3.9 ParameterNumber

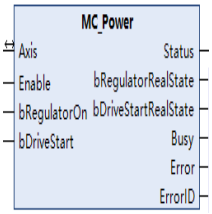
ParameterNumber code of the parameter read/write function block.

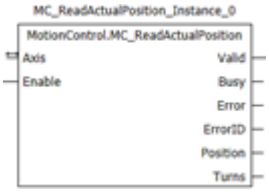
Name	Type	Init	Comment	Read/Write Property	ParameterNumber
Axis identifier.	-	-	-	R: ReadBoolParameter r: ReadParameter W: WriteBoolParameter w: WriteParameter	-
bVirtual	BOOL	FALSE	Is it a virtual axis? 0 indicates real axis, and 1 indicates virtual axis.	R W	1020
bCommunication	BOOL	FALSE	Bus communication establishment flag: Set to TRUE if the communication is successfully established; otherwise it will be set to FALSE if the communication fails.	R	1021
wCommunicationState	WORD	16#FFFF	Status of communication state machine. Use numbers to represent different states. For example, 10 indicates no connection established, and 100 indicates the connection is established.	r	1022

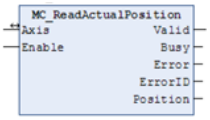
Name	Type	Init	Comment	Read/Write Property	ParameterNumber
eAxisState	18.3.3.2.2.5 MC_AXIS_STATE: Axis State Machine Enumeration	AXIS_POWER_OFF	Axis state machine: 0: AXIS_POWER_OFF (Axis power off state). 1: AXIS_ERRORSTOP (Axis error stop). 2: AXIS_STOPPING (Axis decelerate-to-stop state). 3: AXIS_STANDSTILL (Axis standstill state). 4: AXIS_DISCRETE_MOTION (Axis discrete motion state). 5: AXIS_CONTINUOUS_MOTION (Axis continuous motion state). 6: AXIS_SYNCHRONIZED_MOTION (Axis continuous motion state). 7: AXIS_HOMING (Axis homing state).	r	1025
bAxisEnableOn	BOOL	FALSE	Enable axis	R	1040
bAxisEnableState	BOOL	FALSE	Axis enable signal state, corresponding to the value of 6041 or the enable state of a local axis.	R	1041
fTaskCycle	LREAL	0.004	Set value of a task cycle.	r w	1081
uiDriveError	UINT	0	Driver fault code	r	1100
bError	BOOL	FALSE	Axis error	R	1103
dwErrorID	DWORD	0	Axis error identification code, including driver errors, instruction errors, configuration errors and so on.	r	1104
bForwardDirectionLimit	BOOL	FALSE	Forward rotation direction limit	RW	1120
bBackwardDirectionLimit	BOOL	FALSE	Reverse rotation direction limit	RW	1121
bResetFollowingErrorFlag	BOOL	FALSE	Is the following error currently being cleared?	R	1124

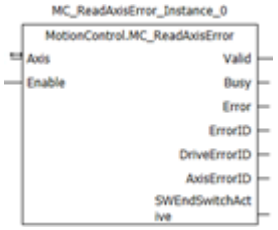
Name	Type	Init	Comment	Read/Write Property	ParameterNumber
fMaxDecelDistance	LREAL	0	Maximum deceleration distance.	r w	1127
fSwLimitDeceleration	LREAL	0	Deceleration rate in position limit state.	r w	1128
eDirection	18.3.3.2.2.9 MC_DIRECTION: Motion Direction Enumeration	DIR_POSITIVE	Current motion direction of an axis: 0: DIR_SHORTEST (Shortest way). 1: DIR_POSITIVE (Positive direction). 2: DIR_NEGATIVE (Negative direction). 3: DIR_CURRENT (Current direction). 4: DIR_NODIRECTION (No direction). 5: DIR_FASTEST (Fastest motion direction).	r	1129
eRampType	18.3.3.2.2.15 MC_RAMPTYPE: Ramp Type Enumeration	TRAPEZ	Acceleration mode: 0: TRAPEZ (Trapezoidal curve). 1: CURVE (S-curve). 2: SINSQUARE (Sin2 curve).	r w	1130
eControllerMode	18.3.3.2.2.7 MC_CONTROLLER_MODE: Controller Mode Enumeration	MC_CSP	Axis control mode: 8: MC_CSP (Cyclic synchronous position mode). 9: MC_CSV (Cyclic synchronous velocity mode). 10: MC_CST (Cyclic synchronous torque mode).	r	1131
eRealControllerMode	18.3.3.2.2.7 MC_CONTROLLER_MODE: Controller Mode Enumeration	MC_CSP	Actual control mode obtained from an axis: 8: MC_CSP (Cyclic synchronous position mode). 9: MC_CSV (Cyclic synchronous velocity mode). 10: MC_CST (Cyclic synchronous torque mode).	r	1132
fFactorVel	LREAL	1	Velocity scaling factor	r w	1151

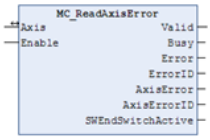


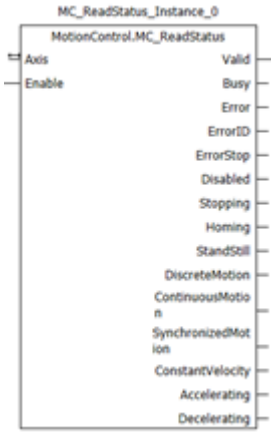


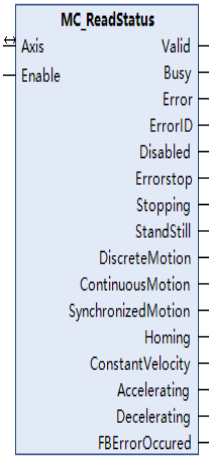












Name	Type	Init	Comment	Read/Write Property	ParameterNumber
fFactorAcc	LREAL	1	Acceleration scaling factor	r w	1152
iMovementType	INT	1	Axis motion type (0: rotational motion, 1: linear motion)	rw	1190
fSetPosition	LREAL	0	Instruction position set in this cycle	r	1191
fActPosition	LREAL	0	Feedback value: the position where the motor operated to in the previous cycle.	r	1192
fPositionPeriod	LREAL	0	Configured module length (unit)	r	1201
dwRatioTechUnitsDenom	DWORD	0	Gear ratio denominator	r w	1204
fRatioTechUnitsNum	LREAL	0	Gear ratio numerator	r w	1205

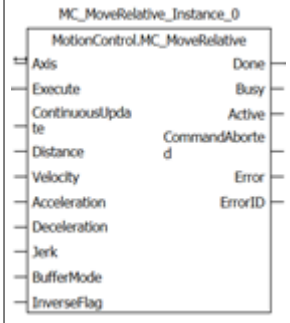
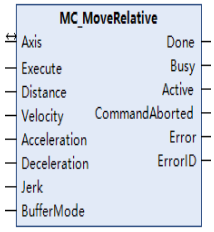
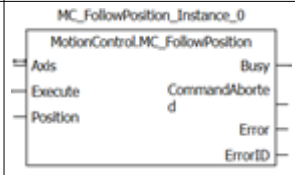
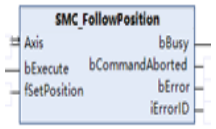
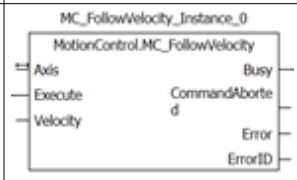
18.3.3.10 Pin Differences

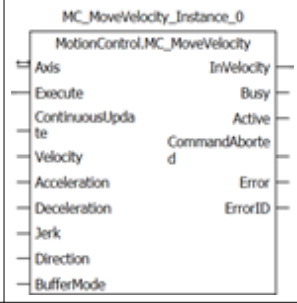


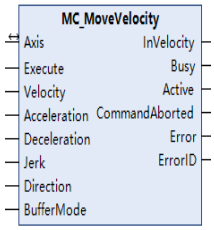


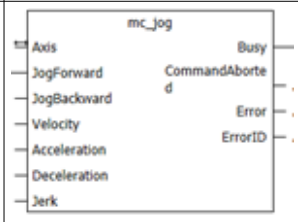


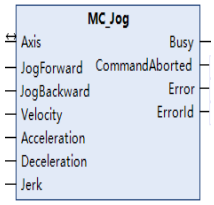


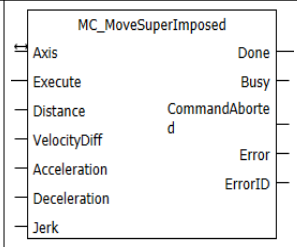


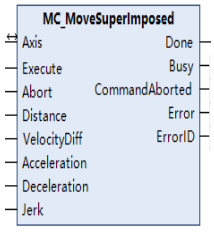


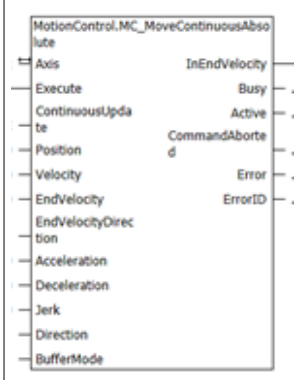


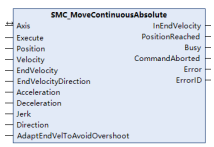




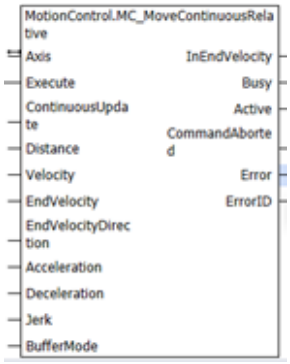


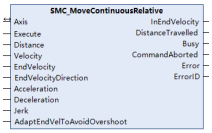


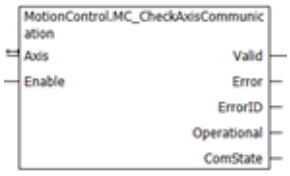


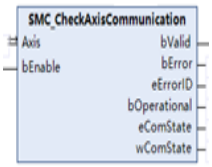


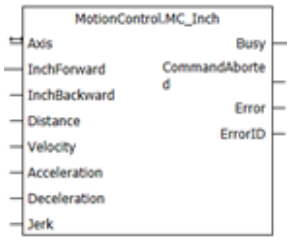
Explanation of pin differences on the instruction side:

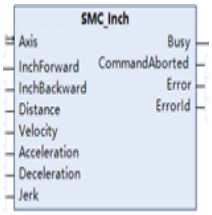


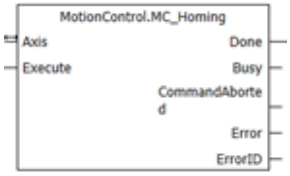


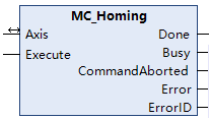


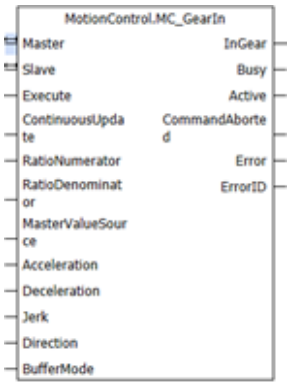


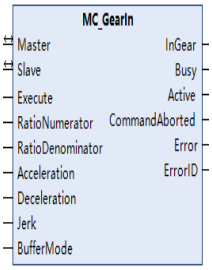


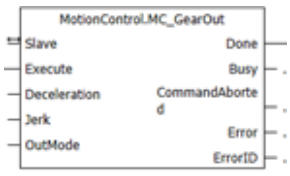


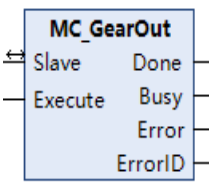




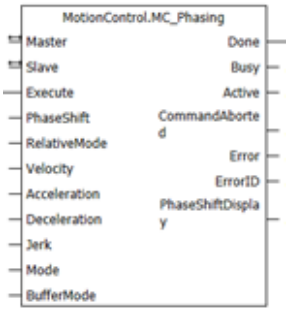


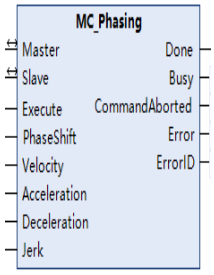


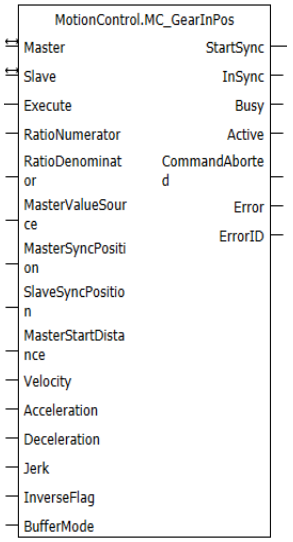


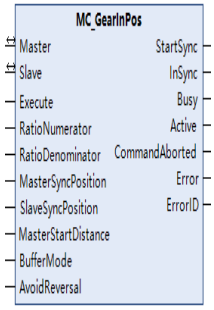


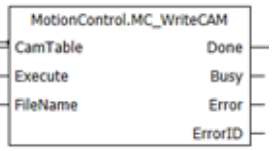
Name	SoftMotion Instruction	Medium Instruction	Explanation of Difference Points Based on Medium Instruction
MC_Power			Missing: bRgulationOn bDriverStart bRgulationRealState bDriverStartRealState
MC_ReadActualPosition			Added: Turns
MC_ReadAxisError			Missing: AxisError
MC_ReadStatus			Missing: FBErrorOccured

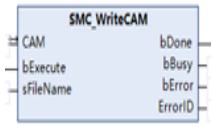


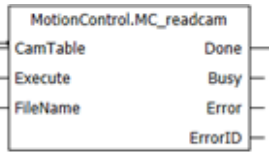


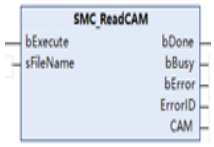


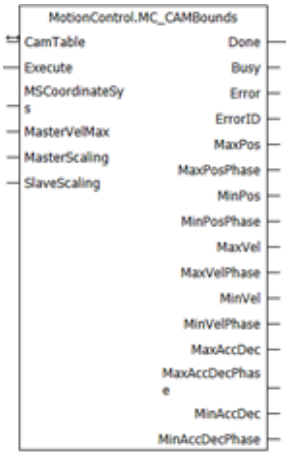


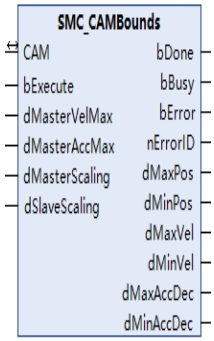




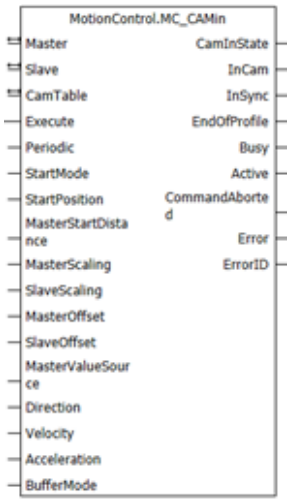


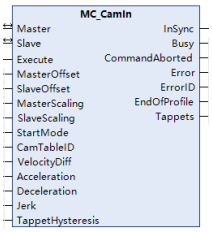


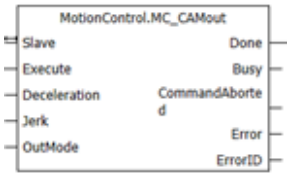


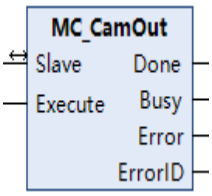


Name	SoftMotion Instruction	Medium Instruction	Explanation of Difference Points Based on Medium Instruction
MC_Reset			-
MC_ReadActualTorque			-
MC_ReadActualVelocity			-
MC_SetPosition			-
MC_TouchProbe			List the parameters from the TRIGGER_REF structure into the input parameters, and add position parameters for rising and falling edge latching.
MC_ReadBoolParameter			-
MC_ReadParameter			-
MC_WriteBoolParameter			-
MC_WriteParameter			-
MC_AbortTrigger			Missing: TruggerInput









Name	SoftMotion Instruction	Medium Instruction	Explanation of Difference Points Based on Medium Instruction
MC_ReadSetPosition			Added: Turns
MC_InPosition			Added: Error ErrorID
MC_AxisDiagnosticLog			-
MC_ChangeGearingRatio			-
MC_SetSoftwareLimits			Missing: SWL_Error_Decelerate Added: Busy
MC_SetControllerMode			-
MC_CheckLimits			-
MC_SetTorqueLimit			-

Name	SoftMotion Instruction	Medium Instruction	Explanation of Difference Points Based on Medium Instruction
MC_GetMaxSetAccDec			Added: Error ErrorID
MC_GetMaxSetVelocity			Added: Error ErrorID
MC_GetTrackingError			Added: Error ErrorID
MC_Halt			Added: BufferMode Active
MC_Stop			Added: CommandAborted
MC_Home			Added: BufferMode Active
MC_MoveAbsolute			Added: ContinuousUpdate InverseFlag

Name	SoftMotion Instruction	Medium Instruction	Explanation of Difference Points Based on Medium Instruction
MC_MoveRelative			Added: ContinuousUpdate InverseFlag
MC_FollowPosition			-
MC_FollowVelocity			-
MC_MoveVelocity			Added: ContinuousUpdate
MC_Jog			-
MC_MoveSuperImposed			Removed: Abort
MC_MoveContinuousAbsolute			Missing: AdaptEndVelToAvoidOversshoot PositionReached Added: ContinuousUpdate BufferMode Active

Name	SoftMotion Instruction	Medium Instruction	Explanation of Difference Points Based on Medium Instruction
MC_MoveContinuous Relative			Missing: AdaptEndVelToAvoidOverssshoot DistanceTravelled Added: ContinuousUpdate BufferMode Active
MC_CheckAxisComm unication			Missing: wComState
MC_Inch			-
MC_Homing			-
MC_GearIn			Added: ContinuousUpdate MasterValueSource Direction
MC_GearOut			Added: Deceleration Jerk OutMode CommandAborted

Name	SoftMotion Instruction	Medium Instruction	Explanation of Difference Points Based on Medium Instruction
MC_Phasing			Added: RelativeMode Mode BufferMode PhaseShiftDisplay
MC_GearInPos			Added: MasterValueSource Velocity Acceleration Deceleration Jerk BufferMode
MC_WriteCAM			-
MC_ReadCAM			-
MC_CAMBounds			Added: MSCOOrdinateSys MaxPosPhase MinPosPhase MaxVelPhase MinVelPhase MaxAccDecPhase MinAccDecPhase Missing: dMasterAccMax

Name	SoftMotion Instruction	Medium Instruction	Explanation of Difference Points Based on Medium Instruction
MC_Camin			Added: CamTable Periodic StartPosition MasterStartDistance MasterValueSource Direction Velocity BufferMode CamInState InCam Active Missing: CamTableID TappetHysteresis Jerk Tappets
MC_CAMout			Added: Deceleration Jerk OutMode CommandAborted

18.3.3.11 Function Differences

Function Overview of the Platform						
Project Description	Function Block or Instruction	Scenario Description	FA Motion Control Instruction	AM600	H5U	Comparison Result

Abnormalities caused by using the same instance	Four MC_Power	Multiple Power instructions of the same instance	The instruction in the last engineering logic determines the output.	The last module determines the output status. The bRegulatorOn parameter of the last conducting module determines the axis enable status.	N/A	Compared to AM600 'busy' output bit, where all modules can be set, this may not match actual operation results.
	Motion instruction	Multiple motion instructions of the same instance	The instruction will return an error 6010 to avoid user program errors.	Confusion between axis status and output bit status	N/A	FA assists users by performing checks to prevent forgetting to modify instances during copying.
	Background configuration interface	Axis motion parameters	For each axis, motion parameter limits can be set. For each axis, commissioning motion parameters can be set individually.	The motion parameter limits for a single axis cannot be set.	The motion parameter limits for a single axis can be set.	Each axis in FA can be independently configured with motion parameters (such as maximum velocity) to prevent motion hazards. This individual axis commissioning simplifies the overall tuning process.
Motion Trajectory Planning for Positioning Motion						

Project Description	Function Block or Instruction	Scenario Description	FA Motion Control Instruction	AM600	H5U	Comparison Result
Rotary axis	Moveabsolute and Moverelative	Position	1. Position and revolution count can be monitored 2. Absolute positioning allows target positions beyond one revolution to be specified.	1. Only the current position is available. 2. If the set position exceeds one revolution, the modulo operation will be performed automatically.	1. Only the current position is available. 2. If the set position exceeds one revolution, the modulo operation will be performed automatically.	1. The total distance traveled can be determined by monitoring the number of revolutions. 2. The application method of automatic modulo operations will be more flexible.
Motion direction	Moveabsolute	Available directions on a rotary axis	0. DIR_SHORTEST 1. DIR_POSITIVE 2. DIR_NEGATIVE 3. DIR_CURRENT 4. DIR_NODIRECTION 5. DIR_FASTEST	1. Positive 2. Negative 3. Current 4. Shortest 5. Fastest	1. Positive 2. Negative 3. Current 4. Shortest	1. AM600 supports the Fastest direction mode, but there is an issue with the fastest path selection. 2. FA supports the No_Direction mode for absolute positioning to a position that is not in the current revolution.

Reverse function	Moveabsolute and Moverelative	When the initial velocity is too high, the deceleration of the instruction is too small to reverse before reaching the target position.	InveserFlag 1. Reverse allowed (According to the instruction motion parameters, first decelerate, and then reverse to target position.) 2. Reverse prohibited (The instruction adaptively adjusts motion parameters to ensure deceleration distance matches the set target displacemen t.)	Only reverse allowed	Only reverse prohibited	FA provides two modes including reverse allowed and reverse prohibited, covering various complex and abnormal operating conditions.
Ease of Use						
Project Description	Function Block or Instruction	Scenario Description	FA Motion Control Instruction	AM600	H5U	Comparison Result
Default motion parameters	Motion instruction	The instructions are called directly with no pin parameters configured.	Default parameter: 0. Error triggered directly.	Default parameter: 0. Error triggered directly.	Default parameter: 0. Error triggered directly.	Future optimization can make the initial parameters follow the default values during operation.

Errors	Universal module	Axis error caused by instruction error	1. For a virtual axis, errors caused by instructions will automatically clear the axis error. 2. For a real axis, whether the axis transitions to the error state due to an instruction-generated error can be configured via an interface option.	On a real axis, errors caused by instructions will not trigger axis errors when the velocity is not 0.	An instruction fault will trigger an axis error.	FA builds on the AM600 design, with further optimization for the virtual axis. This design allows an axis error to be triggered via an instruction, while avoiding the need for users to repeatedly execute the reset instruction unnecessarily.
Instruction-Side Optimization						
Project Description	Function Block or Instruction	Scenario Description	FA Motion Control Instruction	AM600	H5U	Comparison Result
New functions added for motion instructions	Positioning instruction Speed instruction	Trapezoidal motion instruction planning	The minimum precision of LREAL is planned per cycle.	The minimum precision of LREAL is planned per cycle.	H5U ignores some very small displacement values, accumulates several small positions over a single cycle to make up the difference.	FA optimizes the minimum displacement per cycle based on H5U, ensuring smoother motion curves.
		Velocity parameter reading	Instantaneous velocity	The set velocity of AM600 is the instantaneous velocity.	The velocity is the average velocity within a cycle.	FA optimizes the set velocity of H5U, ensuring precise velocity in each cycle.

		Modify parameters during motion	Added ContinueUpdate function: 1. The positioning instruction can modify the velocity and position. 2. The velocity instruction can modify all parameters including direction.	Re-trigger only after modifying the parameters.	Re-trigger only after modifying the parameters.	FA allows motion parameters to be changed at any time while an instruction is executing, offering flexible application and ease of use.
Control mode	Torque control	Torque control	Controlled by separate TorqueControl instruction. The maximum velocity can be set by using this instruction.	TorqueControl instruction. However, the control mode must first be switched to CST. This instruction cannot be executed independently.	Controlled by separate TorqueControl instruction.	FA optimizes the AM600 torque control system, adds a torque control instruction, and includes a velocity safety feature.
	Control mode switching	SetController mode	1. The instruction can be configured via SDO 2. This instruction can be executed during the motion instruction execution.	This instruction can be started only in the standstill state.	No controller mode switching	FA retains the AM600 SetController mode, allowing motion instructions to be executed in CSV mode.

Error clearing	Reset instruction	Clears errors.	It can clear instruction errors, axis errors, and most servo-specified clearable errors, as well as communicati on errors.	Three different instructions are required to clear instruction errors, axis errors, and communicati on errors.	All the errors can be cleared.	FA optimizes the AM600 error clearing function, enabling one-click resolution of all errors including axis status, servo, and communicati on errors.
Motion Instructions and Limits						
Project Description	Function Block and Instruction	Scenario Description	FA Motion Control Instruction	AM600	H5U	Comparison Result

Limit deceleration	Motion instruction	Output status bits and axis status bits	1. For limit deceleration, the system will select the deceleration parameter with the shortest deceleration distance from among the deceleration limit in normal operation, limit deceleration after limit trigger, and maximum limit deceleration distance. 2. The limit deceleration process is in the "Stopping" state. After deceleration is complete, whether the axis enters the error state can be configured via an option in the IDE interface.	1. The deceleration motion planning remains consistent. 2. The limit deceleration directly triggers an ErrorStop.	1. The deceleration motion planning remains consistent. 2. The limit deceleration maintains the previous motion direction.	FA not only implements the limit deceleration process from AM600 and H5U, but also distinguishes between the limit deceleration process and the error-reporting state of the axis after limit deceleration is complete. This allows users to clearly identify the limit deceleration points in their engineering designs.

	Motion instruction	Initial position outside the limit	1. Motion from outside the limit toward the limit is allowed. 2. Attempting to move further away from the limit only triggers an instruction error.	Motion is not allowed when the axis is outside the limit.	When the axis is outside the limit, only inward movement is permitted. Attempting to move further away from the limit triggers an error.	1. FA optimizes motion beyond the AM600 limit switches, ensuring that instructions can be executed to return the system to its original position when the axis is outside the limit range. 2. FA has optimized the response to limit switch collisions, reducing axis errors in the instruction interface. This feature can be selected based on specific application scenarios, eliminating the need for users to manually clear errors.

	Motion instruction	Insufficient limit deceleration distance	Adaptively adjust the deceleration to ensure the speed is reduced to zero at the limit boundary.	Maintaining the current deceleration will eventually cause the axis to exceed the limit boundary.	Maintaining the current deceleration will eventually cause the axis to exceed the limit boundary.	FA supports users in ensuring the axis stops at the limit boundary under various special and complex conditions. It provides a safety net for abnormal operations, guaranteeing absolute safety during use.
	Motion instruction	Position jumps outside the limit	Immediate emergency stop	Slow deceleration	Slow deceleration	
Set Absolute and Relative Positions Using Setposition						
Project Description	Function Block or Instruction	Scenario Description	FA Motion Control Instruction	AM600	H5U	Comparison Result
Motion instruction settings	Moveabsolute	Using a set position in absolute positioning	Calculates the final position and replan the trajectory in the new coordinate system.	The motion trajectory remains unchanged, and the final position does not match the set position.	Setposition instruction is not supported during motion.	1. FA can correct the current position coordinates at any time, providing greater operational convenience.
	Moverelative	Using a set position in relative positioning	Maintain the relative displacement.	The relative displacement remains unchanged.		
Buffer Mode						
Project Description	Function Block or Instruction	Scenario Description	FA Motion Control Instruction	AM600	H5U	Comparison Result

Buffer mode	Motion instruction	Check the buffer mode of the instruction.	1. Aborted 2. Buffered 3. BlendingHigh 4. BlendingNext 5. BlendingLow 6. BlendingPrevious	Only Aborted is supported.	Only relative positioning provides a dedicated function block that supports Buffered execution.	FA supports all PLCOpen buffer modes, enhancing continuity between instructions.
Abnormal buffering	Between positioning instructions and velocity instructions.	Buffering in Blending mode after a velocity instruction	Automatically optimized to Buffered mode	N/A	N/A	FA has implemented adaptive optimizations for logic errors in the buffer, enhancing user convenience.
Cam						
Project Description	Function Block or Instruction	Scenario Description	FA Motion Control Instruction	AM600	H5U	Comparison Result

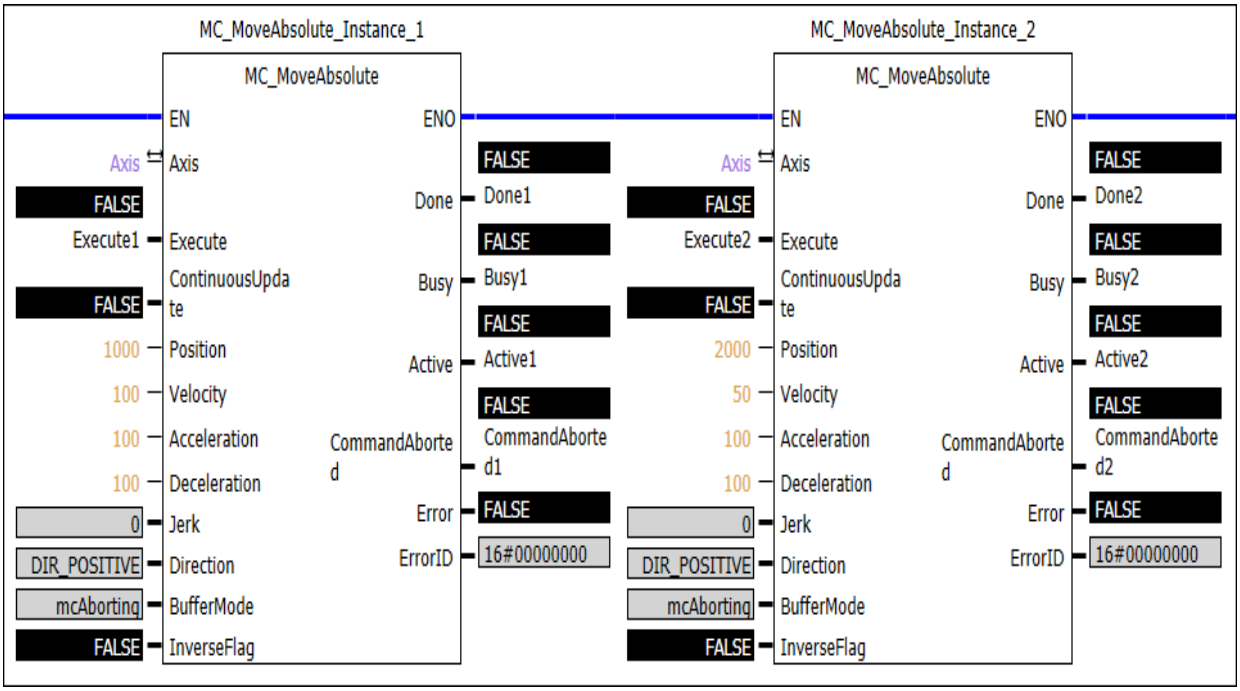
Cam table function	Backend IDE	Cam data	1. Node precision: up to four decimal places 2. Maximum number of cam nodes: 20000 3. Maximum number of dense nodes: 65535	1. Node precision: up to four decimal places 2. Maximum number of cam nodes: 1024	1. Node data precision: up to four decimal places 2. Maximum number of cam nodes: 361	1. The FA configuration environment directly supports checking cam data in dense node type, making import more convenient and intuitive. 2. The data precision of FA is sufficient, and the maximum data length of its instructions is higher than that of H5U and InoProshop.

Data transmission mode	Data exchange	Data transmission and retention function	1. Supports the conversion between key node cam data and dense node data. 2. Import function: Supports importing cam data in both key node and dense node types. 3. Export function: Supports exporting cam data in both key node and dense node types. (File format: CSV) 4. Uploads cam data from the controller.	1. Import function: Supports importing key node data and dense node data. (Data type for dense nodes: cam; data type for key nodes: CSV) 2. Export function: Supports exporting to key node data and dense node data. (Data type for dense nodes: cam; data type for key nodes: CSV)	1. Import function: Only supports the files with special node types. 2. Export function: Only supports the files with special node types. 3. Uploads the cam table from the controller (After a test, the uploaded cam table is used as the cam table parameters during download. The Save instruction is used to store the cam table data during download, instead of the data modified by Generate.)	FA supports data in both key node and dense node types. All exported files are in the widely adopted CSV format, facilitating data exchange with other products. Distinguishing between key node and dense node data enhances data usability and comprehensibility, making it simpler and more comprehensive.

Cam data modification method	GenerateCam instruction	Online modification of cam data	1. Supports WriteCam and ReadCam functions. 2. Allows user-defined cam data to be modified at any time. 3. Provides the Generatecam instruction for modification, which can also be used to validate custom cam data.	1. Modifies user-defined cam data. 2. Uploads the data using WriteCam and ReadCam instructions, allowing it to be modified and then written back.	1. Supports modifying cam data using GenerateCam.	1. FA incorporates all online methods for modifying cam data from H5U and InoProshop, ensuring a consistent user experience. 2. Adds a cam data verification function to ensure the accuracy of user cam data.
Cam curves	Backend IDE	Supported curve connections between cam nodes	1. Straight line 2. Parabola 3. Cubic curve 4. Quintic curve 5. Septic curve 6. Cosine acceleration curve 7. Sine acceleration curve 8. Modified trapezoidal acceleration curve	1. Straight line 2. Quintic curve	1. Straight line 2. Quintic curve	The cam curves significantly enrich the range of multi-order curves that are not available in H5U or InoProshop.

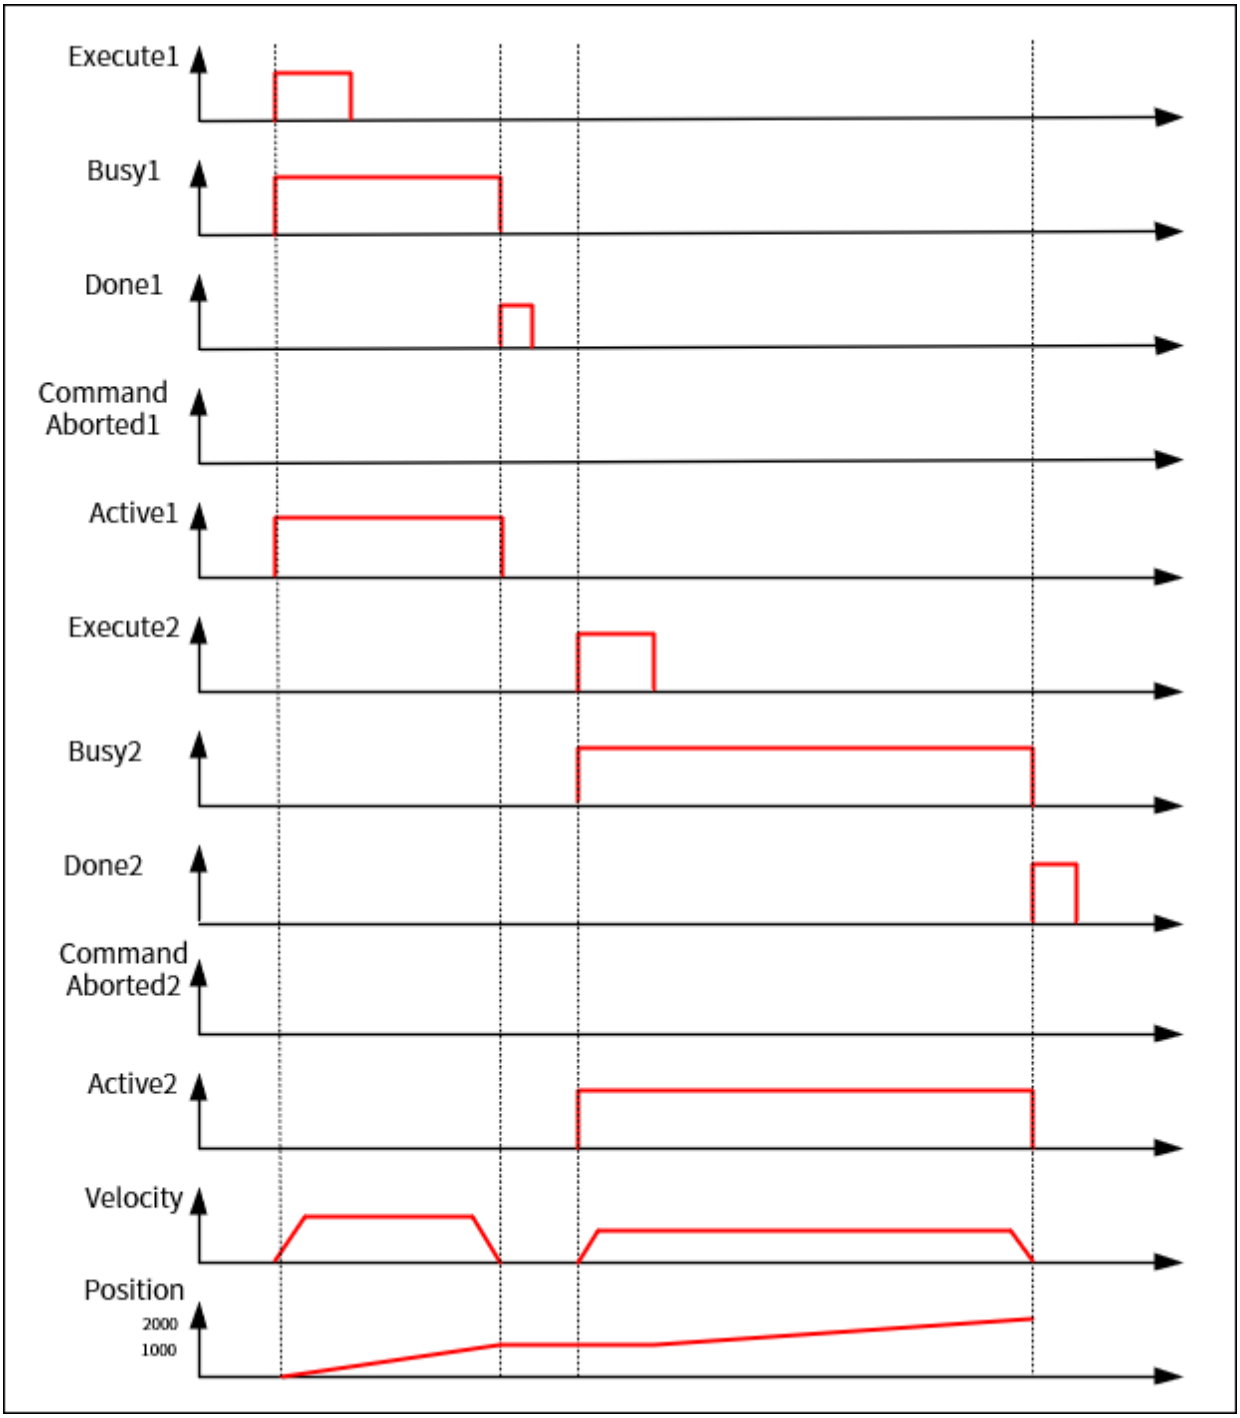
Cam chasing optimization	CamIn	The master and slave axes have an initial position deviation, and the slave axis chases the offset to synchronize.	1. The motion parameters in the instruction ensure continuous position chasing. 2. If a velocity jump occurs at the first node, the dynamic chasing mode can be set to automatically optimize velocity continuity at the start point.	-	1. The position deviation jumps directly.	1. FA ensures continuity of position parameters, preventing stall issues in H5U or InoProshop. 2. The dynamic velocity coupling allows users to ignore velocity jumps during cam curve design, reducing user commissioning difficulty.
Cam triggering mode	CamIn	Start mode	1. Absolute phase trigger 2. Relative phase trigger 3. Immediate trigger	1. Absolute phase trigger 2. Relative phase trigger	1. Absolute phase trigger 2. Relative phase trigger 3. Immediate trigger	FA retains the three triggering modes of H5U, meeting the usage habits of cam users.

Cam deviation compensation	Phase	Slave axis deviation compensation method	1. Motion parameters 2. Master axis phase length	1. Motion parameters	1. Motion parameters	FA has developed its compensation method for master axis phase deviation length. Users no longer need to calculate the entire motion trajectory or various motion parameters. Instead, an object-oriented instruction approach allows users to achieve the desired trajectory without designing complex motion parameters.
New Functions						
Project Description	Function Block or Instruction	Scenario Description	FA Motion Control Instruction	AM600	H5U	Comparison Result
Output the sum or difference of the instruction positions of two axes as a combined instruction position.	MC_Combine axes	Multi-master axis following	New	N/A	N/A	Supports slave axis following mode with multiple master axes.



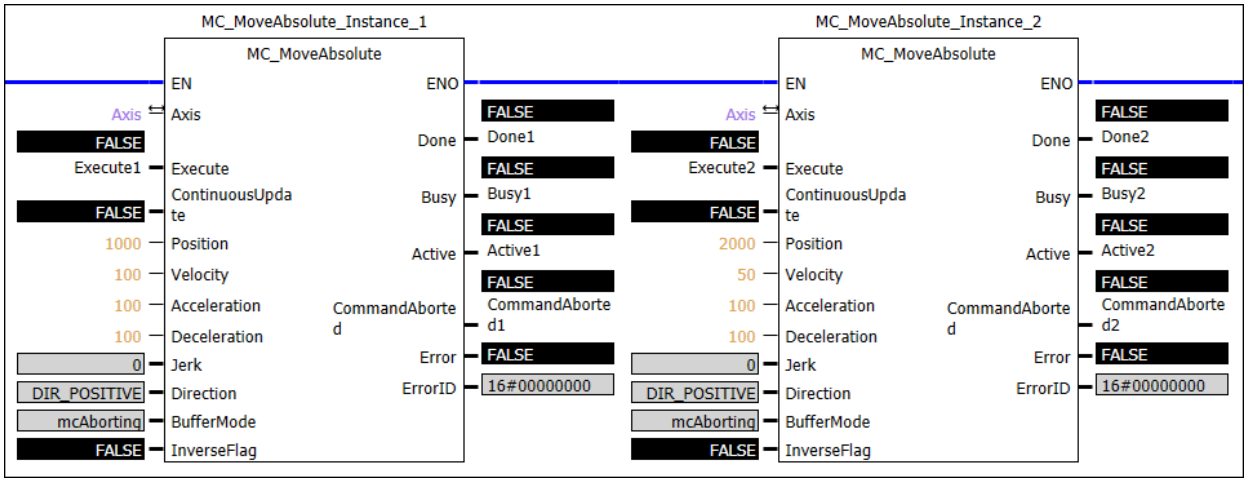
Synchronous positioning	MC_MoveLink	Simplified flying cut	New	N/A	N/A	Simplifies the common four-node flying cut cam into an extremely user-friendly instruction.
Output a specific signal at a specified position	MC_DigitalCamSwitch	Tappet control	Inheritance	N/A	Exists	Inherits the simplified digital cam switch from H5U, streamlining operation while retaining its core functionality.
Periodically record axis parameters to a file.	MC_AxisDiagnosticLog	Parameter recording	Inheritance	Exists	N/A	Logs motion parameters in the controller, facilitating subsequent troubleshooting of trajectories and process adjustments.
Interrupting feed function	MC_MoveFeed	Interrupting feed	New	Exists	N/A	By combining speed, positioning, probing, and relative motion, the engineering design for processes such as marking is simplified.
Reset following error	MC_ResetFollowingError	Following error clearing	New	N/A	N/A	Corrects the servo position deviation.

Execute the emergency stop using a specified method.	MC_ImmediateStop	Emergency stop	New	Exists	N/A	An axis error triggers an emergency stop or shuts down the servo. The introduction of the emergency stop instruction has greatly simplified the engineering design for users.
Monitor axis deviation	MC_InPosition	Accuracy assessment	New	N/A	N/A	Enables users to monitor positioning accuracy more intuitively and easily during motion monitoring.
Halt superimposed motion	MC_HaltSuperImposed	Halting superimposed motion	New	N/A	N/A	Stopping the superimposed motion alone does not affect the main motion, which better aligns with user engineering practices.

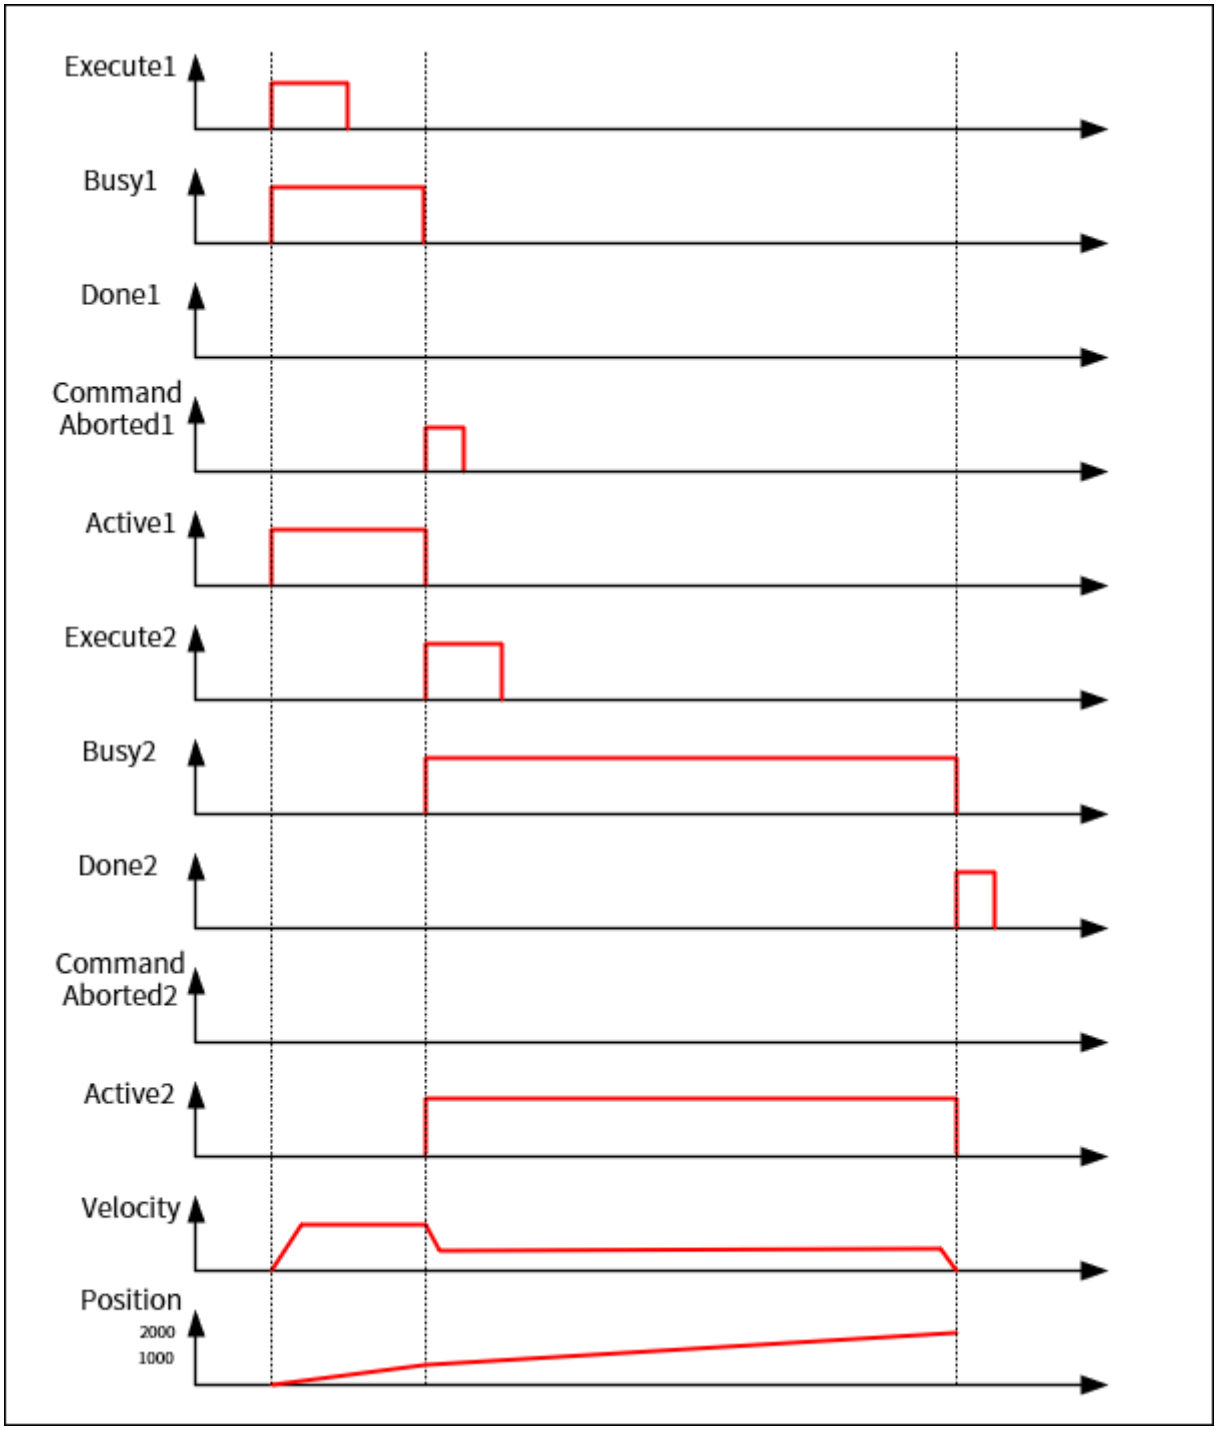


Stop master axis phase shifting	MC_StopPhasing	Stopping phasing compensation	New	N/A	N/A	Stopping only the compensation instruction allows the cam motion to continue running normally, which better aligns with user engineering practices.
Homing operation	MC_Homing WithParameter MC_Homing	Host controller homing	New	N/A	N/A	In addition to the original servo-based homing, a new host controller homing system has been added. Meanwhile, the national standard homing instructions and methods have been refined and simplified so that the system can cover all ten national standard homing methods.

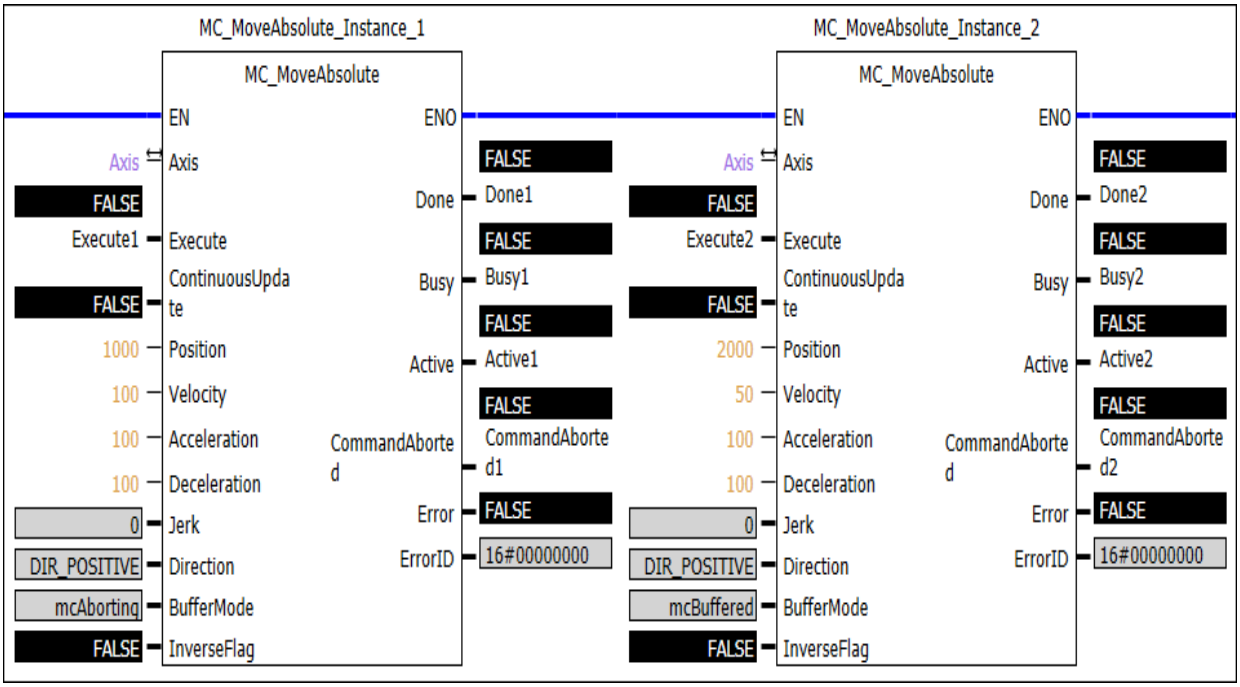
18.3.3.12 Appendix A: Examples of Different Buffer Modes



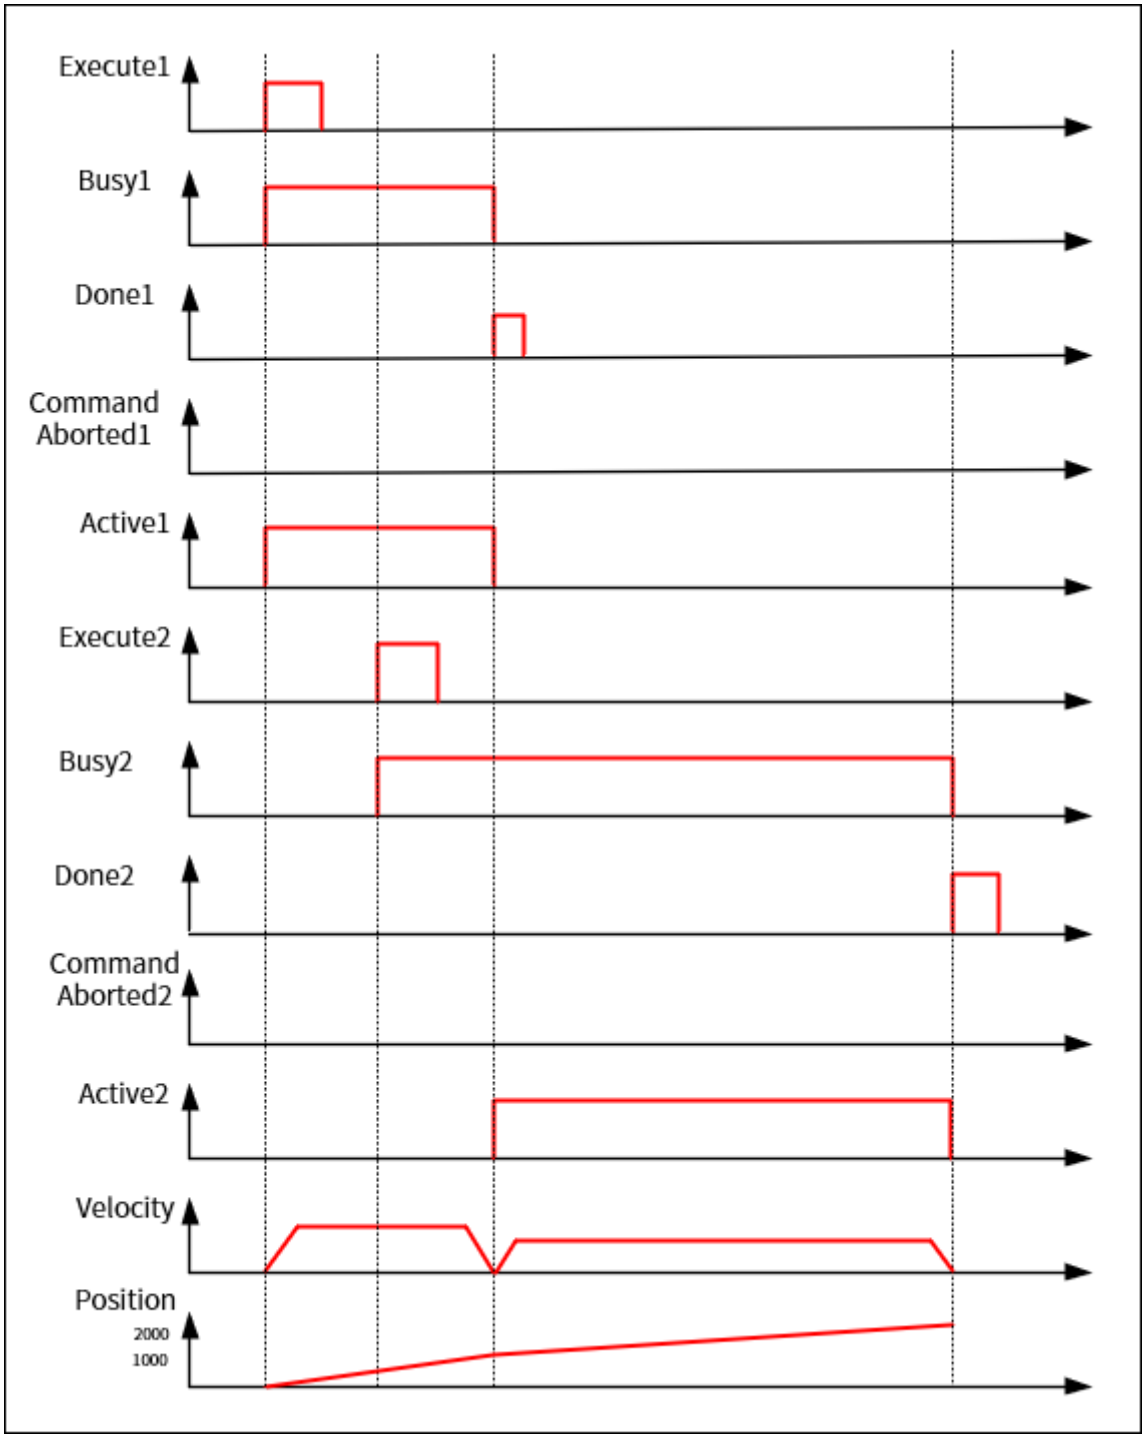
- Example 1: Standard behavior of two absolute movements
  - The figure below shows two basic examples of the MC_MoveAbsolute instructions on the same axis. Their buffer modes are set to "mcAborting".



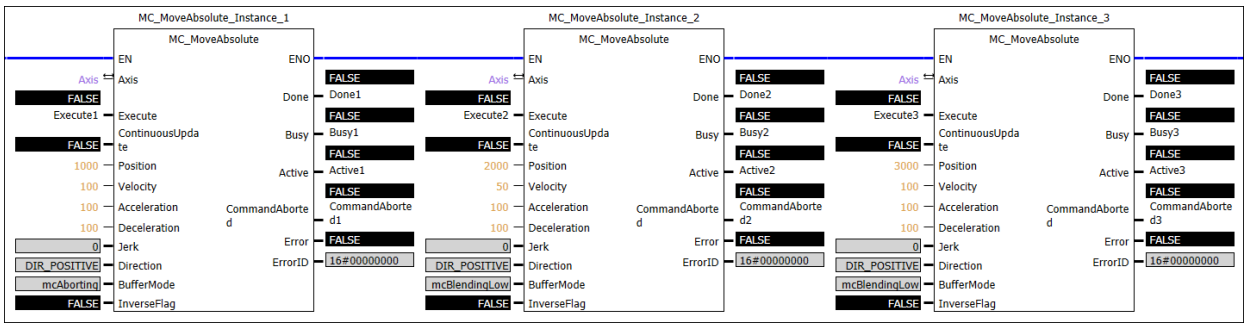
◦ The sequence diagram of the above example shows no interference between the function blocks MC_MoveAbsolute_Instance_1 and MC_MoveAbsolute_Instance_2.



- Example 2: mcAborting
  - The figure below shows two basic examples of the MC_MoveAbsolute instructions on the same axis. Their buffer modes are set to "mcAborting".

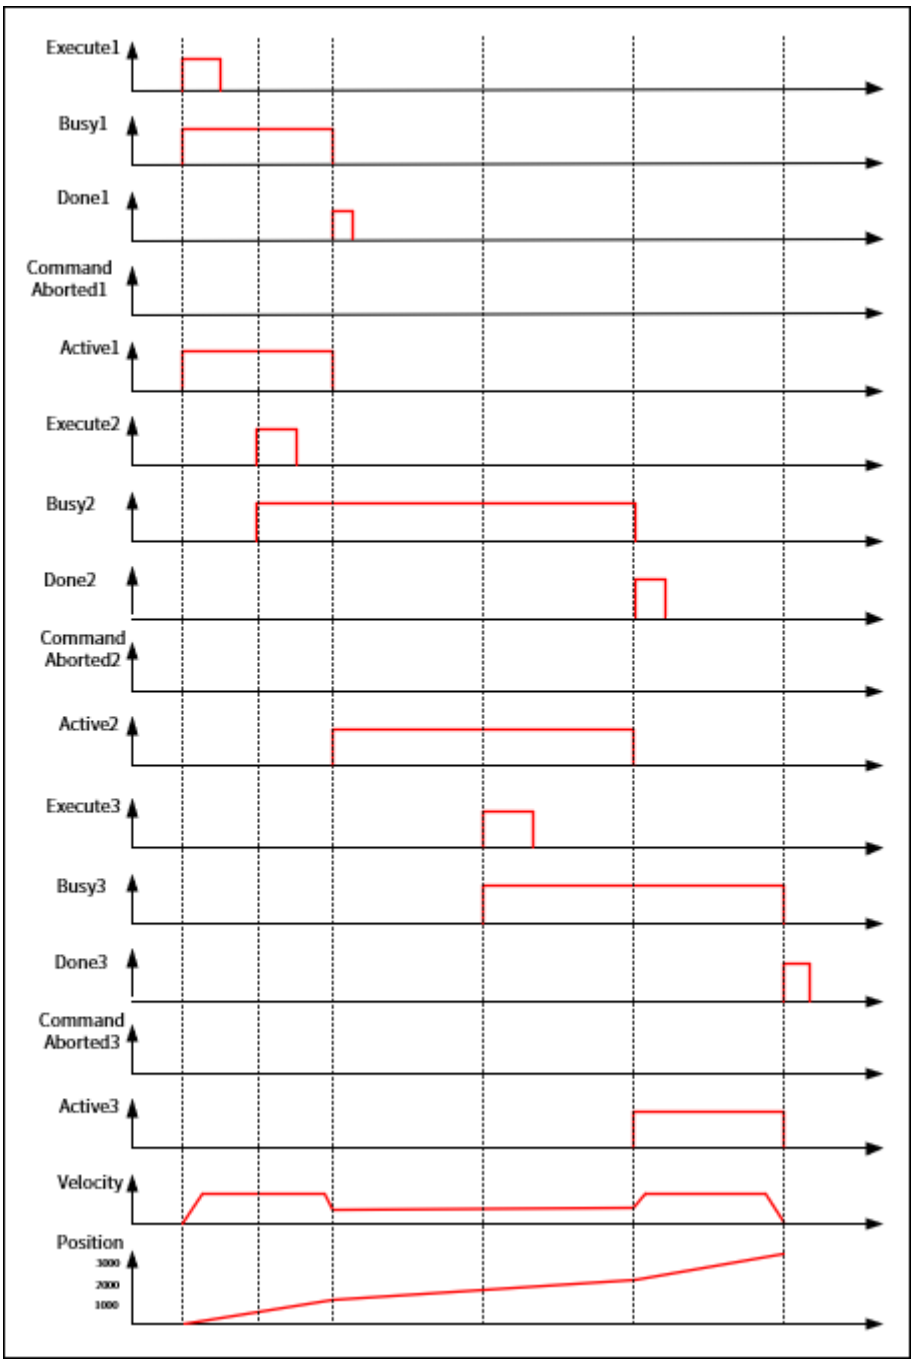


- The sequence diagram of the above example shows that the function block MC_MoveAbsolute_Instance_2 is executed before the function block MC_MoveAbsolute_Instance_1 reaches its setpoint. The currently running function block MC_MoveAbsolute_Instance_1 is moving at a speed of 100, and the function block MC_MoveAbsolute_Instance_2 aborts the function block MC_MoveAbsolute_Instance_1. The subsequently triggered aborting mode function block MC_MoveAbsolute_Instance_2 starts its motion at a speed of 100.



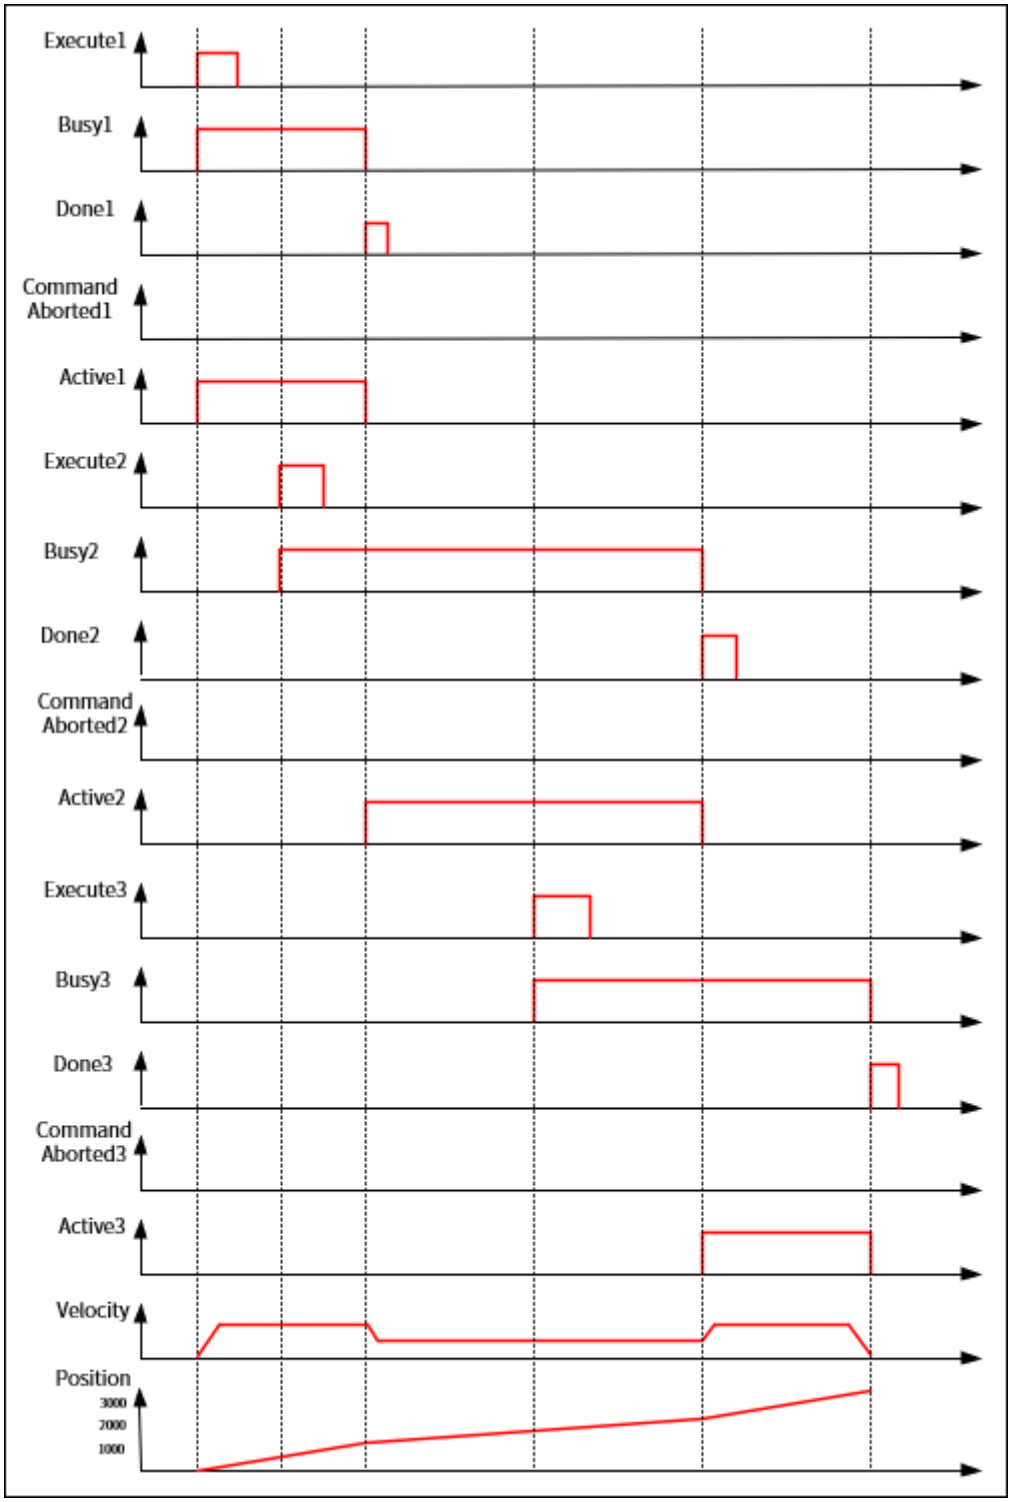
- Example 3: mcBuffered
  - The figure below shows two basic examples of the MC_MoveAbsolute instructions on the same axis. Their buffer modes are set to "mcAborting" and "mcBuffered", respectively.

- The sequence diagram of the above example shows that the function block MC_MoveAbsolute_Instance_2 is executed before the function block MC_MoveAbsolute_Instance_1 reaches its setpoint. When the currently running function block MC_MoveAbsolute_Instance_1 reaches its target position at speed 0, the axis controlled by the subsequently triggered buffer mode function block MC_MoveAbsolute_Instance_2 starts moving, accelerating from 0 to 100.

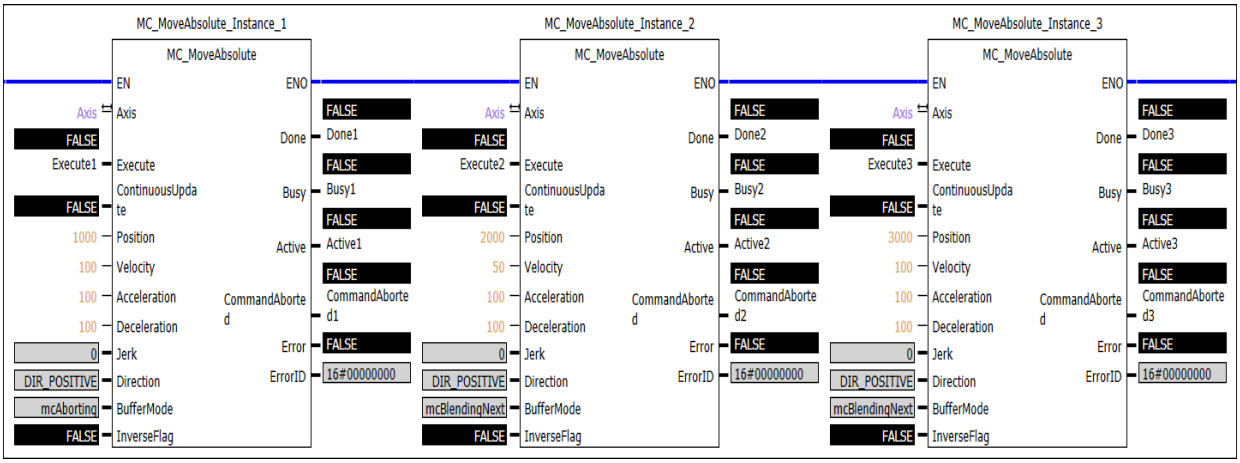


- Example 4: mcBlendingLow
  - The figure below shows three basic examples of the MC_MoveAbsolute instructions on the same axis. Their buffer modes are set to "mcAborting", "mcBlendingLow", and "mcBlendingLow" respectively.

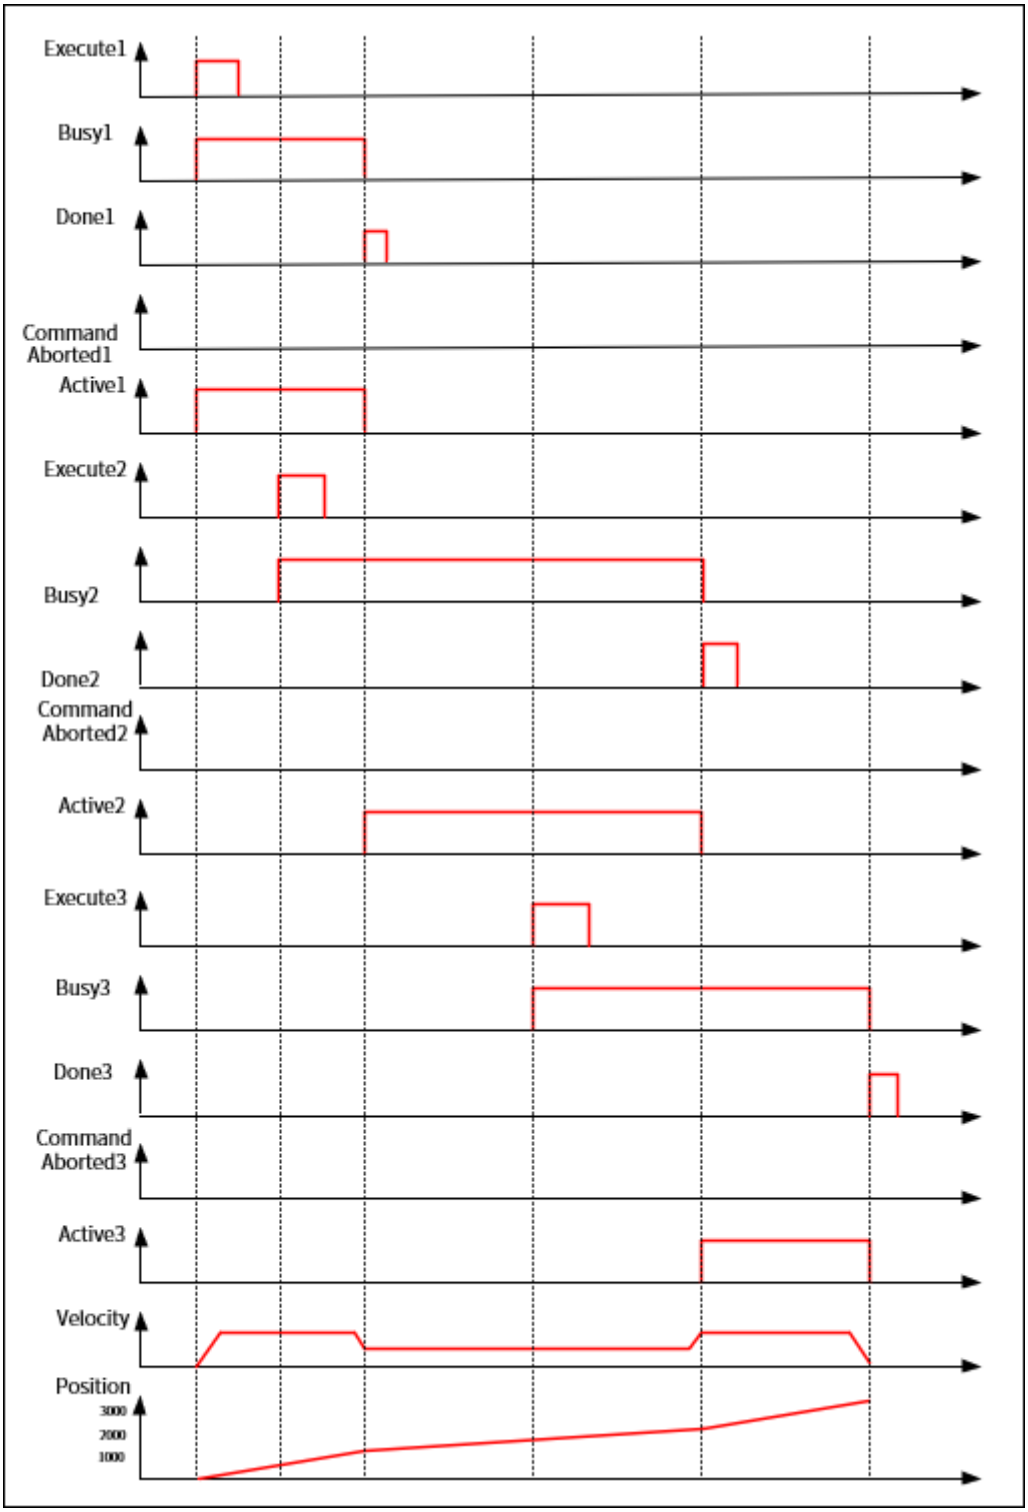
  - The sequence diagram of the above example shows that the function block MC_MoveAbsolute_Instance_2 is executed before the function block MC_MoveAbsolute_Instance_1 reaches its setpoint. Execute the function block MC_MoveAbsolute_Instance_3 before the function



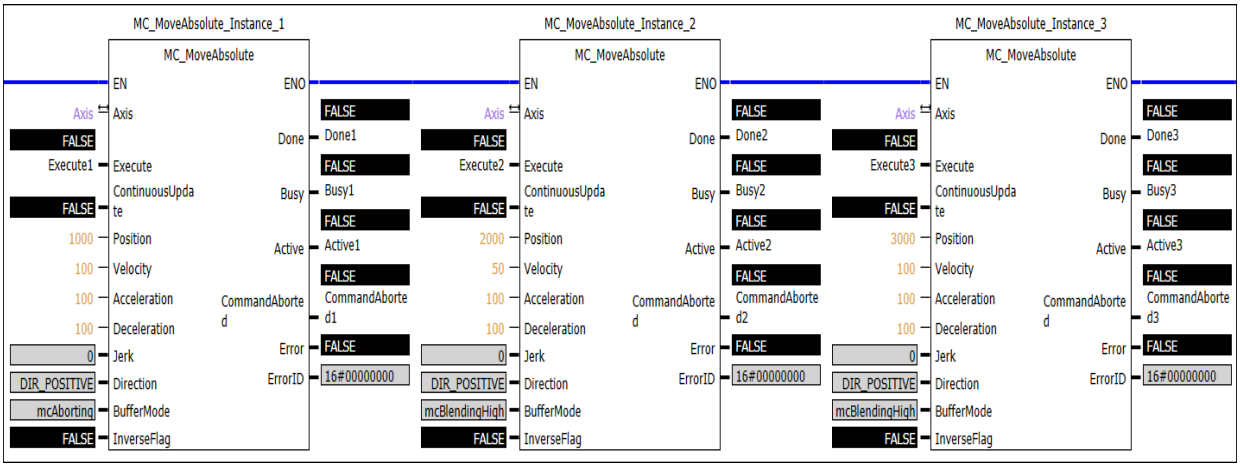
block MC_MoveAbsolute_Instance_2 reaches its setpoint. When the currently running function block MC_MoveAbsolute_Instance_1 reaches its target position at a speed of 50 (using the lower target speed between the current instruction and the buffered instruction), the axis controlled by the subsequently triggered buffer mode function block MC_MoveAbsolute_Instance_2 starts moving at a speed of 50. When the currently running function block MC_MoveAbsolute_Instance_2 reaches its target position at a speed of 50 (using the lower target speed between the current instruction and the buffered instruction), the axis controlled by the subsequently triggered buffer mode function block MC_MoveAbsolute_Instance_3 starts moving at a speed of 50.



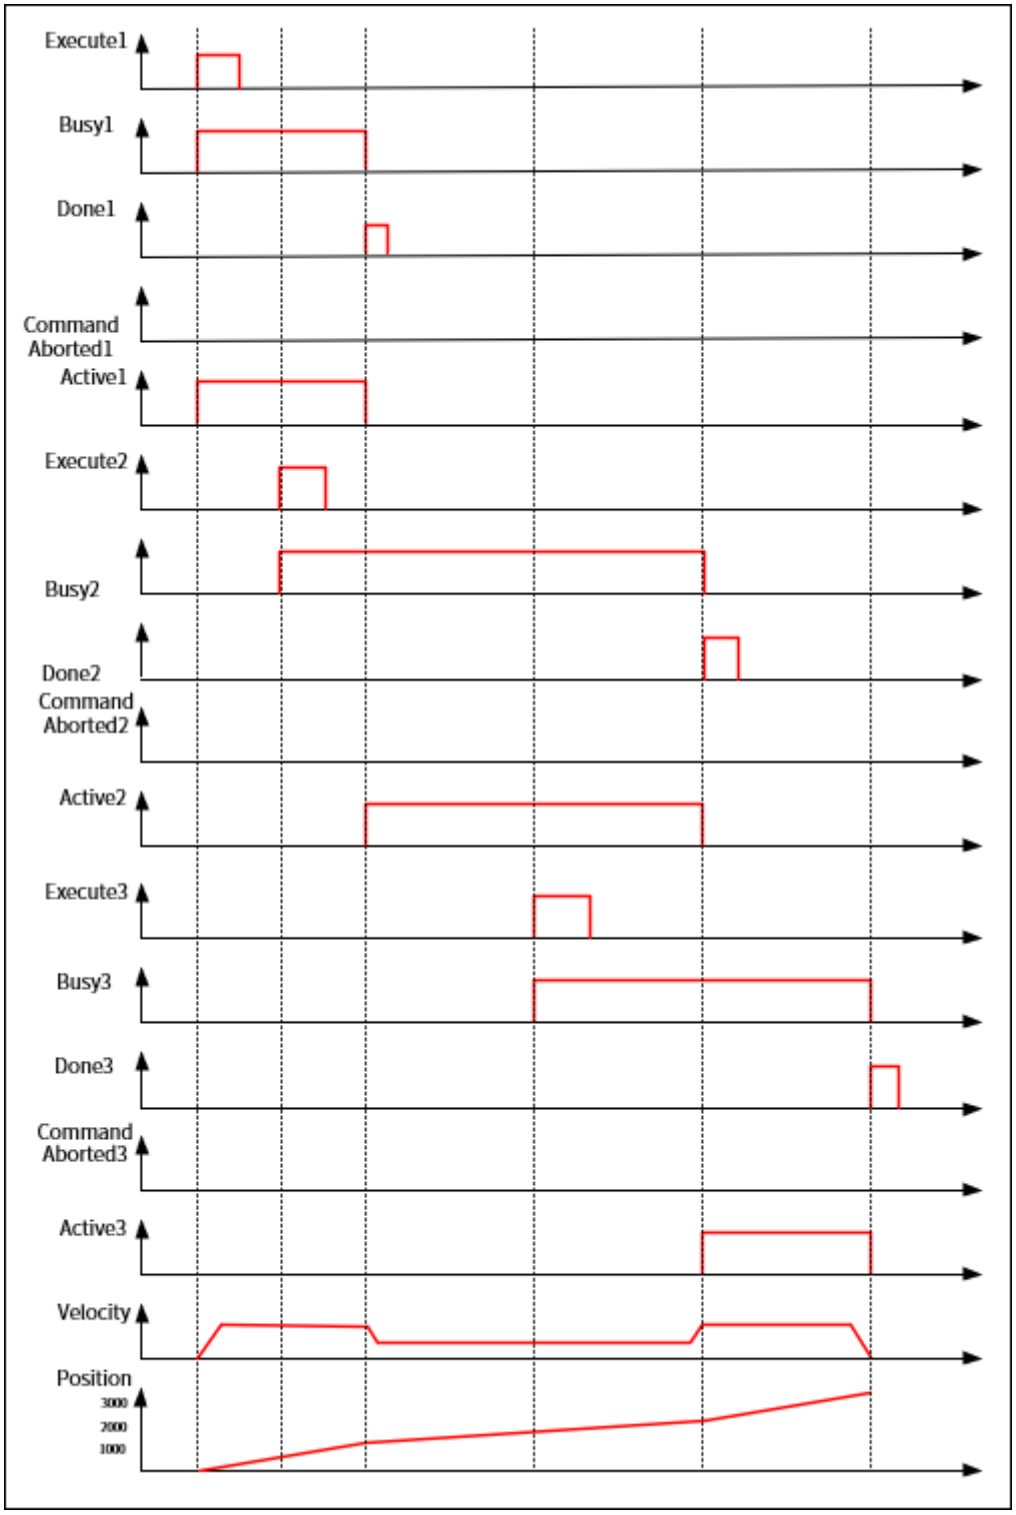
- Example 5: mcBlendingPrevious
  - The figure below shows three basic examples of the MC_MoveAbsolute instructions on the same axis. Their buffer modes are set to "mcAborting", "mcBlendingPrevious", and "mcBlendingPrevious" respectively.



- The sequence diagram of the above example shows that the function block MC_MoveAbsolute_Instance_2 is executed before the function block MC_MoveAbsolute_Instance_1 reaches its setpoint. Execute the function block MC_MoveAbsolute_Instance_3 before the function block MC_MoveAbsolute_Instance_2 reaches its setpoint. When the currently running function block MC_MoveAbsolute_Instance_1 reaches its target position at a speed of 100 (using the target speed for the current instruction), the axis controlled by the subsequently triggered buffer mode function block MC_MoveAbsolute_Instance_2 starts moving at a speed of 100. When the currently running function block MC_MoveAbsolute_Instance_2 reaches its target position at a speed of 50 (using the target speed for the current instruction), the axis controlled by the subsequently triggered buffer mode function block MC_MoveAbsolute_Instance_3 starts moving at a speed of 50.



- Example 6: mcBlendingNext
  - The figure below shows three basic examples of the MC_MoveAbsolute instructions on the same axis. Their buffer modes are set to "mcAborting", "mcBlendingNext", and "mcBlendingNext" respectively.



- The sequence diagram of the above example shows that the function block MC_MoveAbsolute_Instance_2 is executed before the function block MC_MoveAbsolute_Instance_1 reaches its setpoint. Execute the function block MC_MoveAbsolute_Instance_3 before the function block MC_MoveAbsolute_Instance_2 reaches its setpoint. When the currently running function block MC_MoveAbsolute_Instance_1 reaches its target position at a speed of 50 (using the target speed for the buffered instruction), the axis controlled by the subsequently triggered buffer mode function block MC_MoveAbsolute_Instance_2 starts moving at a speed of 50. When the currently running function block MC_MoveAbsolute_Instance_2 reaches its target position at a speed of 100 (using the target speed for the buffered instruction), the axis controlled by the subsequently triggered buffer mode function block MC_MoveAbsolute_Instance_3 starts moving at a speed of 100.

- Example 7: mcBlendingHigh
  - The figure below shows three basic examples of the MC_MoveAbsolute instructions on the same axis. Their buffer modes are set to "mcAborting", "mcBlendingHigh", and "mcBlendingHigh" respectively.

- The sequence diagram of the above example shows that the function block MC_MoveAbsolute_Instance_2 is executed before the function block MC_MoveAbsolute_Instance_1 reaches its setpoint. Execute the function block MC_MoveAbsolute_Instance_3 before the function block MC_MoveAbsolute_Instance_2 reaches its setpoint. When the currently running function block MC_MoveAbsolute_Instance_1 reaches its target position at a speed of 100 (using the higher target speed between the current instruction and the buffered instruction), the subsequently triggered buffer mode function block MC_MoveAbsolute_Instance_2 starts moving at a speed of 100. When the currently running MC_MoveAbsolute_Instance_2 reaches its target position at a speed of 100 (using the higher target speed between the current instruction and the buffered instruction), the subsequently triggered buffer mode function block MC_MoveAbsolute_Instance_3 starts moving at a speed of 100.

- **Function**

  The motor control block controls on-site motors using single DO high/low level signals or dual DO pulse signal. It is applicable to devices with up to two status feedback signals (On/Run or Off/Stop) and is typically applied to the control of motors and similar equipment.

  - **Operation mode**

Operation Mode	Action
Automatic	Outputs signals automatically based on automatic input commands.
Manual	Outputs signals according to manual input commands.
Interlock	When the interlock switch is triggered, the interlock safety value is output. (safety value is configurable)
Local	In this mode, the device is started/stopped locally via the control box located at the local site or controlled by switch. The system tracks the actual status of the device. If no valid feedback is received from the device, the safety value is output.

Priority order: Local > Interlock > Manual > Automatic

- **Bumpless switchover**

Operation Mode	Action
Local → Automatic	In Local mode, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). In Automatic mode, the output is the auto-calculated value directly. This is a bumpy switchover.
Local → Manual	In Local mode, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). The manual value is interlocked with the output to ensure bumpless switchover.
Local → Interlock	In Local mode, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). In Interlock mode, the output is the interlock safety value directly. This is a bumpy switchover.
Interlock → Automatic	In Interlock mode, the output is the interlock safety value directly. In Automatic mode, the output is the auto-calculated value directly. This is a bumpy switchover.
Interlock → Manual	In Interlock mode, the manual value is interlocked with the interlock safety value to ensure bumpless switchover.
Interlock → Local	In Interlock mode, the output is the interlock safety value. At the moment of switching to Local mode without any operation, the on-site device must also be in the interlock safety value state. After that, when the device is operated on-site, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). This is a bumpless switchover.
Manual → Automatic	The output switches directly from the manual output value to the auto-calculated value. This is a bumpy switchover.
Manual → Interlock	The output switches directly from the manual output value to the interlock safety value. This is a bumpy switchover.
Manual → Local	In Manual mode, the output is the current manual value. At the moment of switching to Local mode without any operation, the on-site device must also be in the manual value state. After that, when the device is operated on-site, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). This is a bumpless switchover.
Automatic → Manual	In Automatic mode, the output is the auto-calculated value. At this time, the manual value is interlocked with the auto-calculated value to ensure bumpless switchover.
Automatic → Interlock	The output switches directly from the auto-calculated value to the interlock safety value. This is a bumpy switchover.

Operation Mode	Action
Automatic → Local	In Automatic mode, the output is the auto-calculated value. At the moment of switching to Local mode without any operation, the on-site device must also be in the state of automatic calculation. After that, when the device is operated on-site, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). This is a bumpless switchover.

- **Timeout alarm**

  Timeout alarm triggers if the function block status feedback disagrees with its output beyond the configured timeout period. Prerequisite: The device has running status feedback.

  For example, the function block issues an "open" instruction to the on-site motor. If the device responds normally and starts within the set time, it returns the startup status to the function block – this is the normal startup process. If no correct feedback is received within the set time, the device is considered not properly opened, triggering a timeout alarm. The timeout detection period is configured by the parameter "Config. TimeOutT", which can be configured based on the actual device response.

  Note: Timeout alarm clears automatically when valid feedback is received or command is switched with no manual acknowledgment required.

- **Inspection (Stop Running)**

  After an inspection command is issued, the interlock safety value ILIN is directly output. No automatic, manual, or interlock commands are accepted, ensuring the safety of on-site personnel. In addition, on-site fault signals from will not generate any alarm messages.

- **Start permit**

  When the equipment is in the stopped status and ready to start, the motor can only be started if the st art conditions are met.

  If the start conditions are met and there is a start command, but the feedback already indicates a running status, a restart is not allowed, and the output remains unchanged.

- **Output function**

  One DO level signal can be output to the site to control the opening and closing of motors or valves; alternatively, two pulse-type DO signals can also be output to separately control the motors or valves.

  When Open Signal = TRUE and Close Signal = FALSE, the motor is started; when Open Signal = FALSE and Close Signal = TRUE, the motor is stopped. The pulse width is adjustable via Config.OutPulseT. The pulse stops once the set time elapses.

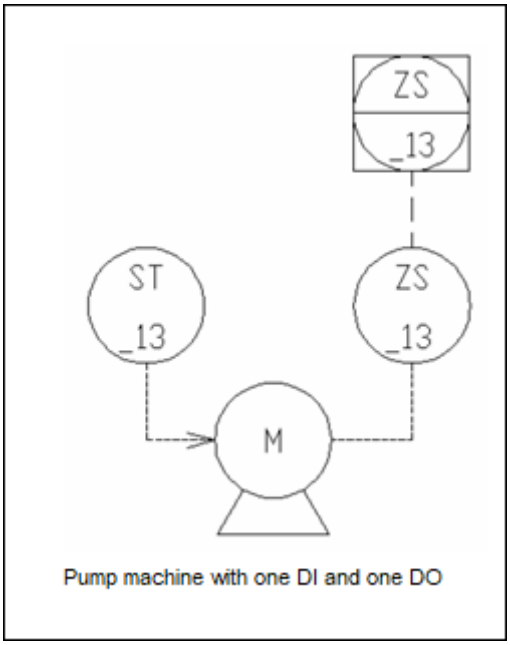
- **Deviation alarm (feedback fluctuation)**

  If the running signal is lost during motor operation, an alarm is triggered.

  For example: If the device is started but the feedback changes to stop, a "feedback open-to-close" alarm is triggered with state set to "feedback error". If the device is stopped but the feedback changes to start, a "feedback close-to-open" alarm is triggered with state set to "feedback error". Deviation alarms can clear automatically when the state returns to normal.

- **Motor trip fault**

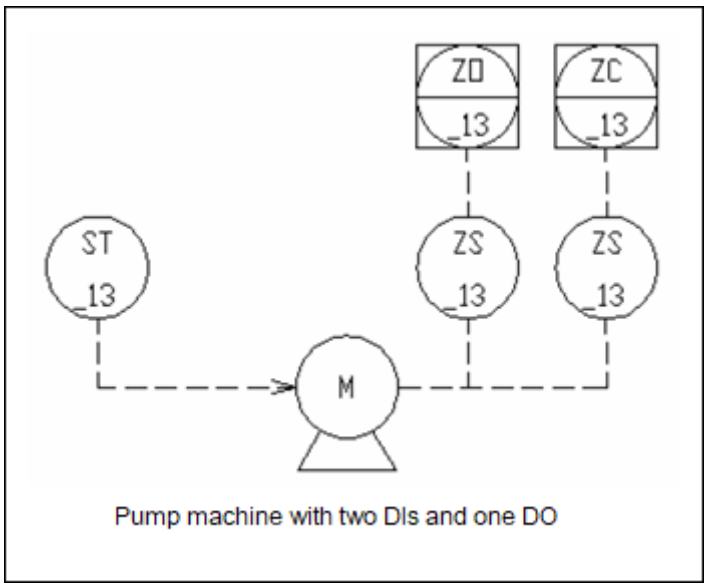
It is used for motor overheat protection to stop the motor (Trip = 1). When a fault occurs, it outputs the interlock safety value and switches to manual mode.



Example of working conditions:

Working Condition	OUT	OperMode (Operation Mode)	State (Operation State)	ErrorBits (Error Output) Bitwise Analysis
Initial status		Determined by the current specific mode: 0: Manual 1: Automatic 2: Interlock 3: Local 4: Inspection	0: Initial status	0
Start command issued, with start feedback received within the timeout period	Output start command Output the start pulse of the set time		1: Started	0
Start command issued, with no start feedback received within the timeout period	Output start command Output the start pulse of the set time		2: Starting	bit0: Start timeout
Stop command issued, with stop feedback received within the timeout period	Output stop command Output the stop pulse of the set time		3: Stopped	0
Stop command issued, with no stop feedback received within the timeout period	Output stop command Output the stop pulse of the set time		4: Stopping	Bit1: Stop timeout
In the started status, feedback changes from start to stop.	/		5: Feedback error	Bit2: Feedback from start to stop.
In the stopped status, feedback changes from stop to start.	/			Bit3: Feedback from stop to start
Trip=1 Motor overheat fault	Output safety value	0: Manual	Set based on the actual feedback	Bit5: Motor overheat alarm
Start feedback and stop feedback are both 1	-	-	5: Feedback error	Bit4: Dual 1 feedback error

Working Condition	OUT	OperMode (Operation Mode)	State (Operation State)	ErrorBits (Error Output) Bitwise Analysis
After the command is issued, start feedback and stop feedback are both 0	-	-	5: Feedback error	



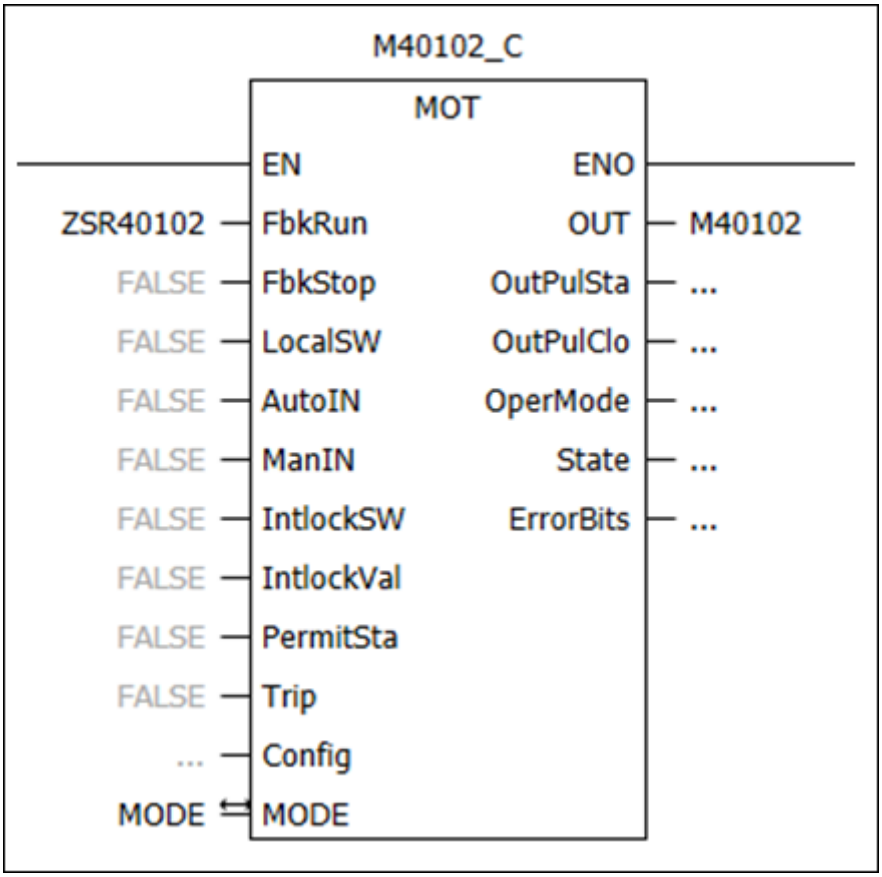
- **Application instance**
  - Single DI single DO pump

    There is a fan drive on-site requires start/stop control of this motor drive. A pump operation fault alarm must be triggered without confirmation if a mismatch occurs between the pump status feedback and the control output after the stroke time has elapsed.

  - Dual DI single DO pump

    A motor on-site requires start/stop control of the pump. A pump operation fault alarm must be triggered without confirmation if a mismatch occurs between the pump status feedback and the control output after the stroke time has elapsed.

Pump machine with two DIs and one DO

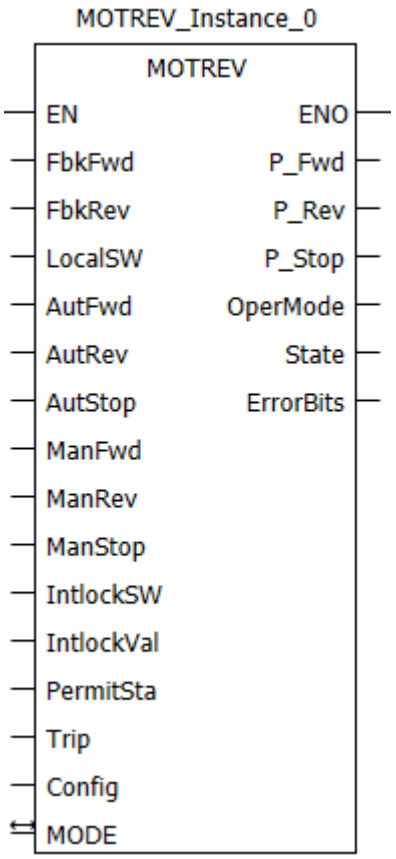


◦ Dual DI dual DO pump

A high-power motor one-site requires start/stop control of the pump. A pump operation fault alarm must be triggered without confirmation if a mismatch occurs between the pump status feedback and the control output after the stroke time has elapsed.

Dual-DI dual-DO pump diagram

Control scheme configuration



Example

No.	Instance	Type	Remarks
1	M40102_C	Motor control function block	-
2	M40102	DO output	-
3	ZSR40102	DI feedback input	In the configuration information, FbkRunEN = TRUE is valid when there is start feedback information.

18.3.4.3 MOTREV

- **Function**

  The bidirectional motor control block refers to the on-site motor equipment being controlled by three switch outputs (pulse signals), that is: three DO pulse signals control the motor's forward, reverse, and stop. Forward and reverse cannot be directly switched; they must go through the stop status. Applicable to devices with at most two status feedback signals (forward, reverse), typically used in motor and motor control.

  - **Operation mode**

Operation Mode	Action
Automatic	Output based on automatic input command.
Manual	Output based on manual input command.
Interlock	When the interlock switch is triggered, the interlock safety value (configurable) is output directly.
Local	In this mode, the device is started/stopped or switched on/off locally via the control box located at the local site. With correct feedback, the system tracks the actual status of the device.

Priority order: Local > Interlock > Manual > Automatic

- **Bumpless switchover**

Operation Mode	Action
Local → Automatic	In Local mode, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). In Automatic mode, the output is the auto-calculated value directly. This is a bumpy switchover.
Local → Manual	In Local mode, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). The manual value is interlocked with the output to ensure bumpless switchover.
Local → Interlock	In Local mode, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). In Interlock mode, the output is the interlock safety value directly. This is a bumpy switchover.
Interlock → Automatic	In Interlock mode, the output is the interlock safety value directly. In Automatic mode, the output is the auto-calculated value directly. This is a bumpy switchover.
Interlock → Manual	In Interlock mode, the manual value is interlocked with the interlock safety value to ensure bumpless switchover.
Interlock → Local	In Interlock mode, the output is the interlock safety value. At the moment of switching to Local mode without any operation, the on-site device must also be in the interlock safety value state. After that, when the device is operated on-site, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). This is a bumpless switchover.
Manual → Automatic	The output switches directly from the manual output value to the auto-calculated value. This is a bumpy switchover.
Manual → Interlock	The output switches directly from the manual output value to the interlock safety value. This is a bumpy switchover.

Operation Mode	Action
Manual → Local	In Manual mode, the output is the current manual value. At the moment of switching to Local mode without any operation, the on-site device must also be in the manual value state. After that, when the device is operated on-site, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). This is a bumpless switchover.
Automatic → Manual	In Automatic mode, the output is the auto-calculated value. At this time, the manual value is interlocked with the auto-calculated value to ensure bumpless switchover.
Automatic → Interlock	The output switches directly from the auto-calculated value to the interlock safety value. This is a bumpy switchover.
Automatic → Local	In Automatic mode, the output is the auto-calculated value. At the moment of switching to Local mode without any operation, the on-site device must also be in the state of automatic calculation. After that, when the device is operated on-site, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). This is a bumpless switchover.

- **Timeout alarm**

  A timeout alarm is triggered when the status feedback of the function block does not match its output within the set timeout period.

  For example, the function block issues a "forward" instruction to the on-site motor. If the device responds normally and forward within the set time, it returns the forward status to the function block - this is the normal forward process. If no correct feedback is received within the set time, the device is considered not properly forwarded, triggering a timeout alarm. The timeout detection period is configured by the parameter "Config. TimeOutT", which can be configured based on the actual device response.

  Note: Timeout alarm clears automatically when valid feedback is received or command is switched with no manual acknowledgment required.

- **Inspection (Stop Running)**

  After an inspection command is issued, the interlock safety value ILIN is directly output. No automatic, manual, or interlock commands are accepted, ensuring the safety of on-site personnel. In addition, on-site fault signals from will not generate any alarm messages.

- **Start permit**

  When the device is in the stop position and ready for forward running or reverse running, the motor can only start if the start conditions are met.

- **Output function**

  Three pulse-type DO signals are output to the site to control the on-site motors.

P_Fwd (Forward)	P_Rev (Reverse)	P_Stop (Stop)	Output Command
1	0	0	Forward start pulse
0	1	0	Reverse start pulse

P_Fwd (Forward)	P_Rev (Reverse)	P_Stop (Stop)	Output Command
0	0	1	Stop pulse

The pulse width is adjustable via Config.OutPulseT. The pulse stops once the set time elapses.

- **Deviation alarm (feedback fluctuation)**

  If the running signal is lost during motor operation, an alarm is triggered.

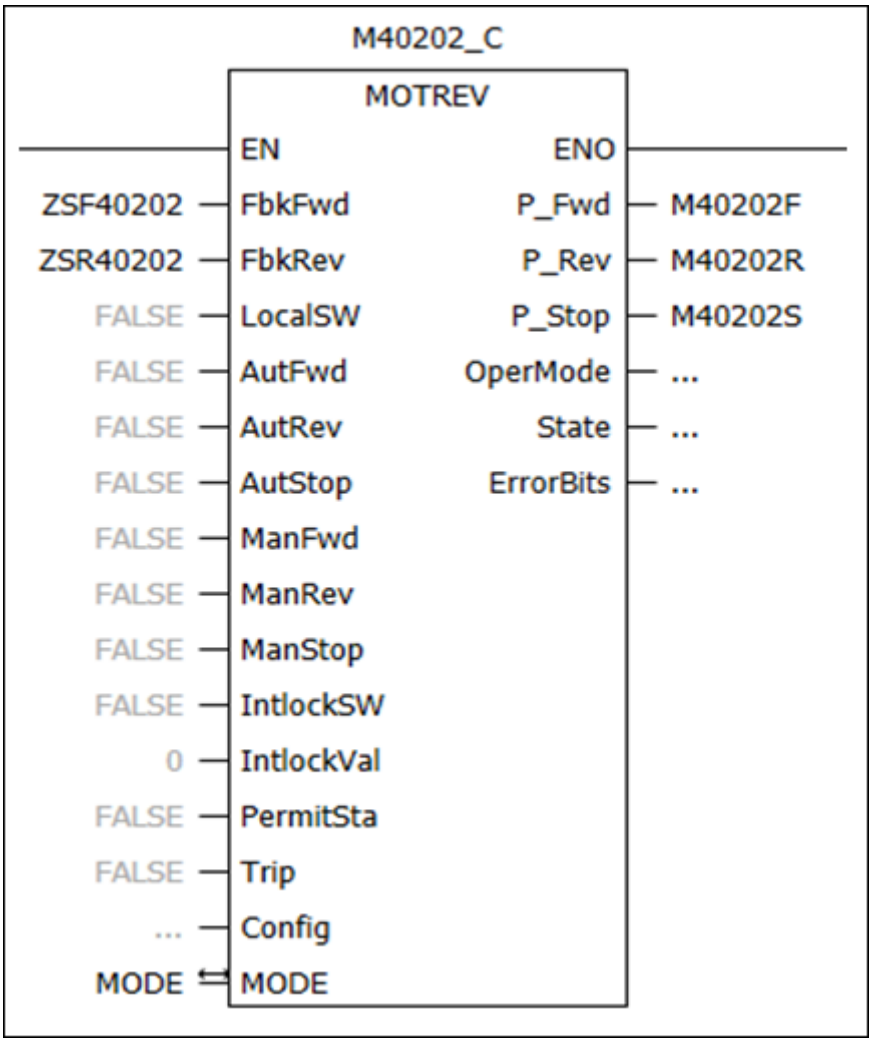
  For example: If the device is in forward running but the feedback changes to stop, a "feedback forward-to-stop" alarm is triggered and the state is set to "feedback error". If the device is in reverse running but the feedback changes to forward, a "feedback reverse-to-forward" alarm is triggered and the state is set to "feedback error". Deviation alarms can clear automatically when the state returns to normal.

- **Motor trip fault**

  It is used for motor overheat protection to stop the motor (Trip=0). When a fault occurs, it outputs the interlock safety value and switches to manual mode.

  Example of working conditions:

Working Condition	OUT	OperMode (Operation Mode)	State (Operation State)	ErrorBits (Error Output) Bitwise Analysis
Initial status	-	Determined by the current specific mode: 0: Manual 1: Automatic 2: Interlock 3: Local 4: Inspection	0: Initial status	0
Start (forward or reverse) command issued, with start (forward or reverse) feedback received within the timeout period	Output start (forward or reverse) command Output the pulse of the set time		1: Forwarded 3: Reversed	0
Start (forward or reverse) command issued, with no start (forward or reverse) feedback received within the timeout period	Output start (forward or reverse) command Output the pulse of the set time		2: Forwarding 4: Reversing	Bit0: Forward timeout Bit1: Reverse timeout
Stop command issued, with stop feedback received within the timeout period	Output stop command Output the stop pulse of the set time		5: Stopped	0
Stop command issued, with no stop feedback received within the timeout period	Output stop command Output the stop pulse of the set time		6: Stopping	Bit2: Stop timeout



Working Condition	OUT	OperMode (Operation Mode)	State (Operation State)	ErrorBits (Error Output) Bitwise Analysis
In the started state (forwarded or reversed), feedback changes from start to stop	/		7: Feedback error	bit3: Feedback from forward to reverse bit4: Feedback from forward to stop bit5: Feedback from reverse to forward bit6: Feedback from reverse to stop
In the stopped state (forward or reverse), feedback changes from stop to start	/			bit7: Feedback from stop to forward bit8: Feedback from stop to reverse
Trip=1 Motor overheat fault	Output safety value	0: Manual	Set based on the actual feedback	Bit9: Motor overheat alarm
Forward feedback and reverse feedback are both 1	-	Determined by the current specific mode	5: Feedback error	Bit11: Dual 1 feedback error
There are multiple input commands, such as forward command and stop command	Remain		-	bit10: Input command error

- **Application instance**
  - **Dual DI triple DO pump machine**

    A bidirectional motor at a site requires the implementation of forward, reverse, and stop control for the motor.

Control scheme configuration

<tr><td>State</td><td>Output state</td><td>BYTE</td><td>-</td><td>1: Start.
2: Stop.</td></tr>
</table>

- **Function**

  It is typically used for the simple control of on-site valve device without feedback signals, including one input command, two pulse output commands, and one level output command.

  - **Operation mode**

    The "MODE" supports both manual and automatic modes. In the automatic mode ("MODE = TRUE"), the output directly responds to the input, and the outpu pulse width of command can be configured via the "PlusWt" parameter.

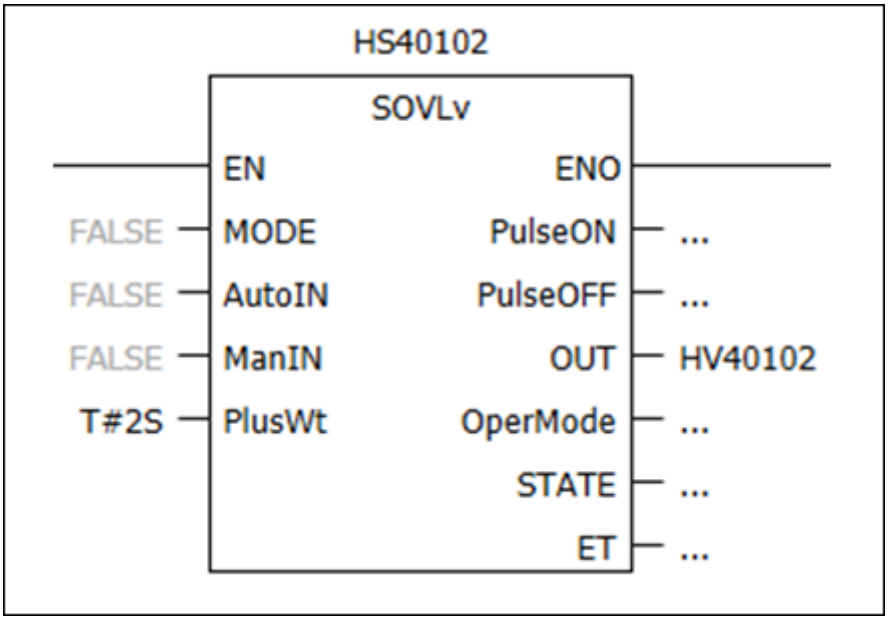
  - **Bumpless switchover**

    Automatic-to-manual switching is bumpless, while manual-to-automatic switching responds directly to the automatic command, which is a bumpy switchover.

- **Application instance**
  - Single DO valve control

    There is a pneumatic valve switch control on a certain device, with no feedback signal from the valve, requiring the implementation of the valve's on-off control.

Single DO valve diagram



◦ Single DO pump stop control

At a certain chemical plant site, there is no feedback information from the pump, requiring the implementation of the pump's start-stop control.

Single-DO pump shutdown diagram

	OutPulClo	Close pulse output	BOOL	FALSE	Close pulse output.
	OperMode	Operation mode	BYTE	0	0: Manual. 1: Automatic. 2: Interlock. 3: Local. 4: Inspection.
	State	Operation state	BYTE	0	0: Initial. 1: Started. 2: Starting. 3: Stopped. 4: Stopping. 5: Feedback error.
	ErrorBits	Error output	WORD	0	bit0: Start timeout. bit1: Stop timeout. bit2: Feedback from start to stop. bit3: Feedback from stop to start. bit4: Dual-1 feedback error.

- **Function**

  The Valve Control Block controls on-site valves using single DO high/low level signals or dual DO pulse signals. It applies to devices with up to two status feedback signals (open/close limit feedback) and is usually used for various valve control applications.

  - **Operation mode**

Operation Mode	Action
Automatic	Output based on automatic input command.
Manual	Output based on manual input command.
Interlock	When the interlock switch is triggered, the interlock safety value (configurable) is output directly.
Local	In this mode, the device is started/stopped locally via the control box located at the local site or c ontrolled by switch. The system tracks the actual status of the device. If no valid feedback is received from the device, the safety value is output.

Priority order: Local > Interlock > Manual > Automatic

- **Bumpless switchover**

Operation Mode	Action
Local → Automatic	In Local mode, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). In Automatic mode, the output is the auto-calculated value directly. This is a bumpy switchover.
Local → Manual	In Local mode, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). The manual value is interlocked with the output to ensure bumpless switchover.
Local → Interlock	In Local mode, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). In Interlock mode, the output is the interlock safety value directly. This is a bumpy switchover.
Interlock → Automatic	In Interlock mode, the output is the interlock safety value directly. In Automatic mode, the output is the auto-calculated value directly. This is a bumpy switchover.
Interlock → Manual	In Interlock mode, the manual value is interlocked with the interlock safety value to ensure bumpless switchover.
Interlock → Local	In Interlock mode, the output is the interlock safety value. At the moment of switching to Local mode without any operation, the on-site device must also be in the interlock safety value state. After that, when the device is operated on-site, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). This is a bumpless switchover.
Manual → Automatic	The output switches directly from the manual output value to the auto-calculated value. This is a bumpy switchover.
Manual → Interlock	The output switches directly from the manual output value to the interlock safety value. This is a bumpy switchover.

Operation Mode	Action
Manual → Local	In Manual mode, the output is the current manual value. At the moment of switching to Local mode without any operation, the on-site device must also be in the manual value state. After that, when the device is operated on-site, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). This is a bumpless switchover.
Automatic → Manual	In Automatic mode, the output is the auto-calculated value. At this time, the manual value is interlocked with the auto-calculated value to ensure bumpless switchover.
Automatic → Interlock	The output switches directly from the auto-calculated value to the interlock safety value. This is a bumpy switchover.
Automatic → Local	In Automatic mode, the output is the auto-calculated value. At the moment of switching to Local mode without any operation, the on-site device must also be in the state of automatic calculation. After that, when the device is operated on-site, the output interlocks with the running status of the on-site device (if there is no feedback or the feedback status is correct, the output remains unchanged). This is a bumpless switchover.

- **Timeout alarm**

  Timeout alarm triggers if the function block status feedback disagrees with its output beyond the configured timeout period. Prerequisite: The device has running status feedback.

  For example, the function block issues an "open" instruction to the on-site valve. If the device responds normally and starts within the set time, it returns the startup status to the function block - this is the normal startup process. If no correct feedback is received within the set time, the device is considered not properly opened, triggering a timeout alarm. The timeout detection period is configured by the parameter "Config. TimeOutT", which can be configured based on the actual device response.

  Note: Timeout alarm clears automatically when valid feedback is received or command is switched with no manual acknowledgment required.

  Feedback status and configuration:

Feedback Switch Settings	Feedback Status	
FbkRunEN = TRUE FbkStopEN = FALSE	FbkRun = TRUE	Open feedback
	FbkRun = FALSE	Close feedback
FbkRunEN = FALSE FbkStopEN = TRUE	FbkStop = TRUE	Close feedback
	FbkStop = FALSE	Open feedback
FbkRunEN = TRUE FbkStopEN = TRUE	FbkRun = TRUE FbkStop = FALSE	Open feedback

Feedback Switch Settings	Feedback Status	
	FbkRun = FALSE FbkStop = TRUE	Close feedback
	FbkRun = TRUE FbkStop = TRUE	Feedback error
FbkRunEN = FALSE FbkStopEN = FALSE	No feedback signal	No feedback signal (e.g., send Open instruction → time elapses → deemed Open)

- **Maintenance**

  After a maintenance command is issued, the interlock safety value ILIN is directly output. No automatic, manual, or interlock commands are accepted, ensuring the safety of on-site personnel. In addition, on-site fault signals from will not generate any alarm messages.

- **Output function**

  One DO level signal can be output to the site to control the opening and closing of valves; alternatively, two pulse-type DO signals can also be output to separately control the opening and closing.

  When Open Signal = TRUE and Close Signal = FALSE, the valve is opened; when Open Signal = FALSE and Close Signal = TRUE , the valve is closed. The pulse width is adjustable via Config.OutPulseT. The pulse stops once the set time elapses.

- **Deviation alarm (feedback fluctuation)**

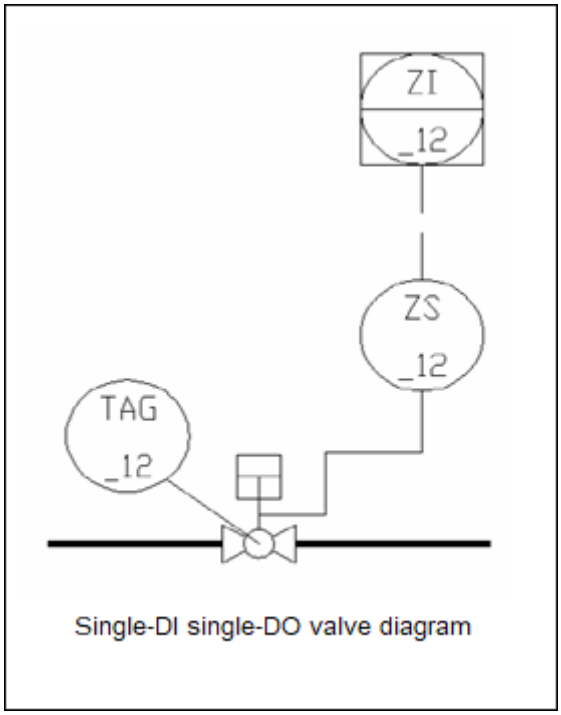
  If the operating signal is lost for more than the set time during motor operation, an alarm is triggered.

- **Numerical display function**

  Pressure and flow in the valve pipeline are displayed (for monitoring only, not used for control).

  Example of working conditions:

Working Condition	OUT	OperMode (Operation Mode)	State (Operation State)	ErrorBits (Error Output) Bitwise Analysis
Initial status	-	Determined by the current specific mode: 0: Manual 1: Automatic 2: Interlock 3: Local 4: Inspection	0: Initial status	0
Open command issued, with open feedback within timeout period	Output open command Output open pulse of configured duration		1: Open limit	0



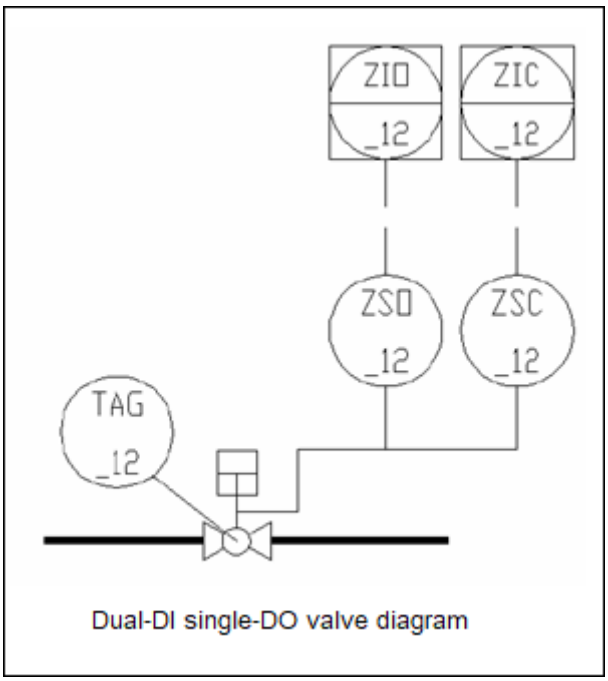
Working Condition	OUT	OperMode (Operation Mode)	State (Operation State)	ErrorBits (Error Output) Bitwise Analysis
Open command issued, with no open feedback received within timeout	Output open command Output open pulse of configured duration		2: Opening	Bit0: Open timeout
Open command issued, with close feedback received within timeout	Output close command Output close pulse of configured duration		3: Close limit	0
Close command issued, with no close feedback received within timeout	Output close command Output close pulse of configured duration		4: Closing	Bit1: Close timeout
Feedback switches from open to close when in open limit	/		5: Feedback error	Bit2: Feedback (Open→Close)
Feedback switches from close to open when in close limit	/			Bit3: Feedback (Close→Open)
Both open and close feedback are 1			5: Feedback error	Bit4: Dual 1 feedback error

When both the open feedback and close feedback are 0, the valve may be in an intermediate running state which must not be deemed a feedback error.

- **Application instance**
  - **Single DI single DO valve**

    A solenoid valve on-site requires open/close control. A valve operation fault alarm be triggered without confirmation if a mismatch occurs between the valve status feedback and the control output after the stroke time has elapsed.

    Configuration



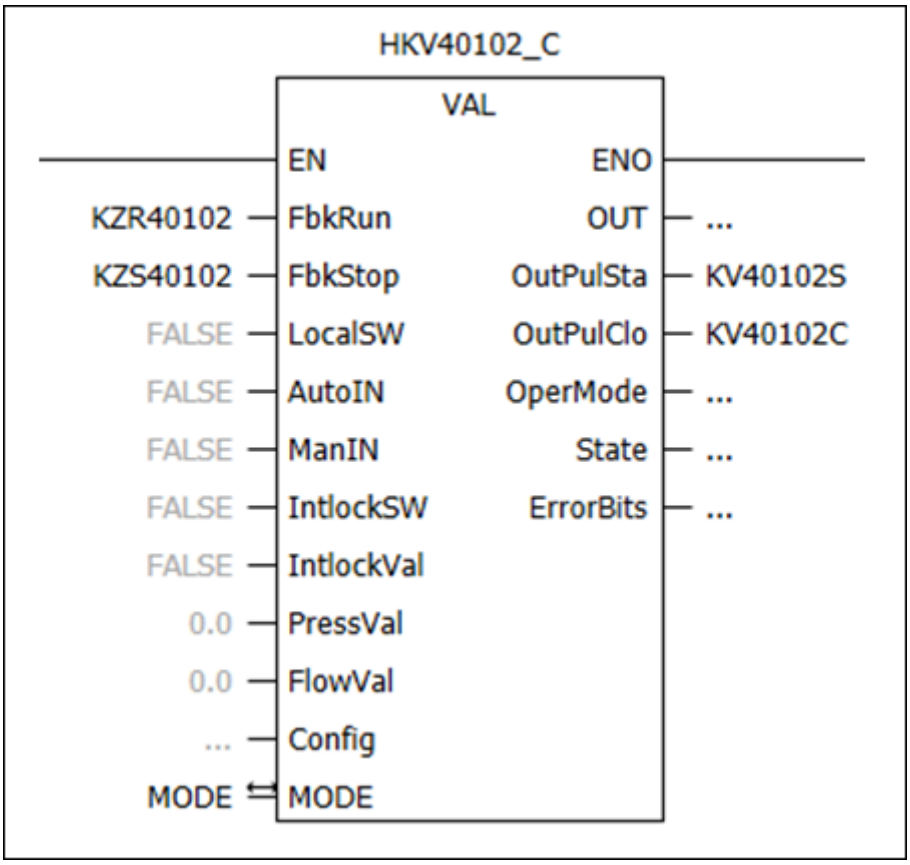
Single-DI single-DO valve diagram

- **Dual DI single DO valve**

  A solenoid valve on a plant unit requires open/close control and operability on the flow chart. A valve operation fault alarm be triggered without confirmation if a mismatch occurs between the valve status feedback and the control output after the stroke time has elapsed.

  Configuration

Dual-DI single-DO valve diagram



- **Dual DI dual DO valve**

  An electric water valve requires open/close control. A valve operation fault alarm be triggered without confirmation if a mismatch occurs between the valve status feedback and the control output after the stroke time has elapsed.

Dual-DI dual-DO valve diagram

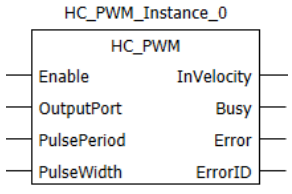
Control scheme configuration

Example

No.	Instance	Type	Remarks
1	HKV40102_C	Valve control function block	-
2	KV40102S	DO output	Open pulse
3	KV40102C	DO output	Close pulse

No.	Instance	Type	Remarks
4	KZR40102	DI input	In the configuration information, FbkRunEN = TRUE is valid when there is open feedback information.
5	KZS40102	DI input	In the configuration information, FbkStopEN = TRUE is valid when there is close feedback information.

18.3.5 High-Speed I/O Instructions



18.3.5.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable Library Version
18.3.5.2 HC_PWM	FB	High-speed pulse width modulation	CmpHCHighSpeedIo	Library version 1.0.0.0 and later
18.3.5.3 HC_EnableInterrupt	FB	Enable interrupt		Library version 1.0.0.0 and later

18.3.5.2 HC_PWM

This instruction implements high-speed pulse width modulation (PWM).

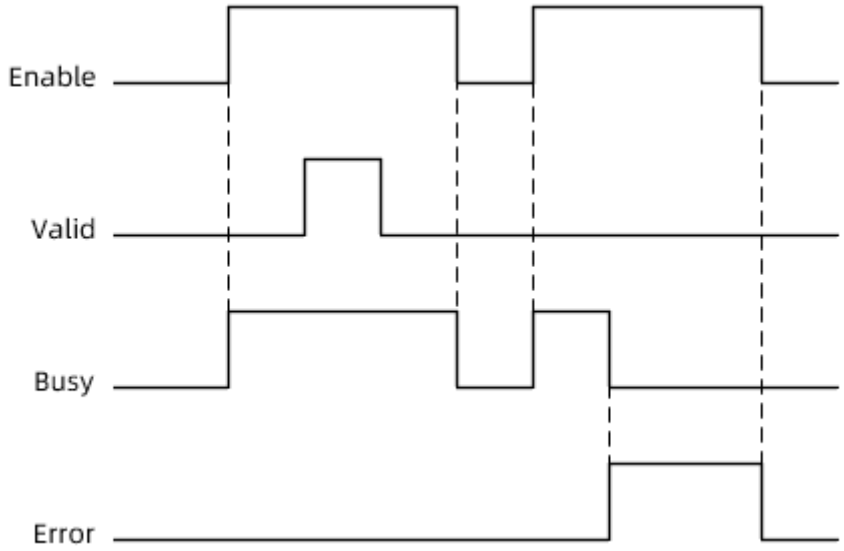
- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
HC_PWM	High-speed pulse width modulation	FB		HC_PWM_Instance_0(Enable := , OutputPort := , PulsePeriod := , PulseWidth := , InVelocity => , Busy => , Error => , ErrorID =>);

- **Related variables**

  Input variables

Input Variable	Name	Data Type	Valid Range	Default Value	Description
Enable	Enable	BOOL	TRUE, FALSE	FALSE	TRUE: The instruction is enabled. FALSE: The instruction is not enabled.
OutputPort	Pulse output terminal	BYTE	Positive number	0	PWM output terminal. • EVO400 series: Y0, Y2, Y4, Y6. • EVO500 series: Y0, Y2, Y4, Y6. • EVO700 series: Y0, Y2.
PulsePeriod	Pulse cycle	DINT	5 to 214748364	0	Width (in 100 ns) of a full square wave.
PulseWidth	High-level pulse width	DINT	2 to 214748364	0	Width (in 100 ns) of the high level in a square wave.



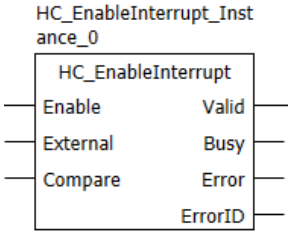
Output variables

Output Variable	Name	Data Type	Valid Range	Default Value	Description
InVelocity	Frequency setpoint reached flag	BOOL	TRUE, FALSE	FALSE	TRUE when the pulse width or frequency reaches the setpoint.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	TRUE when outputting the high-level square wave signal.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
ErrorID	Fault code	UINT	-	0	A fault code (18.3.5.4 Fault Codes) is output when a fault occurs.

- **Function**
  This function block implements dynamic PWM.

  Taking an EVO500 device as an example, after the terminal Y0/Y2 is set to PWM mode, the Y0+Y1/Y2+Y3 output cannot be controlled by the user program or the device I/O mapping interface of the programming software during the execution of the function block HC_PWM.

- **Timing diagram**



- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.5.3 HC_EnableInterrupt

This instruction enables interrupts.

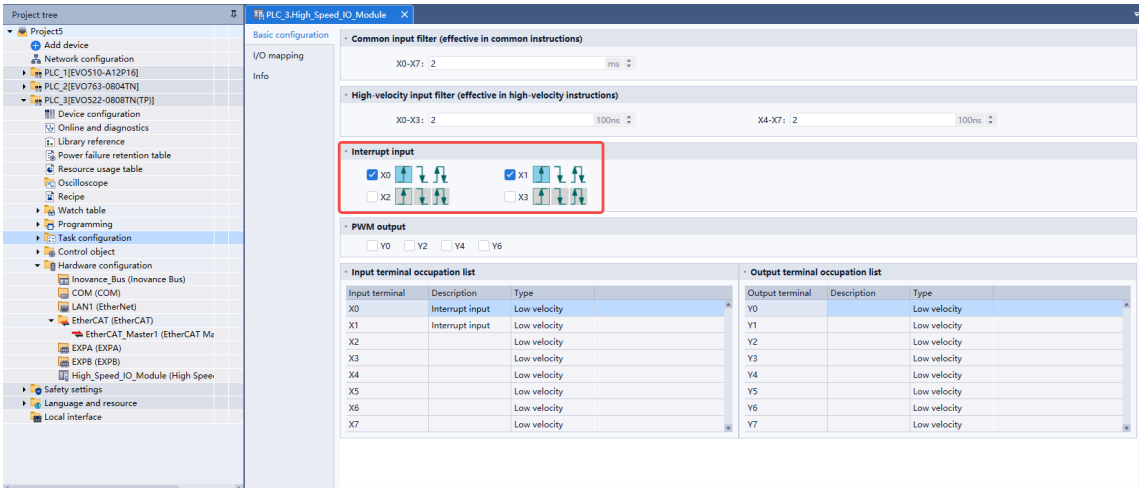
- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
HC_EnableInterrupt	Enable interrupt	FB		HC_EnableInterrupt_Instance_0(Enable := , External := , Compare := , Valid => , Busy => , Error => , ErrorID =>);

- **Related variables**

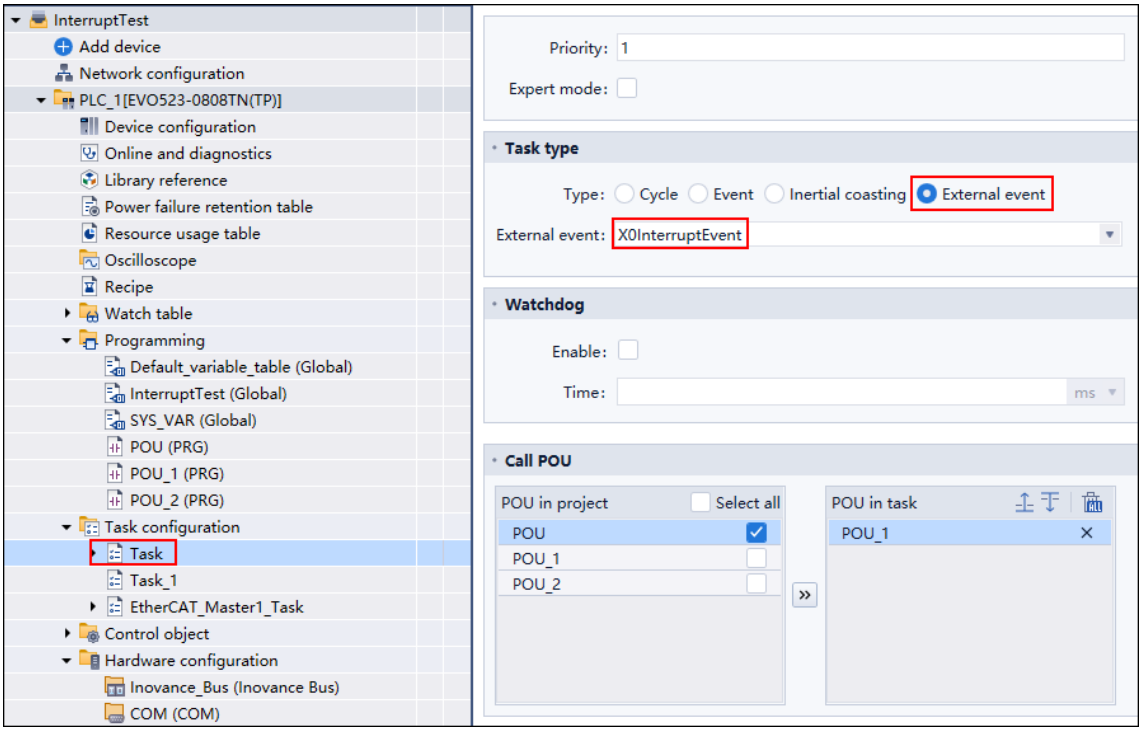
  Input variables

Variable	Name	Data Type	Valid Range	Default Value	Description
Enable	Enable	BOOL	TRUE, FALSE	FALSE	TRUE: The instruction is enabled. FALSE: The instruction is not enabled.



Variable	Name	Data Type	Valid Range	Default Value	Description
External	External input interrupted	UINT	0 to 15	0	Enable external interrupt. For example, if this variable value is set to 3 (binary 2#11), terminals 0 and 1 are enabled.
Compare	Compare interrupt	UINT	0 to 15	0	Enable compare interrupt. For example, if this variable value is set to 3 (binary 2#11), the high-speed counters 0 and 1 compare interrupts are enabled.

Output variables

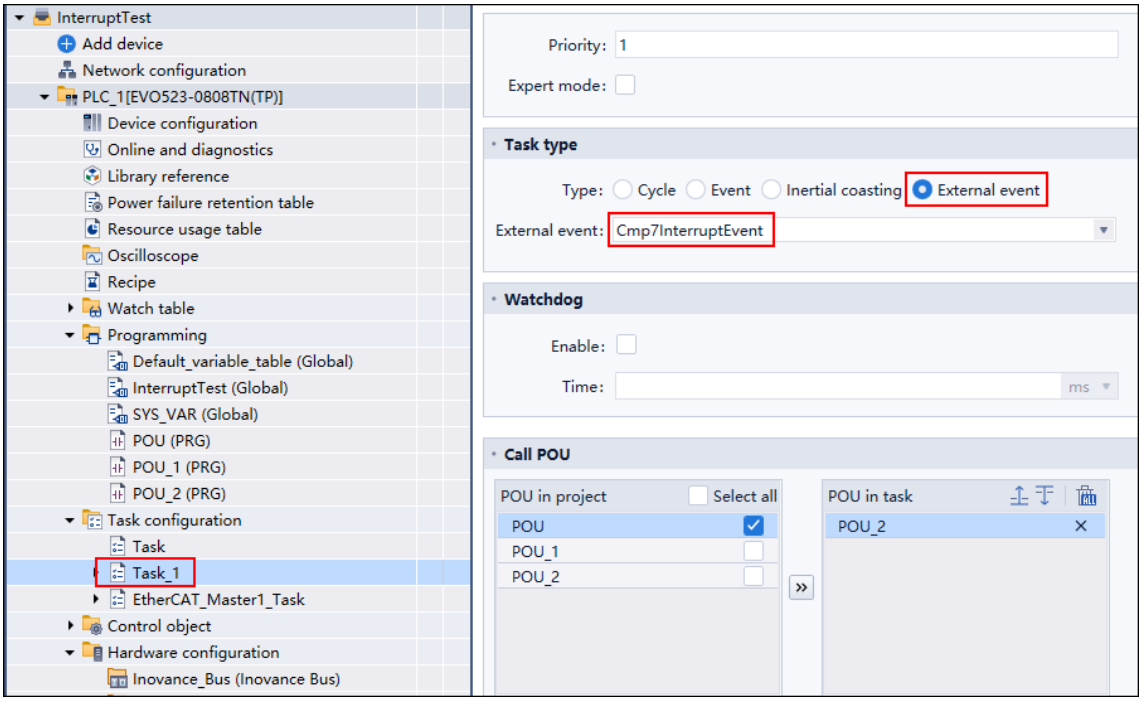


Variable	Name	Data Type	Valid Range	Default Value	Description
Valid	Interrupt valid	BOOL	TRUE, FALSE	FALSE	The interrupt is valid.
Busy	Executing	BOOL	TRUE, FALSE	FALSE	The function block is being executed.
Error	Fault	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
ErrorID	Fault code	UINT	-	0	A fault code (18.3.5.4 Fault Codes) is output when a fault occurs.

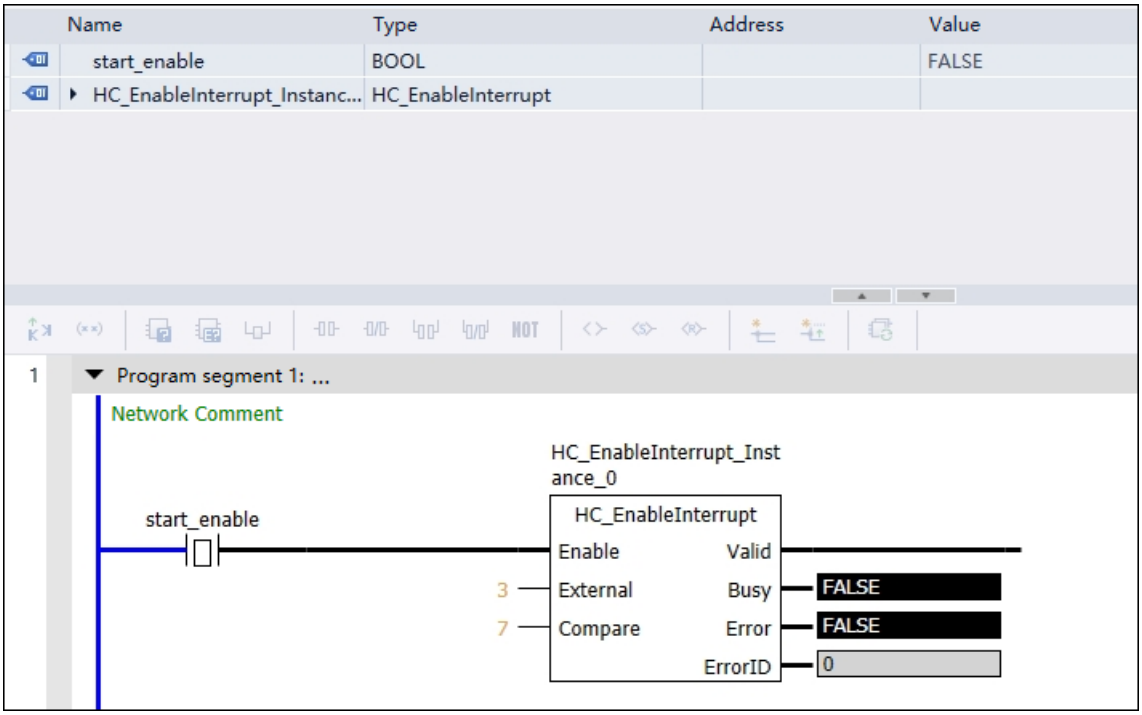
- **Function**
  - This function block is used to enable the external interrupt and high-speed counter compare interrupt.
  - Only EVO400, EVO500, and APC500 series PLCs support this function.
  - Instructions for using the external interrupt:

    1. Before enabling the external input interrupt, configure the external interrupt enable and interrupt trigger mode in the software.

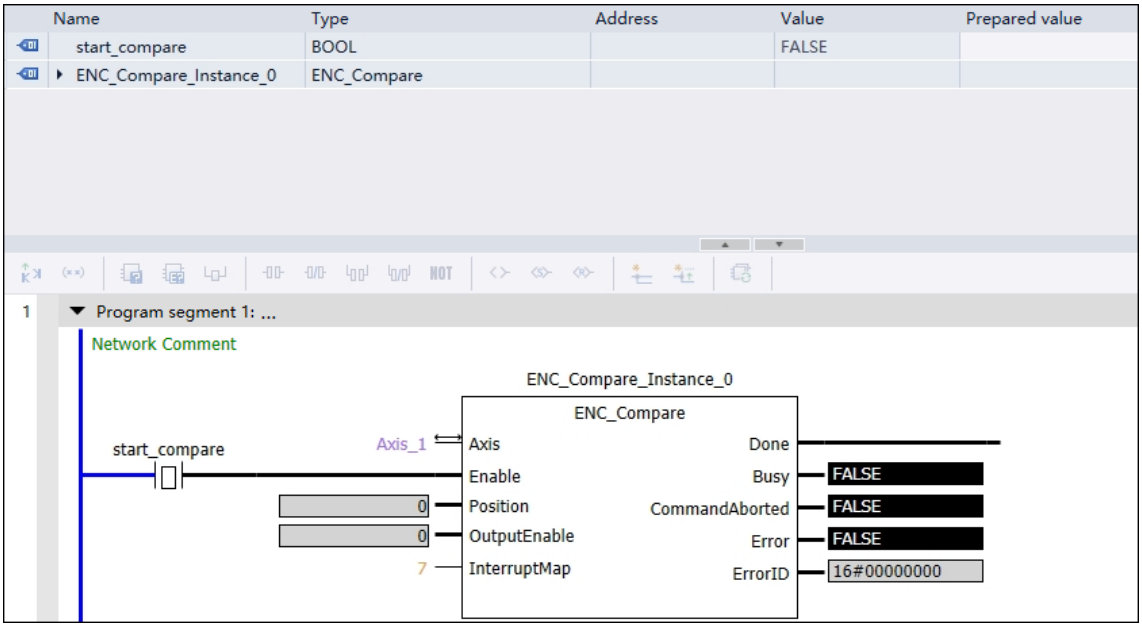
    2. Create the task of external interrupt event.



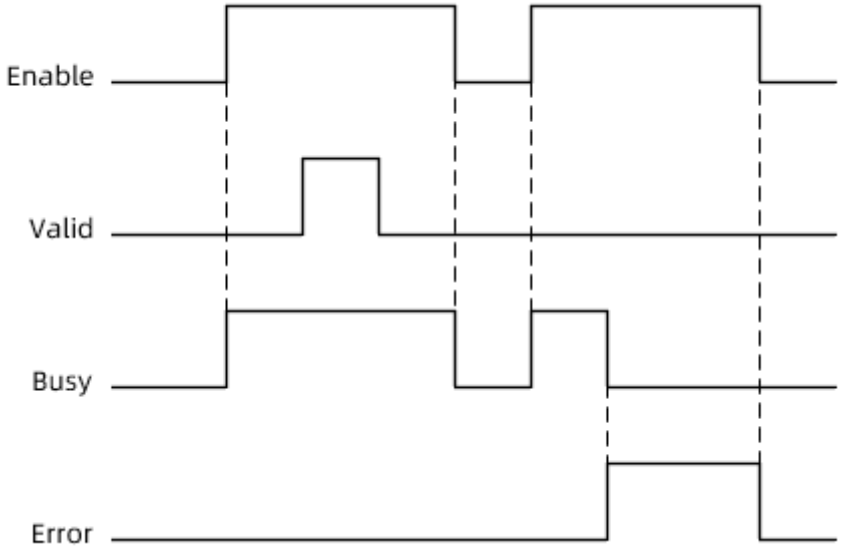
3. Call the HC_EnableInterrupt function block to enable the interrupt.



◦ Instructions for using the compare interrupt:



1. Create the task of compare interrupt event.



2. Use the HC_EnableInterrupt to enable the high-speed counters 0 to 3 compare interrupts.

3. Before triggering the compare interrupt using ENC_Compare, ENC_ArrayCompare, or ENC_StepCompare, input the created interrupt task to the InterruptMap pin.

- **Timing diagram**

- **Faults**

  For faults related to this instruction with specific descriptions, causes and remedies, see the Fault Codes.

18.3.5.4 Fault Codes

Fault Code (Decimal)	Fault Code (Hexadecimal)	Description	Cause	Remedy
0001	0001	Missing configuration parameter for the PLC's general I/O function: Bus cycle task.	The iFA software version is incompatible. The required parameters are missing in the downloaded device configuration file.	Update the iFA software version. (The current run uses default parameters.)

Fault Code (Decimal)	Fault Code (Hexadecimal)	Description	Cause	Remedy
0002	0002	Axis in commissioning state.	The axis associated with this instruction is currently in commissioning state.	Exit the axis commissioning mode and then execute this instruction.
0003	0003	Invalid terminal setting for HC_PWM.	No appropriate terminal is checked on the iFA interface.	Check the PWM output terminal on the iFA interface.
0004	0004	Terminal conflict for HC_PWM.	Multiple instances are output to the same terminal simultaneously.	Check whether multiple instances are output to the same terminal.
0005	0005	HC_PWM pulse period and pulse width equal to 0.	The pulse period and pulse width are set to 0.	Set a non-zero value.
0006	0006	HC_PWM pulse period equal to 0.	The pulse period is set to 0.	Set a non-zero value.
0007	0007	HC_PWM pulse width equal to 0.	The pulse width is set to 0.	Set a non-zero value.
0008	0008	HC_PWM pulse width exceeding the pulse period.	The pulse width exceeds the pulse period.	Set the pulse width to be less than the pulse period.
0009	0009	HC_PWM pulse period and pulse width less than the minimum values.	The pulse period and pulse width are less than their respective minimum values.	Set the pulse period to be not less than the minimum value 5 and the pulse width to be not less than the minimum value 2.
0010	000A	HC_PWM pulse period less than the minimum value.	The pulse period is less than the minimum value.	Set the pulse period to be not less than the minimum value 5.
0011	000B	HC_PWM pulse width less than the minimum value.	The pulse width is less than the minimum value.	Set the pulse width to be not less than the minimum value 2.

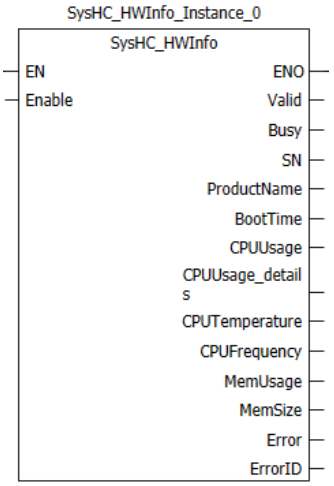
Fault Code (Decimal)	Fault Code (Hexadecimal)	Description	Cause	Remedy
0012	000C	HC_PWM pulse period and pulse width greater than the maximum values.	The pulse period and pulse width are greater than their respective maximum values.	Set the pulse period and pulse width to be not greater than the maximum value 214748364.
0013	000D	HC_PWM pulse period greater than the minimum value.	The pulse period is greater than the maximum value.	Set the pulse period to be not greater than the maximum value 214748364.
0014	000E	HC_PWM pulse width greater than the maximum value.	The pulse width is greater than the maximum value.	Set the pulse width to be not greater than the maximum value 214748364.
0015	000F	HC_EnableInterrupt External value out of limit.	1. The External value is out of limit. 2. The pin for External is not configured in the software.	1. Set the External value to be within the range of 0 to 15. 2. Enable external interrupt for the External pin in the iFA.
0016	0010	HC_EnableInterrupt Compare value out of limit.	1. The Compare value is out of limit. 2. The corresponding channel is not configured with a high-speed counter.	1. Set the Compare value to be within the range of 0 to 15. 2. Assign the high-speed counter channel for Compare to a local encoder axis.
0017	0011	HC_EnableInterrupt enabled repeatedly.	Multiple HC_EnableInterrupt function blocks are not allowed to be triggered.	Use the same HC_EnableInterrupt function block to enable all interrupts.
0018	0012	HC_EnableInterrupt not supported on this device.	The interrupt task is supported on EVO400, EVO500, and APC500 series devices only.	Check whether the PLC model is EVO400, EVO500 or APC500 series.

18.4 Communication and Diagnostics

18.4.1 System Information

18.4.1.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.1.2 SysHC_HWInfo	FB	Obtain hardware Information	SysHCPlcInfo	Library version 1.0.0.0 and later
18.4.1.3 SysHC_SWInfo	FB	Obtain software information		Library version 1.0.0.0 and later
18.4.1.4 SysHC_NetworkInfo	FB	Get network information		Library version 1.0.0.0 and later
18.4.1.5 SysHC_NetworkConfig	FB	Configure network properties		Library version 1.0.0.0 and later
18.4.1.6 GetTaskInterval	FC	Obtain task interval		Library version 1.1.0.0 and later
18.4.1.7 GetDeviceDiag	FB	Obtain device diagnostic information		Library version 1.2.0.0 and later
18.4.1.8 GetDeviceStatus	FB	Obtain device state		Library version 1.2.0.0 and later
18.4.1.9 GetTaskInfo	FC	Obtain task information		Library version 1.1.0.0 and later
18.4.1.10 SysHC_GetPersistentDatainfo	FB	Obtain device state		Library version 1.3.0.0 and later
18.4.1.11 SysHC_WritePersistentData	FB	Save backup file		Library version 1.3.0.0 and later
18.4.1.12 SysHC_ReadPersistentData	FB	Read backup file		Library version 1.3.0.0 and later
18.4.1.13 SysHC_Umount	FB	Unmount an external storage device		Library version 1.3.0.0 and later
18.4.1.14 SysHC_GetSystemDate	FB	Get system date		Library version 1.3.0.0 and later
18.4.1.15 SysHC_SetSystemDate	FB	Set system date		Library version 1.3.0.0 and later
18.4.1.16 SysHC_GetSystemTimeZone	FB	Get system timezone		Library version 1.3.0.0 and later



Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.1.17 SysHC_SetSystemTimeZone	FB	Set system timezone		Library version 1.3.0.0 and later
18.4.1.18 SysHC_CPUInfo	FB	Obtain CPU information such as memory, frequency, and temperature		Library version 1.3.0.0 and later
18.4.1.19 SysHC_UDiskPath	FB	Get the system path of the PLC's USB interface		Library version 1.3.0.0 and later
18.4.1.20 GetBootVersion	FC	Get BIOS version		Library version 1.3.0.0 and later
18.4.1.21 GetPLCVersion	FC	Get PLC firmware version		Library version 1.3.0.0 and later
18.4.1.22 GetProductName	FC	Get PLC device name		Library version 1.3.0.0 and later
18.4.1.23 GetSerialNumber	FC	Get the PLC serial number (unique)		Library version 1.3.0.0 and later
18.4.1.24 GetFPGALogicVersion	FC	Get the FPGA logic version		Library version 1.3.0.0 and later
18.4.1.25 SysHC_Appbackup	FB	Backup user program data by calling instruction		Library version 1.3.0.0 and later
18.4.1.26 SysHC_FaultRecord	FB	Get fault data recording by calling instruction		Library version 1.4.0.0 and later
18.4.1.27 SysHC_OperationRecord	FB	Get program data recording by calling instruction		Library versions 1.4.0.0 and later
18.4.1.28 SysHC_AppDownInfo	FB	Get the latest user program download information of the PLC		Library versions 1.4.0.0 and later
18.4.1.29 UTF16ToGB2312	FC	UTF16 to GB2312 encoding conversion		Applicable to library version 1.5.0.0 and later
18.4.1.30 UTF8ToGB2312	FC	UTF8 To GB2312 encoding conversion		Applicable to library version 1.5.0.0 and later
18.4.1.31 GB2312ToUTF16	FC	GB2312 To UTF16 encoding conversion		Applicable to library version 1.5.0.0 and later
18.4.1.32 GB2312ToUTF8	FC	GB2312 To UTF8 encoding conversion		Applicable to library version 1.5.0.0 and later
18.4.1.33 SDCard1StatusGet	FC	Get all the status flags of SD memory card		Applicable to library version 1.5.0.0 and later
18.4.1.34 SysHC_NtpClient	FB	NTP time sync		Applicable to library version 1.5.0.0 and later
18.4.1.35 SysHC_NetworkInfoV2	FB	Get network information		Applicable to library version 1.5.0.0 and later

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.1.36 SysHC_NetworkConfigV2	FB	Configure network properties		Applicable to library version 1.5.0.0 and later

18.4.1.2 SysHC_HWInfo

This instruction obtains the hardware information of the device, including the total power-on time, average CPU usage, CPU usage per core, CPU temperature, CPU frequency, memory utilization, and total memory size.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
SysHC_HWInfo	Obtain hardware Information	FB		SysHC_HWInfo_Instance_0(Enable := , Valid =>, Busy => , SN => , ProductName => , BootTime => , CPUUsage => , CPUUsage_details => , CPUTemperature => , CPUFrequency => , MemUsage => , MemSize => , Error => , ErrorID =>);

- **Related variables**

Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Enable	Active high	BOOL	TRUE, FALSE	FALSE	Active High.
Output	Valid	Output active	BOOL	TRUE, FALSE	FALSE	Instruction is actively executing.
	Busy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.
	SN	Product SN code	STRING	-	''	Product SN code.

18.4.1.4 SysHC_NetworkInfo

This instruction obtains the network information of the device, including IP address, subnet mask, gateway information, and DHCP status.

- **Instruction format**

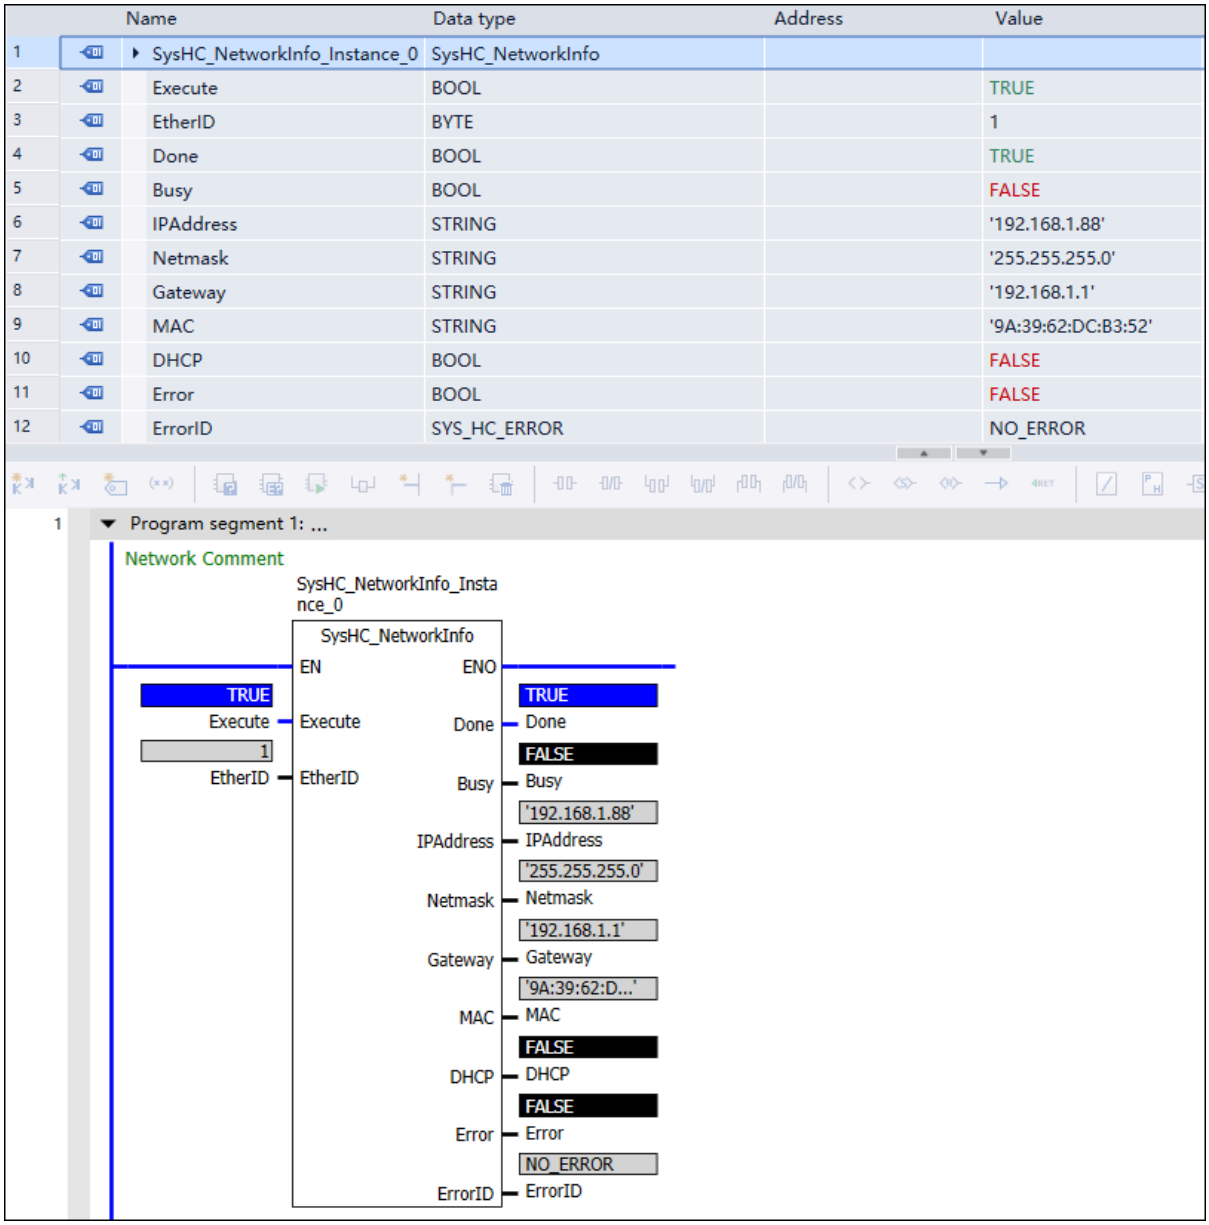
Instruction	Name	FB/FC	LD Representation	ST Representation
SysHC_NetworkInfo	Get network information	FB		SysHC_NetworkInfo_Instance_0(Execute := , EtherID := , Done => , Busy => , IPAddress => , Netmask => , Gateway => , MAC => , DHCP => , Error => , ErrorID =>);

- **Related variables**

  Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Rising edge-triggered	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered
	EtherID	Network port ID	BYTE	1 ~ 255	0	Network port ID number.
Output	Done	Done	BOOL	TRUE, FALSE	FALSE	Instruction is completed.
	Busy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.
	IPAddress	IP address	STRING	-	''	IP address.
	Netmask	Subnet mask	STRING	-	''	Subnet mask.
	Gateway	Gateway information	STRING	-	''	Gateway information.
	MAC	MAC address	STRING	-	''	MAC address.
	DHCP	DHCP status	BOOL	TRUE, FALSE	FALSE	DHCP status.
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	Set to TRUE when an error occurs.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	ErrorID	Fault code	SYS_HC_ERROR	-	NO_ERROR	See Fault Codes.



- **Function**
  - Devices that do not support DHCP default to FALSE.
  - The EtherID must correspond to the actual hardware Ethernet port, starting from 1.
- **Program example**

  ST:

	Name	Data type	Address	Value
1	SysHC_NetworkInfo_Instance_0	SysHC_NetworkInfo		
2	Execute	BOOL		TRUE
3	EtherID	BYTE		1

18.4.1.6 GetTaskInterval

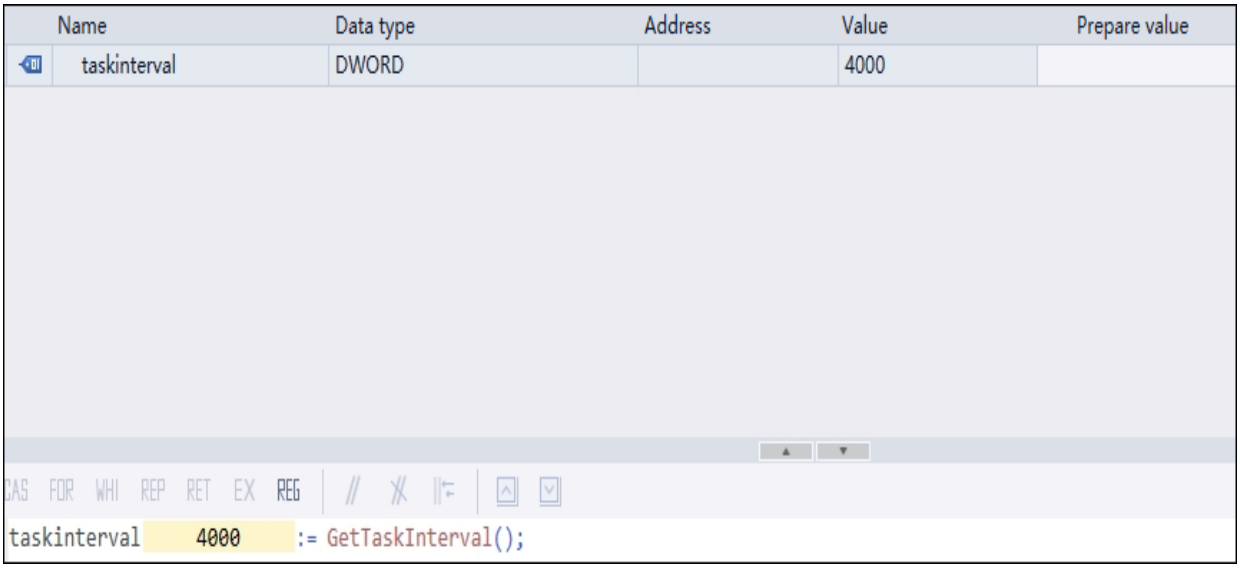
This instruction obtains task interval.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
GetTaskInterval	Obtain task interval	FC		:= GetTaskInterval();

- **Related variables**

  Variable



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	GetTaskInterval	Task interval	DWORD	Depends on data type	0	Task interval in us.

- **Function**

  This instruction is valid only for periodic tasks, and other tasks a value of 0.return 0.

- **Program example**

  ST:

  LD:

18.4.1.7 GetDeviceDiag

This instruction obtains device diagnostic information and device status.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
GetDeviceDiag	Obtain device diagnostic information	FB		GetDeviceDiag_Instance_0(xExecute := , dwDeviceId := , eInfo_Type := , DeviceInfo := , xVaild => , xBusy => , xError => , eErrorID =>);

- **Related variables**

Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Enable	BOOL	TRUE, FALSE	FALSE	SF_R_TRIG is a rising edge-triggered instruction.
	dwDeviceId	Device ID	DWORD	0 to FFFFFFFF	0	The identifier ID of the device, see 10.6.1.2 Device ID for details.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	eInfo_Type	Information category	Info_Type	0 to 3	0	Select the device status or device diagnostic information to be obtained. 1: DeviceStatus (device status) 2: Reserved 3: DeviceDiag (device diagnostic information)
	DeviceInfo	Device info	ANY	Determined by the user-defined DeviceInfo type	0	Returned diagnostic information or device status.
Output	xVaild	Valid instruction	BOOL	TRUE, FALSE	FALSE	It indicates whether the instruction output is valid.
	xBusy	Instruction in use	BOOL	TRUE, FALSE	FALSE	It Indicates whether the instruction is being called.
	xError	Instruction error	BOOL	TRUE, FALSE	FALSE	It indicates whether the instruction call ha s failed.
	eErrorID	Instruction error ID	ErrorID	0 to 4	0	For fault codes generated when an instruction error occurs, see Fault description for details.

- **Function**
  - When the input parameter "xExecute" changes from FALSE to TRUE, the instruction is enabled and can be used to obtain diagnostic information after certain conditions are met.
  - You can determine whether the expected output is diagnostic information or device status by inputting different eInfo_type values. Diagnostic information is received as an array of DeviceDiag structures defined in the library. Device status is received by DeviceInfo using the DeviceStatus (ENUM type) data defined in the library.
    - Internal members of the DeviceDiag structure data type

Element	Note
ErrorTime	Fault occurrence time
ErrorCode	Fault code
ExternalCode	Extended fault code
GeneralStateCode	General status code

Element	Note
ExternalStateCode	Extended status code

- Enumerated values of the DeviceStatus data type

DeviceStatus Value	Note
1	Disable: The device is disabled
2	Error: The device is in a fault state.
3	Normal: The device is in normal operation.

- **Program example**

  Input dwDeviceID corresponding to the device to be diagnosed, and select eInfo_type as needed to determine whether to obtain device diagnostic information or device status.

  - When eInfo_type is input as DeviceStatus, the data type pointed to by DeviceInfo must be DeviceStatus.
  - When eInfo_type is input as DeviceDiag, the data type pointed to by DeviceInfo must be an array, where the array elements are the DeviceDiag structure defined in the library.

  ST:

	Name	Type	Address	Value
1	GetDeviceDiag_Instance_0	GetDeviceDiag		
2	executeFlag	BOOL		TRUE
3	Id	DWORD		1376257
4	DiagType	INFO_TYPE		DeviceDiag
5	DiagInfo	ARRAY [0..10] OF DeviceDiag		
6	DiagInfo[0]	DeviceDiag		
7	ErrorTime	STRING		'1970/1/7 6:13:28'
8	ErrorCode	STRING		'0x400001'
9	ExternelCode	STRING		'0x0'
10	GeneralStateCode	STRING		'0x0'
11	ExternelStateCode	STRING		'0x0'
12	DiagInfo[1]	DeviceDiag		
13	DiagInfo[2]	DeviceDiag		
14	DiagInfo[3]	DeviceDiag		
15	DiagInfo[4]	DeviceDiag		
16	DiagInfo[5]	DeviceDiag		
17	DiagInfo[6]	DeviceDiag		
18	DiagInfo[7]	DeviceDiag		
19	DiagInfo[8]	DeviceDiag		
20	DiagInfo[9]	DeviceDiag		
21	DiagInfo[10]	DeviceDiag		
22	Out_VaildFlag	BOOL		TRUE
23	Out_BusyFlag	BOOL		FALSE
24	Out_ErrorFlag	BOOL		FALSE
25	Out_ErrorID	ERRORID		NoError

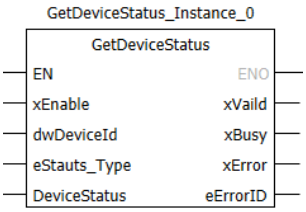
```
GetDeviceDiag_Instance_0(
xExecute TRUE := executeFlag TRUE,
dwDeviceId 1376257 := Id 1376257 ,
eInfo_TypeDeviceD... := DiagTypeDeviceD...,
DeviceInfo :=DiagInfo ,
xVaild TRUE => Out_VaildFlag TRUE ,
xBusy FALSE => Out_BusyFlag FALSE ,
xError FALSE =>Out_ErrorFlag FALSE ,
eErrorID NoError =>Out_ErrorID NoError );RETURN
```

  LD:

- **Fault description**

  When an error occurs, find the corresponding error via eErrorID, and locate the root cause of the error.

Fault code	Value	Description
0	NoError	No fault.
1	DeviceIDError	DeviceID error (for scenarios where the DeviceID is out of range).
2	NoSupport	The device does not support this type (for the device corresponding to DeviceID, either the device node has not been created or the device does not support this diagnostic information).
3	NotMatch	The information category does not match the diagnostic information category bound by the user.
4	GetFiled	Information acquisition failed.



- **Note:**

  The user determines whether the expected output is diagnostic information or device status based on the input value of eInfo_type. Diagnostic information must be received by DeviceInfo in the form of a structure array, where the structure is defined as DeviceDiag in the library, and the number of array elements is customizable by the user. Device status needs to be received using the DeviceStatus (ENUM type) data as DeviceInfo. If eInfo_type does not match the specified receiving data type, the instruction will report an error: NotMatch, indicating that the information category is inconsistent with the diagnostic information category bound by the user.

18.4.1.8 GetDeviceStatus

This instruction obtains the device status in real time.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
GetDeviceStatus	Obtain device state	FB		GetDeviceStatus_Instance_0(xEnable := , dwDeviceId := , eStauts_Type := , DeviceStatus := , xVaild => , xBusy => , xError => , eErrorID =>);

- **Related variables**

Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Enable instruction	BOOL	TRUE, FALSE	FALSE	Active High.
	dwDeviceId	Device ID	DWORD	0 to FFFFFFFF	0	The identifier ID of the device, see 10.6.1.2 Device ID for details.
	eStatus_Type	Information category	Status_Type	0 to 2	0	Select to obtain device status. 1: DeviceStatus: Device status. 2: Reserved.
	DeviceStatus	Device info	ANY	Determined by the user-defined DeviceStatus type	0	The returned device status.
Output	xVaild	Valid instruction	BOOL	TRUE, FALSE	FALSE	It indicates whether the instruction output is valid.
	xBusy	Instruction in use	BOOL	TRUE, FALSE	FALSE	It Indicates whether the instruction is being called.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	xError	Instruction error	BOOL	TRUE, FALSE	FALSE	It indicates whether the instruction call has failed.
	eErrorID	Instruction error ID	ErrorID	0 to 4	0	For fault codes generated when an instruction error occurs, see Fault description for details.

- **Function**
  - When the input parameter "xEnable" = TRUE, the diagnostic instruction enters the enabled state. After the operable conditions are met, diagnostic information acquisition can be performed. When the parameter "xEnable" is FALSE, diagnostic information acquisition is stopped.
  - The output device status is determined by the input eStatus_Type. The device status must be received using the DeviceStatus (ENUM type) data defined in the library.
    - Enumerated values of the DeviceStatus data type

DeviceStatus Value	Note
1	Disable: The device is disabled
2	Error: The device is in a fault state.
3	Normal: The device is in normal operation.

- **Program example**

  Input the DeviceID corresponding to the device that needs diagnosis, select eStatus_Type, and then get the device status. When the eStatus_Type = DevieStatus, the received data type pointed to by DeviceStatus must be DeviceStatus.

  ST:

	Name	Data type	Address	Value
1	GetDeviceStatus_Instance_0	GetDeviceStatus		
2	xEnable	BOOL		TRUE
3	dwDeviceId	DWORD		65537
4	eStauts_Type	STATUS_TYPE		DeviceStatus
5	DeviceStatus	ANY		
6	xVaild	BOOL		TRUE
7	xBusy	BOOL		TRUE
8	xError	BOOL		FALSE
9	eErrorID	ERRORID		NoError
10	enable	BOOL		TRUE
11	ID	DWORD		65537
12	status	DEVICESTATUS		Normal

```
GetDeviceStatus_Instance_0(xEnable TRUE :=enable TRUE ,
                           dwDeviceId 65537 := ID 65537 ,
                           eStauts_Type := ,
                           DeviceStatus :=status Normal ,
                           xVaild => ,
                           xBusy => ,
                           xError => ,
                           eErrorID => );
```

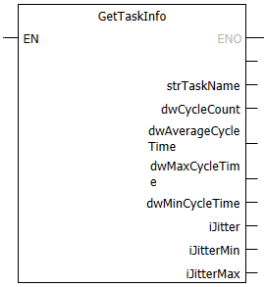
LD:

	Name	Type	Address	Value
1	GetDeviceStatus_Instance_0	GetDeviceStatus		
2	xEnable	BOOL		TRUE
3	dwDeviceId	DWORD		65537
4	eStauts_Type	STATUS_TYPE		DeviceStatus
5	DeviceStatus	ANY		
6	xVaild	BOOL		TRUE
7	xBusy	BOOL		TRUE
8	xError	BOOL		FALSE
9	eErrorID	ERRORID		NoError
10	status_1	DEVICESTATUS		Normal

- **Fault description**

  When an error occurs, find the corresponding error via eErrorID, and locate the root cause of the error.

Fault code	Value	Description
0	NoError	No fault.
1	DeviceIDError	DeviceID error (for scenarios where the DeviceID is out of range).
2	NoSupport	The device does not support this type (for the device corresponding to DeviceID, either the device node has not been created or the device does not support this diagnostic information).



Fault code	Value	Description
3	NotMatch	The information category does not match the diagnostic information category bound by the user.
4	GetFiled	Information acquisition failed.

- **Note**
  When obtaining the device status, DeviceStatus (ENUM type) is used as the DeviceStatus receiver. If Status_type does not match the specified receiving data type, the instruction will report an error: NotMatch, indicating that the information category is inconsistent with the diagnostic information category bound by the user.

18.4.1.9 GetTaskInfo

This instruction obtains the task information including task name/cycle count/average execution time/max execution time/min execution time/jitter time/min jitter/max jitter.

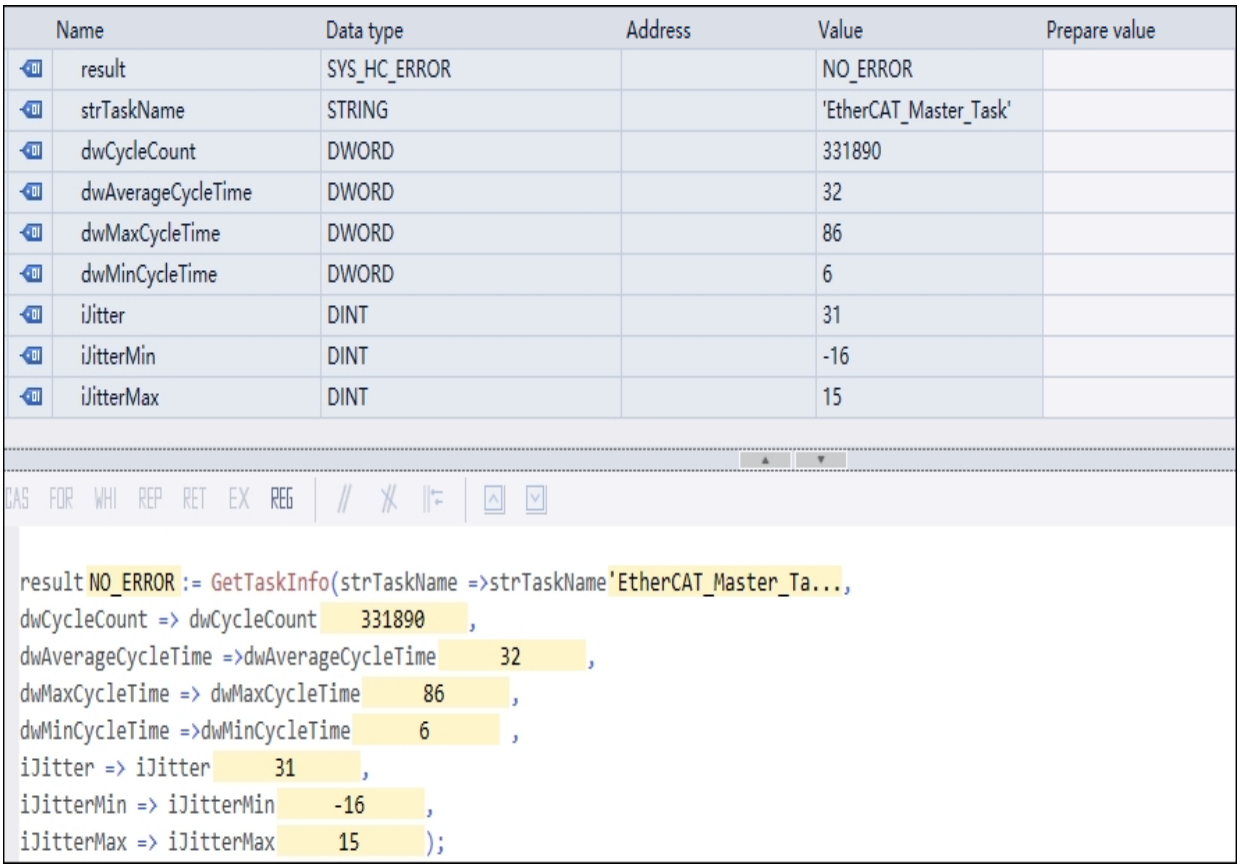
- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
GetTaskInfo	Obtain task information	FC		:= GetTaskInfo(strTaskName => , dwCycleCount => , dwAverageCycleTime => , dwMaxCycleTime => , dwMinCycleTime => , iJitter => , iJitterMin => , iJitterMax =>);

- **Related variables**

  Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	GetTaskInfo	Instruction execution result	SYS_HC_ERROR	Follows data type	NO_ERROR	It is the result of instruction execution. For details, see Fault Codes.
	strTaskName	Task name	STRING	Follows data type	''	Task name.
	dwCycleCount	Number of cycles	DWORD	Depends on data type	0	Number of cycles.
	dwAverageCycleTime	Average execution time	DWORD	Depends on data type	0	Average execution time in ms



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	dwMaxCycleTime	Maximum execution time	DWORD	Depends on data type	0	Maximum execution time in us.
	dwMinCycleTime	Minimum execution time	DWORD	Depends on data type	0	Minimum execution time in us.
	iJitter	Jitter time	DINT	Follows data type	0	Jitter time in us.
	iJitterMin	Minimum jitter time	DINT	Follows data type	0	Minimum jitter time in us.
	iJitterMax	Maximum jitter time	DINT	Follows data type	0	Maximum jitter time in us.

- **Function**

  Obtainment successful: GetTaskInfo returns NO_ERROR. Obtainment failed: GetTaskInfo returns FAILURE_OBTAIN.

- **Program example**

  ST:

Name	Data type	Address	Value	Prepare value
result	SYS_HC_ERROR		NO_ERROR	
strTaskName	STRING		'EtherCAT_Master_Task'	
dwCycleCount	DWORD		331890	
dwAverageCycleTime	DWORD		32	
dwMaxCycleTime	DWORD		86	
dwMinCycleTime	DWORD		6	
iJitter	DINT		31	
iJitterMin	DINT		-16	
iJitterMax	DINT		15	

```
result NO_ERROR := GetTaskInfo(strTaskName =>strTaskName'EtherCAT_Master_Ta...,
dwCycleCount => dwCycleCount    331890    ,
dwAverageCycleTime =>dwAverageCycleTime    32    ,
dwMaxCycleTime => dwMaxCycleTime    86    ,
dwMinCycleTime =>dwMinCycleTime    6    ,
iJitter => iJitter    31    ,
iJitterMin => iJitterMin    -16    ,
iJitterMax => iJitterMax    15    );
```

  LD:

18.4.1.10 SysHC_GetPersistentDatainfo

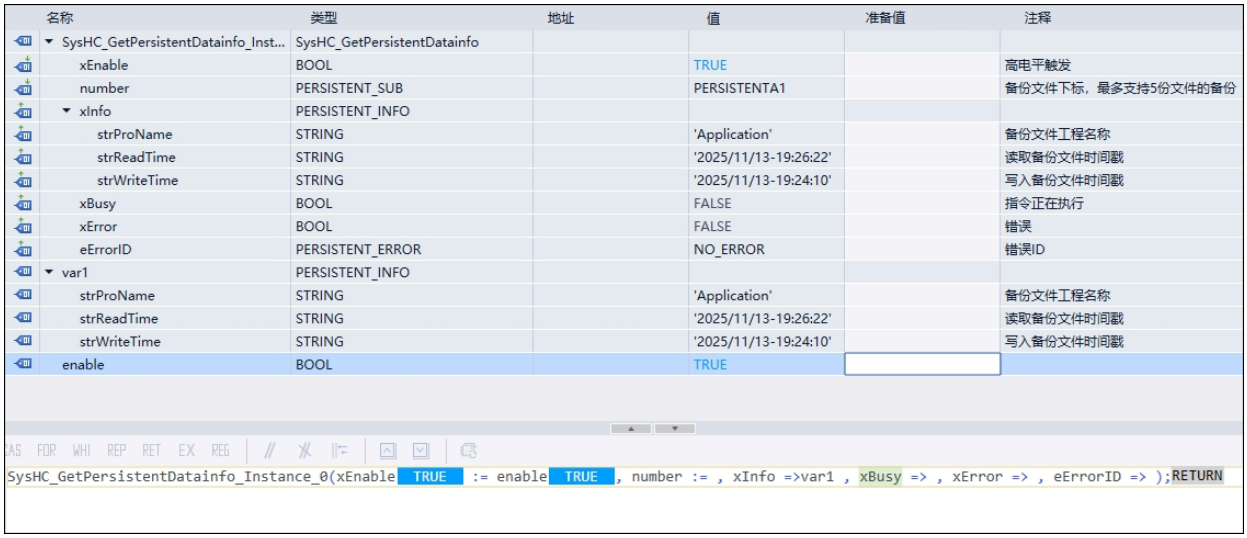
This instruction enables user programs to read information from retentive backup files.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_GetPersistentDatainfo	Obtain device state	FB		SysHC_GetPersistentDatainfo_Instance_0(xEnable := , number := , xInfo => , xBusy => , xError => , eErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Active high	BOOL	TRUE, FALSE	FALSE	Active High.
	number	Backup file index	PERSISTENT_SUB	1 to 5	1	Backup file sub-index, supporting backup of up to five files PERSISTENT_1: File 1. PERSISTENT_2: File 2. PERSISTENT_3: File 3. PERSISTENT_4: File 4. PERSISTENT_5: File 5.
Output	xInfo	Backup file information	PERSISTENT_INFO	-	NULL	• strProName: Name of the project for the backup file. • strReadTime: Read the backup timestamp. • strWriteTime: Read the backup timestamp.
	xBusy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Executing
	xError	Fault	BOOL	TRUE, FALSE	FALSE	Error.
	eErrorID	Fault ID	PERSISTENT_ERROR	-	NO_ERROR	See Fault Codes.

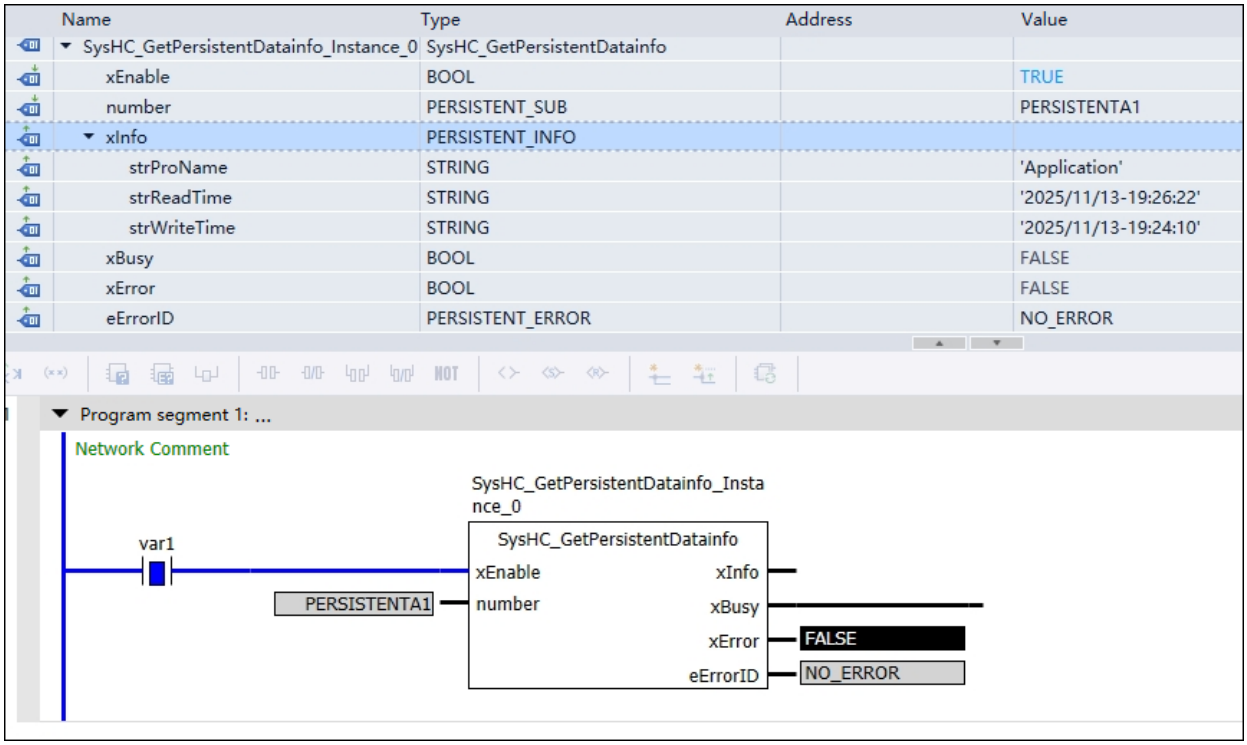


NOTE

For strProName read as an unknown string (possibly as Chinese), you can use the ConvertUTF8toUTF16() conversion function to convert the read information into Chinese. The Chinese structure type is WSTRING.

- **Function description**
  This instruction enables user programs to read information from retentive backup files.
- **Fault scenarios**
  - The PLC version does not support data backup at power failure.
  - The backup and restore function blocks are repeated within 10 seconds.
  - The backup and restore function blocks run simultaneously.
  - The backup file does not match the running program of the user.
  - The background version does not support the file backup function.
  - The backup file fails to be restored.

- **Program example**



ST:

名称	类型	地址	值	准备值	注释
SysHC_GetPersistentDatainfo_Inst...	SysHC_GetPersistentDatainfo				
xEnable	BOOL		TRUE		高电平触发
number	PERSISTENT_SUB		PERSISTENTA1		备份文件下标，最多支持5份文件的备份
xInfo	PERSISTENT_INFO				
strProName	STRING		'Application'		备份文件工程名称
strReadTime	STRING		'2025/11/13-19:26:22'		读取备份文件时间戳
strWriteTime	STRING		'2025/11/13-19:24:10'		写入备份文件时间戳
xBusy	BOOL		FALSE		指令正在执行
xError	BOOL		FALSE		错误
eErrorID	PERSISTENT_ERROR		NO_ERROR		错误ID
var1	PERSISTENT_INFO				
strProName	STRING		'Application'		备份文件工程名称

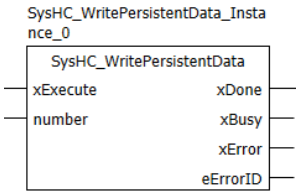
```
SysHC_GetPersistentDatainfo_Instance_0(xEnable := enable, number := , xInfo =>var1 , xBusy => , xError => , eErrorID => );RETURN
```



LD:

18.4.1.11 SysHC_WritePersistentData

This instruction enables the user program to quickly back up retentive data.

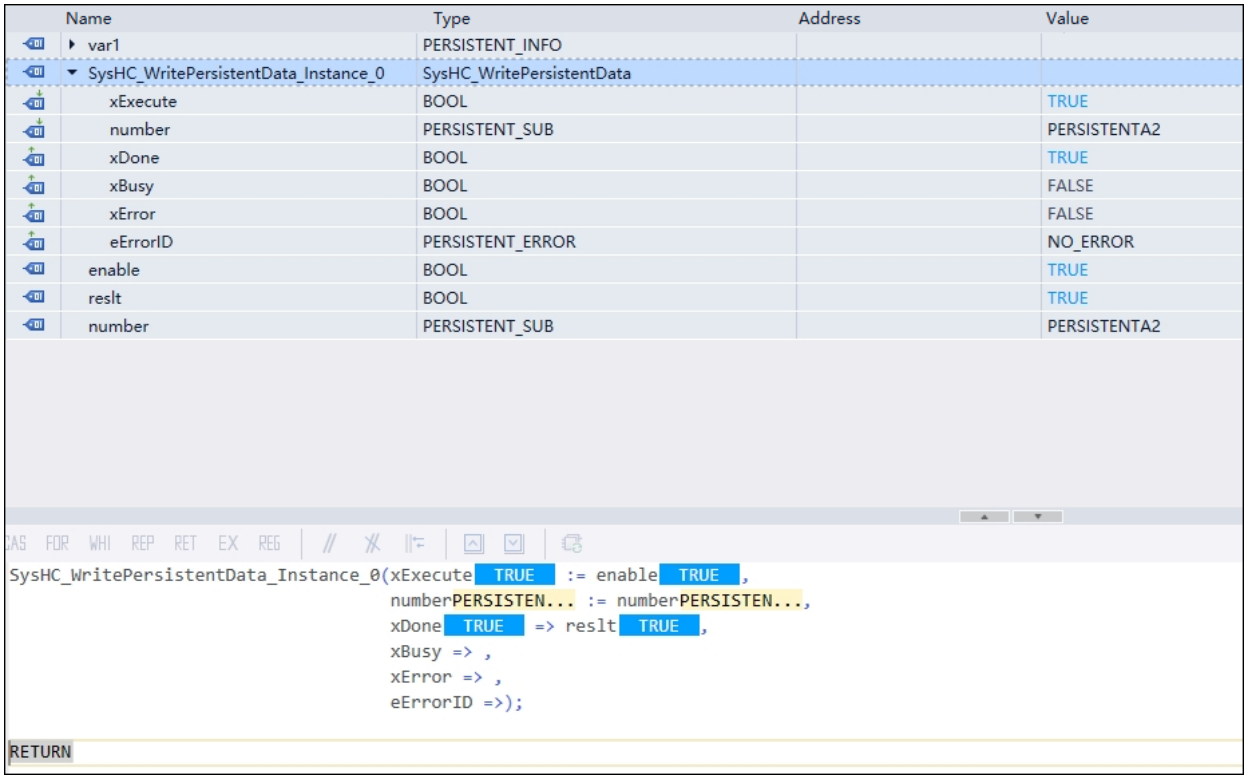
- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_WritePersistentData	Save backup file	FB		SysHC_WritePersistentData_Instance_0(xExecute := , number := , xDone => , xBusy => , xError => , eErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Active on rising edge	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered.
	number	Backup file index	PERSISTENT_SUB	1 to 5	1	Backup file sub-index, supporting backup of up to five files PERSISTENT_1: File 1. PERSISTENT_2: File 2. PERSISTENT_3: File 3. PERSISTENT_4: File 4. PERSISTENT_5: File 5.
Output	xDone	Output active	BOOL	TRUE, FALSE	FALSE	Output active.
	xBusy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Executing
	xError	Fault	BOOL	TRUE, FALSE	FALSE	Error.
	eErrorID	Fault ID	PERSISTENT_ERROR	-	NO_ERROR	See Fault Codes.

NOTE



For strProName read as an unknown string (possibly as Chinese), you can use the ConvertUTF8toUTF16() conversion function to convert the read information into Chinese. The Chinese structure type is WSTRING.

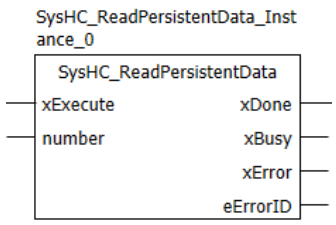
- **Function description**

  This instruction enables the user program to quickly backup retentive data. After completing this operation, you can transfer the file to an external storage device. For detailed instructions, see 10.11.8 Backing Up the Program to an External Storage Device.

- **Fault scenarios**
  - The PLC version does not support data backup at power failure.
  - The backup and restore function blocks are repeated within 10 seconds.
  - The backup and restore function blocks run simultaneously.
  - The backup file does not match the running program of the user.
  - The background version does not support the file backup function.
  - The backup file fails to be restored.
- **Program example**

  ST:

  LD:



- **Precautions**
  - It is not recommended to use the current backup, restore, and backup information reading function blocks in tasks with high time requirements.
  - It is recommended to use the backup file information reading function block in tasks with a larger cycle and lower priority.
  - When the CPU utilization is high, operating the backup and restore function blocks will cause jitter in task execution.
  - The backup and restore function blocks cannot be called repeatedly within 60 s.
  - In the obtained function block information, the name of the file read is the project name of the power failure data written to the backup.
  - Performing backup at runtime is to save data in the running backup area.
  - When the restore function block is used, data in the backup area during running changes greatly.
  - When file backup is not completed, the file reading function block does not take effect. When file reading is not completed, the file backup function does not take effect.
  - The enable variable of the triggered function block cannot be the persistent variable.
  - It is not recommended to frequently call the backup and restore function blocks.

18.4.1.12 SysHC_ReadPersistentData

This instruction enables the user program to quickly restore retentive data.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_ReadPersistentData	Read backup file	FB		SysHC_ReadPersistentData_Instance_0(xExecute := , number := , xDone => , xBusy => , xError => , eErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Active on rising edge	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered.
	number	Backup file index	PERSISTENT_SUB	1 to 5	PERSISTENT_1	Backup file sub-index, supporting backup of up to five files. PERSISTENT_1: File 1. PERSISTENT_2: File 2. PERSISTENT_3: File 3. PERSISTENT_4: File 4. PERSISTENT_5: File 5.
Output	xDone	Output active	BOOL	TRUE, FALSE	FALSE	Output active.
	xBusy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Executing
	xError	Fault	BOOL	TRUE, FALSE	FALSE	Error.
	eErrorID	Fault ID	PERSISTENT_ERROR	-	NO_ERROR	See Fault Codes.

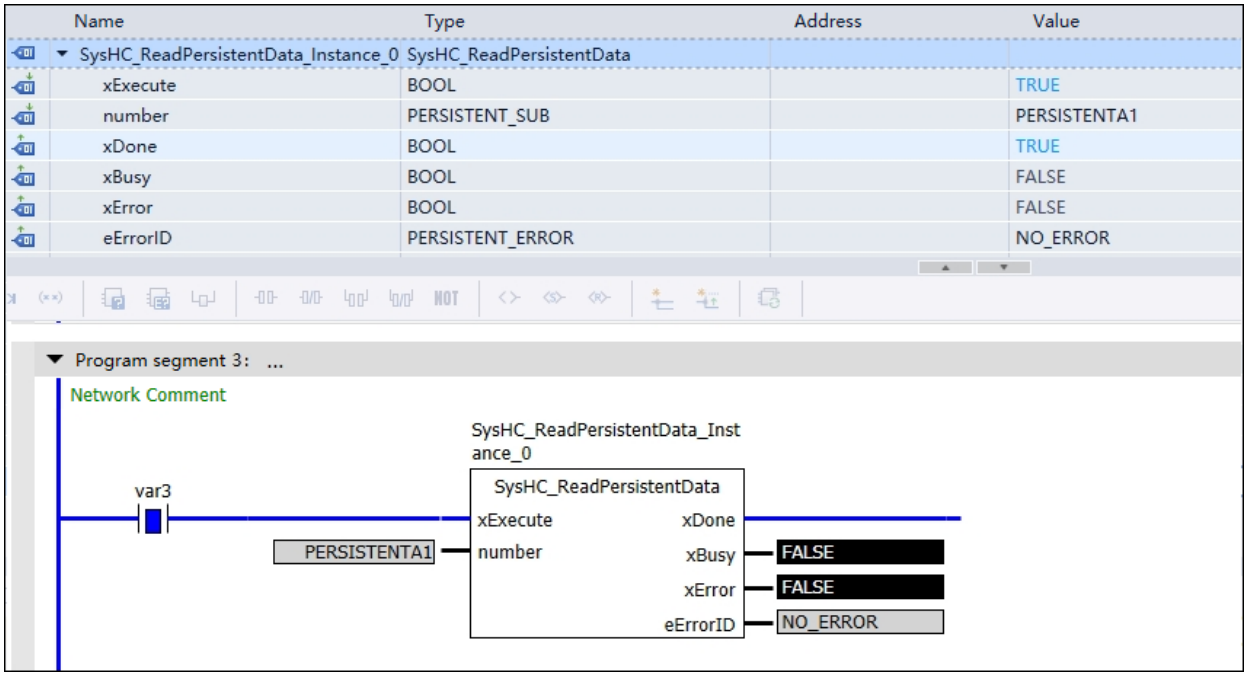
NOTE

For strProName read as an unknown string (possibly as Chinese), you can use the ConvertUTF8toUTF16() conversion function to convert the read information into Chinese. The Chinese structure type is WSTRING.

- **Function description**
  This instruction enables the user program to quickly restore retentive data.
- **Fault scenarios**
  - The PLC version does not support data backup at power failure.
  - The backup and restore function blocks are repeated within 10 seconds.

- The backup and restore function blocks run simultaneously.
- The backup file does not match the running program of the user.
- The background version does not support the file backup function.
- The backup file fails to be restored.

- **Program example**



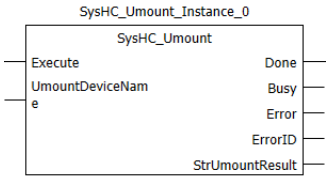
ST:

Name	Type	Address	Value
enable	BOOL		TRUE
reslt	BOOL		FALSE
number	PERSISTENT_SUB		PERSISTENTA2
SysHC_ReadPersistentData_Instance...	SysHC_ReadPersistentData		
xExecute	BOOL		TRUE
number	PERSISTENT_SUB		PERSISTENTA2
xDone	BOOL		FALSE
xBusy	BOOL		FALSE
xError	BOOL		TRUE
eErrorID	PERSISTENT_ERROR		PERSIS_NO_BAK

```
SysHC_ReadPersistentData_Instance_0(xExecute TRUE := enable TRUE ,
                                    numberPERSISTEN... := numberPERSISTEN...,
                                    xDone FALSE =>reslt FALSE ,
                                    xBusy => ,
                                    xError => ,
                                    eErrorID =>);

RETURN
```

LD:



- **Precautions**
  - It is not recommended to use the current backup, restore, and backup information reading function blocks in tasks with high time requirements.
  - It is recommended to use the backup file information reading function block in tasks with a larger cycle and lower priority.
  - When the CPU utilization is high, operating the backup and restore function blocks will cause jitter in task execution.
  - The backup and restore function blocks cannot be called repeatedly within 60 s.
  - In the obtained function block information, the name of the file read is the project name of the power failure data written to the backup.
  - Performing backup at runtime is to save data in the running backup area.
  - When the restore function block is used, data in the backup area during running changes greatly.
  - When file backup is not completed, the file reading function block does not take effect. When file reading is not completed, the file backup function does not take effect.
  - The enable variable of the triggered function block cannot be the persistent variable.
  - It is not recommended to frequently call the backup and restore function blocks.

18.4.1.13 SysHC_Umount

This instruction unmounts external storage devices. It uses an external library to ensure that you can perform a safe unmount before manually ejecting the SD card or USB device.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_Umount	Unmount an external storage device	FB		SysHC_Umount_Instanc e_0(Execute := , UmountDeviceName := , Done => , Busy => , Error => , ErrorID => , StrUmountResult =>);

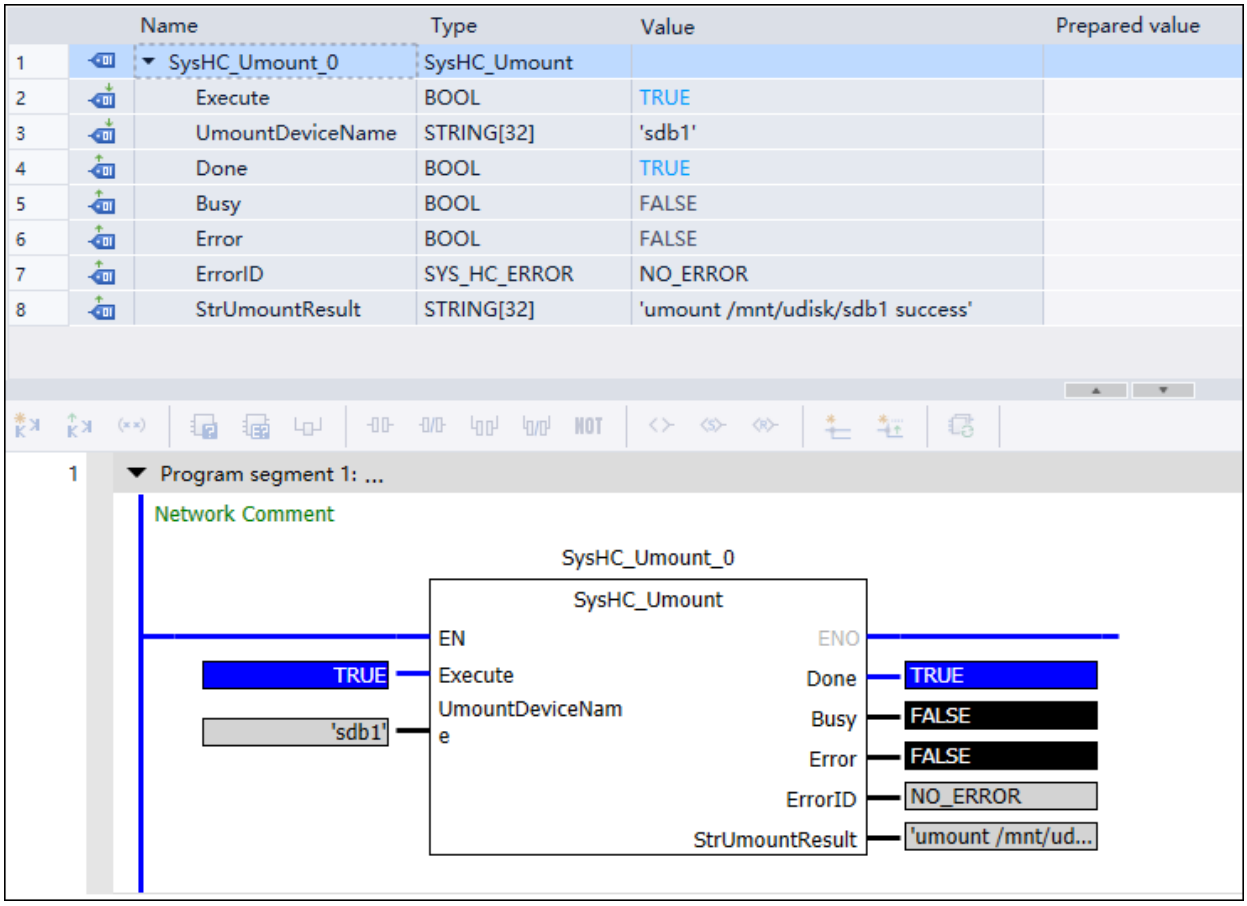
- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Function block enable	BOOL	TRUE, FALSE	FALSE	The instruction is triggered on a rising edge.
	UmountDevice Name	External device name to unmount	STRING[32]	-	'SD'	External device name to unmount, which can be up to 32 bytes. SD and USB devices are supported. • SD parameter: SD. • USB parameter: Fill in according to SysHC_UDiskPath query, for example sdb1.
Output	Done	Output active	BOOL	TRUE, FALSE	FALSE	Output active.
	Busy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.
	Error	Fault	BOOL	TRUE, FALSE	FALSE	Error.
	ErrorID	Error ID	SYS_HC_ER ROR	-	NO_ERR OR	See Fault Codes. When the ErrorID is UNKNOWN_ERROR, strUmountResult outputs the content of the unmount failure.
	StrUmountRes ult	Output the unmount result	STRING[32]	-	-	Output the unmount result.

- **Function description**

  To unmount an external USB storage device (USB flash disk), first call the SysHC_UDiskPath instruction to

obtain the file path of the connected USB storage device to the PLC, and then assign the last field of the file path (e.g., sdb1) to UmountDeviceName.



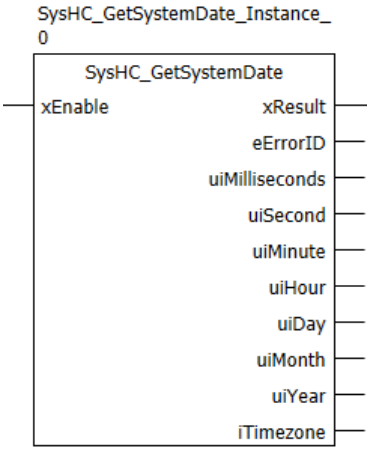
- **Program example**

  ST:

	Name	Type	Add...	Value
1	SysHC_Umount_Instance_0	SysHC_Umount		
2	Execute	BOOL		TRUE
3	UmountDeviceName	STRING[32]		'sdb1'
4	Done	BOOL		TRUE
5	Busy	BOOL		FALSE
6	Error	BOOL		FALSE
7	ErrorID	SYS_HC_ERROR		NO_ERROR
8	StrUmountResult	STRING[32]		'umount /mnt/udisk/sdb1 success'
9	test	BOOL		TRUE

```
1 SysHC_Umount_Instance_0(Execute TRUE := test TRUE ,
2                         UmountDeviceName := ,
3                         Done => ,
4                         Busy => ,
5                         Error => ,
6                         ErrorID => ,
7                         StrUmountResult => );RETURN
```

  LD:



- **Note**

  After successful execution of the instruction, manually eject the SD card or the corresponding USB external device to be unmounted.

18.4.1.14 SysHC_GetSystemDate

This instruction gets the system date.

- **Instruction format**

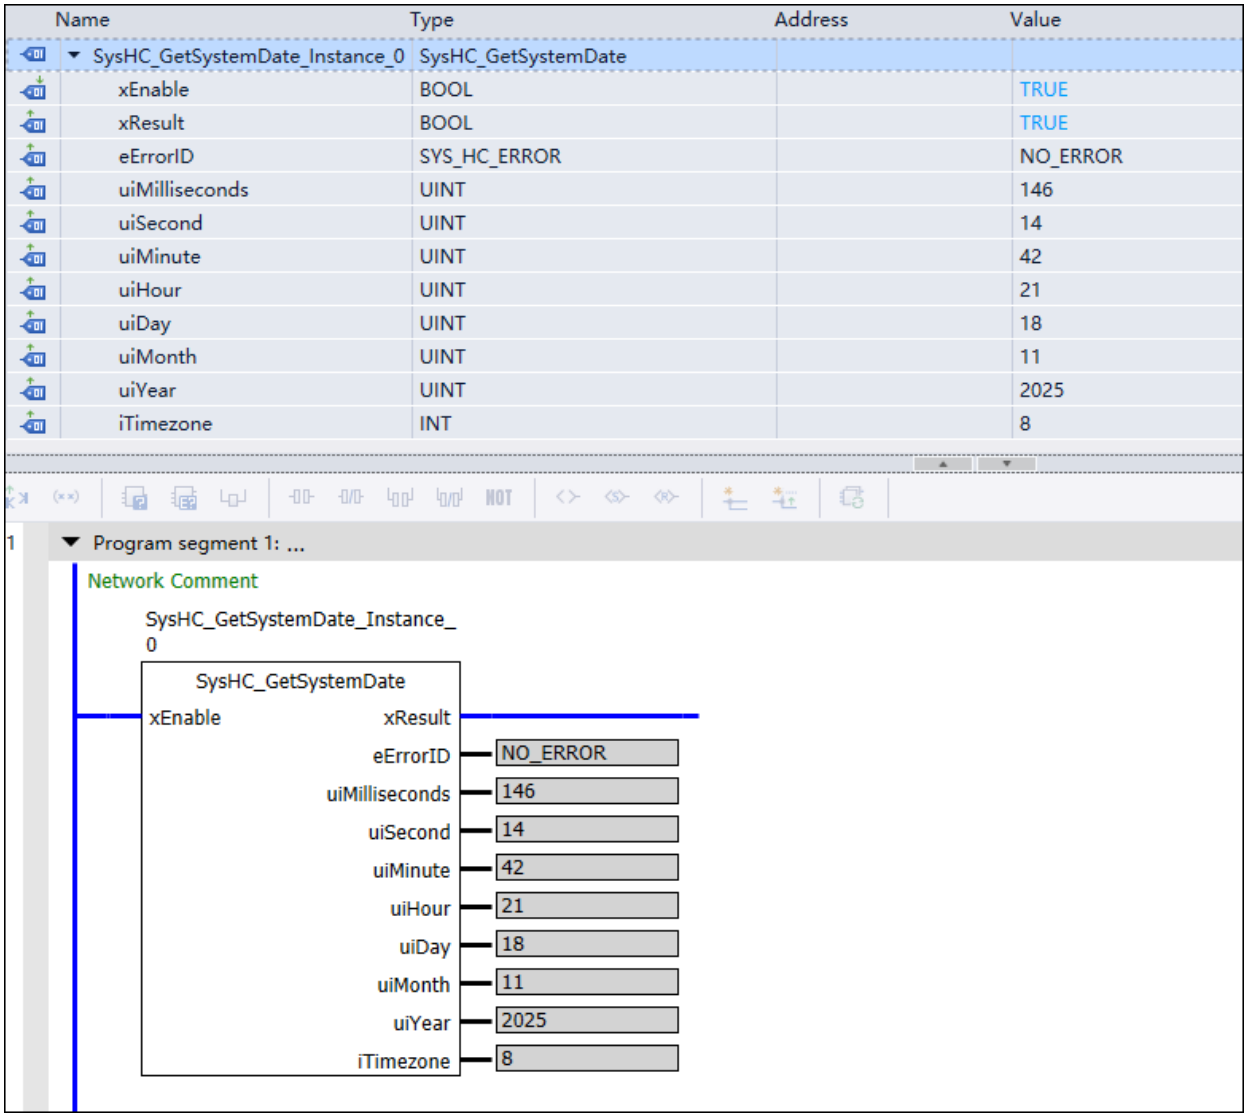
Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_GetSystemDate	Get system date	FB		SysHC_GetSystemDate_Instance_0(xEnable := , xResult => , eErrorID => , uiMilliseconds => , uiSecond => , uiMinute => , uiHour => , uiDay => , uiMonth => , uiYear => , iTimezone =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Function block enable	BOOL	TRUE, FALSE	FALSE	Level triggered
Output	XResult	Execution result	BOOL	TRUE, FALSE	FALSE	Execution result.
	eErrorID	Fault ID	SYS_HC_ERROR	Follows data type	-	Fault ID.
	uiMilliseconds	Milliseconds	UINT	0 to 999	-	Milliseconds (ms)
	uiSecond	Second	UINT	0 to 59	-	Seconds (s)
	uiMinute	Minute	UINT	0 to 59	-	Minutes (min)
	uiHour	Hour	UINT	0 to 23	-	Hours (h)
	uiDay	Day	UINT	1 to 31	-	Day
	uiMonth	Month	UINT	1 to 12	-	Month
	uiYear	Year	UINT	2000 to 2038	-	Year
	iTimezone	Time zone	INT	-12 to +14	-	Time zone.

- **Function description**

  This function block is mainly used to get the system date.



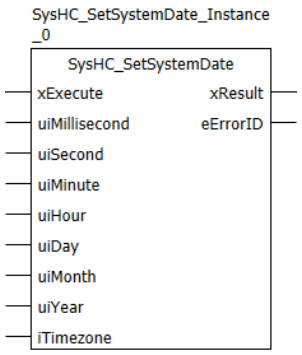
- **Program example**

  ST:

Name	Type	Address	Value
SysHC_GetSystemDate_Instan...	SysHC_GetSystemDate		
Enable	BOOL		TRUE
Result	BOOL		TRUE
ErrorID	SYS_HC_ERROR		NO_ERROR
uiMilliseconds	UINT		966
uiSecond	UINT		48
uiMinute	UINT		41
uiHour	UINT		21
uiDay	UINT		18
uiMonth	UINT		11
uiYear	UINT		2025
iTimezone	INT		8

```
SysHC_GetSystemDate_Instance_0(
xEnable TRUE := Enable TRUE,
xResult TRUE => Result TRUE,
eErrorID NO_ERROR => ErrorID NO_ERROR,
uiMilliseconds 966 => uiMilliseconds 966,
uiSecond 48 => uiSecond 48,
uiMinute 41 => uiMinute 41,
uiHour 21 => uiHour 21,
uiDay 18 => uiDay 18,
uiMonth 11 => uiMonth 11,
uiYear 2025 => uiYear 2025,
iTimezone 8 => iTimezone 8);
```

  LD:



- **Note**

  SysHC_GetSystemDate is an asynchronous instruction. Frequent enabling within a single task cycle may cause data acquisition error or induce task jitter.

18.4.1.15 SysHC_SetSystemDate

This instruction sets the system date.

- **Instruction format**

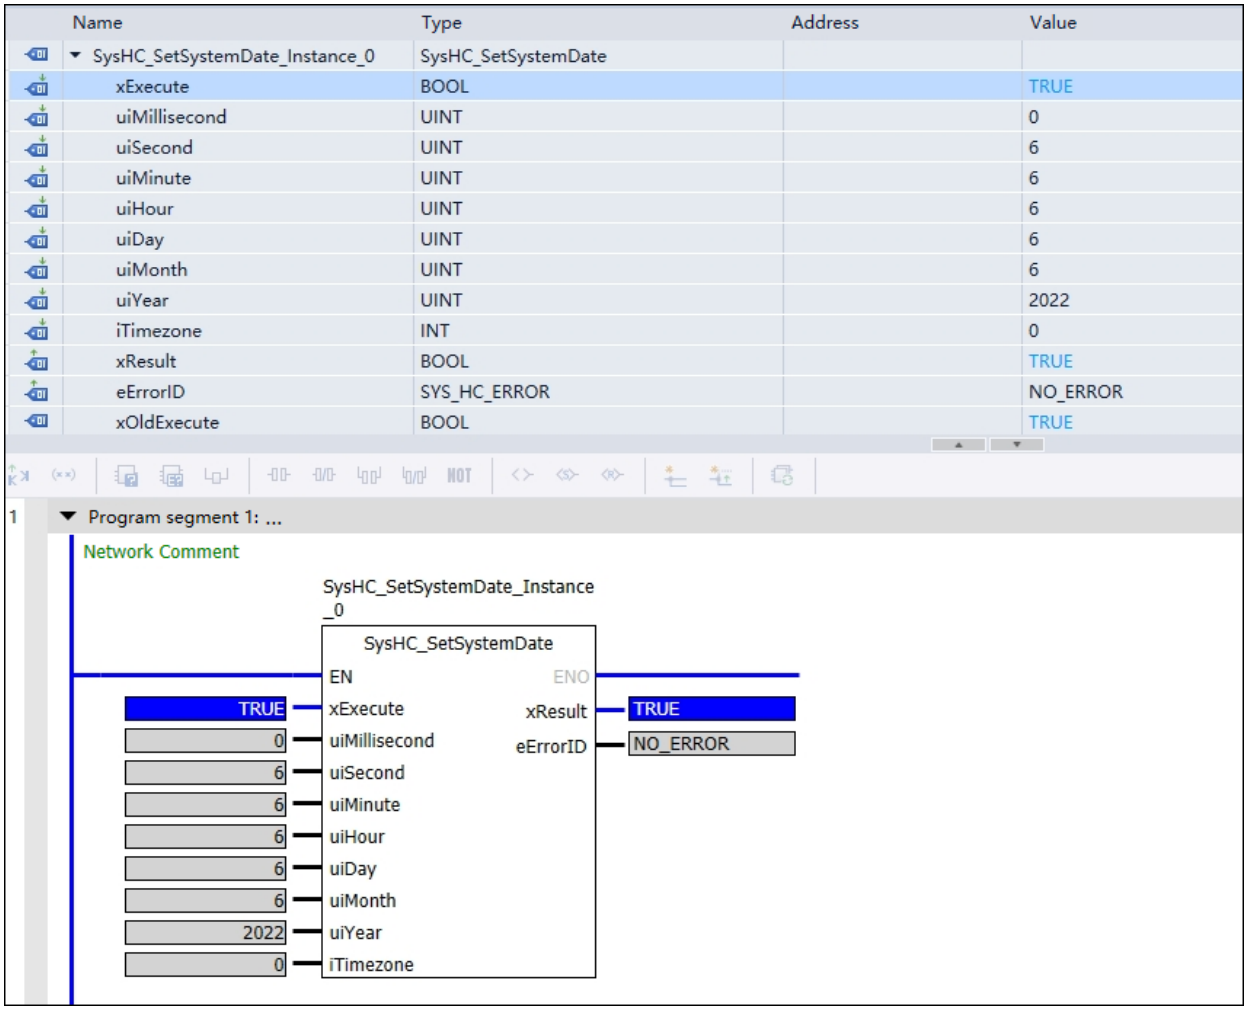
Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_SetSystemDate	Set system date	FB		SysHC_SetSystemDate_Instance_0(xExecute := , uiMillisecond := , uiSecond := , uiMinute := , uiHour := , uiDay := , uiMonth := , uiYear := , iTimezone := , xResult => , eErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Function block enable	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered
	uiMillisecond	Milliseconds	UINT	0 to 999	-	Milliseconds (ms)
	uiSecond	Second	UINT	0 to 59	-	Seconds (s)
	uiMinute	Minute	UINT	0 to 59	-	Minutes (min)
	uiHour	Hour	UINT	0 to 23	-	Hours (h)
	uiDay	Day	UINT	1 to 31	-	Day
	uiMonth	Month	UINT	1 to 12	-	Month
	uiYear	Year	UINT	2000 to 2038	-	Year
	iTimezone	Time zone	INT	-12 to +14	-	Time zone (reserved and cannot be set).
Output	xResult	Execution result	BOOL	TRUE, FALSE	FALSE	Execution result.
	eErrorID	Fault ID	SYS_HC_ERROR	Follows data type	-	See Fault Codes.

- **Function description**

  This function block is mainly used to set the system date.



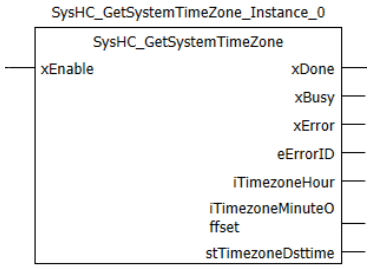
- **Program example**

  ST:

Name	Type	Address	Value
SysHC_SetSystemDate_Instanc...	SysHC_SetSystemDate		
Execute	BOOL		TRUE
uiMilliseconds	UINT		0
uiSecond	UINT		2
uiMinute	UINT		2
uiHour	UINT		2
uiDay	UINT		2
uiMonth	UINT		2
uiYear	UINT		2025
iTimezone	INT		0
Result	BOOL		FALSE
ErrorID	SYS_HC_ERROR		NO_ERROR

```
SysHC_SetSystemDate_Instance_0(
xExecute TRUE := Execute TRUE,
uiMillisecond 0 := uiMilliseconds 0,
uiSecond 2 := uiSecond 2,
uiMinute 2 := uiMinute 2,
uiHour 2 := uiMinute 2,
uiDay 2 := uiDay 2,
uiMonth 2 := uiMonth 2,
uiYear 2025 := uiYear 2025,
iTimezone 0 := iTimezone 0,
xResult FALSE => Result FALSE,
eErrorID NO_ERROR => ErrorID NO_ERROR );
```

LD:



- **Precautions**
  - Set the system time of EVO400/EVO500 via SysHC_SetSystemDate. If no external RTC expansion card is installed, the instruction reports "UNKNOWN_ERROR", signifying a failure to write time data to the RTC chip. Nevertheless, the local system time of the device will be updated normally. Without an RTC module, the device time may reset to January 1, 1970 after a power loss.
  - SysHC_SetSystemDate is an asynchronous instruction. Frequent enabling within a single task cycle may cause data writing error or induce task jitter.

18.4.1.16 SysHC_GetSystemTimeZone

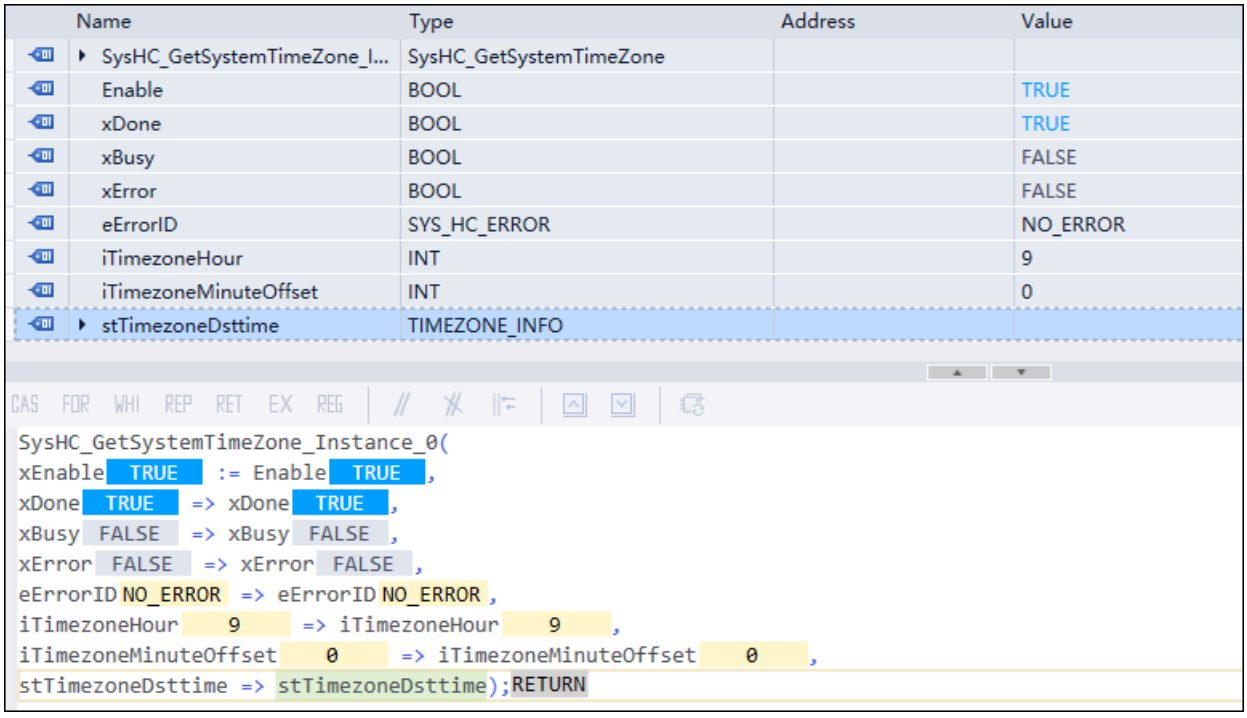
This instruction gets the system timezone information.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_GetSystemTimeZone	Get system time zone	FB		SysHC_GetSystemTimeZone_Instance_0(xEnable := , xDone => , xBusy => , xError => , eErrorID => , iTimezoneHour => , iTimezoneMinuteOffset => , stTimezoneDsttime =>);

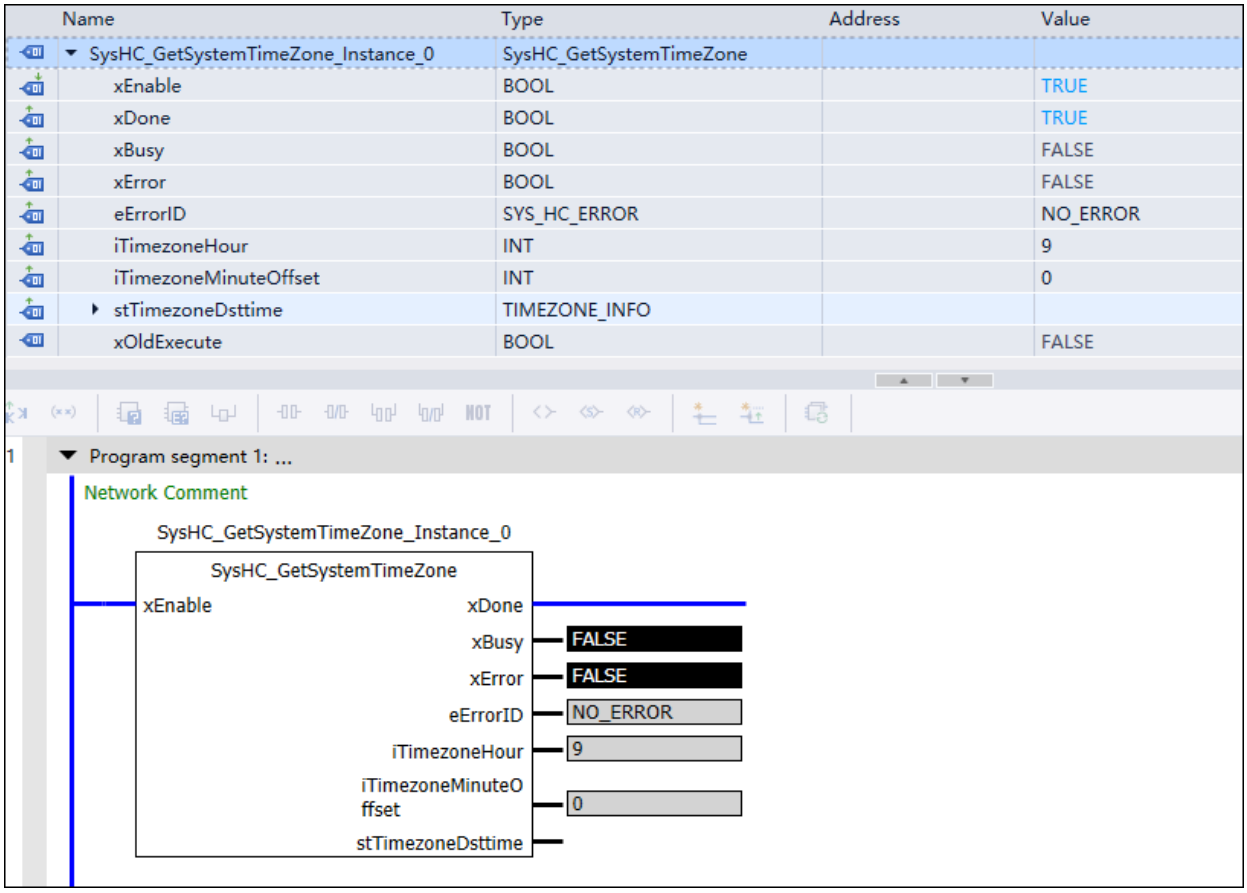
- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Enable	BOOL	TRUE, FALSE	FALSE	Function enable, level-triggered
Output	xDone	FB completion flag	BOOL	TRUE, FALSE	-	Function block completion flag.
	xBusy	Function block execution flag	BOOL	TRUE, FALSE	-	Function block execution flag
	xError	Function block fault flag	BOOL	TRUE, FALSE	-	Function block fault flag
	eErrorID	Function block fault ID	SYS_HC_ERROR	Follows data type	-	See Fault Codes.
	iTimezoneHour	Time zone information	INT	-12 to +14	8	Integer time zone offset in hours.
	iTimezoneMinuteOffset	Timezone information	INT	0 to 59	0	Non-integer time zone offset in minutes.
	stTimezoneDsttime	DST configuration	TIMEZONE_INFO	-	-	DST structure.



- **Function**
  - This function block is mainly used to get the system time zone information.
  - Description of internal members of the TIMEZONE_INFO data structure:

Name of Structure Member	Name	Data Type	Valid Range	Default Value	Description
iDstTimeZoneOffset	DST offset	INT	0~120	-	DST offset in minutes.
iDstStartWeekth	DST start time	INT	0 to 4	-	DST start time: week (0: 1st week)

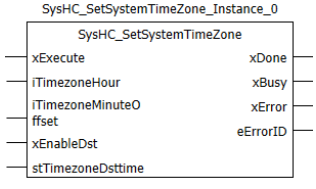


Name of Structure Member	Name	Data Type	Valid Range	Default Value	Description
iDstStartWeekday	DST start time	INT	0 to 6	-	DST start time: day of the week (0: Sunday)
iDstStartMonth	DST start time	INT	0 to 11	-	DST start time: month (0: January)
iDstStartHour	DST start time	INT	0 to 23	-	DST start time: hour
iDstEndWeekth	DST end time	INT	0 to 4	-	DST end time: week (0: 1st week)
iDstEndWeekday	DST end time	INT	0 to 6	-	DST end time: day of the week (0: Sunday)
iDstEndMonth	DST end time	INT	0 to 11	-	DST end time: month (0: January)
iDstEndHour	DST end time	INT	0 to 23	-	DST end time: hour

- **Program example**

ST:

LD:



- **Note**
  The SysHCPlcInfo 1.3.0.0 library version does not support DST time zone setting. The DST function is unavailable.

18.4.1.17 SysHC_SetSystemTimeZone

Set system time zone information.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_SetSystemTimeZone	Set system timezone	FB		SysHC_SetSystemTimeZone_Instance_0(xExecute := , iTimezoneHour := , iTimezoneMinuteOffset := , xEnableDst := , stTimezoneDsttime := , xDone => , xBusy => , xError => , eErrorID =>);

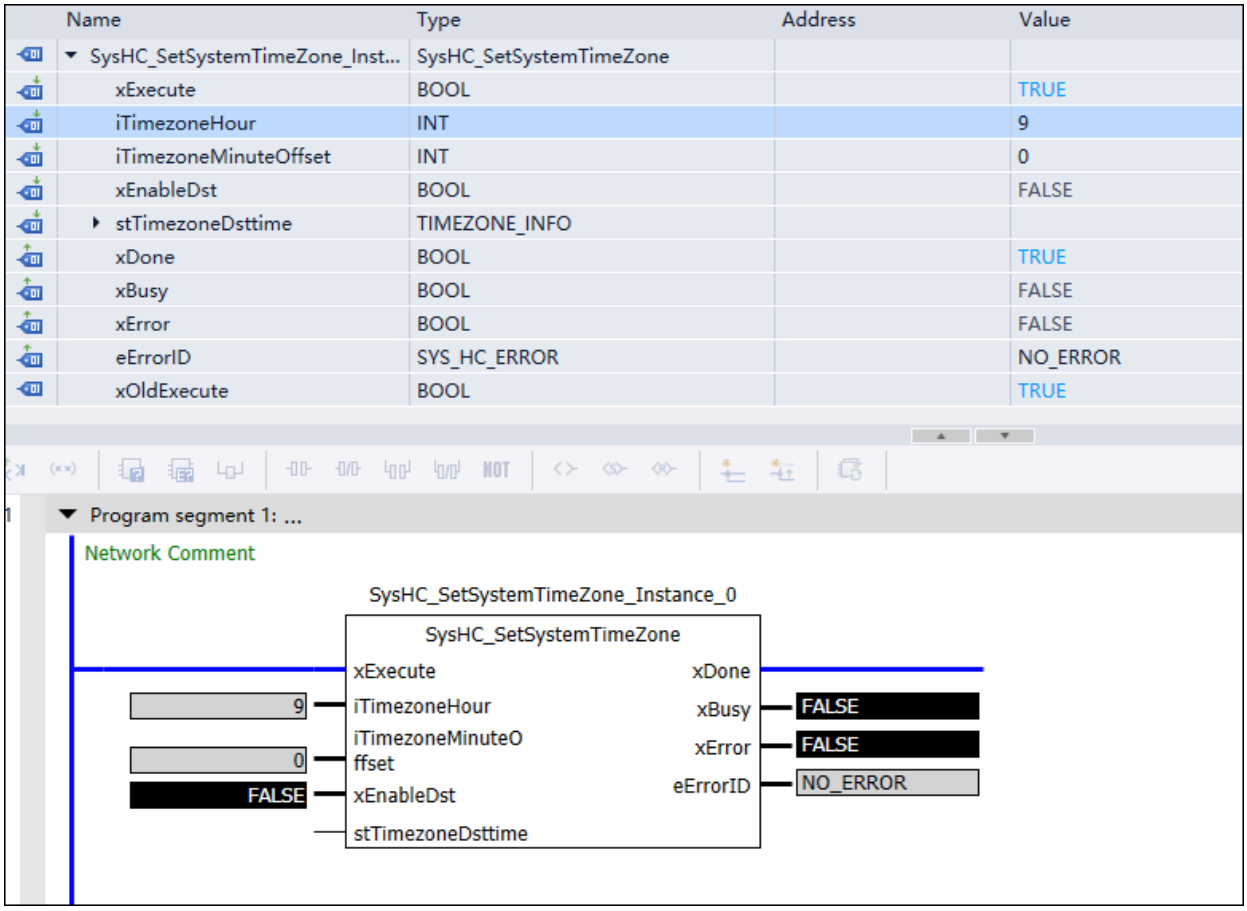
- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Enable	BOOL	TRUE, FALSE	FALSE	Triggered on the rising edge
	iTimezoneHour	Time zone information	INT	-12 to +14	8	Integer time zone offset in hours.
	iTimezoneMinuteOffset	Timezone information	INT	0 to 59	0	Non-integer time zone offset in minutes.
	xEnableDst	Enable DST setting	BOOL	TRUE, FALSE	FALSE	Enable daylight saving time.
	stTimezoneDsttime	DST configuration	TIMEZONE_INFO	-	-	DST structure.
Output	xDone	FB completion flag	BOOL	TRUE, FALSE	-	Function block completion flag.
	xBusy	Function block execution flag	BOOL	TRUE, FALSE	-	Function block execution flag
	xError	Function block fault flag	BOOL	TRUE, FALSE	-	Function block fault flag
	eErrorID	Function block fault ID	SYS_HC_ERROR	Follows data type	-	See Fault Codes.

- **Function**
  - This function block is mainly used for system time zone settings, including integer time zone offset, time zone minute offset, and daylight saving time.
  - Description of internal members of the TIMEZONE_INFO data structure:

Name of Structure Member	Name	Data Type	Valid Range	Default Value	Description
iDstTimeZoneOffset	DST offset	INT	0~120	-	DST offset in minutes.
iDstStartWeekth	DST start time	INT	0 to 4	-	DST start time: week (0: 1st week)
iDstStartWeekday	DST start time	INT	0 to 6	-	DST start time: day of the week (0: Sunday)
iDstStartMonth	DST start time	INT	0 to 11	-	DST start time: month (0: January)
iDstStartHour	DST start time	INT	0 to 23	-	DST start time: hour
iDstEndWeekth	DST end time	INT	0 to 4	-	DST end time: week (0: 1st week)

Name of Structure Member	Name	Data Type	Valid Range	Default Value	Description
iDstEndWeekday	DST end time	INT	0 to 6	-	DST end time: day of the week (0: Sunday)
iDstEndMonth	DST end time	INT	0 to 11	-	DST end time: month (0: January)
iDstEndHour	DST end time	INT	0 to 23	-	DST end time: hour



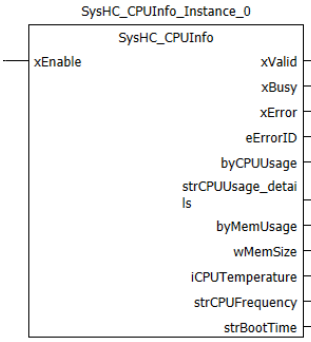
- **Program example**

ST:

Name	Type	Address	Value
SysHC_SetSystemTimeZone_In...	SysHC_SetSystemTimeZone		
xExecute	BOOL		TRUE
iTimezoneHour	INT		9
iTimezoneMinuteOffset	INT		0
xEnableDst	BOOL		FALSE
stTimezoneDsttime	TIMEZONE_INFO		
xDone	BOOL		TRUE
xBusy	BOOL		FALSE
xError	BOOL		FALSE
eErrorID	SYS_HC_ERROR		NO_ERROR

```
SysHC_SetSystemTimeZone_Instance_0(
xExecute TRUE := xExecute TRUE,
iTimezoneHour 9 := iTimezoneHour 9,
iTimezoneMinuteOffset 0 := iTimezoneMinuteOffset 0,
xEnableDst FALSE := xEnableDst FALSE,
stTimezoneDsttime := stTimezoneDsttime,
xDone TRUE => xDone TRUE,
xBusy FALSE => xBusy FALSE,
xError FALSE => xError FALSE,
eErrorID NO_ERROR => eErrorID NO_ERROR );RETURN
```

LD:



- **Precautions**
  - The interval between DST end and start times must not be less than the set DST offset. Consecutive or same months for DST start and end are not supported.
  - The SysHCPlcInfo 1.3.0.0 library version does not support DST time zone setting. The DST function is unavailable.

18.4.1.18 SysHC_CPUInfo

This instruction obtains the CPU information such as memory, frequency, and temperature.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_CPUInfo	Obtain CPU information such as memory, frequency, and temperature	FB		SysHC_CPUInfo_Instance_0(xEnable := , xValid => , xBusy => , xError => , eErrorID => , byCPUUsage => , strCPUUsage_details => , byMemUsage => , wMemSize => , iCPUTemperature => , strCPUFrequency => , strBootTime =>);

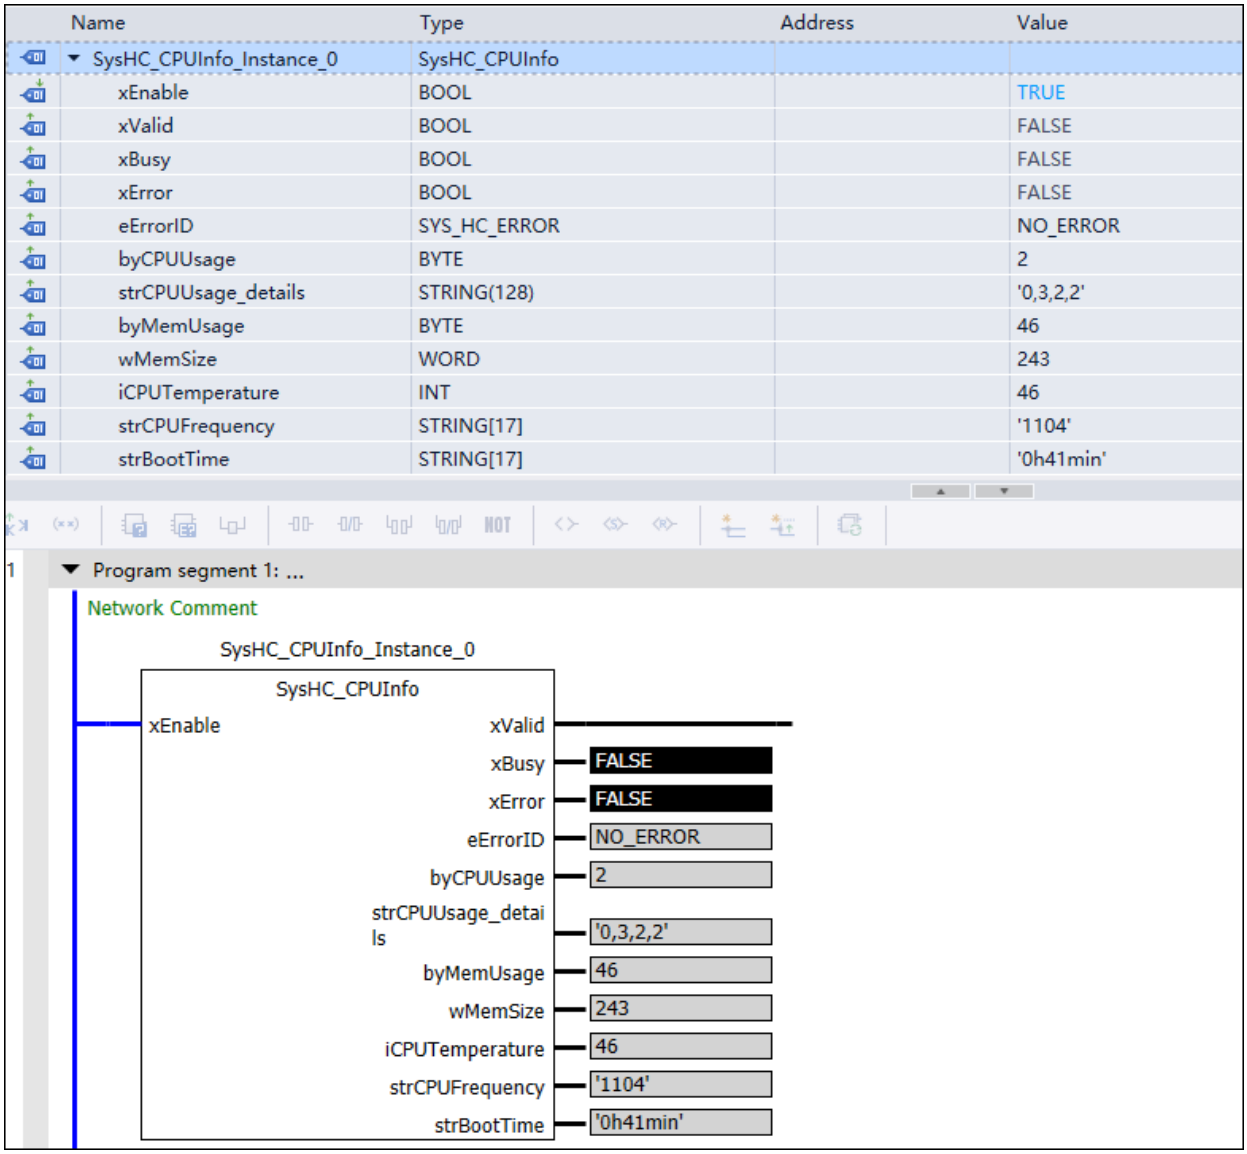
- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Active high	BOOL	TRUE, FALSE	FALSE	Active High.
Output	xValid	Output active	BOOL	TRUE, FALSE	FALSE	Output active.
	xBusy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Executing
	xError	Fault	BOOL	TRUE, FALSE	FALSE	Error.
	eErrorID	Fault ID	SYS_HC_ERROR	-	NO_ERROR	See Fault Codes.
	byCPUUsage	CPU Load	BYTE	0 to 255	0	CPU load rate.
	strCPUUsage_details	Detailed CPU Load	STRING(128)	-	-	Separate CPU load rate.
	byMemUsage	Memory usage	BYTE	0 to 255	0	Memory usage.
	wMemSize	Memory size	WORD	0 to 65535	0	Memory size in MB.
	iCPUTemperature	CPU temperature	INT	0 to 255	0	CPU temperature in °C
	strCPUFrequency	CPU frequency	STRING[17]	-	-	CPU frequency in MHz.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	strBootTime	Startup time	STRING[17]	-	-	Startup time.

- **Function Description**

  This function block is mainly used to obtain CPU information such as memory, frequency, and temperature.



- **Program example**

  ST:

Name	Type	Address	Value
SysHC_CPUInfo_Instance_0	SysHC_CPUInfo		
xEnable	BOOL		TRUE

```

  LD:

18.4.1.19 SysHC_UDiskPath

This instruction gets the path information of USB flash disk.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_UDiskPath	Get the system path of the PLC USB interface	FB		SysHC_UDiskPath_Instance_0(xEnable := , xValid => , xBusy => , xError => , eErrorID => , strUDiskPath1 => , strUDiskPath2 => , strUDiskPath3 => , strUDiskPath4 =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Active high	BOOL	TRUE, FALSE	FALSE	Active High.
Output	xValid	Output active	BOOL	TRUE, FALSE	FALSE	Output active.
	xBusy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.
	xError	Fault	BOOL	TRUE, FALSE	FALSE	Error.
	eErrorID	Fault ID	SYS_HC_ERROR	-	NO_ERROR	See Fault Codes.
	strUDiskPath1	USB disk path 1	STRING[33]	-	-	USB disk path 1.
	strUDiskPath2	USB disk path 2	STRING[33]	-	-	USB disk path 2.
	strUDiskPath3	USB disk path 3	STRING[33]	-	-	USB disk path 3.
	strUDiskPath4	USB disk path 4	STRING[33]	-	-	USB disk path 4.

- **Function Description**

  This function block is used to obtain the system path of the PLC USB interface.

- **Program example**

  ST:

Name	Type	Address	Value
SysHC_UDiskPath_Instance_0	SysHC_UDiskPath		
xEnable	BOOL		TRUE
xValid	BOOL		TRUE
xBusy	BOOL		TRUE
xError	BOOL		FALSE
eErrorID	SYS_HC_ERROR		NO_ERROR
strUDiskPath1	STRING[33]		'/mnt/sdcard'
strUDiskPath2	STRING[33]		''
strUDiskPath3	STRING[33]		''
strUDiskPath4	STRING[33]		''

```
SysHC_UDiskPath_Instance_0(
xEnable TRUE  := xEnable TRUE ,
xValid TRUE  => xValid TRUE ,
xBusy TRUE  => xBusy TRUE ,
xError FALSE  => xError FALSE ,
eErrorID NO_ERROR  => eErrorID NO_ERROR ,
strUDiskPath1 '/mnt/sdcard'  => strUDiskPath1 '/mnt/sdcard' ,
strUDiskPath2 ''  => strUDiskPath2 '' ,
strUDiskPath3 ''  => strUDiskPath3 '' ,
strUDiskPath4 ''  => strUDiskPath4 '' );RETURN
```

LD:

Name	Type	Address	Value
SysHC_UDiskPath_Instance_0	SysHC_UDiskPath

xValid	BOOL		TRUE
xBusy	BOOL		TRUE
xError	BOOL		FALSE
eErrorID	SYS_HC_ERROR		NO_ERROR
strUDiskPath1	STRING[33]		'/mnt/sdcard'
strUDiskPath2	STRING[33]		''
strUDiskPath3	STRING[33]		''
strUDiskPath4	STRING[33]		''

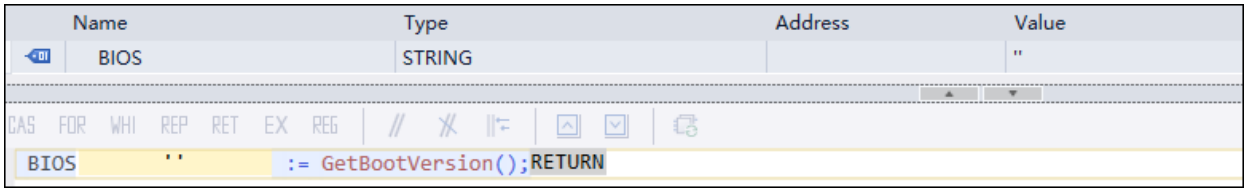
18.4.1.20 GetBootVersion

This instruction gets the Boot version number.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
GetBootVersion	Get BIOS version	FC		:= GetBootVersion();

- **Related variables**



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	GetBootVersion	Boot version number	STRING	-	-	Boot version number

- **Function description**

  This function block is mainly used to get the Boot version number.

- **Program example**

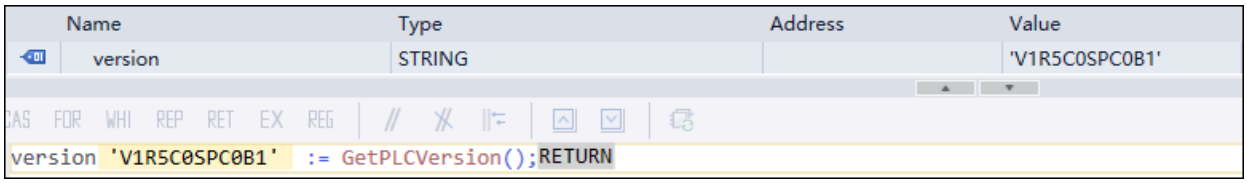
  ST:

  LD:

18.4.1.21 GetPLCVersion

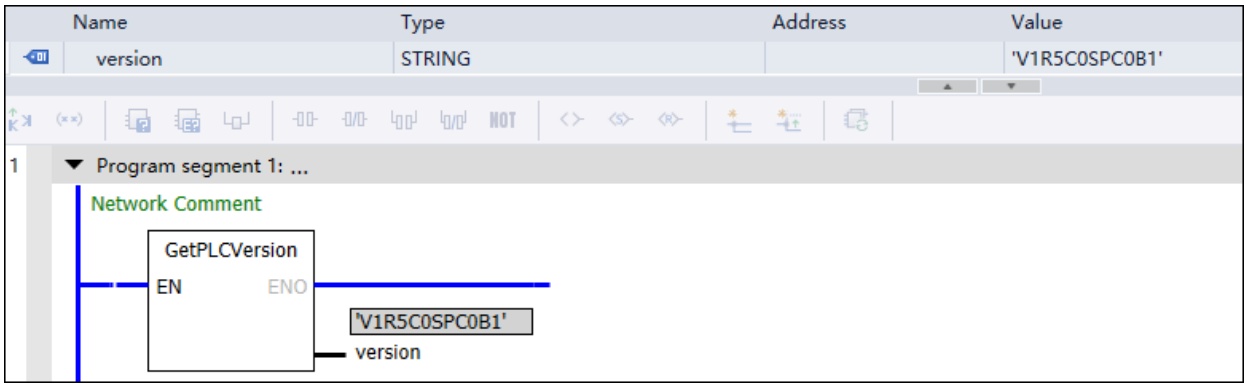
This instruction gets the PLC version number.

- **Instruction format**



Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
GetPLCVersion	Get the PLC firmware version	FC		:= GetPLCVersion();

- **Related variables**



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	GetPLCVersion	Get PLC version number	STRING	-	-	This instruction gets the PLC version number.

- **Function description**
  This function block is mainly used to get the PLC version number.
- **Program example**

  ST:

  LD:

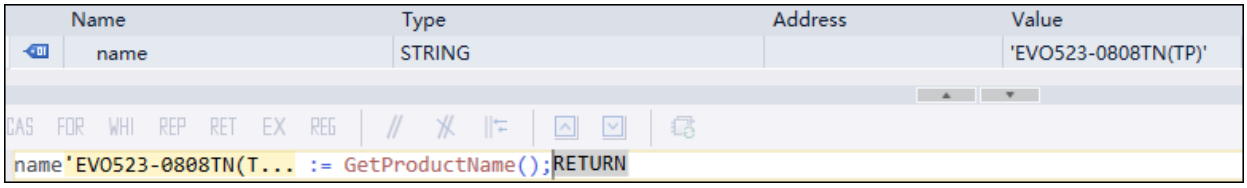
18.4.1.22 GetProductName

This instruction gets the PLC device name.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
GetProductName	Get PLC device name	FC	GetProductName EN ENO	:= GetProductName();

- **Related variables**



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	GetProductName	Get device name	STRING	-	-	This instruction gets the device name.

- **Function description**

  This function block is mainly used to get the PLC device name.

- **Program example**

  ST:

  LD:

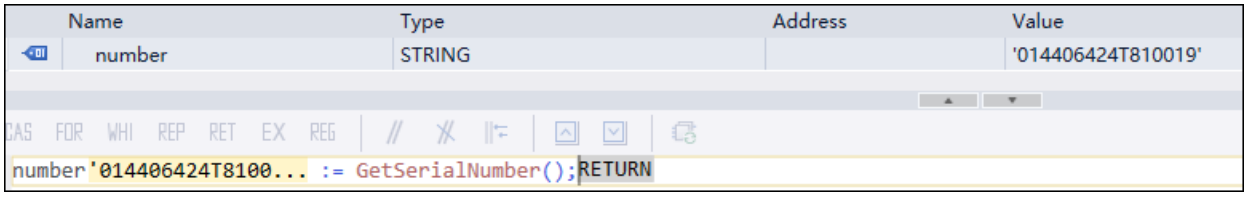
18.4.1.23 GetSerialNumber

This instruction gets the SN number.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
GetSerialNumber	Get the PLC serial number (unique)	FC	GetSerialNumber EN ENO	:= GetSerialNumber();

- **Related variables**



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	GetSerialNumber	Get SN number	STRING	-	-	This instruction gets the SN number.

- **Function description**

  This function block is mainly used to get the PLC serial number.

- **Program example**

  ST:

  LD:

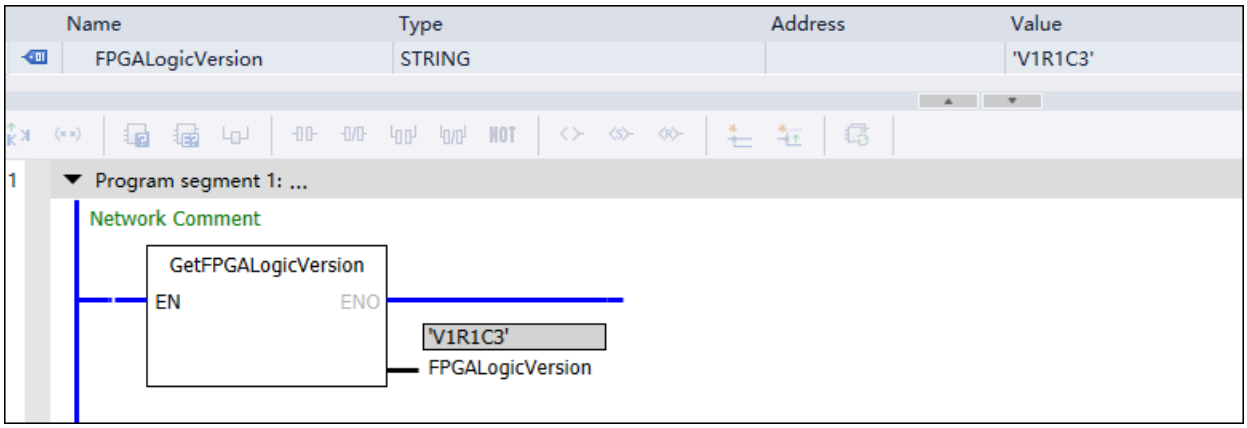
18.4.1.24 GetFPGALogicVersion

This instruction gets the FPGA software version number.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
GetFPGALogicVersion	Get the FPGA logic version number	FC		:= GetFPGALogicVersion();

- **Related variables**



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	GetFPGALogicVersion	Get the FPGA software version number	STRING	-	-	This instruction gets the FPGA software version number.

- **Function description**
  This function block is primarily used to get the FPGA software version number.
- **Program example**

  ST:

  LD:

18.4.1.25 SysHC_Appbackup

This instruction backups user program. The function block implements user program triggered backup through an external library method.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_Appbackup	Instruction-based user program data backup	FB		SysHC_Appbackup_Instance_0(xExecute := , StrBackupDir := , xDone => , xBusy => , xError => , eErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Function block enable	BOOL	TRUE, FALSE	FALSE	Enable of triggering at the rising edge to obtain the backup result.
	StrBackupDir	Backup file directory name	STRING[64]	-	-	Specified directory name to start with the "/", without any illegal characters such as @ # , !, supporting up to 32 bytes.
Output	xDone	Output active	BOOL	TRUE, FALSE	FALSE	Output active.
	xBusy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Executing
	xError	Fault	BOOL	TRUE, FALSE	FALSE	Error.
	eErrorID	Fault ID	BYTE	-	0	Error ID. For details, see Fault description.

- **Function**
  - This instruction applies to the EVO400, EVO500, EVO700, and EVO800 series products.
  - To write backup data to an external USB storage device (USB flash disk), call the SysHC_UDiskPath instruction to get the file path of the USB storage device connected to the PLC . The StrBackupDir parameter can be set to the path to call the SysHC_AppBackup backup instruction.
  - For EVO400/EVO500, if input parameter "StrBackupDir" is empty, the default storage path is: /home/ino/inosys/app/PLCprogram.
  - For EVO700, if input parameter "StrBackupDir" is empty, the default storage path is: /inocfg/app/PLCprogram.
  - For EVO800, if input parameter "StrBackupDir" is empty, the default storage path is: /home/ino/inocfg/app/PLCprogram.
- **Program example**

  ST:

Name	Type	Address	Value
SysHC_Appbackup_Instance_0	SysHC_Appbackup		
xExecute	BOOL		TRUE
StrBackupDir	STRING[64]		'/mnt/udisk/sdc1'
xDone	BOOL		TRUE
xBusy	BOOL		FALSE
xError	BOOL		FALSE
eErrorID	BYTE		0

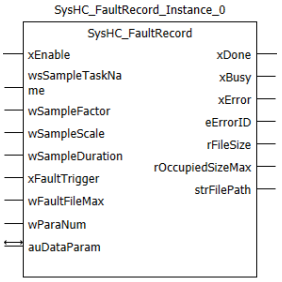
```
SysHC_Appbackup_Instance_0(
xExecute TRUE := xExecute TRUE ,
StrBackupDir'/mnt/udisk/sd... := StrBackupDir'/mnt/udisk/sd...,
xDone TRUE => xDone TRUE ,
xBusy FALSE => xBusy FALSE ,
xError FALSE => xError FALSE ,
eErrorID 0 => eErrorID 0 );RETURN
```

LD:

Name	Type	Address	Value
SysHC_Appbackup_Instance_0	SysHC_Appbackup		
xExecute	BOOL		TRUE
StrBackupDir	STRING[64]		'/mnt/udisk/sdc1'
xDone	BOOL		TRUE
xBusy	BOOL		FALSE
xError	BOOL		FALSE
eErrorID	BYTE		0
xLastExecute	BOOL		TRUE

- **Fault description**

  When an error occurs, locate the corresponding error via eErrorID and find the cause of the error.



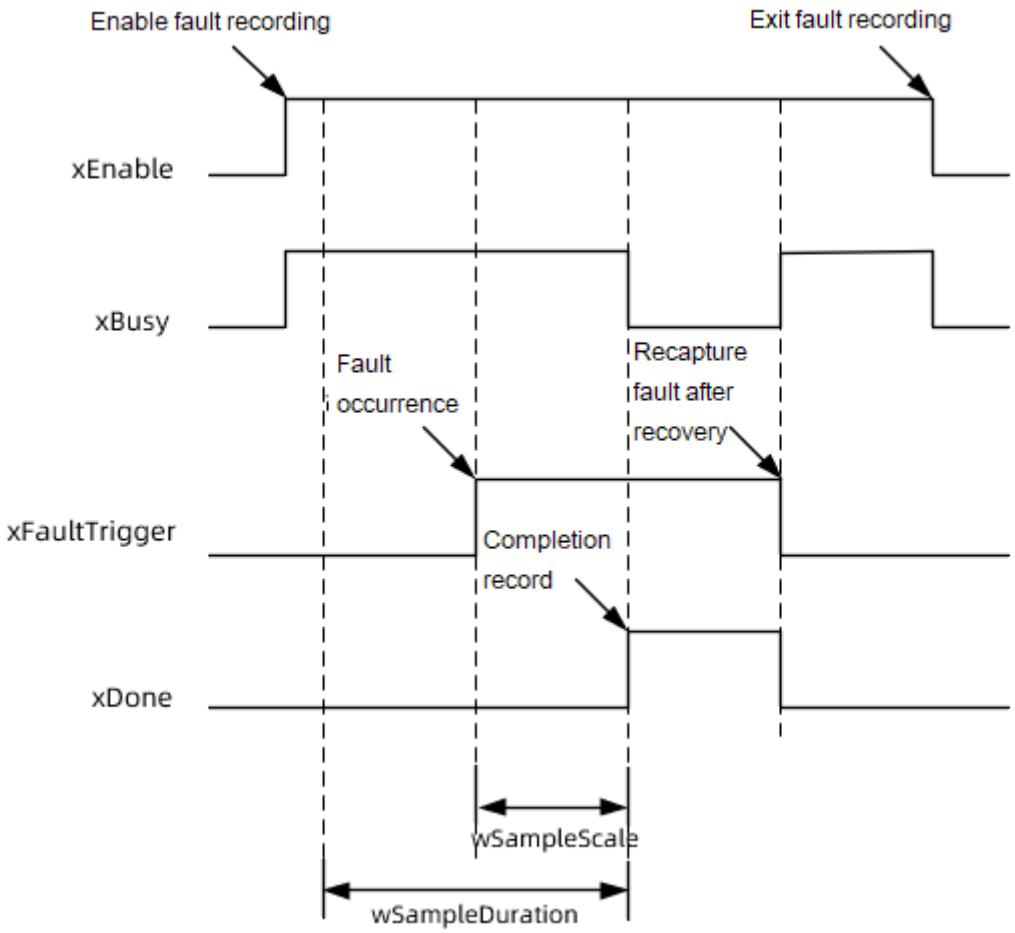
Fault Code	Description
0xEE	No SD card or USB flash disk is detected.
0xAA	The directory name "StrBackupDir" is invalid.
0x11	The source file for backup does not exist.
0x12	The system memory usage exceeds the limit, causing the failure to start backup.
0x13	Multiple instances are calling this instruction repeatedly. Repeated calls are prohibited.
0x31	Failed to create the backup directory before backup execution.
0x32	Failed to pack the backup files during the backup process.
0x33	No corresponding backup file is generated after backup ends.
0xEF	Multiple USB flash disks are inserted, but only one is allowed during backup.

- **Precautions**
  - EVO400/EVO500 PLCs have limited built-in flash storage space, so an external SD expansion card is required (which needs to be expanded by using the GE20-TF-RTC expansion card) to store the data backed up by the backup instruction. EVO400/AM500 PLCs do not support hot swapping recognition of SD cards, so the SD card must be connected before the device is powered on and then started.
  - When the system memory usage exceeds 80%, backup is not allowed, and calling the backup instruction returns the error code 0x12.
  - Only the latest backup file package is retained. Multiple backups will clear other file packages in the backup directory.
  - If an IEC task enables backup instruction pins by event triggering, events need to be continuously triggered to refresh the instruction execution result. This prevents pin occupancy from causing the failure to call instructions in other tasks.
  - The backup instruction function block is not suitable for calling under FUN and METH.
  - When the backup instruction is called for backup, it is necessary to ensure that all the .app and .crc files under the app folder exist. If any one is missing, the error code 0x11 will be returned.
  - The instruction cannot be triggered for backup when there are multiple apps in the PLC.
  - The user program restoration method is the same as the SD card user program upgrade method described above. For details, see 14.1.2.2 Upgrading User Program via SD Card/USB Disk.

18.4.1.26 SysHC_FaultRecord

When a specified fault is triggered, the associated variable data during the period before and after the fault is automatically collected and saved as a file.

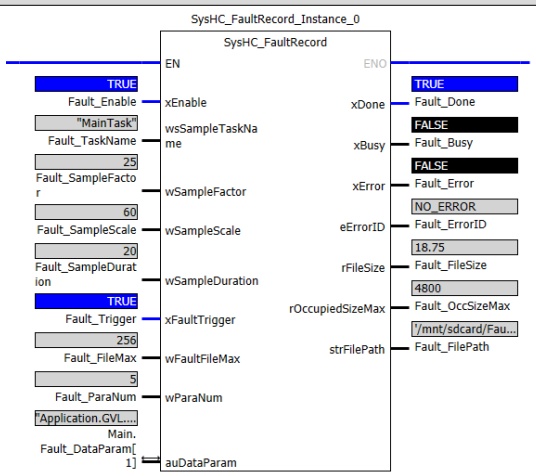
- **Instruction format**

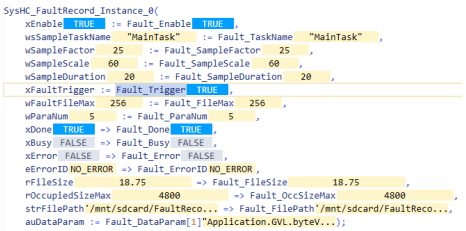


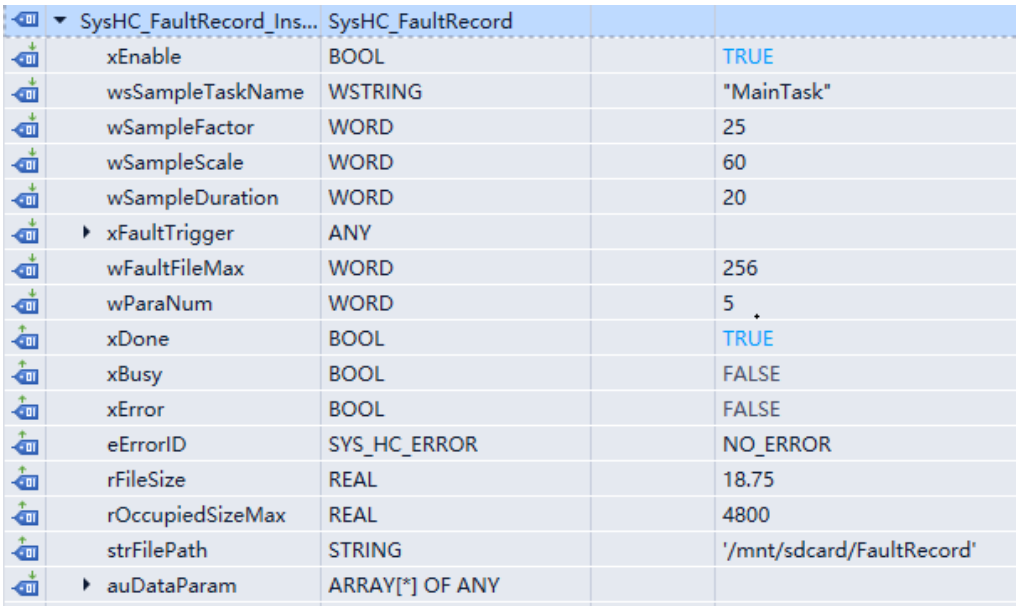
Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_FaultRecord	Get fault data recording by calling instruction	FB		SysHC_FaultRecord_Instance_0(xEnable := , wsSampleTaskName := , wSampleFactor := , wSampleScale := , wSampleDuration := , xFaultTrigger := , wFaultFileMax := , wParaNum := , xDone => , xBusy => , xError => , eErrorID => , rFileSize => , rOccupiedSizeMax => , strFilePath => , auDataParam :=);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input/ Output	auDataParam	Variable recording symbol	ARRAY[*] OF ANY	Follows data type	-	Array of variables to be recorded. The number of array elements must not exceed 64, and the element type is WSTRING.
Input	xEnable	Instruction enable	BOOL	TRUE, FALSE	FALSE	High level triggered
	wsSampleTaskName	Sampling task	WSTRING	Follows data type	-	The instruction configures the variable data to be collected in the task.
	wSampleFactor	Sampling cycle factor	WORD	>=1	-	One sampling cycle = Sampling cycle factor × Cycle of the sampling task The calculation result must be within 1ms to 1s.
	wSampleScale	Sampling ratio	WORD	10 to 90	-	The ratio of the sampling time after a fault trigger to the total sampling time (wSampleDuration).
	wSampleDuration	Total sampling time	WORD	EVO500 and APC520 series: [20, 120] Other series: [20, 600]	-	Total sampling duration, unit: seconds
	xFaultTrigger	Fault trigger signal	ANY	Follows data type	-	Indicates whether a fault is triggered.
	wFaultFileMax	Max. number of record files	WORD	(0, 1000]	-	If this value is exceeded, the oldest fault record file will be overwritten.







Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	wParaNum	Number of variables to be sampled	WORD	EVO500 and APC520 series: <=32 Other series: <=64	-	The number of variables collected in the record file cannot exceed the number of elements in the auDataParam array. For example, 10 indicates that the values of the first 10 elements in the auDataParam array are recorded.
Output	xDone	Execution completion flag	BOOL	TRUE, FALSE	-	Indicates whether the instruction is completed.
	xBusy	Execution flag	BOOL	TRUE, FALSE	-	Indicates the instruction is being executed.
	xError	Error flag	BOOL	TRUE, FALSE	-	Indicates the error of the instruction.
	eErrorID	Fault code	SYS_HC_ERROR	Follows data type	-	See Fault Codes.
	rFileSize	Size of record file	REAL	Follows data type	-	Size of a record file, unit: kByte
	rOccupiedSizeMax	Maximum storage space occupied by record files	REAL	Follows data type	-	Size of all record files, rOccupiedSizeMax = rFileSize × wFaultFileMax, unit: kByte
	strFilePath	Storage path for record files	STRING	Follows data type	-	Absolute path for storing the record files.

- **Function description**
  When a fault is specified to trigger, the associated variable data within the time period before and after the fault (wSampleDuration) will be automatically collected and saved as a file to an external storage device (USB flash drive or SD card).
- **Timing diagram**

- **Program example**

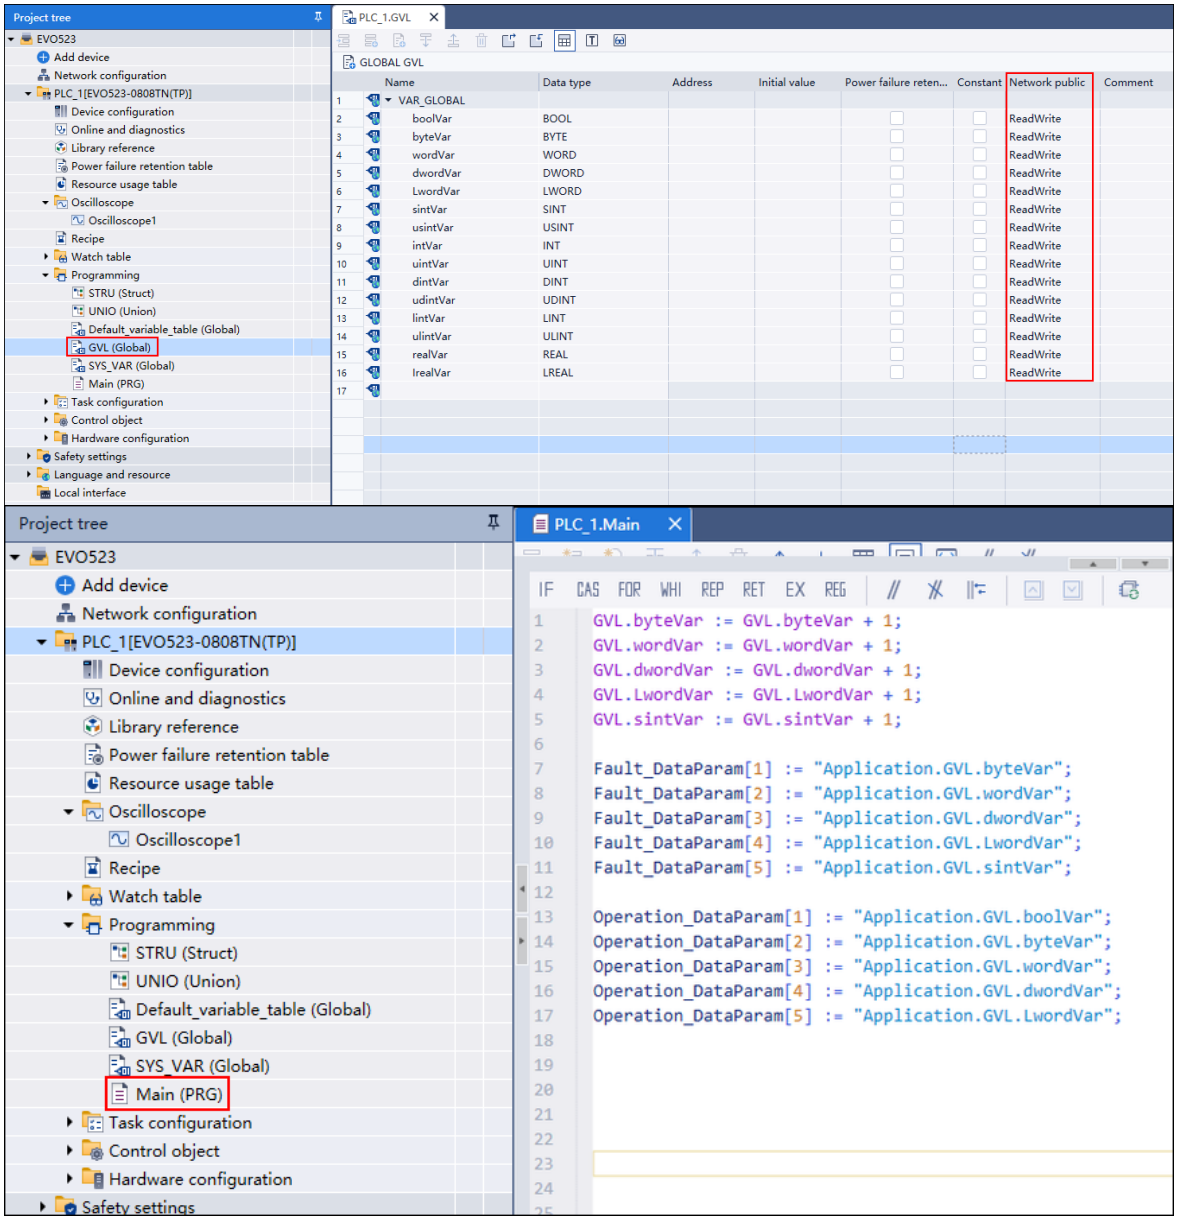
Define variables	VAR SysHC_FaultRecord_Instance_0: SysHC_FaultRecord; Fault_Enable: BOOL; Fault_TaskName: WSTRING; Fault_SampleFactor: WORD; Fault_SampleScale: WORD; Fault_SampleDuration: WORD; Fault_Trigger: BOOL; Fault_FileMax: WORD; Fault_ParaNum: WORD; Fault_Done: BOOL; Fault_Busy: BOOL; Fault_Error: BOOL; Fault_ErrorID: SYS_HC_ERROR; Fault_FileSize: REAL; Fault_OccSizeMax: REAL; Fault_FilePath: STRING; Fault_DataParam: ARRAY[1..32] OF WSTRING; END_VAR	



Item	LD	ST
Program		
Run result		

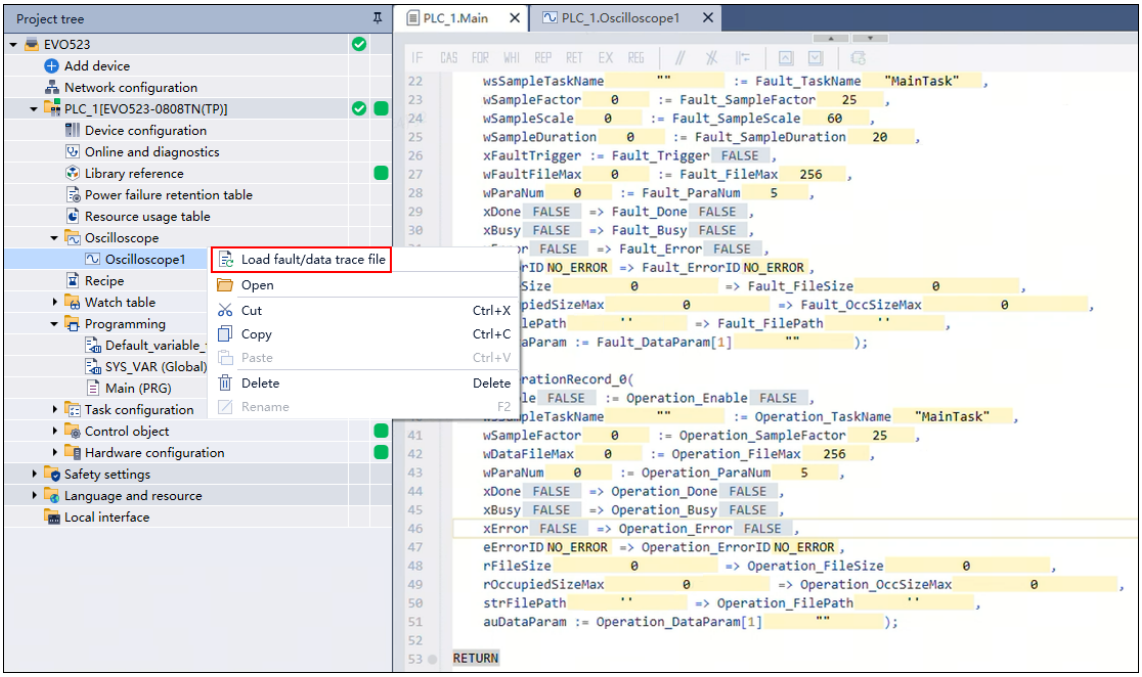
- **Usage Example**

  1. Define the global or local variables to be recorded in the sampling task. The data types for fault and data recording include: BOOL, BYTE, WORD, DWORD, LWORD, SINT, USINT, INT, UINT, DINT, UDINT, LINT, ULINT, REAL and LREAL.

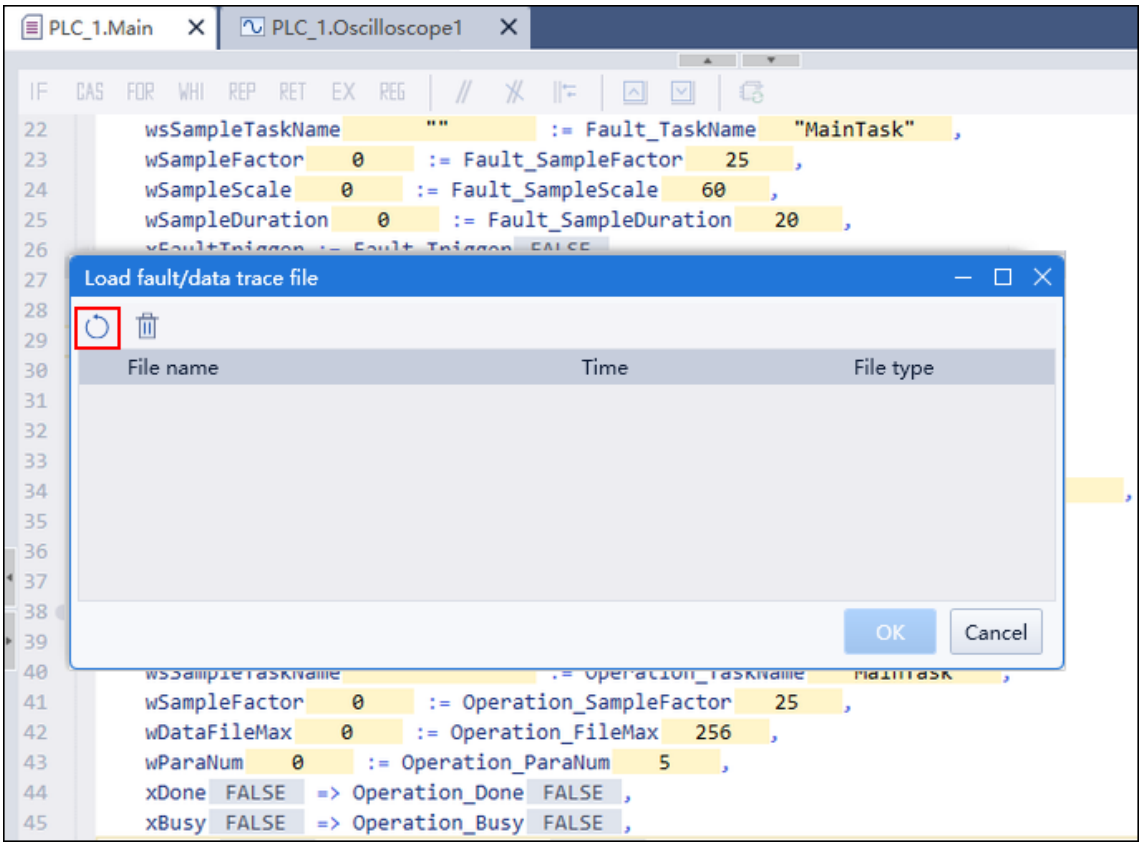
     > NOTE
     >
     > The data involved in recording must have read-write or read permissions.

     The following figures take a global variable as an example.

2. Configure the fault and data recording instruction.



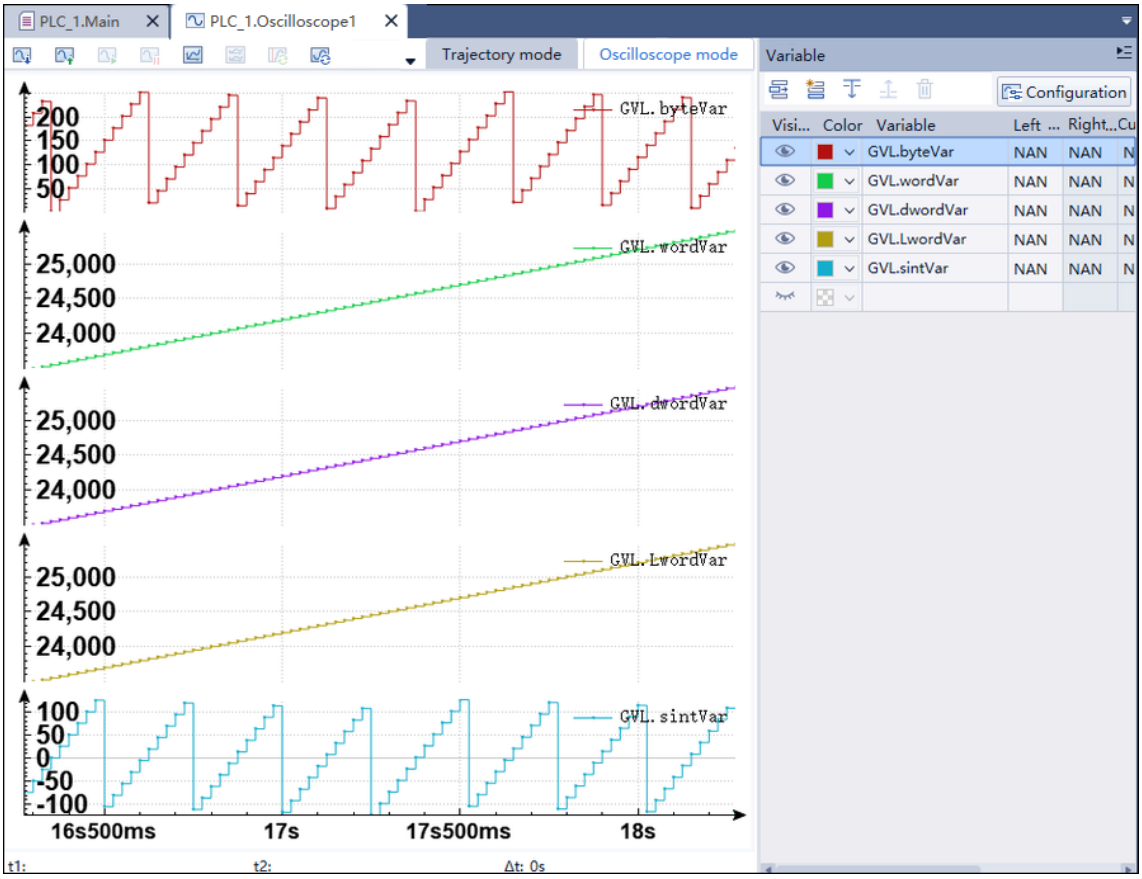
3. Call the fault and data recording function block.



4. After executing the fault and data recording function block, you can view or export the related record data in the oscilloscope.

   a. Right-click "Oscilloscope" in the project tree, select "Add oscilloscope", and create a new oscilloscope.

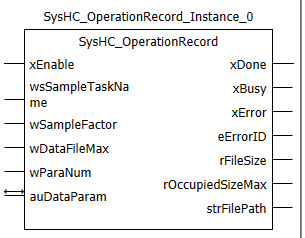
   b. Right-click the newly created oscilloscope, and selected "Load fault/data trace file".



c. Click the refresh button in the pop-up window.

d.

Select the fault or data recording file, click "OK", and the data will be loaded.



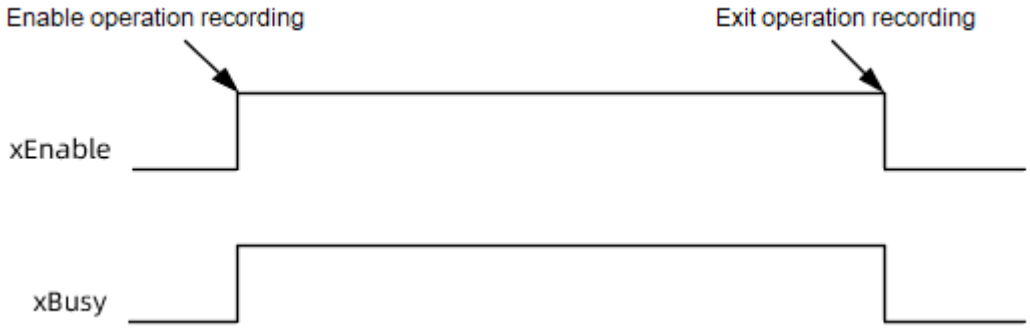
e. (Optional) Right-click the oscilloscope interface, select "Save oscilloscope data", and then choose the save format.

- **Precautions**
  - This instruction can be called only once at the same time.
  - After executing the instruction, a record file will be generated each time a fault is triggered.
  - The task mounting of the recording function is determined by the input parameter (wsSampleTaskName), independent of the task where the instruction resides.
  - Place the instruction in a lower-priority task to avoid affecting higher-priority IEC tasks.
    For example, if the EtherCAT task priority is 0 and MainTask priority is 2 in the project, place the instruction in MainTask and set the wsSampleTaskName parameter to the EtherCAT task. In this case, the recording function can synchronize sampling with the EtherCAT task without affecting the task stability.
  - Before using this instruction, a folder named FaultRecord must be created on the target external memory device (USB flash disk or SD card).
  - Ensure the total byte length of instruction data meets the requirements: 1 to 32 bytes for EVO500 and APC520 series, and 1 to 128 bytes for other series.

18.4.1.27 SysHC_OperationRecord

This instruction automatically collects associated variable data and store it as a file.

- **Instruction format**

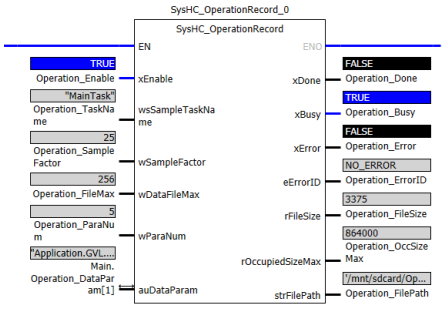


Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_OperationRecord	Get program data recording by calling instruction	FB		SysHC_OperationRecord_Instance_0(xEnable := , wsSampleTaskName := , wSampleFactor := , wDataFileMax := , wParaNum := , xDone => , xBusy => , xError => , eErrorID => , rFileSize => , rOccupiedSizeMax => , strFilePath => , auDataParam :=);

- **Related variables**

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input/Output	auDataParam	Variable recording symbol	ARRAY[*] OF ANY	Follows data type	-	Array of variables to be recorded. The number of array elements must not exceed 64, and the element type is WSTRING.
Input	xEnable	Instruction enable	BOOL	TRUE, FALSE	FALSE	High level triggered
	wsSampleTaskName	Sampling task	WSTRING	Follows data type	-	The instruction configures the variable data to be collected in the task.
	wSampleFactor	Sampling cycle factor	WORD	>=1	-	One sampling cycle = Sampling cycle factor × Cycle of the sampling task The calculation result must be within 1ms to 10s.
	wDataFileMax	Max. number of record files	WORD	(0, 720]	-	If this value is exceeded, the oldest record file will be overwritten.

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	wParaNum	Number of variables to be sampled	WORD	EVO500 and APC520 series: <=32 Other series: <=64	-	The number of variables collected in the record file cannot exceed the number of elements in the auDataParam array. For example, 10 indicates that the values of the first 10 elements in the auDataParam array are recorded.
Output	xDone	Execution completion flag	BOOL	TRUE, FALSE	-	Indicates whether the instruction is completed.
	xBusy	Execution flag	BOOL	TRUE, FALSE	-	Indicates the instruction is being executed.
	xError	Error flag	BOOL	TRUE, FALSE	-	Indicates the error of the instruction.
	eErrorID	Fault code	SYS_HC_ERROR	Follows data type	-	See Fault Codes.
	rFileSize	Size of record file	REAL	Follows data type	-	Size of a record file, unit: kByte
	rOccupiedSizeMax	Maximum storage space occupied by record files	REAL	Follows data type	-	Size of all record files, rOccupiedSizeMax = rFileSize × wDataFileMax, unit kByte.
	strFilePath	Storage path for record files	STRING	Follows data type	-	Absolute path for storing the record files.



- **Function description**
  This instruction collects associated variable data automatically and saves it as a file to an external storage device (USB flash disk or SD card).
- **Timing diagram**

- **Program example**

- **Usage example**
  For details, see the Usage example in the SysHC_FaultRecord instruction.
- **Precautions**
  - This instruction can be called only once at the same time.
  - After executing the instruction, a record file will be generated every hour.
  - The task mounting of the recording function is determined by the input parameter (wsSampleTaskName), independent of the task where the instruction resides.
  - Place the instruction in a lower-priority task to avoid affecting higher-priority IEC tasks.
    For example, if the EtherCAT task priority is 0 and MainTask priority is 2 in the project, place the instruction in MainTask and set the wsSampleTaskName parameter to the EtherCAT task. In this case, the recording function can synchronize sampling with the EtherCAT task without affecting the task stability.
  - Before using this instruction, a folder named OperationRecord must be created on the target external memory device (USB flash disk or SD card).
  - Ensure the total byte length of instruction data meets the requirements: 1 to 32 bytes for EVO500 and APC520 series, and 1 to 128 bytes for other series.

18.4.1.28 SysHC_AppDownInfo

This instruction gets the latest user program information for the PLC.

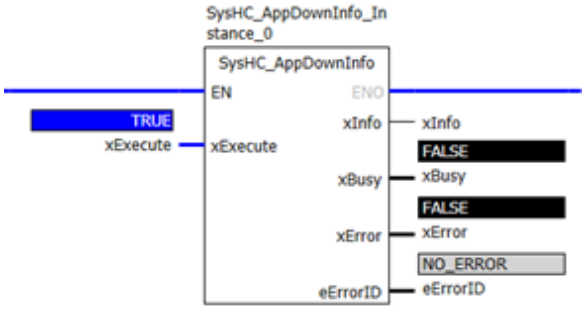
- **Instruction format**

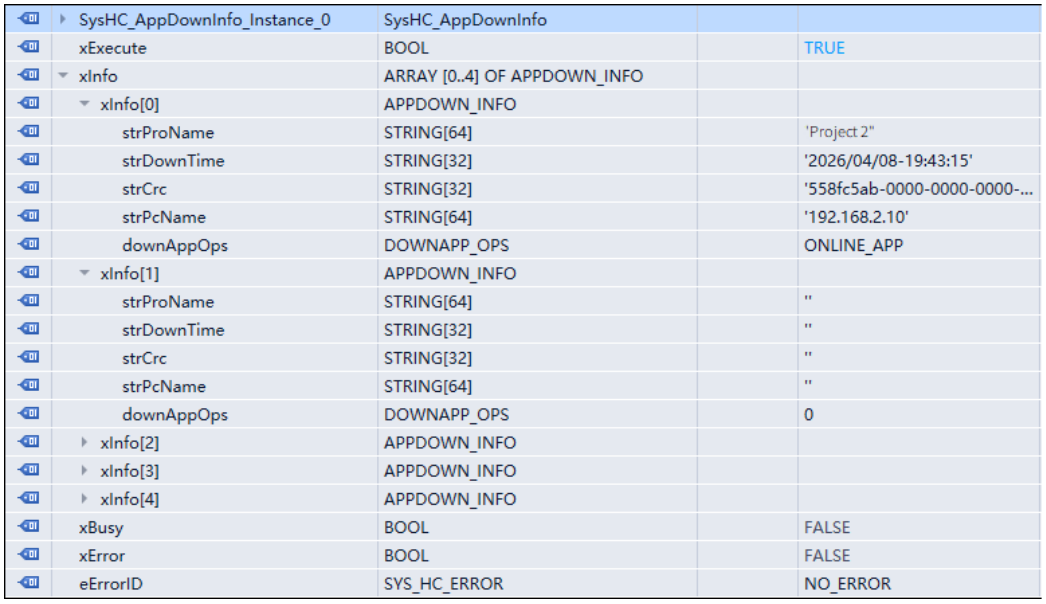
Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_AppDownInfo	Get the latest user program download information of the PLC	FB		SysHC_AppDownInfo_Instance_0(xExecute := , xInfo => , xBusy => , xError => , eErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Instruction enable	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered
Output	xInfo	Download project info	ARRAY [0..4] OF APPDOWN_INFO	-	-	Download the project information.
	xBusy	Execution flag	BOOL	TRUE, FALSE	-	Indicates the instruction is being executed.
	xError	Error flag	BOOL	TRUE, FALSE	-	Indicates the error of the execution.
	eErrorID	Fault code	SYS_HC_ERROR	Follows data type	-	Instruction fault codes. For details, see Fault Codes.

- **Function**
  - This instruction gets the latest user program information of the PLC, including the project name, download timestamp, project checksum, host computer name, and download mode.
  - xInfo is of structure type APPDOWN_INFO. The structure members are described in the table below.





Variable	Data Type	Valid Range	Default Value	Description
strProName	STRING[64]	-	-	Project name
strDownTime	STRING[32]	-	-	Read timestamp
strCrc	STRING[32]	-	-	Project checksum
strPcName	STRING[64]	-	-	Host computer name
downAppOps	DOWNAPP_OPS	-	-	Download mode

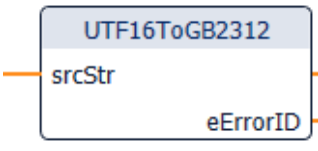
downAppOps is of enumeration type DOWNAPP_OPS. The descriptions of enumeration values are in the table below.

Variable	Value	Description
ONLINE_APP	1	Online download
UDISK_APP	2	USB flash disk download
DOWNLOAD_APP	3	Full download

- **Program example**

Item	LD	ST
Define variables	VAR SysHC_AppDownInfo_Instance_0: SysHC_AppDownInfo; xExecute: BOOL; xInfo: ARRAY [0..4] OF APPDOWN_INFO; xBusy: BOOL; xError: BOOL; eErrorID: SYS_HC_ERROR; END_VAR	

Item	LD	ST
Program		SysHC_AppDownInfo_Instance_0(xExecute TRUE := xExecute TRUE, xInfo => xInfo, xBusy FALSE => xBusy FALSE, xError FALSE => xError FALSE, eErrorID NO_ERROR => eErrorID NO_ERROR);
Operation result		



SysHC_AppDownInfo_Instance_0	SysHC_AppDownInfo		
xExecute	BOOL		TRUE
xInfo	ARRAY [0..4] OF APPDOWN_INFO		
xInfo[0]	APPDOWN_INFO		
strProName	STRING[64]		'Project 2"
strDownTime	STRING[32]		'2026/04/08-19:43:15'
strCrc	STRING[32]		'558fc5ab-0000-0000-0000-...
strPcName	STRING[64]		'192.168.2.10'
downAppOps	DOWNAPP_OPS		ONLINE_APP
xInfo[1]	APPDOWN_INFO		
strProName	STRING[64]		''
strDownTime	STRING[32]		''
strCrc	STRING[32]		''
strPcName	STRING[64]		''
downAppOps	DOWNAPP_OPS		0
xInfo[2]	APPDOWN_INFO		
xInfo[3]	APPDOWN_INFO		
xInfo[4]	APPDOWN_INFO		
xBusy	BOOL		FALSE
xError	BOOL		FALSE
eErrorID	SYS_HC_ERROR		NO_ERROR

- **Precautions**
  - This instruction only gets the latest five download records of the first user program.
  - If the output parameters strProName and strPcName display garbled text, you need to use the ConvertUTF8toUTF16 instruction to convert them to Chinese.

18.4.1.29 UTF16ToGB2312

This instruction converts the encoding format from UTF-16 to GB2312.

- **Instruction format**

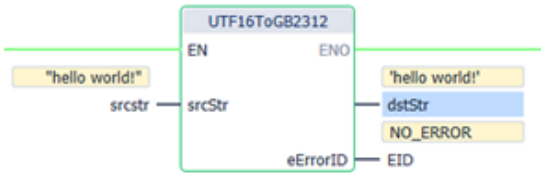
Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
UTF16ToGB2312	UTF16 to GB2312 encoding conversion	FC		:= UTF16ToGB2312(srcStr := , eErrorID =>);

- **Related variables**

Variable

Input/ Output	Variable	Name	Valid Range	Default Value	Description
Input	srcStr	Source string	Follows data type	-	Input string

Input/ Output	Variable	Name	Valid Range	Default Value	Description
Output	UTF16ToGB2312	Conversion result	Follows data type	-	The conversion result obtained after the instruction execution is completed.
	eErrorID	Fault code	Follows data type	-	Fault code after conversion. 0: NO_ERROR (Conversion completed) 1: INVAILD_INPUT (Input error) 2: CONVERT_FAIL (Conversion failed)



Variable types

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String					
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING	WSTRING
srcStr	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	√
UTF16ToGB2312	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	√	-
eErrorID	SYS_HC_CONVERT_ERROR																				

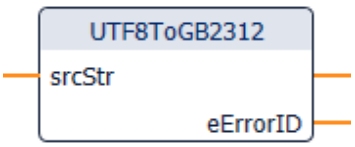
- **Function**
  This instruction converts the encoding format from UTF-16 to GB2312.
- **Program example**

<table>
<tr><th>Item</th><th>LD</th><th>ST</th></tr>
<tr><td>Define variables</td><td colspan="2">

```
VAR
    srcstr: WSTRING;
    EID: SYS_HC_CONVERT_ERROR;
    dstStr: STRING;
END_VAR
```

</td></tr>
<tr><td>Program</td><td>
</td><td>

```
dstStr 'hello world!'  := UTF16ToGB2312(
    srcStr := srcstr "hello world!" ,
    eErrorID => EID NO_ERROR );RETURN
```



</td></tr>
<tr><td>Execution result</td><td colspan="2">
<table>

<tr><td>▼ VAR</td><td></td><td></td><td></td></tr>
<tr><td>srcstr</td><td>WSTRING</td><td></td><td>"hello world!"</td></tr>
<tr><td>EID</td><td>SYS_HC_CONVERT_ERROR</td><td></td><td>NO_ERROR</td></tr>
<tr><td>dstStr</td><td>STRING(1985)</td><td></td><td>'hello world!'</td></tr>
</table>
</td></tr>
</table>

- **Precautions**
  - This instruction supports a maximum conversion length of 1985 bytes. Overlimit will cause automatic truncation.
  - If the input contains characters unsupported by GB2312, UTF-8, or UTF-16, the conversion will fail.
  - The input variable of the UTF16ToGB2312 conversion instruction is limited to WSTRING. If a constant value is input manually, it must be strictly assigned in the WSTRING wide string format. The iFA software interface uniformly adopts UTF-8 character encoding. When calling the encoding conversion interface, strictly match the data type and character encoding format of the input variable. Mismatched parameters will directly cause conversion failure.

18.4.1.30 UTF8ToGB2312

This instruction converts the encoding format from UTF-8 to GB2312.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
UTF8ToGB2312	UTF8 To GB2312 encoding conversion	FC		:= UTF8ToGB2312(srcStr := , eErrorID =>);

- **Related variables**

Output	GB2312ToUTF8	Conversion result	Follows data type	-	The conversion result obtained after the instruction execution is completed.

Input/ Output	Variable	Name	Valid Range	Default Value	Description
	eErrorID	Fault code	Follows data type	-	Fault code after conversion. 0: NO_ERROR (Conversion completed) 1: INVAILD_INPUT (Input error) 2: CONVERT_FAIL (Conversion failed)

Variable types

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String					
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING	WSTRING
srcStr	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	√	-
GB2312ToUTF8	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	√	-
eErrorID	SYS_HC_CONVERT_ERROR																				

- **Function**

  This instruction converts the encoding format from GB2312 to UTF-8.

- **Program example**

Item	LD	ST
Define variables	VAR srcstr: STRING; EID: SYS_HC_CONVERT_ERROR; dstStr: STRING; END_VAR	

Item	LD	ST
Program		`dstStr 'hello world!' := GB2312ToUTF8( srcStr := srcstr 'hello world!' , eErrorID => EID NO_ERROR );`
Execution result	VAR srcstr: STRING: 'hello world!' EID: SYS_HC_CONVERT_ERROR: NO_ERROR dstStr: STRING(1985): 'hello world!'	

- **Precautions**
  - This instruction supports a maximum conversion length of 1985 bytes. Overlimit will cause automatic truncation.
  - If the input contains characters unsupported by GB2312, UTF-8, or UTF-16, the conversion will fail.
  - The input variable of the GB2312ToUTF8 conversion instruction is limited to STRING. If a constant value is input manually, it must be strictly assigned in the STRING string format. The iFA software interface uniformly adopts UTF-8 character encoding. When calling the encoding conversion interface, strictly match the data type and character encoding format of the input variable. Mismatched parameters will directly cause conversion failure.

18.4.1.33 SDCard1StatusGet

This instruction gets the SD card status and updates the corresponding variable in the system.

- **Instruction format**

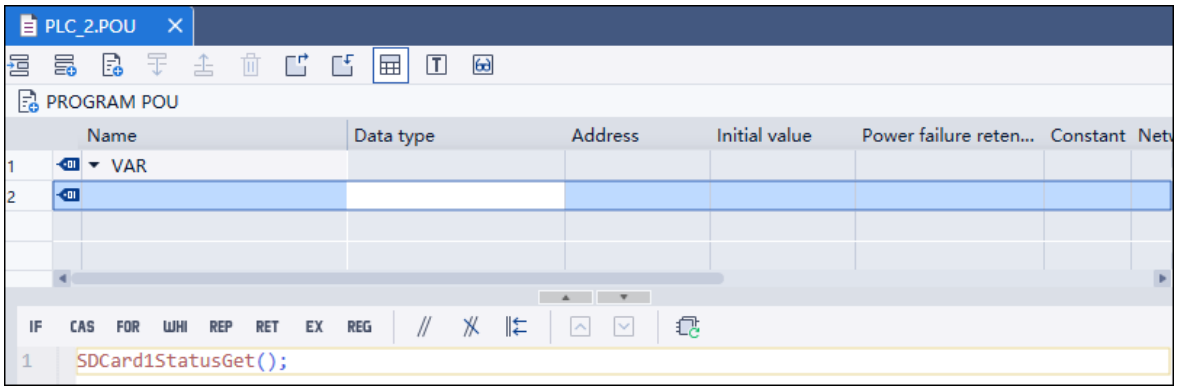
Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SDCard1StatusGet	Get all the status flags of SD memory card	FC		:= SDCard1StatusGet( );

- **Example**

  The SDCard1StatusGet instruction gets the SD card status and update the corresponding variable in the system. The following provides instructions for use.

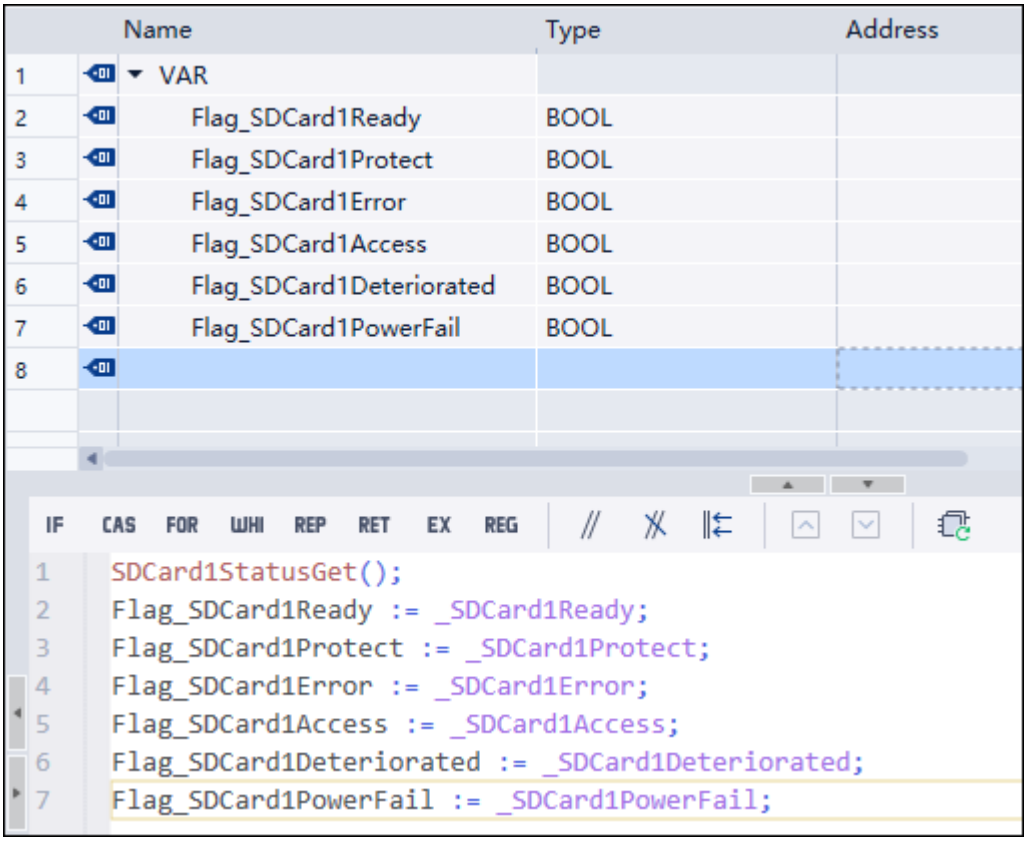
  Prerequisites

  • A project has been created and devices have been added. For specific operations, see 7 Project Deployment.

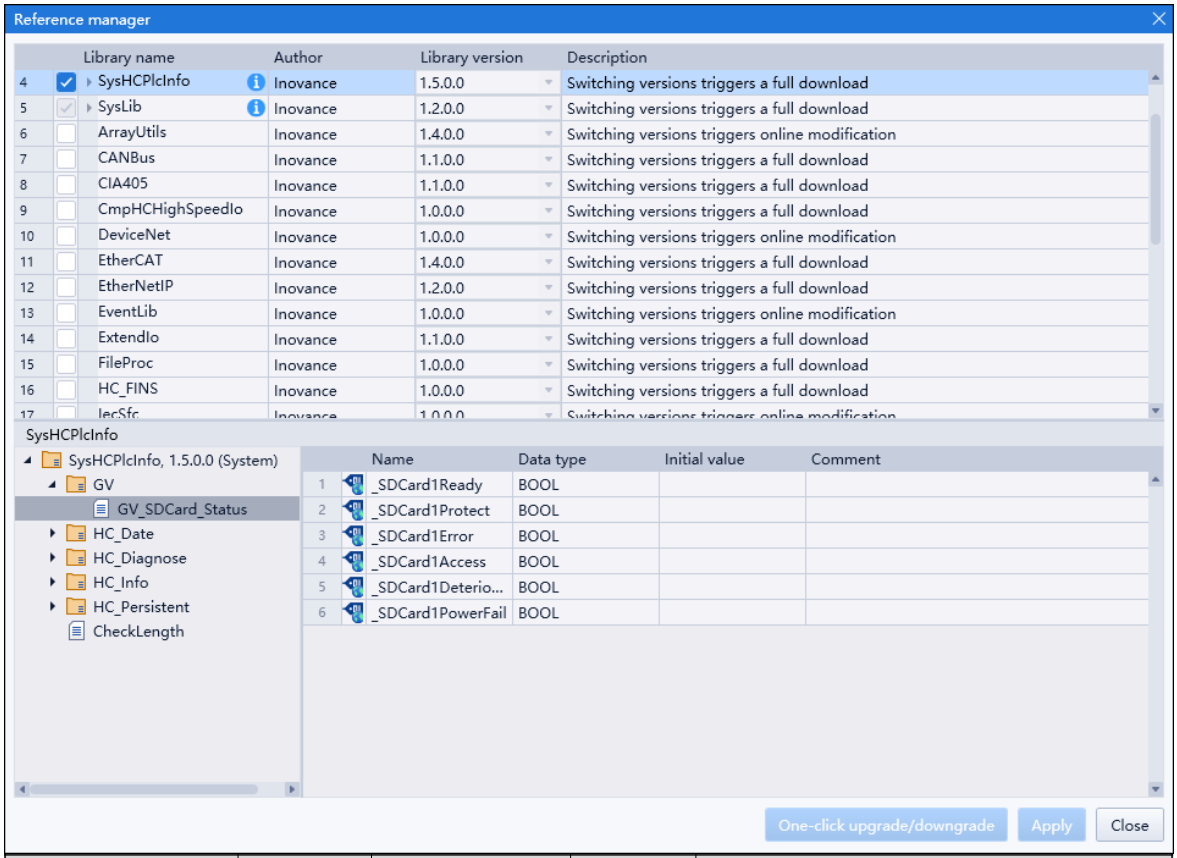


• The SysHCPlcInfo library version 1.5.0.0 or later has been referenced. For reference operations, see 12.3 Library Reference.

Procedure

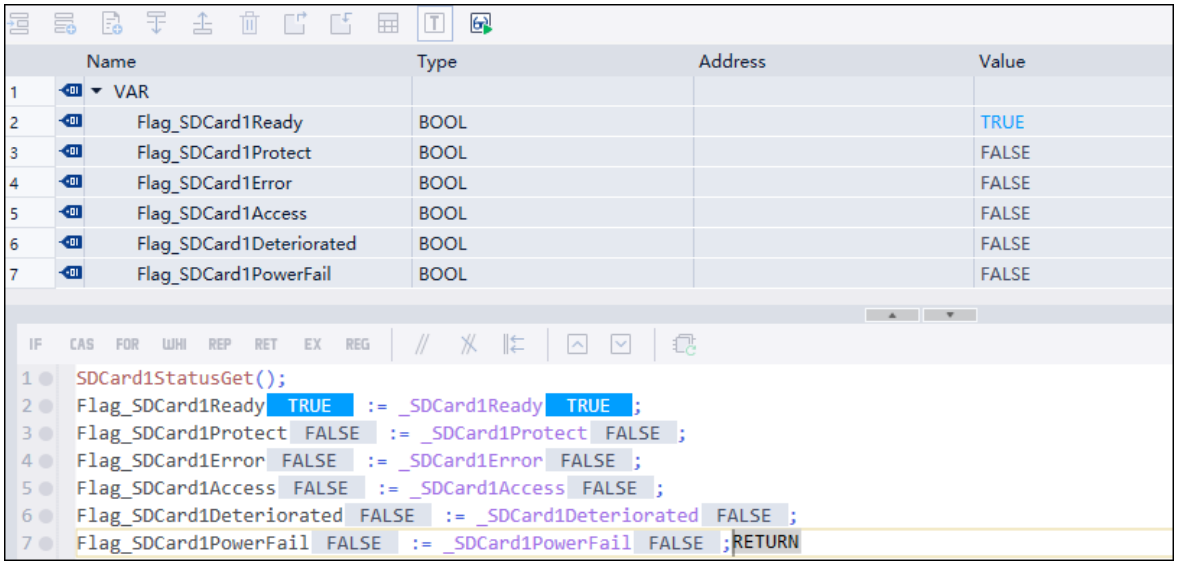


1. Click "Programming" in the project tree to create a POU of PRG type, with ST and LD languages both supported. This section takes ST language as an example.



2. Double-click to open the POU interface, select the "SDCard1StatusGet" instruction in the toolbox on the right, double-click it or drag it directly to the program editing area, delete ":=", and create the instruction instance object.

3. Use the GV_SDCard_Status global variable from the SysHCPlcInfo library to get the SD card status.

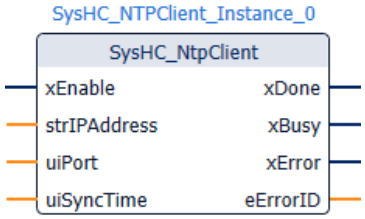


The GV_SDCard_Status global variable is shown in the figure below.

Variable	Data Type	Valid Range	Default Value	Description
_SDCard1Ready	BOOL	TRUE, FALSE	FALSE	TRUE: The SD card is correctly mounted and can be used. FALSE: The SD card is not mounted and cannot be used.

Variable	Data Type	Valid Range	Default Value	Description
_SDCard1Protect	BOOL	TRUE, FALSE	FALSE	TRUE: The SD card is write-protected and files cannot be written. FALSE: The SD card is not write-protected and files can be written.
_SDCard1Error	BOOL	TRUE, FALSE	FALSE	TRUE: The SD card is incorrectly formatted and cannot be used. FALSE: The SD card is correctly formatted and ready for use.
_SDCard1Access	BOOL	TRUE, FALSE	FALSE	TRUE: The SD card is reading/writing files. FALSE: The SD card is idle.
_SDCard1Deteriorated	BOOL	TRUE, FALSE	FALSE	TRUE: The SD card has reached its service life and needs to be replaced. FALSE: The SD card has not reached its service life.
_SDCard1PowerFail	BOOL	TRUE, FALSE	FALSE	Its is a global power-loss-retentive variable. TRUE: The SD card has been inserted, removed, unmounted, or experienced a power loss during use. FALSE: The SD card has not been inserted, removed, unmounted, or experienced a power loss during use.

4. Add the POU to a cyclic task. After the task starts running, check the execution result.



- **Precautions**
  - If you need to obtain the SD card status, call the SDCard1StatusGet() function in a cyclic task, and then the corresponding variable will be updated in the system.

- The _SDCard1Access system variable notifies external systems that the SD card is being accessed. The SD card access status is not reflected in real time, causing incorrect operations of the user program. Therefore, do not use this variable as a flag in the user program.
- The _SDCard1PowerFail system variable notifies external systems that the SD card has been inserted, removed, unmounted, or experienced a power loss during use. The initial value of this flag is FALSE. After the corresponding event is triggered, it will be set to TRUE and will not automatically reset to FALSE. You need to manually set or reset it.
- For devices with multiple USB ports, this instruction only reads the variable corresponding to the USB flash disk status of the first USB port.

18.4.1.34 SysHC_NtpClient

This instruction synchronizes NTP time.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
SysHC_NtpClient	NTP time sync	FB		SysHC_NTPClient_Instance_0(xEnable := , strIPAddress := , uiPort := , uiSyncTime := , xDone => , xBusy => , xError => , eErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Function block enable	BOOL	TRUE, FALSE	FALSE	Active High.
	strIPAddress	IP address	STRING	Follows data type	-	IP address
	uiPort	Network port	UINT	Follow data type	123	Network port address
	uiSyncTime	PLC synchronization time	UDINT	10 to 86400	-	PLC synchronization time, unit: s
Output	xDone	Output active	BOOL	TRUE, FALSE	FALSE	Output active.
	xBusy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Executing

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	xError	Fault	BOOL	TRUE, FALSE	FALSE	Set to TRUE when an error occurs.
	eErrorID	Fault code	SYS_HC_ERROR	Follows data type	NO_ERROR	See Fault Codes.

- **Function**
  This instruction requests and receives time from the NTP server to calibrate the device time.
- **Program example**
  - Activate the NTP server:
    1. Set and deploy the NTP server parameters including xEnable (value set to TRUE), strIPAddress (actual address of the NTP server), uiPort, and uiSyncTime.
    2. After successful parameter deployment, set R_TRIG to TRUE to activate the NTP server, and the system time will be updated according to the set synchronization time.
  - Modify the NTP parameters:
    1. Set and deploy the NTP server parameters including xEnable (value set to TRUE), strIPAddress (actual address of the NTP server to be modified), uiPort, and uiSyncTime (synchronization time value to be modified).
    2. After successful parameter deployment, set R_TRIG to TRUE to update the NTP parameters, and the system time will be updated according to the new NTP server address and synchronization time.
  - Deactivate the NTP server:
    1. Set xEnable to FALSE.
    2. After successful parameter deployment, set R_TRIG to TRUE to deactivate the NTP server.

18.4.1.37 Fault Codes

- SYS_HC_ERROR

Fault code	Value	Description
NO_ERROR	0	No error occurred
WRONG_PARAMETER	1	Incorrect range of the input parameters; incorrect format of the input parameters
FAILURE_OBTAIN	2	Parameter obtainment failed; non-compliant parameter obtainment
ETHER_ID_ERROR	3	Network port ID out of range
Com_ID_ERROR	4	Serial port ID out of range
Slave_ID_ERROR	5	Slave ID input out of range
Slave_IP_ERROR	6	Slave IP out of range
FAILURE_SET	7	Parameter setting failed
UNKNOWN_ERROR	8	Unknown error
INVAILD_IP	9	Invalid configured IP
PARAMETER_ERROR	16	Invalid configured parameter
GET_TIMEZONE_ERROR	18	Time zone source file missing
SET_TIMEZONE_ERROR	19	Time zone source file missing
TIMEZONE_PARAM_ERROR	20	Invalid configured time zone
PARAM_ERROR_TASKNAME	21	Sampling task error
PARAM_ERROR_INTERVAL	22	Sampling interval exceeds the upper/lower limit
PARAM_ERROR_DURATION	23	Sampling duration exceeds the upper/lower limit
FUNCTION_NOT_SUPPORT	24	Some instructions are not supported under simulation mode
PARAM_ERROR_FILEMAX	25	Max. number of record files exceeds the upper/lower limit
PARAM ERROR_TRIGGER	26	Trigger signal error
PARAM_ERROR_DATAPARAM	27	Sampling data error
PARAM_ERROR_SCALE	28	Sampling ratio error
PARAM_ERROR_DATALEN	29	Length of record data exceeds the limit
NO SPACE	30	Insufficient remaining disk space
DOUBLE_TRIG	31	Overlapping enable signals of function block
WRITEFILE_ERROR	32	Failed to write record files
OCCUPIEDSPACE OVERFLOW	33	Recording file storage exceeds the limit
GETVARINFO ERROR	34	Failed to get parameter information
GETDATATYPE_ERROR	35	Failed to get parameter type

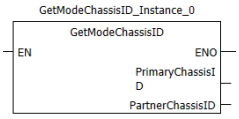
Fault code	Value	Description
NO_SUPPORTED_DATATYPE	36	Data type is not supported
GETVARADDR_ERROR	37	Failed to get parameter address
NO_TARGET_FILE	38	No target file
NO_READ_ACCESS	39	No read permission for variable

- PERSISTENT_ERROR

Fault code	Value	Description
NO_ERROR	0	No fault
PERSIS_NO_APP	1	The application startup order is not first.
PERSIS_NO_XML	2	No XML file is running.
PERSIS_NO_BAK	3	No backup XML file available.
PERSIS_APP_MATCH	4	The application and XML file do not match.
PERSIS_MRETAIN_VER	5	The data backup version is V1.
ERROR_FB_TIMEOUT	6	Failed to refresh fb variables.
PERSIS_SYS_ERROR	7	Internal system runtime error.
PERSIS_TIME_DELAY	8	Repeat operation prohibited within 10 seconds.
PERSIS_RUN_CONF	9	Data backup read/write operation conflict.
PERSIS_PARSE_ERROR	10	XML parsing error.
PERSIS_CRC_ERROR	11	XML CRC error.

18.4.2 Redundancy Information

18.4.2.1 Instruction List



Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.2.2 GetModeChassisID	FB	Obtain the rack number of redundant device	Redundancy	Library version 1.0.0.0 and later
18.4.2.3 GetRunStopKeyMatchState	FB	Obtain the status of whether the redundant rack run/stop key positions match		Library version 1.0.0.0 and later
18.4.2.4 GetSystemRedundancyMode	FB	This instruction obtains the primary and partner modes of the redundant rack.		Library version 1.0.0.0 and later
18.4.2.5 GetSystemRedundancyState	FB	Obtain the redundancy confirmation status of the redundant rack		Library version 1.0.0.0 and later

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.2.6 GetControllerModuleDiagnosisInformation	FB	Obtain basic diagnostic information of the controller module	Diagnosis	Library version 1.0.0.0 and later
18.4.2.7 GetRedundancyModuleDiagnosisInformation	FB	This instruction obtains the basic diagnostic information of the redundancy module.		Library version 1.0.0.0 and later
18.4.2.8 GetTemperature	FB	Obtain the ambient temperature of the controller		Library version 1.0.0.0 and later

18.4.2.2 GetModeChassisID

This instruction obtains the rack number of redundant device.

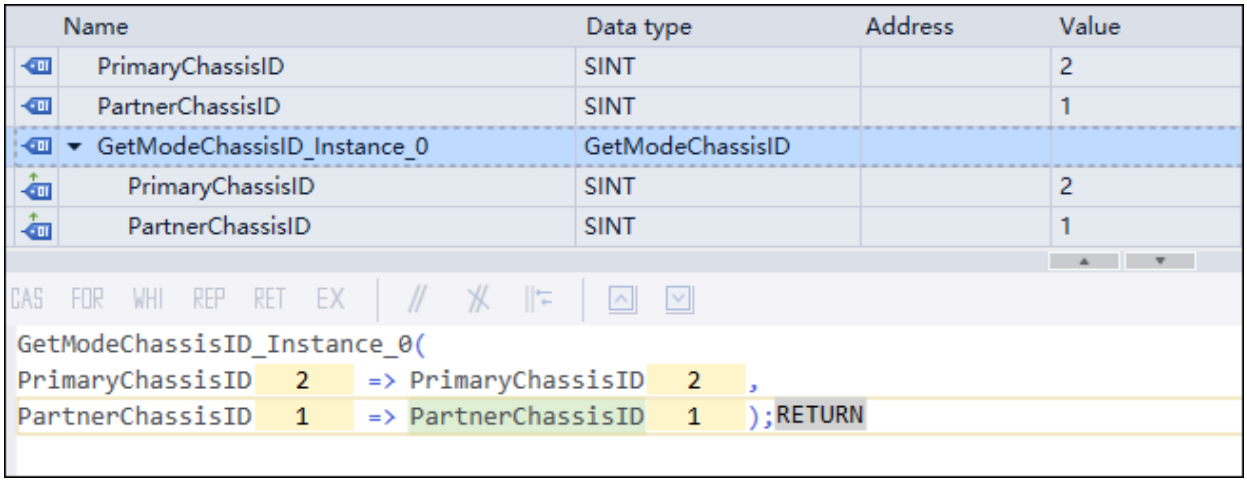
- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
GetModeChassisID	Obtain the rack number of redundant device	FB		GetModeChassisID _Instance_0(PrimaryChassisID => , PartnerChassisID =>);

- **Related variables**

Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	PrimaryChassisID	Primary module rack number	SINT	-1, 1, 2	0	-1: Failed to get primary module rack number. 1: Rack A. 2: Rack B.



Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	PartnerChassisID	Redundant module rack number	SINT	-1, 1, 2, 3	0	-1: Failed to get redundant module rack number. 1: Rack A. 2: Rack B. 3: Non-redundant project or redundancy not established.

- **Function**

  The program starts to obatin the primary module rack number and the redundant module rack number when it is powered on and running.

- **Program example**

  ST:

  LD:

18.4.2.3 GetRunStopKeyMatchState

This instruction obtains the status of whether the redundant rack run/stop key positions match.

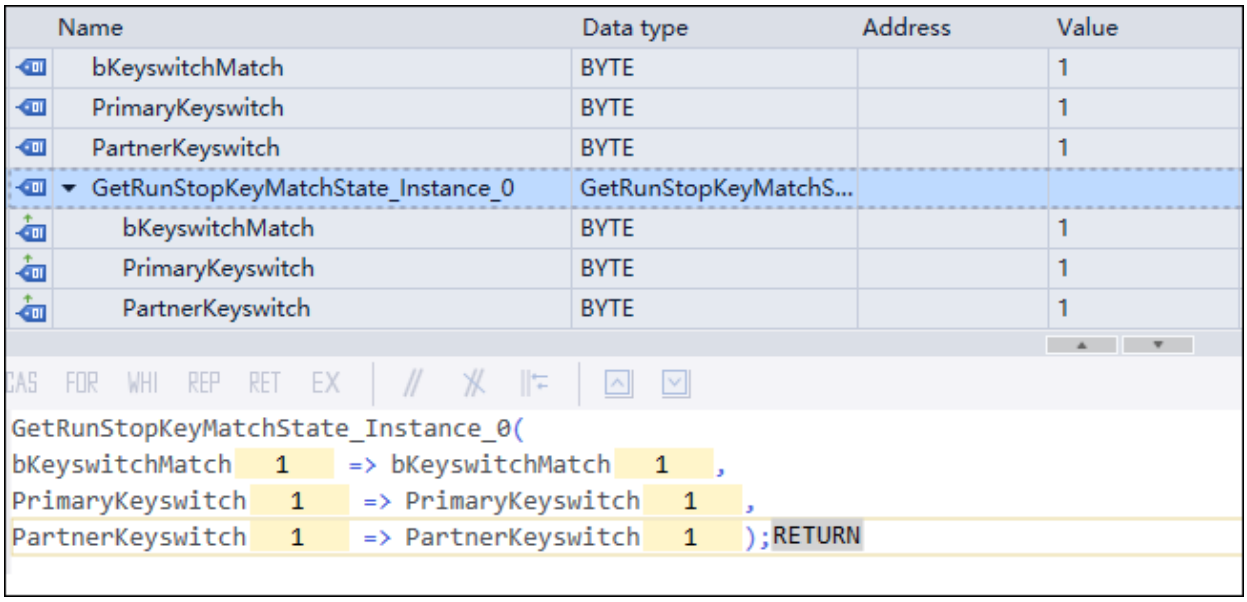
- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
GetRunStopKeyMatchState	Obtain the status of whether the redundant rack run/stop key positions match	FB		GetRunStopKeyMatchState_Instance_0(bKeyswitchMatch => , PrimaryKeyswitch => , PartnerKeyswitch =>);

- **Related variables**

Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	bKeyswitchMatch	Whether the key positions of the dual racks match	BYTE	0, 1 , , 255	0	0: Key positions not matching. 1: Key positions matching. 255: Redundant mode not established or non-redundant project.
	PrimaryKeyswitch	Switch position of primary module	BYTE	1, 2	0	1: Run. 2: Stop.



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	PartnerKeysw itch	Key position of backup module	BYTE	1, 2, 255	0	1: Run. 2: Stop. 255: Redundant mode not established or non-redundant project.

- **Function**

  The program starts module acquisition of the run/stop key positions and compares them for consistency when powered on.

- **Program example**

  ST:

  LD:

18.4.2.4 GetSystemRedundancyMode

This instruction obtains the primary and partner modes of the redundant rack.

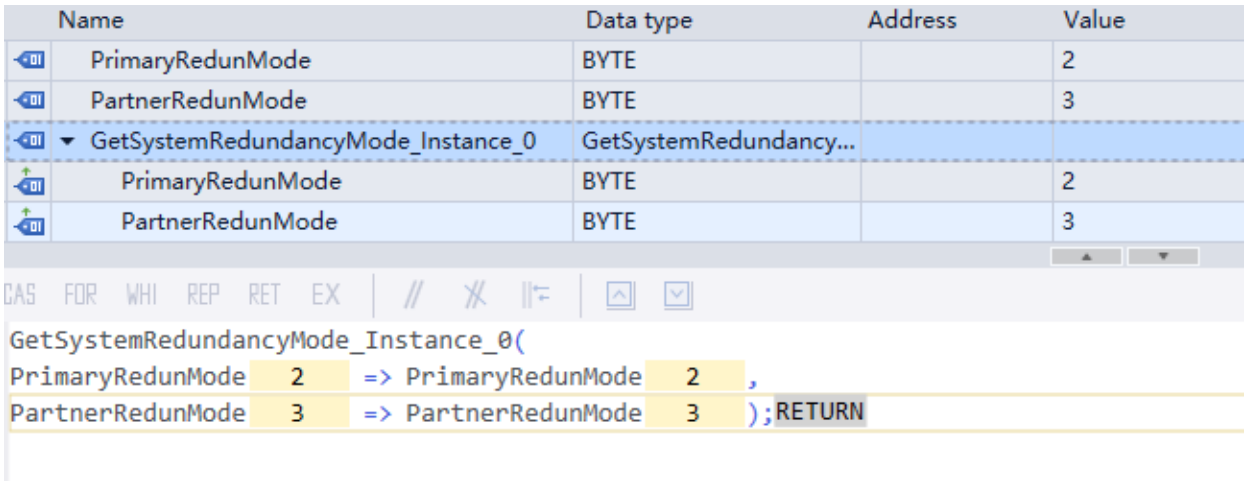
- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
GetSystemRedundancyMode	This instruction obtains the primary and partner modes of the redundant rack.	FB		GetSystemRedundancyMode_Instance_0(PrimaryRedunMode => , PartnerRedunMode =>);

- **Related variables**

Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	PrimaryRedunMode	Primary rack redundancy mode	BYTE	2, 3, 5	0	2: Primary. 3: Backup 5: Fault mode.



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	PartnerRedunMode	Backup rack redundancy mode	BYTE	2, 3, 5, 255	0	2: Primary. 3: Backup 5: Fault mode. 255: Obtainment timeout

- **Function**

  The program starts to obtain the primary-partner status of the racks upon power-on and operation.

- **Program example**

  ST:

  LD:

18.4.2.5 GetSystemRedundancyState

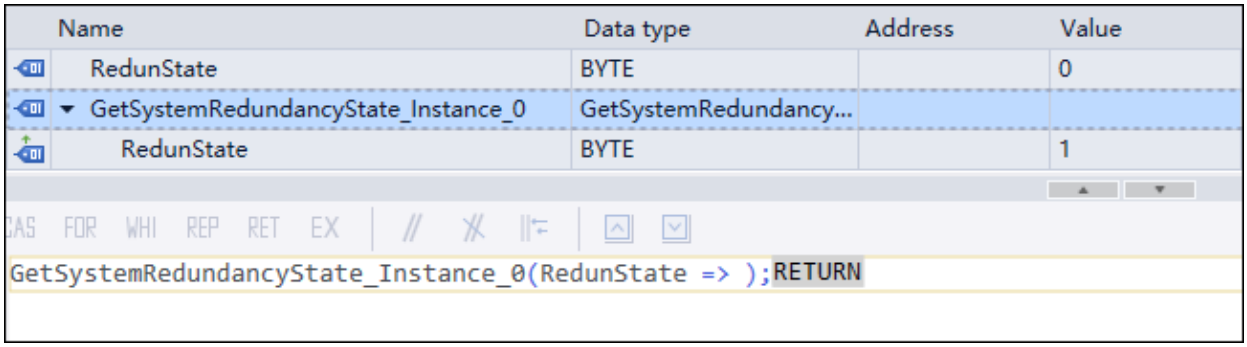
This instruction obtains the redundancy confirmation state of the redundant rack.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
GetSystemRedundancyState	Obtain the redundancy confirmation status of the redundant rack	FB		GetSystemRedundancyState_Instance_0(RedunState =>);

- **Related variables**

  Variable



Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	RedunState	Redundancy state	BYTE	0, 1, 2	0	0: Redundancy not confirmed. 1: Redundancy confirmed. 2: Redundancy confirming.

- **Function**

  The program starts to obtain the state of redundant rack as soon as it is powered on and running.

- **Program example**

  ST:

  LD:

18.4.2.6 GetControllerModuleDiagnosisInformation

This instructiuon obtains basic diagnostic information of the controller module.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
GetControllerModuleDiagnosisInformation	Obtain basic diagnostic information of the controller module	FB		GetControllerModuleDiagnosisInformation_Instance_0(result => , slotNum => , model => , SN => , softwareVersion => , FPGAVersion => , OSVersion => , runTime => , runStatus => , faultFlag => , switchTimes => , sdCardStatus => , sdCardTotalSize => , sdCardfFreeSize =>);

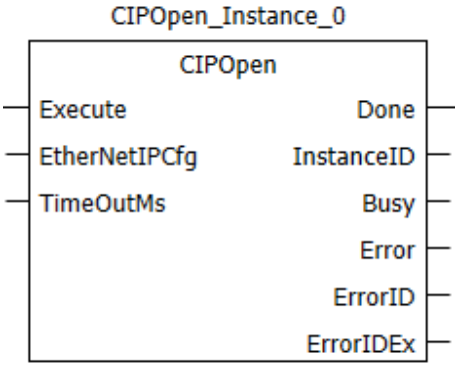
18.4.3 EtherNetIP

18.4.3.1 Instruction List



Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.3.2 CIPOpen	FB	Establish EIP Class-3 connection	EtherNetIP	Library version 1.0.0.0 and later
18.4.3.3 CIPClose	FB	Close EIP Class 3 connection		Library version 1.0.0.0 and later
18.4.3.4 CIPOpenWithDataSize	FB	Create a Class 3 connection with a specified size		Library version 1.0.0.0 and later
18.4.3.5 CIPRead	FB	Read variable		Library version 1.0.0.0 and later
18.4.3.6 CIPWrite	FB	Write variable		Library version 1.0.0.0 and later
18.4.3.7 CIPSend	FB	Send Class3 display message		Library version 1.0.0.0 and later
18.4.3.8 generic_Service	FB	EIP generic service		Library version 1.2.0.0 and later
18.4.3.9 Get_Attributes_All	FB	Get all attributes of a specific instance		Library version 1.2.0.0 and later
18.4.3.10 Get_Attribute_Single	FB	Get specified attributes of a specific instance		Library version 1.2.0.0 and later

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.3.11 Set_Attributes_All	FB	Set all attributes of a specific instance		Library version 1.2.0.0 and later
18.4.3.12 Set_Attribute_Single	FB	Set a specified attribute of a specific instance		Library version 1.2.0.0 and later
18.4.3.13 GetEIPSystemstats	FB	Get diagnostic information of EIP system		Library version 1.2.0.0 and later
18.4.3.14 GetEIPConnectstats	FB	Get diagnostic information of EIP connection		Library version 1.2.0.0 and later
18.4.3.15 EIP_SetRemAdapterConfIP	FB	Set the connection configuration IP address of the remote adapter		Library version 1.2.0.0 and later
18.4.3.16 SysHC_EthernetIPDeviceDiagnose	FB	Obtain the fault diagnostics of the EIP slave	SysHCPlcInfo	Library version 1.0.0.0 and later
18.4.3.17 SysHC_EthernetIPSlaveDiagnose	FB	Obtain the fault diagnostics of the EIP master		Library version 1.0.0.0 and later

18.4.3.2 CIPOpen

This instruction specifies the corresponding slave IP and the Ethernet port ID to be triggered, and establish an EIP connection.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
CIPOpen	Establish EIP Class-3 connection	FB		CIPOpen_Instance_0(Execute := , EtherNetIPCfg := , TimeOutMs := , Done => , InstanceID => , Busy => , Error => , ErrorID => , ErrorIDEx =>);

- **Related variables**

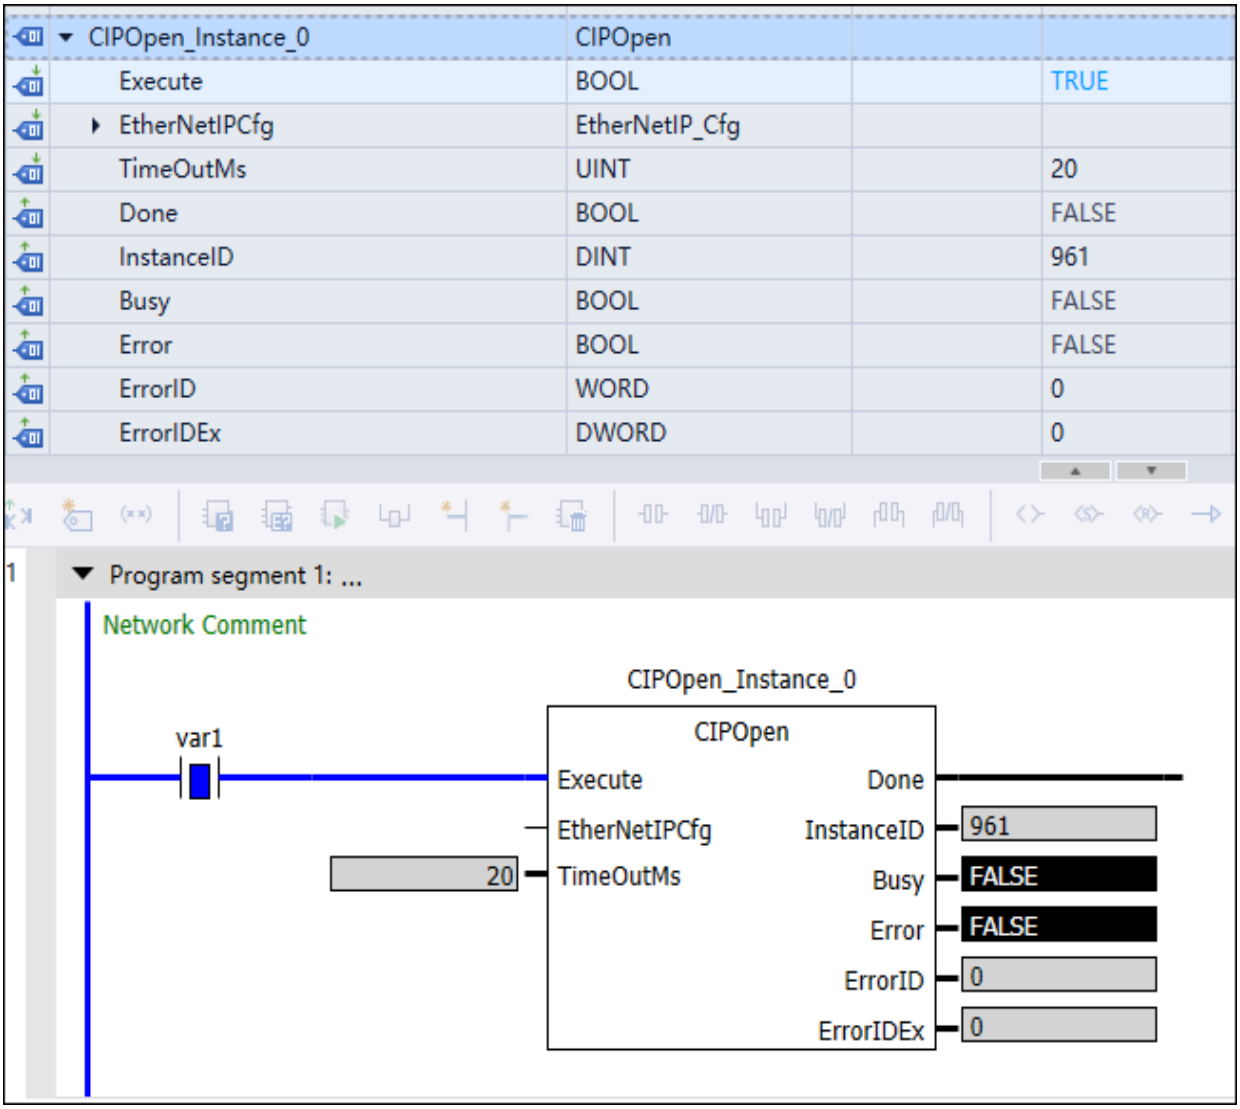
  Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Rising edge-triggered	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered
	EtherNetIPCfg	IP configuration and Ethernet port designation for the connected slave	EtherNet IP_Cfg	-	0	IP configuration and Ethernet port designation for the connected slave.
	TimeOutMs	Connection timeout period	UINT	20 ms to 5000ms	20	Connection timeout period.
Output	Done	Done	BOOL	TRUE, FALSE	FALSE	Instruction is completed.
	InstanceID	Created instance number	DINT	961 to 992	0	The instance number is an automatically generated variable by the program, and manually input values are invalid.
	Busy	Executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	Error status.
	ErrorID	General fault code	WORD	Follow data type	0	General fault code. See 18.4.3.19 EIP Standard Fault Codes.
	ErrorIDEx	Extended fault code	DWORD	Depends on data type	0	Extended fault code. For details, see 18.4.3.19 EIP Standard Fault Codesand 18.4.3.20 Fault Codes.

- **Function description**
  - This instruction specifies the corresponding slave IP and the Ethernet port ID to be triggered, and establish an EIP connection.
  - The data type of EtherNetIPCfg is the structure EtherNetIP_Cfg, whose meaning is as follows.

Variable	Name	Data type	Initial Value	Description
LocalEtherNetID	Ethernet port ID	BYTE	0	Ethernet port ID: LAN1 = 1, LAN2 = 2, and so on.
RemoteAddress	IP configuration structure	ARRAY [0..3] OF BYTE	0	IP configuration follows standard IP specifications, and errors are reported after occurrence.

- **Timing diagram**



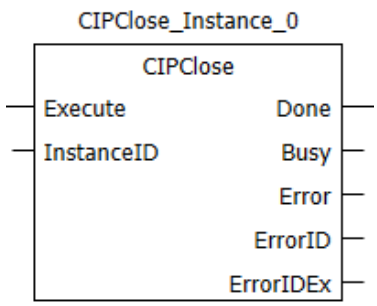
- **Program example**

  ST:

Name	Data type	Address	Value
CIPOpen_Instance_0	CIPOpen		
Execute	BOOL		TRUE
EtherNetIPCfg	EtherNetIP_Cfg		
LocalEtherNetID	BYTE		2
RemoteAddress	ARRAY [0..3] OF BYTE		
RemoteAddress[0]	BYTE		192
RemoteAddress[1]	BYTE		168
RemoteAddress[2]	BYTE		2
RemoteAddress[3]	BYTE		66
TimeOutMs	UINT		20
Done	BOOL		FALSE
InstanceID	DINT		963
Busy	BOOL		FALSE
Error	BOOL		FALSE
ErrorID	WORD		0
ErrorIDEx	DWORD		0
CIPOpenWithDataSize_Instance_0	CIPOpenWithDataSize		
CIPRead_Instance_0	CIPRead		

```
CIPOpen_Instance_0(
Execute TRUE := var1 TRUE ,
EtherNetIPCfg := ,
TimeOutMs := ,
Done => ,
InstanceID => ,
Busy => ,
Error => ,
ErrorID => ,
ErrorIDEx => );
```

LD:



- **Precautions**
  - IP configuration follows standard IP specifications, and errors are reported after occurrence.
  - InstanceID represents the instance number of a successfully opened connection, supporting up to 32 connections.
  - Each time the CIPOpen instruction is successfully executed, an available InstanceID is generated, and the newly generated InstanceID increments sequentially. If the instruction execution fails, the available InstanceID generated by the last successfully executed instruction is returned.
  - ErrorID and ErrorIDEX are general fault codes and extended status codes, indicating faults at the time of connection.
  - When the EtherNetIPCfg and TimeOutMs settings are out of specification range, the Error bit is set.
  - The maximum amount of data accessible via CIP is 81920 bytes. If this limit is exceeded, fault code 61461 ("Requested data exceeding the specified size") will be reported.

18.4.3.3 CIPClose

This instruction specifies the corresponding instance ID to close this connection.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
CIPClose	Close EIP Class 3 connection	FB		CIPClose_Instance_0(Execute := , InstanceID := , Done => , Busy => , Error => , ErrorID => , ErrorIDEx =>);

- **Related variables**

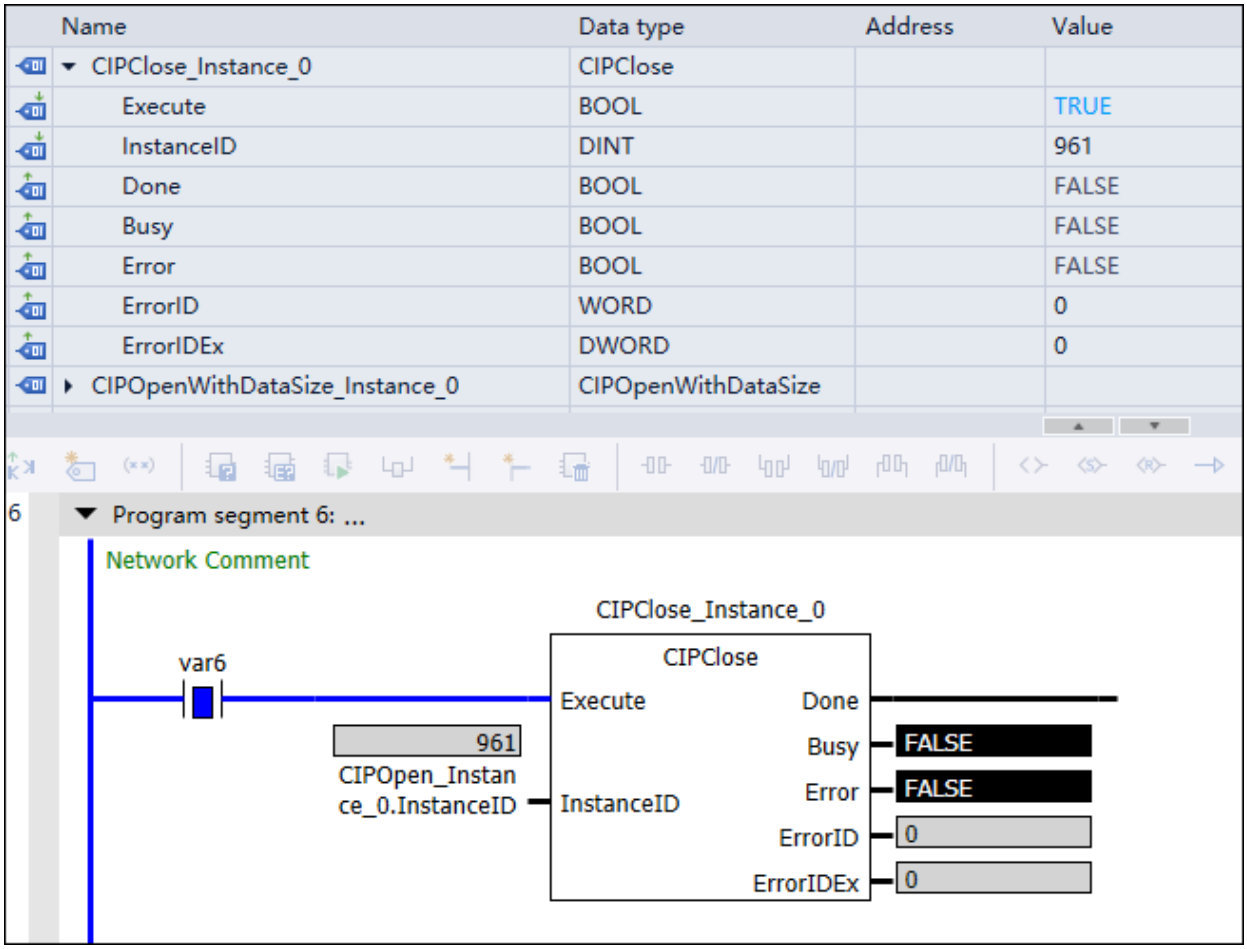
  Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Rising edge-triggered	BOOL	TRUE, FALSE	FALSE	SF_R_TRIG is a rising edge-triggered instruction.
	InstanceID	InstanceID of a connection window	DINT	InstanceID associated with CIPOpen output	0	InstanceID of a connection window.
Output	Done	Done	BOOL	TRUE, FALSE	FALSE	Instruction is completed.
	Busy	Executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	Error status.
	ErrorID	General fault code	WORD	Follow data type	0	General fault code. See 18.4.3.19 EIP Standard Fault Codes.
	ErrorIDEx	Extended fault code	DWORD	Depends on data type	0	Extended fault code. For details, see 18.4.3.19 EIP Standard Fault Codesand 18.4.3.20 Fault Codes.

- **Function description**

  This instruction specifies the corresponding instance ID to close this connection.

- **Sequence diagram**



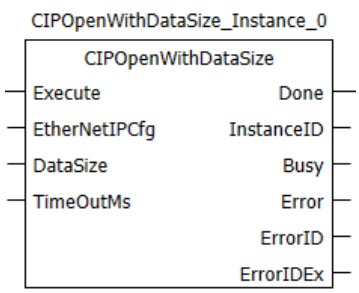
- **Program example**

  ST:

Name	Data type	Address	Value
CIPClose_Instance_0	CIPClose		
Execute	BOOL		TRUE
InstanceID	DINT		963
Done	BOOL		FALSE
Busy	BOOL		FALSE
Error	BOOL		FALSE
ErrorID	WORD		0
ErrorIDEx	DWORD		0
var1	BOOL		TRUE

```
CIPClose_Instance_0(
Execute  TRUE  := var6  TRUE  ,
InstanceID  963  := CIPOpen_Instance_0.InstanceID  963  ,
Done => ,
Busy => ,
Error => ,
ErrorID => ,
ErrorIDEx => );RETURN
```

  LD:



- **Precautions**
  - If the InstanceID parameter setting is out of specification or not created, the Error bit is set.
  - The instance ID created by CIPOpen cannot be reused after CIPClose is executed. Reuse will trigger fault code 61446 connection error.

18.4.3.4 CIPOpenWithDataSize

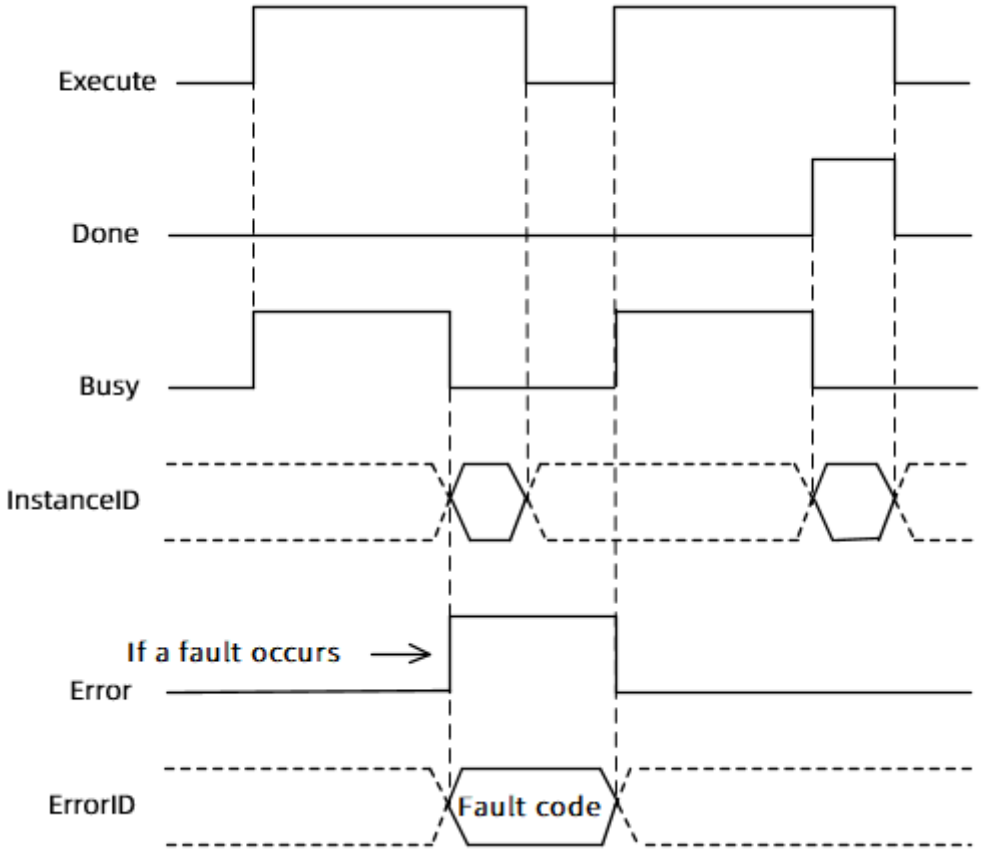
This instruction specifies the corresponding slave IP, the Ethernet port ID to be triggered, and the tag size to establish an EIP connection.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
CIPOpenWithDataSize	Create a Class 3 connection with a specified size	FB		CIPOpenWithDataSize_Instance_0(Execute := , EtherNetIPCfg := , DataSize := , TimeOutMs := , Done => , InstanceID => , Busy => , Error => , ErrorID => , ErrorIDEx =>);

- **Related variables**

  Variable



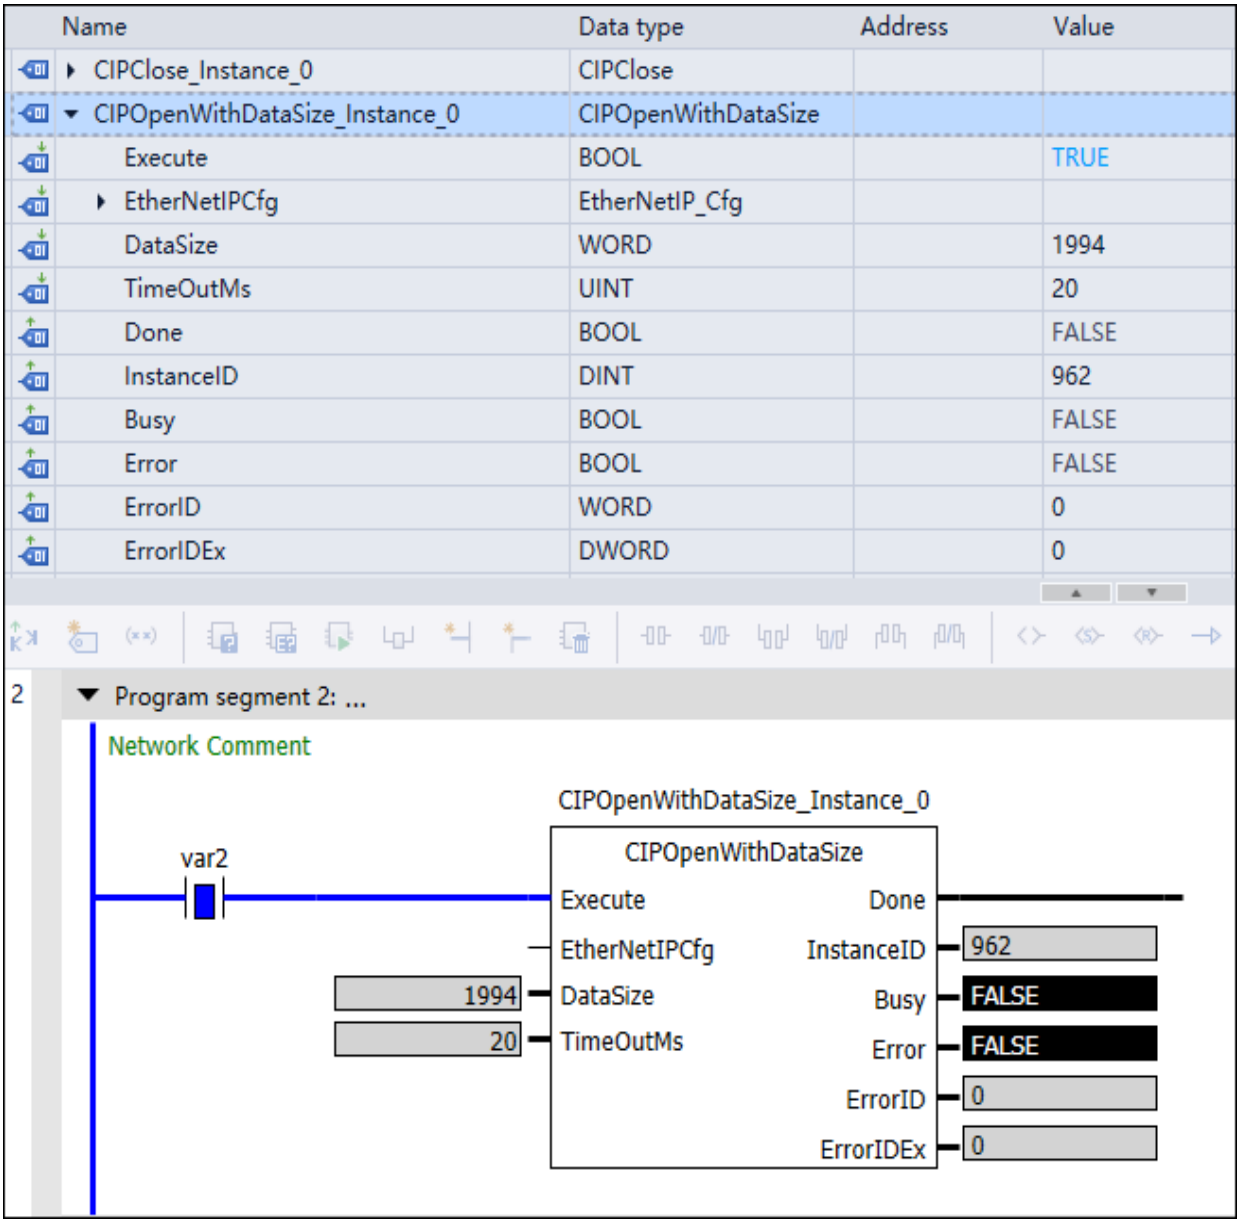
Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Rising edge-triggered	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered
	EtherNetIPCfg	IP configuration and Ethernet port designation for the connected slave	EtherNetIP_Cfg	-	0	IP configuration and Ethernet port designation for the connected slave.
	DataSize	Connection window size	WORD	1 to 65481	1	Connection window size.
	TimeOutMs	Connection timeout period	UINT	20 to 5000	20	Connection timeout period.
Output	Done	Done	BOOL	TRUE, FALSE	FALSE	Instruction is completed.
	InstanceID	Created instance number	DINT	961 to 992	0	Created instance number.
	Busy	Executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	Error status.
	ErrorID	General fault code	WORD	Follow data type	0	General fault code. See 18.4.3.19 EIP Standard Fault Codes.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	ErrorIDEx	Extended fault code	DWORD	Depends on data type	0	Extended fault code. For details, see 18.4.3.19 EIP Standard Fault Codesand 18.4.3.20 Fault Codes.

- **Function description**

  This instruction specifies the corresponding slave IP, the Ethernet port ID to be triggered, and the tag size to establish an EIP connection.

- **Sequence diagram**



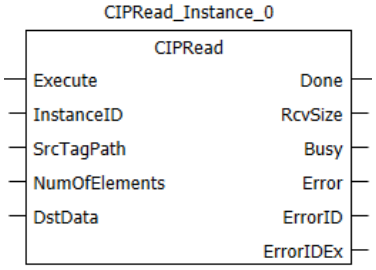
- **Program example**

  ST:

Name	Data type	Address	Value
CIPOpenWithDataSize_Instance_0	CIPOpenWithDataSize		
Execute	BOOL		TRUE
EtherNetIPCfg	EtherNetIP_Cfg		
LocalEtherNetID	BYTE		2
RemoteAddress	ARRAY [0..3] OF BYTE		
RemoteAddress[0]	BYTE		192
RemoteAddress[1]	BYTE		168
RemoteAddress[2]	BYTE		2
RemoteAddress[3]	BYTE		66
DataSize	WORD		1994
TimeOutMs	UINT		20
Done	BOOL		FALSE
InstanceID	DINT		964
Busy	BOOL		FALSE
Error	BOOL		FALSE
ErrorID	WORD		0
ErrorIDEx	DWORD		0

```
ErrorIDEx => );
CIPOpenWithDataSize_Instance_0(
Execute TRUE := var2 TRUE ,
EtherNetIPCfg := ,
DataSize := ,
TimeOutMs := ,
Done => ,
InstanceID => ,
Busy => ,
Error => ,
ErrorID => ,
ErrorIDEx => );
```

LD:



- **Precautions**
  - IP configuration follows standard IP specifications, and errors are reported after occurrence.
  - The maximum value of DataSize is 65481. If the DataSize value is 0, it is limited to the maximum of 65481.
  - InstanceID represents the instance number of a successfully opened connection, supporting up to 32 connections.
  - Each time the CIPOpenWithDataSize instruction is successfully executed, an available InstanceID is generated, and the newly generated InstanceID increments sequentially. If the instruction execution fails, the available InstanceID generated by the last successfully executed instruction is returned.

18.4.3.5 CIPRead

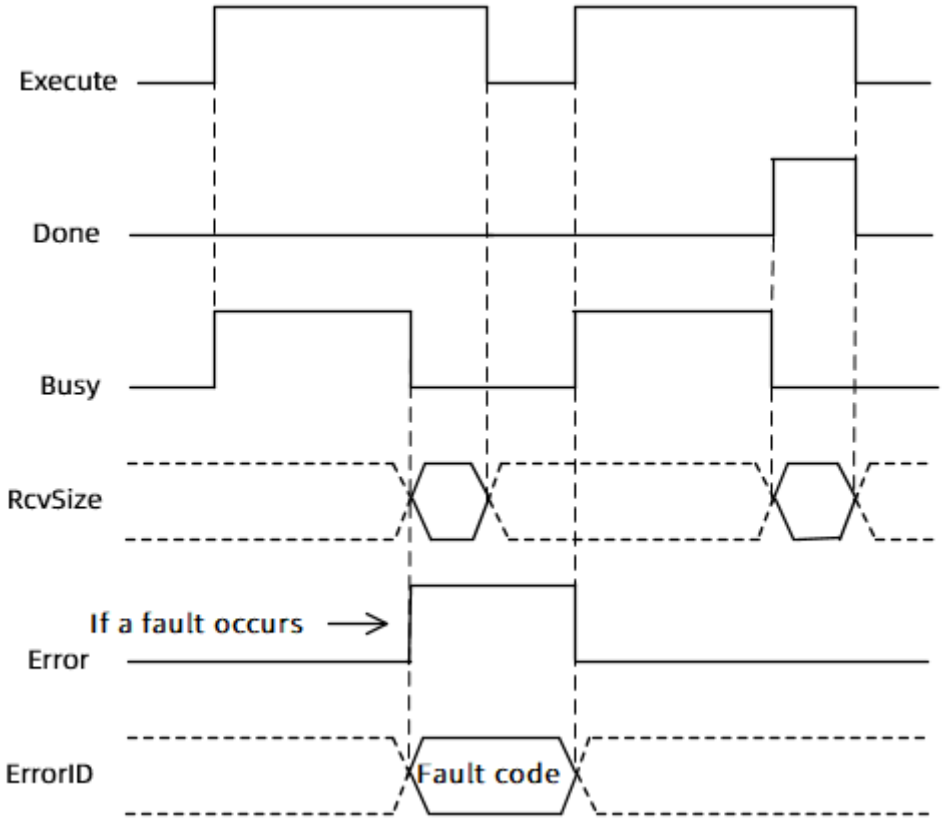
This instruction writes the data of remote controller public variables into local variables.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
CIPRead	Variable reading	FB		CIPRead_Instance_0(Execute := , InstanceID := , SrcTagPath := , NumOfElements := , DstData := , Done => , RcvSize => , Busy => , Error => , ErrorID => , ErrorIDEx =>);

- **Related variables**

  Variable



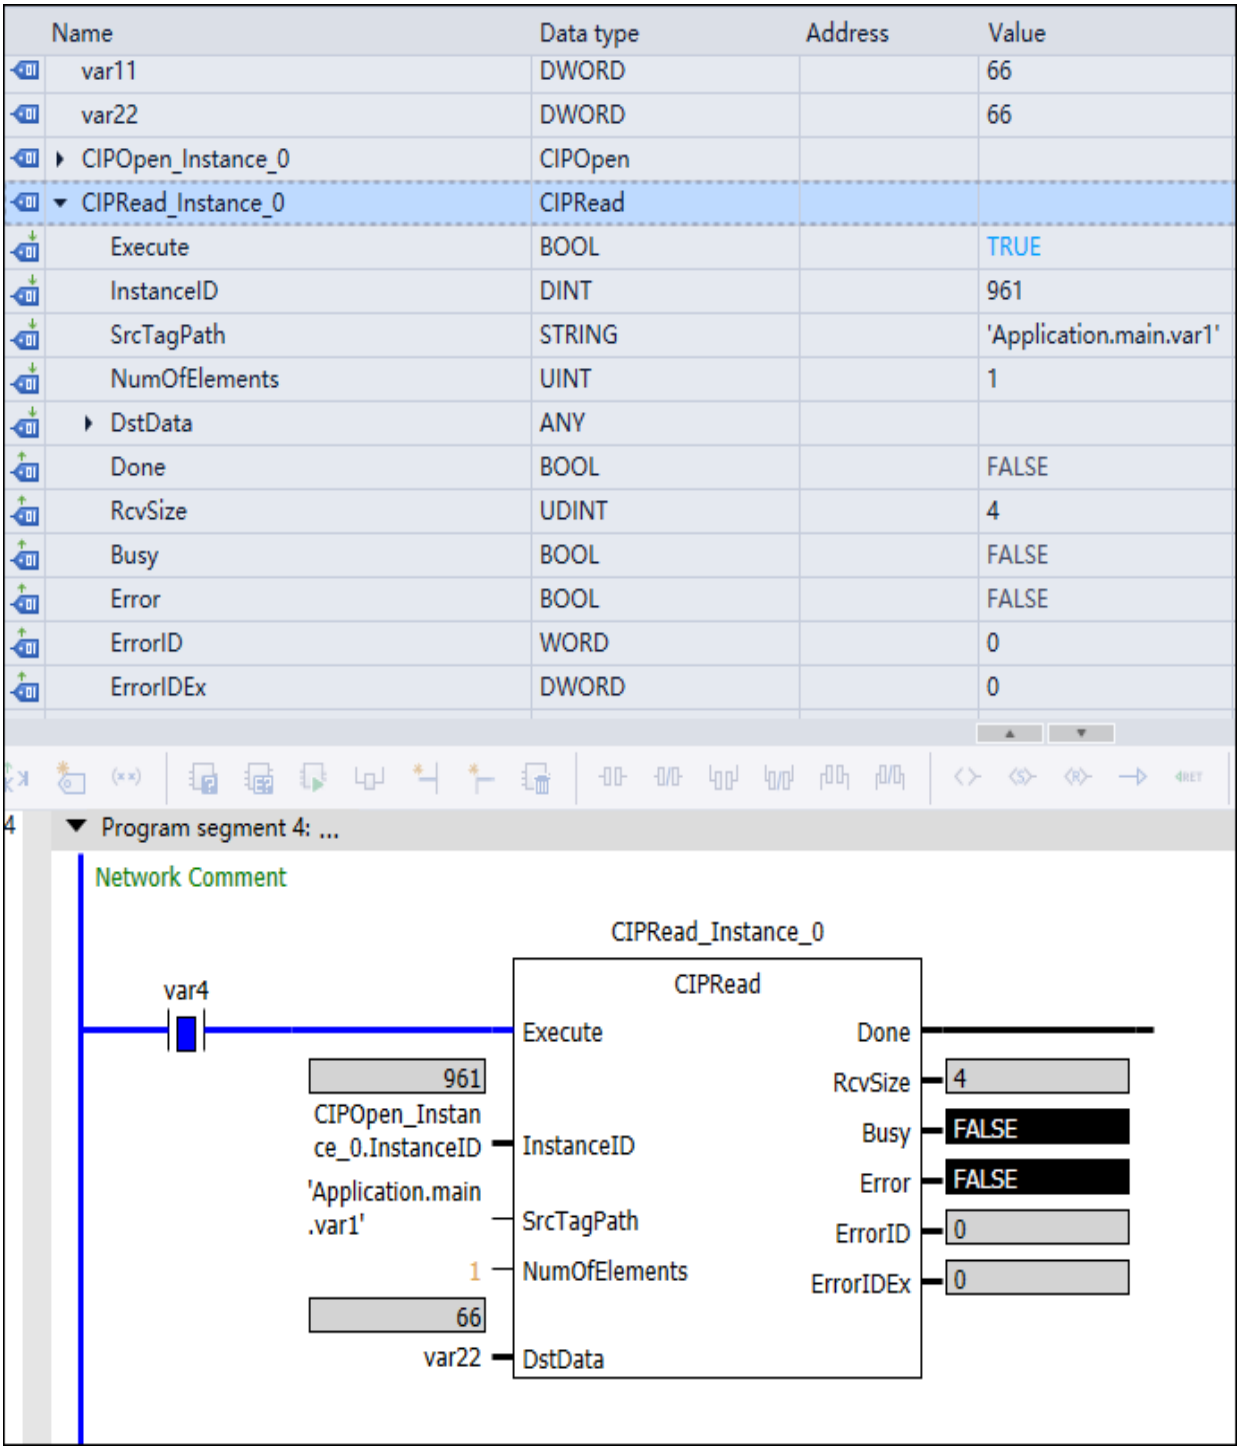
Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Rising edge-triggered	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered
	InstanceID	Instance ID for the specified operation	DINT	InstanceID associated with CIPOpen output	0	Instance ID for the specified operation.
	SrcTagPath	External variable name	STRING	String composed of external variable names	''	External variable name or variable path.
	NumOfElements	Number of elements	UINT	Single element value is 1, and array is filled in based on the actual number of elements	0	Number of elements.
	DstData	Local variable for reading data	ANY	Local variable of the data	-	Local variable for reading data.
Output	Done	Done	BOOL	TRUE, FALSE	FALSE	Instruction is completed.
	RcvSize	Return byte size	DINT	Follows data type	0	Actual return byte size.
	Busy	Executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	Error status.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	ErrorID	General fault code	WORD	Follow data type	0	General fault code. See 18.4.3.19 EIP Standard Fault Codes.
	ErrorIDEx	Extended fault code	DWORD	Depends on data type	0	Extended fault code. For details, see 18.4.3.19 EIP Standard Fault Codesand 18.4.3.20 Fault Codes.

- **Function description**

  This instruction writes the data of remote controller public variables into local variables.

- **Sequence diagram**



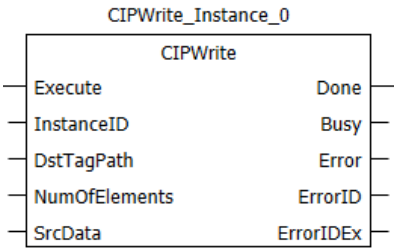
- **Program example**

  ST:

Name	Data type	Address	Value
CIPOpen_Instance_0	CIPOpen		
CIPOpenWithDataSize_Instance_0	CIPOpenWithDataSize		
CIPRead_Instance_0	CIPRead		
Execute	BOOL		TRUE
InstanceID	DINT		963
SrcTagPath	STRING		'Application.main.var1'
NumOfElements	UINT		1
DstData	ANY		
Done	BOOL		FALSE
RcvSize	UDINT		4
Busy	BOOL		FALSE
Error	BOOL		FALSE
ErrorID	WORD		0
ErrorIDEx	DWORD		0

```
ErrorIDEx => );
CIPRead_Instance_0(
Execute TRUE := var3 TRUE ,
InstanceID 963 := CIPOpen_Instance_0.InstanceID 963 ,
SrcTagPath'Application.main.va... := SrcTagPath2'Application.main.va...,
NumOfElements 1 := 1,
DstData := var22 22 ,
Done => ,
RcvSize => ,
Busy => ,
Error => ,
ErrorID => ,
ErrorIDEx => );
```

LD:



- **Precautions**
  - The CIPRead instruction does not support overall access to multi-dimensional arrays and structures.
  - If the selected InstanceID exceeds the length limit or has not been created, the Error bit is set.
  - An error is reported when the settings for InstanceID, SrcTagPath, NumberOfElements, and DstData output parameters do not match the specifications.
  - There are no restrictions on the length and validation rules for the external variable name SrcTagPath.
  - The NumberOfElements must not exceed the range of the DINT type. A single element value is 1, and an array is filled based on the actual number of elements.
  - The external variable accessed by SrcTagPath must be a network public variable.
  - When executing multiple CIPRead instructions, assign a different InstanceID (generated via CIPOpen or CIPOpenWithDataSize instruction) to each instruction instance. If multiple instructions use the same InstanceID, communication may be interrupted.

18.4.3.6 CIPWrite

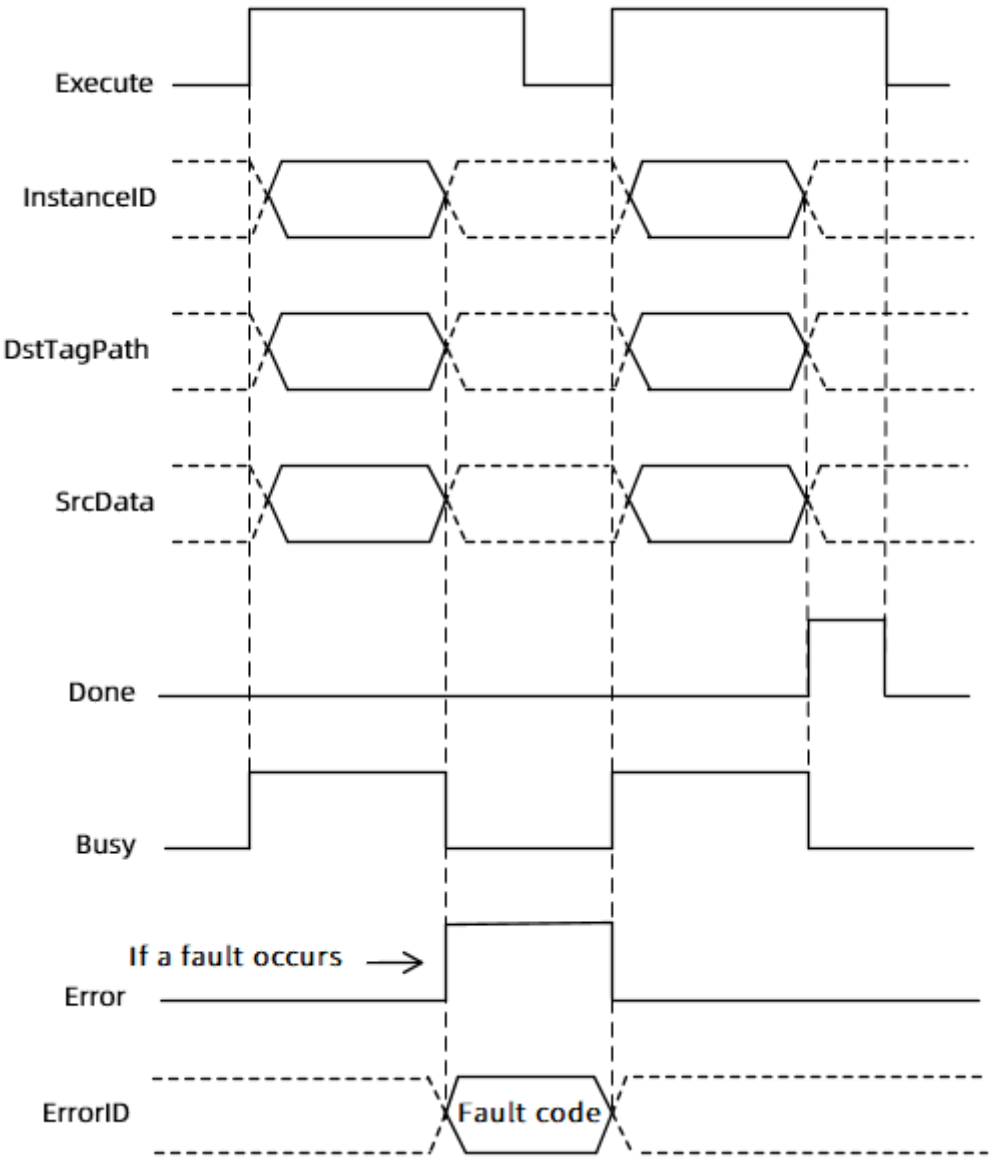
This instruction writes the data of local public variables into the specified public variables of the remote controller.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
CIPWrite	Variable writing	FB		CIPWrite_Instance_0(Execute := , InstanceID := , DstTagPath := , NumOfElements := , SrcData := , Done => , Busy => , Error => , ErrorID => , ErrorIDEx =>);

- **Related variables**

Variable



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Rising edge-triggered	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered
	InstanceID	Instance ID for the specified operation	DINT	InstanceID associated with CIPOpen output	0	Instance ID for the specified operation.
	DstTagPath	External variable name	STRING	String composed of external variable names	''	External variable name or variable path.
	NumOfElements	Number of elements	UINT	Single element value is 1, and array is filled in based on the actual number of elements	0	Number of elements.
	SrcData	Local variable for writing data	ANY	Local variable of the data	-	Local variable for writing data.
Output	Done	Done	BOOL	TRUE, FALSE	FALSE	Instruction is completed.
	Busy	Executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	Error status.
	ErrorID	General fault code	WORD	Follow data type	0	General fault code. See 18.4.3.19 EIP Standard Fault Codes.

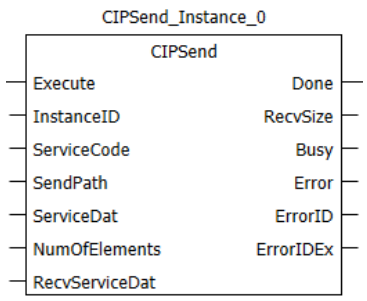
LD:



- **Precautions**
  - The CIPWrite instruction does not support overall access to multi-dimensional arrays and structures.
  - If the selected InstanceID exceeds the length limit or has not been created, the Error bit is set.
  - An error is reported when the InstanceID, DstTagPath, NumberOfElements, and SrcData output parameters do not match the specifications.
  - There are no restrictions on the length and validation rules for the external variable name DstTagPath.
  - The NumberOfElements must not exceed the range of the DINT type. A single element value is 1, and an array is filled based on the actual number of elements.
  - The external variable accessed by DstTagPath must be a network public variable.

◦ When executing multiple CIPWrite instructions, assign a different InstanceID (generated via CIPOpen or CIPOpenWithDataSize instruction) to each instruction instance. If multiple instructions use the same InstanceID, communication may be interrupted.

18.4.3.7 CIPSend

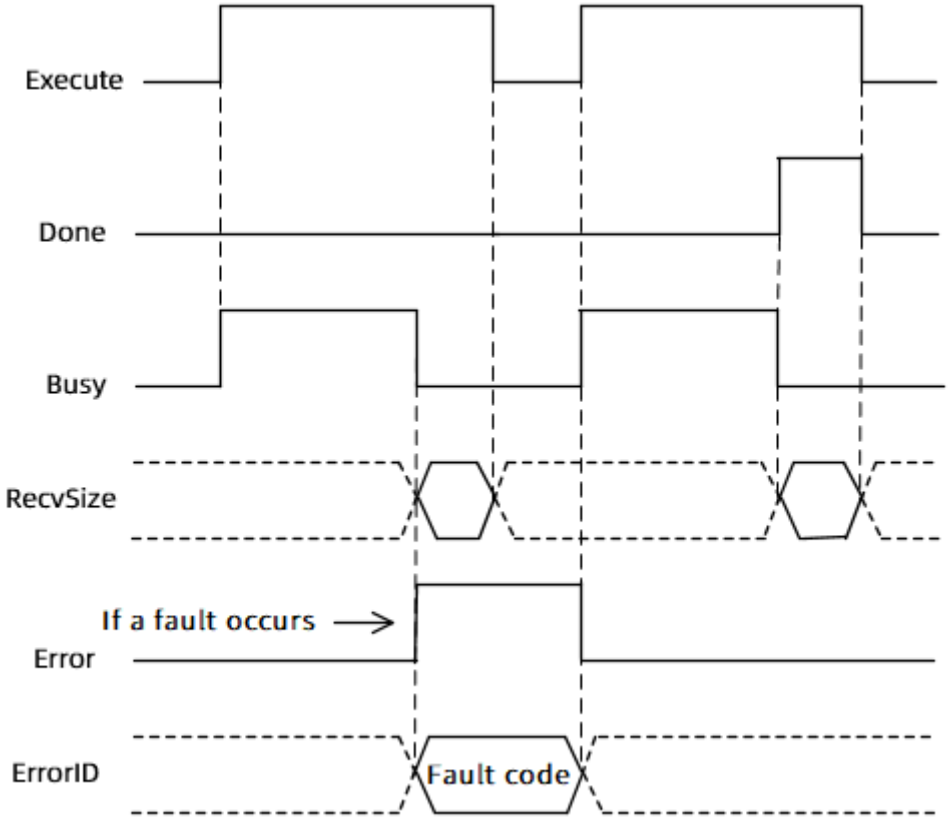
This instruction sends Class 3 data to the specified controller.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
CIPSend	Send Class3 display message	FB		CIPSend_Instance_0(Execute := , InstanceID := , ServiceCode := , SendPath := , ServiceDat := , NumOfElements := , RecvServiceDat := , Done => , RecvSize => , Busy => , Error => , ErrorID => , ErrorIDEx =>);

- **Related variables**

Variable



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Rising edge-triggered	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered
	InstanceID	Instance ID for the specified operation	DINT	InstanceID associated with CIPOpen output	0	Instance ID for the specified operation.
	ServiceCode	Service code	BYTE	EIP standard service code	0	Service code. See 18.4.3.18 EIP Standard Service Codes.
	SendPath	Send path	ExplicitMsg SendPath	Fill in according to the service code	0	The send path is composed of ClassID/InstanceID/isAttributeID /AttributeID.

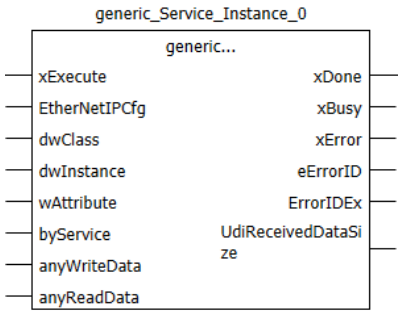
LD:



- **Precautions**
  - The CIPSend instruction does not support overall access to multi-dimensional arrays and structures.
  - Service code. For details, see 18.4.3.18 EIP Standard Service Codes.
  - ServiceData is a local variable that is only enabled when the service code includes write attributes; it does not need to be associated in other cases.
  - RecvServiceData is a local variable that receives the response of the service code, and RecvSize is the size of the response after the data is successfully sent.
  - When executing multiple CIPSend instructions, assign a different InstanceID (generated via CIPOpen or CIPOpenWithDataSize instruction) to each instruction instance. If multiple instructions use the same InstanceID, communication may be interrupted.

18.4.3.8 generic_Service

This is the instruction for EtherNet/IP generic service.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
generic_Service	EIP generic service	FB		generic_Service_Instance_0 (xExecute := , EtherNetIPCfg := , dwClass := , dwInstance := , wAttribute := , byService := , anyWriteData := , anyReadData := , xDone => , xBusy => , xError => , eErrorID => , ErrorIDEx => , UdiReceivedDataSize =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Enable	BOOL	TRUE, FALSE	-	Edge-triggered switch to execute the function block
	EtherNetIPCfg	Address of the target device	EtherNetIP_Cfg	Follows data type	-	IP address of the target device.
	dwClass	Class ID	DWORD	Follows data type	-	Requested class ID.
	dwInstance	Instance ID	DWORD	Follows data type	-	Requested instance ID.
	wAttribute	Attribute ID	WORD	Follows data type	-	Requested attribute ID. Set to 0xFFFF if not used.
	byService	Service code	BYTE	Follows data type	-	Requested service code. For details, see 18.4.3.18 EIP Standard Service Codes.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	anyWriteData	Requested data	ANY	Follows data type	-	Requested data will be filled into the data field of the request frame and sent.
	anyReadData	Response data	ANY	Follows data type	-	Content of the response message.
Output	xDone	Function block completed state	BOOL	TRUE, FALSE	-	Function block completed state
	xBusy	Execution status of function block	BOOL	TRUE, FALSE	-	Execution status of function block.
	xError	Error status of function block	BOOL	TRUE, FALSE	-	Error status of function block.
	eErrorID	Function block fault ID	ERROR	Follows data range	-	Function block fault ID. For details, see 18.4.3.19 EIP Standard Fault Codes.
	ErrorIDEx	Function block extended error ID	DWORD	Follows data range	-	Function block extended fault ID. For details, see 18.4.3.19 EIP Standard Fault Codes and 18.4.3.20 Fault Codes.
	udiReceivedDataSize	Actual length of received data	UDINT	Follows data range	-	Actual length of received data.

- **Function**
  - This instruction is for EtherNet/IP generic service, which is used to send an unconnected explicit message request to a device at a specific IP address.
  - The data type of eErrorID is the structure ERROR. The meaning is as follows.

Enumeration Value	Number	Description
NO_ERROR	0	The specified object has successfully executed the service.
CONNECTION_FAILURE	16#1	A connection-related service along the connection path has failed.
RESOURCE_UNAVAILABLE	16#2	The object resource required to execute the requested service is unavailable.

Enumeration Value	Number	Description
INVALID_PARAM_VALUE	16#3	See status code 0x20, which is the preferred value for this condition.
PATH_SEGMENT_ERROR	16#4	The processing node cannot recognize the path segment identifier or segment syntax. If a path segment error occurs, path processing must stop.
PATH_DESTINATION_UNKNOWN	16#5	The path references an object type, instance, or structural element that is unknown or does not exist in the processing node. If a destination path unknown error occurs, perform path processing.
PARTIAL_TRANSFER	16#6	Only partial expected data has been transferred.
CONNECTION_LOST	16#7	The message connection has been lost.
SERVICE_NOT_SUPPORTED	16#8	The requested service is not implemented or not defined for this object type/instance.
INVALID_ATTRIBUTE_VALUE	16#9	Invalid attribute data has been detected.
ATTRIBUTE_LIST_ERROR	16#A	In a Get_Attribute_List or Set_Attribute_List response, the status of an attribute is non-zero.
ALREADY_IN_REQUEST_STATE	16#B	The object is already in the service request mode/state.
OBJECT_STATE_ERROR	16#C	The object cannot perform the requested service in current mode/state.
OBJECT_ALREADY_EXISTS	16#D	The object instance requested to be created already exists.
ATTRIBUTE_NOT_SETTABLE	16#E	A modification request is received for an unmodifiable attribute.
PRIVILEGE_VIOLATION	16#F	Privilege/permission check failed.
DEVICE_STATE_ERROR	16#10	The current mode/state of the device prohibits execution of the requested service.
REPLY_DATA_TOO_LARGE	16#11	The data to be transmitted in the response buffer is larger than the allocated response buffer.
FRAGMENTATION_OF_VALUE	16#12	The service specifies an operation that splits a primary data value, i.e. half of a REAL data type.
NOT_ENOUGH_DATA	16#13	The service does not provide enough data to perform the specified operation.
ATTRIBUTE_NOT_SUPPORTED	16#14	The attribute specified in the request is not supported.
TOO_MUCH_DATA	16#15	The service provides more data than expected.
OBJECT_DOES_NOT_EXIST	16#16	The specified object does not exist in the device.
SERVICE_FRAGMENTATION_SEQUENCE_NOT_IN_PROGRESSS	16#17	The fragmentation sequence for this service is not active for this data.
NO_STORED_ATTRIBUTE_DATA	16#18	The attribute data for this object is not saved prior to the requested server.

Enumeration Value	Number	Description
STORE_OPERATION_FAILURE	16#19	The attribute data for this object is not saved due to a failed attempt.
ROUTING_FAILURE_REQUEST_PACKET_TOO_LARGE	16#1A	The service request packet is too large to be transmitted on the path from the target to the network. The routing device is forced to abort the service.
ROUTING_FAILURE_RESPONSE_PACKET_TOO_LARGE	16#1B	The service response packet is too large to be transmitted on the path from the target to the network. The routing device is forced to abort the service.
MISSING_ATTRIBUTE_LISTENTRY_DATA	16#1C	The service does not provide the attribute from the attribute list required to perform the requested operation.
INVALID_ATTRIBUTE_VALUE_LIST	16#1D	The service is returning a list of attributes, including status information for invalid attributes.
EMBEDDED_SERVICE_ERROR	16#1E	An embedded service causes an error.
VENDOR_SPECIFIC_ERROR	16#1F	A vendor-specific error occurs. The additional code field of the error response defines the specific error encountered. This applies only when the error codes displayed in this table or in the object type definition do not accurately reflect the condition.
INVALID_PARAMETER	16#20	The parameter associated with the request is invalid. This code is used when this specification and/or the specification of requireman application object are not met.
WRITE_ONEC_VALUE_OR_MEDIUM_ALREADY_WRITTEN	16#21	An attempt is made to write to a write-once medium that has already been written (e.g., WORM drive, PROM), or to modify a value that cannot be changed once established.
INVALID_REPLY_RECEIVED	16#22	An invalid reply is received (e.g., the reply service code does not match the expected service code, or the reply message is shorter than the expected minimum reply size). This status code can be used for other reasons of invalid replies.
BUFFER_OVERFLOW	16#23	The received message is larger than the receiving buffer can handle. The message is discarded.
MESSAGE_FORMAT_ERROR	16#24	The server does not support the format of the received message.
KEY_FAILURE_IN_PATH	16#25	The key segment as the first segment in the path does not match the target module. The object-specific status must indicate failure of each part of the key check.
PATH_SIZE_INVALID	16#26	The path size sent with the service request is either too small to route the request to the object, or contains too much routing data.

Enumeration Value	Number	Description
UNEXPECTED_ATTRIBUTE_IN_LIST	16#27	An attempt is made to set an attribute that cannot be set at this time.
INVALID_MEMBER_ID	16#28	The member ID specified in the request does not exist in the specified type/instance/attribute.
MEMBER_NOT_SETTABLE	16#29	A request is received to modify a non-modifiable member.
GROUP_2_ONLY_SERVER_GENERAL_FAILURE	16#2A	This error code can only be reported by DeviceNet Group 2 servers with a code space of 4K or lower, and can only be used in place of unsupported services, unsupported attributes, and non-settable attributes.
UNKNOWN_MODBUS_ERROR	16#2B	The CIP to Modbus converter receives an unknown Modbus error code.
ATTRIBUTE_NOT_GETTABLE	16#2C	A request is received to read a non-readable attribute.
INSTANCE_NOT_DELETABLE	16#2D	The requested object instance cannot be deleted.
SERVICE_NOT_SUPPORTED_FOR_SPECIFIED_PATH	16#2E	The object supports the service, but does not support the specified application path (e.g., attribute). Note: Do not use for any setting services (use general status code 0x0E or 0x29 instead).
TIME_OUT	16#100	Request timed out.
INTERFACE_MISSING	16#101	IEtherNetIPService is not implemented.
REMOTE_CALL_FAILED	16#102	No physical connection.
NULL_POINTER	16#103	Invalid input value: NULL.
INVALID_DATA_SIZE	16#104	Data size is invalid.
WRONG_INTERFACE_VERSION	16#105	Version does not match. The device implements a different version of the interface for the called method.
NO_MEMORY	16#106	Insufficient memory.
UNKNOWN_ERROR	16#107	An unknown error occurred.
ABORTED	16#108	The service is aborted.

  LD:

18.4.3.13 GetEIPSystemstats

Retrieve EIP system-level diagnostic information.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
GetEIPSystemstats	Retrieve EIP system diagnostic information	FB		GetEIPSystemstats_Instance_0(byStackIndex := , bClear := , stSystemStats => , bResult =>);

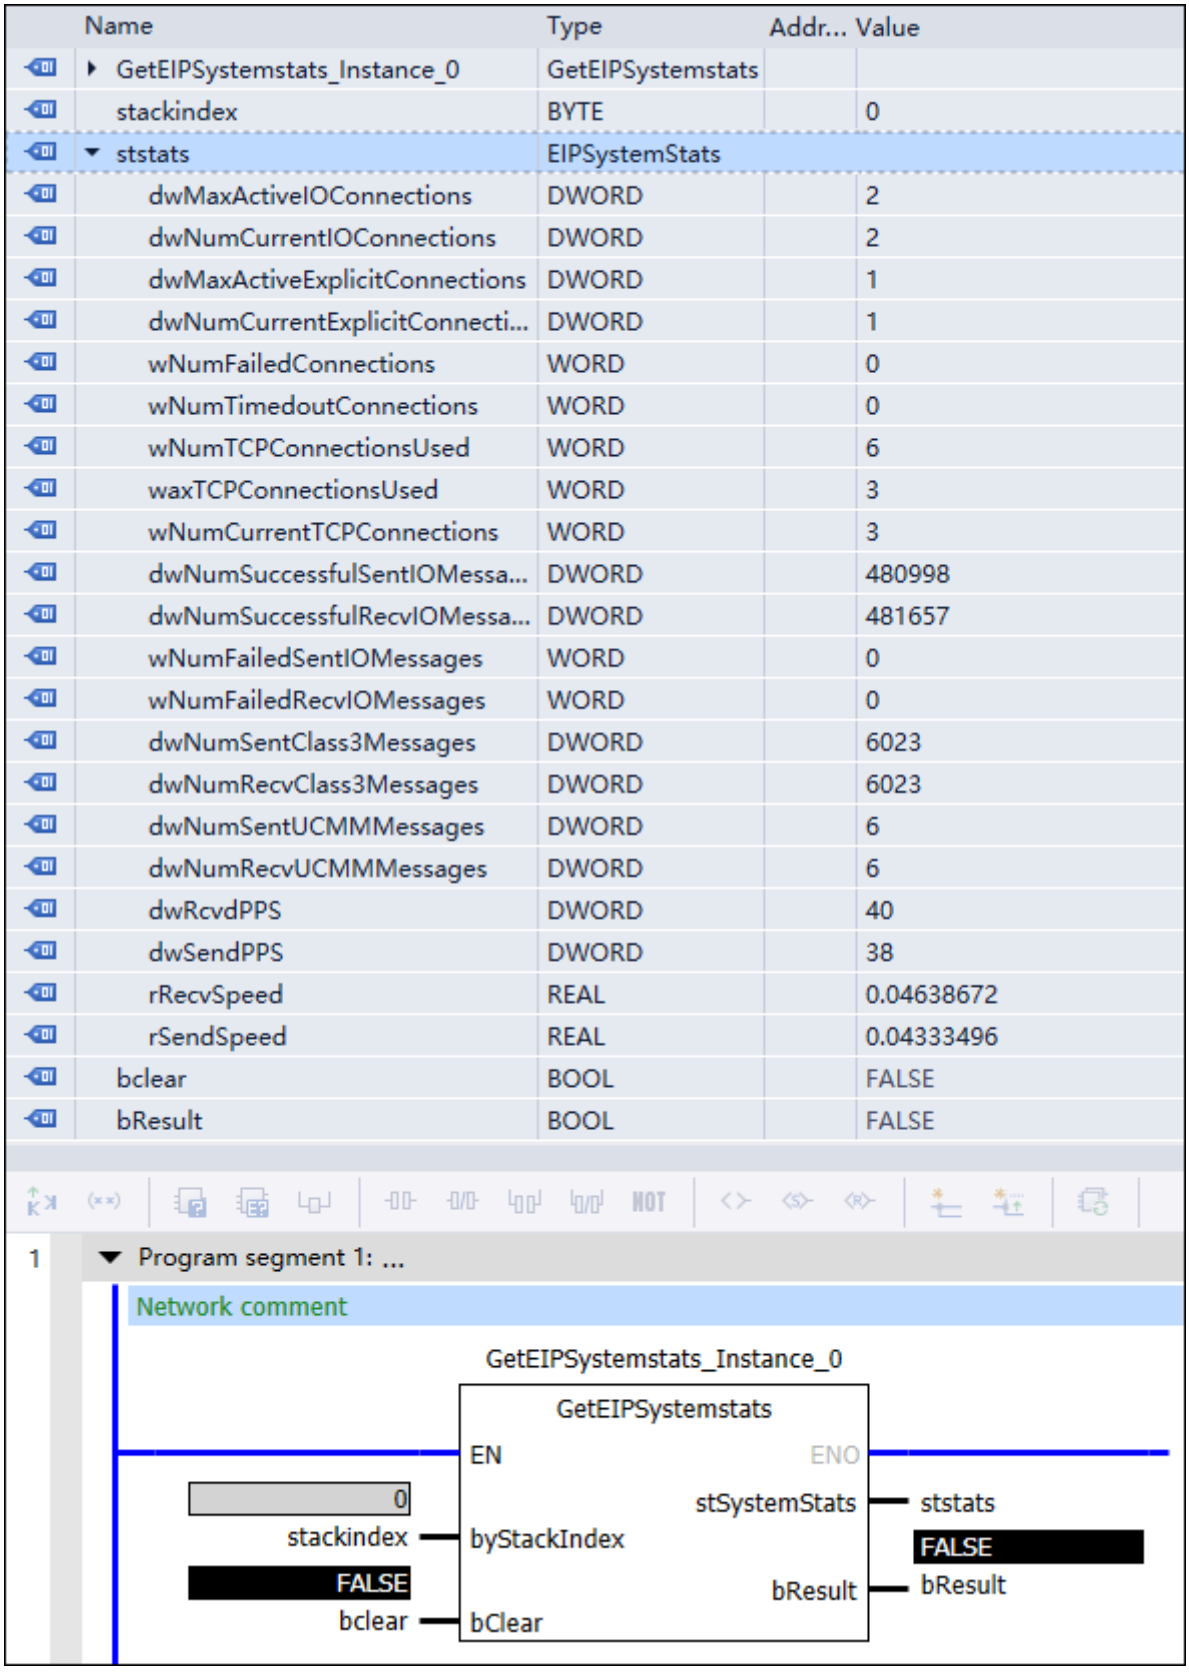
- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	byStackIndex	Protocol stack number	BYTE	Follows data type	0	If EIP protocol is added to network ports, the value is 0 for the first port, 1 for the second port, and so on. If EIP is only configured on a single network port, the value is 0.
	bClear	Diagnostic data clear	BOOL	TRUE, FALSE	FALSE	Active high. Clears the current diagnostic data.
Output	stSystemStats	EIP system diagnostic information	EIPSystem Stats	Follows data type	-	EIP system diagnostic data structure, which stores the obtained diagnostic information.
	bResult	Execution result	BOOL	TRUE, FALSE	-	Execution result. TRUE: Error FALSE: No error

- **Function**
  - This function block retrieves real-time system-level diagnostics of the selected EIP stack, with data continuously counted internally. A high bClear signal clears historical statistics and restarts counting. The block returns instant sampled data on execution, so valid live data is still accessible when bClear is asserted.
  - The data type of stSystemStats is the EIPSystemStats structure, defined as follows.

Structure member	Data Type	Description
dwMaxActiveIOConnections	DWORD	Max number of I/O connections opened at the same time
dwNumCurrentIOConnections	DWORD	Current number of I/O connections
dwMaxActiveExplicitConnections	DWORD	Number of Class3 connections opened at the same time
dwNumCurrentExplicitConnections	DWORD	Number of currently active Class3 connections
wNumFailedConnections	WORD	Number of failed connection attempts
wNum TimedoutConnections	WORD	Total number of timed out connections
wNumTCPConnectionsUsed	WORD	Total number of established sessions
waxTCPConnectionsUsed	WORD	Maximum number of established sessions at the same time
wNumCurrent TCPConnections	WORD	Current number of established sessions

Structure member	Data Type	Description
dwNumSuccessfulSentlOMessages	DWORD	Total number of successfully sent I/O messages
dwNumSuccessfulRecvIOMessages	DWORD	Total number of successfully received I/O messages
wNum FailedSentlOMessages	WORD	Failed sent I/O packets
wNum FailedRecvlOMessages	WORD	Incorrect I/O data packets received
dwNumSentClass3Messages	DWORD	Total number of Class3 messages sent
dwNumRecvClass3Messages	DWORD	Total number of Class3 messages received
dwNumSentUCMMMessages	DWORD	Total number of UCMM messages sent
dwNumRecvUCMMMessages	DWORD	Total number of UCMM messages received
dwRcvdPPS	DWORD	Receive PPS
dwSendPPS	DWORD	Send PPS
rRecvSpeed	REAL	Receive speed
rSendSpeed	REAL	Send speed



- **Program example**

18.4.3.14 GetEIPConnectstats

This instruction gets the diagnostic information of EIP connection.

- **Instruction format**

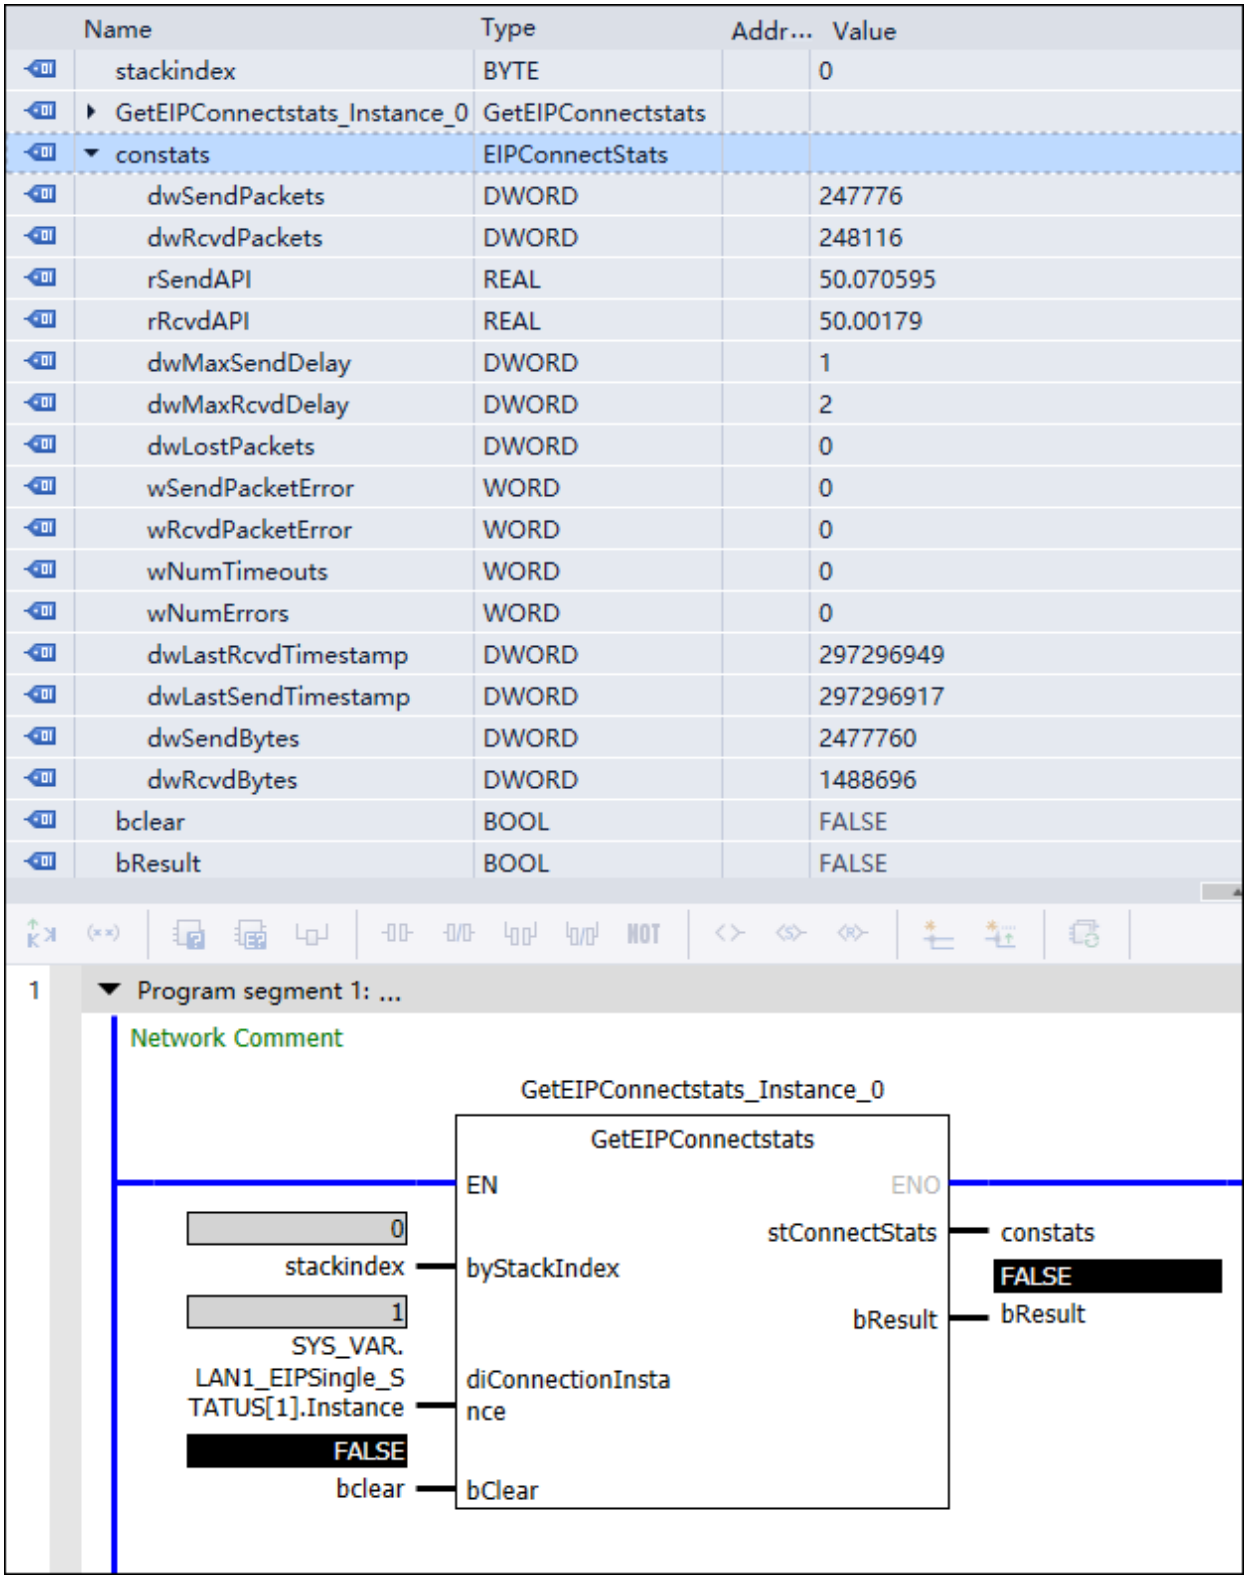
Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
GetEIPConnectstats	Get diagnostic information of EIP connection	FB		GetEIPConnectstats_Instance_0(byStackIndex := , diConnectionInstance := , bClear := , stConnectStats => , bResult =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	byStackIndex	Protocol stack number	BYTE	Follows data type	0	If EIP protocol is added to network ports, the value is 0 for the first port, 1 for the second port, and so on. If EIP is only configured on a single network port, the value is 0.
	diConnectionInstance	Connection ID	DINT	Follows data type	-	Connection instance.
	bClear	Diagnostic data clear	BOOL	TRUE, FALSE	FALSE	Active high. Clears the current diagnostic data.
Output	stConnectStats	Diagnostic information of EIP connection diagnostic	EIPConnectStats	Follows data type	-	EIP connection diagnostic data structure, which stores the obtained diagnostic information.
	bResult	Execution result	BOOL	TRUE, FALSE	-	Execution result. TRUE: Error FALSE: No error

- **Function**
  - This function block retrieves real-time system-level diagnostics of the specified EIP connection, with data continuously counted internally. A high bClear signal clears historical statistics and restarts counting. The block returns instant sampled data on execution, so valid live data is still accessible when bClear is asserted.
  - The data type of stConnectStats is the structure EIPConnectStats, whose meaning is as follows.

Structure member	Data Type	Description
dwSendPackets	DWORD	Number of data packets sent by the connection protocol stack
dwRcydPackets	DWORD	Number of data packets received by the connection protocol stack
rSendAPI	REAL	Actual interval between sent data packets for the connection
rRcvdAPI	REAL	Actual interval between received data packets for the connection
dwMaxSendDelay	DWORD	Maximum delay between any two sent data packets
dwMaxRcvdDelay	DWORD	Maximum delay between any two received data packets
dwLostPackets	DWORD	Number of lost data packets The PacketSequenceNumber of each new data packet increments by 1 to detect packet loss.
wSendPacketError	WORD	Number of data packets that failed to send
wRcydPacketError	WORD	Number of data packets that failed to receive
wNum Timeouts	WORD	Number of connection timeouts, also the number of retry attempts to establish the connection
wNumErrors	WORD	Number of connection errors, also the number of retry attempts to establish the connection
dwLastRcvdTimestamp	DWORD	Timestamp of the last received data packet
dwLastSendTimestamp	DWORD	Timestamp of the last sent data packet
dwSendBytes	DWORD	Number of bytes to transmit
dwRcvdBytes	DWORD	Number of bytes to receive



- **Program example**

  ST:

Name	Type	Addr...	Value	Prepared value

LD:

18.4.3.15 EIP_SetRemAdapterConfIP

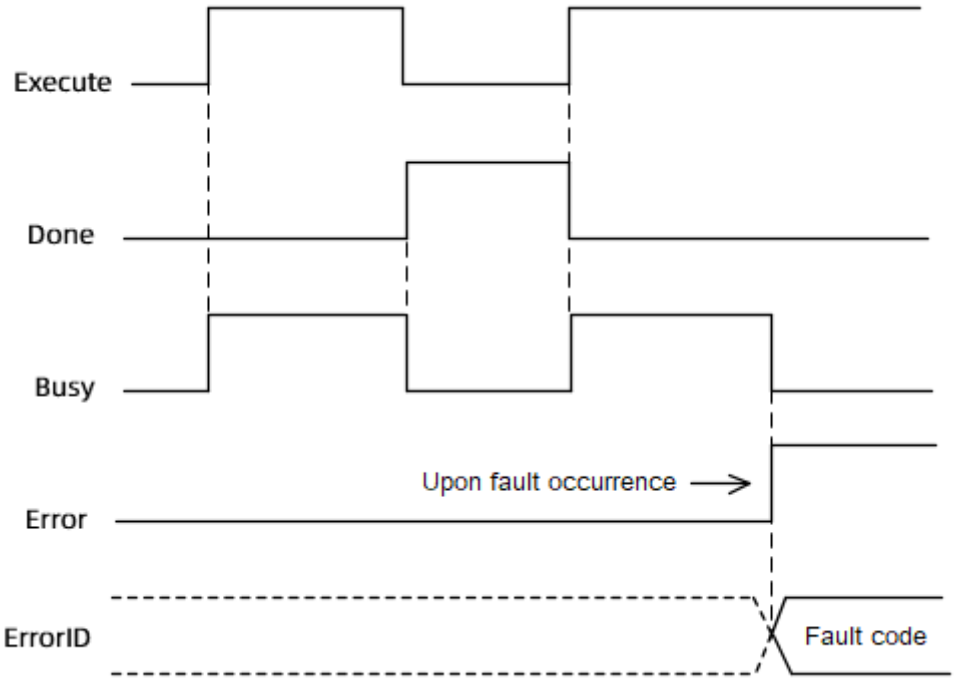
This instruction sets the configuration IP address for the specified remote adapter.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
EIP_SetRemAdapterConfIP	Set the connection configuration IP address of the remote adapter	FB		EIP_SetRemAdapterConfIP_Instance_0(Execute := , LocalEtherNetID := , RemAdapterAliasID := , IPAddress := , Done => , Busy => , Error => , ErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Rising edge-triggered	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered
	LocalEtherNetID	Ethernet port ID	BYTE	1 to 255	0	Ethernet port ID: LAN1 = 1, LAN2 = 2, and so on.
	RemAdapterAliasID	Remote adapter alias ID	UDINT	1 to 2000	0	Adapter alias ID set in the iFA software.
	IPAddress	Configuring IP address	ARRAY[0..3] OF BYTE	[0 to 255, 0 to 255, 0 to 255, 0 to 255]	[0,0,0,0]	IP address configuration follows standard IP specifications, and faults are reported after occurrence.
	Done	Done	BOOL	TRUE, FALSE	FALSE	Instruction is completed.
	Busy	Executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	Error status.



Output

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	ErrorID	Fault Codes	WORD	Follow data type	0	3: Network port ID out of range 5: Remote adapter alias ID out of range 6: Remote adapter IP duplicated

- **Function**

  This instruction specifies the corresponding remote adapter alias ID, network port ID, and IP address to be configured, and sets the configuration IP of the corresponding remote adapter.

- **Timing diagram**

- **Program example**

  ST:

Name	Type	Address	Value
EIP_SetRemAdapterConfIP_Instance_0	EIP_SetRemAdapterConfIP		
Execute	BOOL		TRUE
LocalEtherNetID	BYTE		1
RemAdapterAliasID	UDINT		2
IPAddress	ARRAY [0..3] OF BYTE

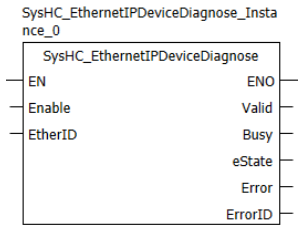
IPAddress[3]	BYTE		52
Done	BOOL		TRUE
Busy	BOOL		FALSE
Error	BOOL		FALSE
ErrorID	WORD		0
bExec	BOOL		TRUE
bDone	BOOL		TRUE

```
EIP_SetRemAdapterConfIP_Instance_0(Execute TRUE := bExec TRUE,
                                   LocalEtherNetID := ,
                                   RemAdapterAliasID := ,
                                   IPAddress := ,
                                   Done TRUE => bDone TRUE,
                                   Busy => ,
                                   Error => ,
                                   ErrorID => );
```

LD:

Name	Type	Address	Value
EIP_SetRemAdapterConfIP_Instance_0	EIP_SetRemAdapterConfIP		
Execute	BOOL		TRUE
LocalEtherNetID	BYTE		1
RemAdapterAliasID	UDINT		1
IPAddress	ARRAY [0..3] OF BYTE		
IPAddress[0]	BYTE		192
IPAddress[1]	BYTE		168
IPAddress[2]	BYTE		1
IPAddress[3]	BYTE		50
Done	BOOL		TRUE
Busy	BOOL		FALSE
Error	BOOL		FALSE
ErrorID	WORD		0
bExec	BOOL		TRUE



- **Precautions**
  - IP configuration follows standard IP specifications, and errors are reported after occurrence.
  - If LocalEtherNetID or RemAdapterAliasID is not within the PLC project configuration range, Error is set.

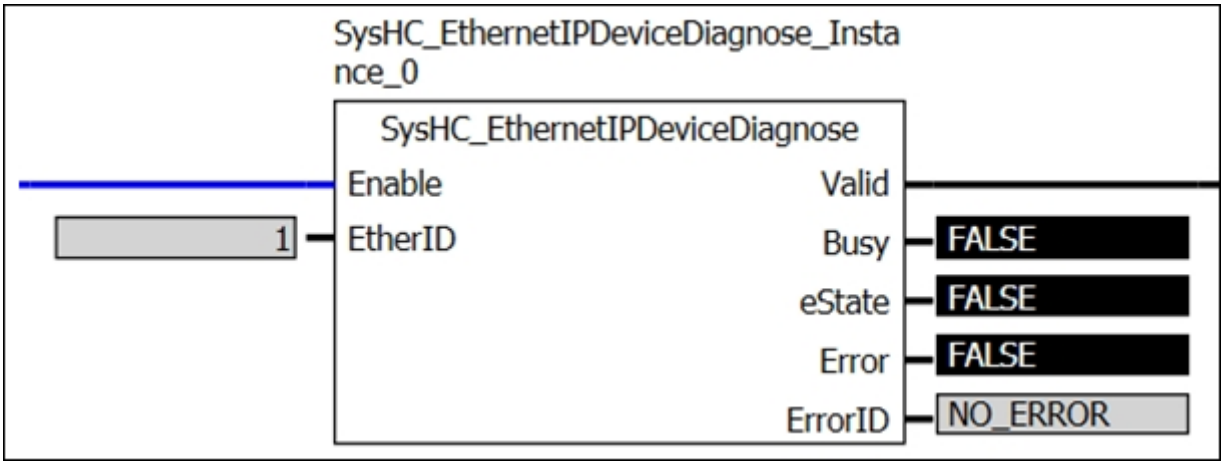
- If the IP address set by the instruction is the same as the currently active IP address of the remote adapter, Error is set.
- If the IP address set by the instruction is the same as the currently active IP address of another remote adapter under the same Ethernet port, Error is set.

18.4.3.16 SysHC_EthernetIPDeviceDiagnose

This instruction obtains the fault diagnostics of the PLC when it functions as an EthernetIP slave.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
SysHC_EthernetIPDeviceDiagnose	Obtain the fault diagnostics of the EIP slave	FB		SysHC_EthernetIPDeviceDiagnose_Instance_0(Enable := , EtherID := , Valid => , Busy => , eState => , Error => , ErrorID =>);

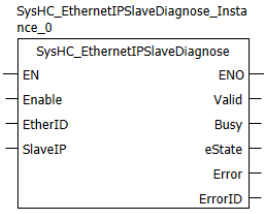


- **Related variables**

Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Enable	High level triggered	BOOL	TRUE, FALSE	FALSE	High level triggered
	EtherID	Network port ID	BYTE	-	0	Network port ID number.
Output	Valid	Execution status	BOOL	TRUE, FALSE	FALSE	Instruction is actively executing.
	Busy	Executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.
	eState	Diagnostic status bit	BOOL	TRUE, FALSE	FALSE	Diagnostic status bit.
	Error	Error occurred	BOOL	TRUE, FALSE	FALSE	Set to TRUE when an error occurs.

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	ErrorID	Fault code	SYS_HC_ERROR	-	NO_ERROR	See 18.4.1.37 Fault Codes.



- **Function**
  - When Enable = TRUE, it enters a runnable state, at which point the fault diagnostics can be obtained; when Enable = FALSE, it enters an unrunnable state, and the fault diagnostics cannot be obtained.
  - If no slave is configured, all input EtherID values are invalid, and the error ETHER_ID_ERROR is returned.
  - The EtherID is assigned based on the order of EtherNet/IP-supported ports in the "Hardware Configuration" list of the project tree. For example, for the EVO800 PLC, the EtherIDs of LAN1, LAN2, and EIP3 ports are 1, 2, and 3, respectively; for the EVO523 PLC, if the LAN1 port is in switch mode, the EtherID is 1, and if it is in independent IP mode, the EtherID of the LAN1_A port is 1 and that of the LAN1_B port is 2.
  - If the slave corresponding to the input EtherID is disabled, acquisition of fault diagnosis information fails, and the error FAILURE_OBTAIN is returned.
- **Program example**

18.4.3.17 SysHC_EthernetIPSlaveDiagnose

This instruction obtains the fault diagnostics of the PLC when it functions as an EthernetIP slave that the master connected to.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
SysHC_EthernetIPSlaveDiagnose	Obtain the fault diagnostics of the EIP master	FB		SysHC_EthernetIPSlaveDiagnose_Instance_0(Enable := , EtherID := , SlaveIP := , Valid => , Busy => , eState => , Error => , ErrorID =>);

- **Related variables**

  Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Enable	High level triggered	BOOL	TRUE, FALSE	FALSE	High level triggered
	EtherID	Network port ID	BYTE	-	0	Network port ID number.
	SlaveIP	Slave IP address	STRING	-	-	Slave IP address.
Output	Valid	Execution status	BOOL	TRUE, FALSE	FALSE	Instruction is actively executing.
	Busy	Executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.
	eState	Diagnostic status bit	BOOL	TRUE, FALSE	FALSE	Diagnostic status bit.
	Error	Error occurred	BOOL	TRUE, FALSE	FALSE	Set to TRUE when an error occurs.
	ErrorID	Fault code	SYS_HC_ERROR	-	NO_ERROR	See 18.4.1.37 Fault Codes.

- **Function**
  - When Enable = TRUE, it enters a runnable state, at which point the fault diagnostics can be obtained; when Enable = FALSE, it enters an unrunnable state, and the fault diagnostics cannot be obtained.

- If no slave is configured, all input EtherID values are invalid, and the error ETHER_ID_ERROR is returned.
- The EtherID is assigned based on the order of EtherNet/IP-supported ports in the "Hardware Configuration" list of the project tree. For example, for the EVO800 PLC, the EtherIDs of LAN1, LAN2, and EIP3 ports are 1, 2, and 3, respectively; for the EVO523 PLC, if the LAN1 port is in switch mode, the EtherID is 1, and if it is in independent IP mode, the EtherID of the LAN1_A port is 1 and that of the LAN1_B port is 2.
- If the slave corresponding to the input EtherID is disabled, acquisition of fault diagnosis information fails, and the error FAILURE_OBTAIN is returned.
- If the slave IP address SlaveIP is invalid, or if there is no slave device corresponding to the current IP address, the error Slave_IP_ERROR is returned.

- **Program example**

18.4.3.18 EIP Standard Service Code

18.4.3.19 EIP Standard Fault Codes

General Fault Code (Hexadecimal)	Extended Fault Code (Hexadecimal)	General Fault Code (decimal)	Extended Fault Code (decimal)	Description	Solution
0x01	0x100	1	256	Connection is in use or duplicate connection is attempted.	-
0x01	0x103	1	259	Transfer type or trigger method is not supported.	Check whether the transfer type and trigger method settings are correct.
0x01	0x105	1	261	Ownership conflict or OUNID mismatch: The configuration is already owned by another initiator.	Check whether the device has already been connected by another device.

General Fault Code (Hexadecimal)	Extended Fault Code (Hexadecimal)	General Fault Code (decimal)	Extended Fault Code (decimal)	Description	Solution
0x01	0x106	1	262	Ownership conflict: Other connections have exclusive access to part of the resources. For example, two PLCs control the output points of an IO module simultaneously.	Check whether multiple masters are connecting to the device simultaneously or whether there is a configuration error.
0x01	0x107	1	263	Target connection is not found. Forward_Close request to close a connection that does not exist on the target node.	-
0x01	0x108	1	264	Network connection parameters, connection type, connection priority are invalid. Redundancy owner, or fixed/variable value device is not supported.	Check whether the connection parameters are set correctly.
0x01	0x109	1	265	Connection size is invalid.	Check whether the connection parameters are set correctly.
0x01	0x110	1	272	Connection target is not configured, and the connection request does not include a data segment for configuration.	Check whether the connection includes configuration data and if the length and content of the configuration data are correct.
0x01	0x111	1	273	RPI is not supported, or the timeout value generated by the connection timeout multiplier is not supported by the device, or the production inhibit time is invalid.	Check whether the RPI, timeout multiplier, and production inhibit time meet the requirements of the target device.

General Fault Code (Hexadecimal)	Extended Fault Code (Hexadecimal)	General Fault Code (decimal)	Extended Fault Code (decimal)	Description	Solution
0x01	0x112	1	274	RPI value is unacceptable. RPI value in the Forward_Open request exceeds the range required by the target device or the target device is producing at a different cycle.	Check whether the RPI meets the target device requirements.
0x01	0x113	1	275	The connection limit has been exceeded, and the target device cannot support any more connections.	Check whether the number of connections to the target device has reached the limit.
0x01	0x114	1	276	Vendor ID or product code does not match.	Check whether the configured device matches the target device.
0x01	0x115	1	277	Product type does not match.	Check whether the configured device matches the target device.
0x01	0x116	1	278	Version does not match.	Check whether the EDS file device version matches the target device, or use the compatibility mode.
0x01	0x117	1	279	Invalid production or consumption path.	Check whether the EDS file is used correctly or whether the parameter configuration of the generic device is correct.
0x01	0x118	1	280	Invalid or inconsistent configuration path.	Check whether the EDS file is used correctly or whether the parameter configuration of the generic device is correct.
0x01	0x119	1	281	A non-ListenOnly connection is not enabled. No non-ListenOnly connection using the same path has been enabled for the ListenOnly connection, or the type of the currently established connection is not multicast.	Check whether other connections with the same path have been established before using ListenOnly, or whether the current connection type with the enabled connection is multicast.

General Fault Code (Hexadecimal)	Extended Fault Code (Hexadecimal)	General Fault Code (decimal)	Extended Fault Code (decimal)	Description	Solution
0x01	0x11A	1	282	Target object exceeds connection limit.	Check whether the number of connections to this object on the target device has reached the limit.
0x01	0x11B	1	283	Production inhibit time is greater than RPI.	Modify production inhibit time to be less than RPI.
0x01	0x11C	1	284	Transfer type is not supported.	Check whether the EDS file is used correctly or whether the parameter configuration of the generic device is correct.
0x01	0x11D	1	285	T → O trigger method is not supported.	Check whether the trigger type is correct.
0x01	0x11E	1	286	Direction specified in the transfer type/trigger method parameters is not supported.	Check whether the EDS file is used correctly or whether the parameter configuration of the generic device is correct.
0x01	0x11F	1	287	O → T fixed/variable flag is not supported.	Check whether the O → T fixed/variable flag setting is correct.
0x01	0x120	1	288	T → O fixed/variable flag is not supported.	Check whether the T → O fixed/variable flag setting is correct.
0x01	0x121	1	289	O → T priority is not supported.	Check whether the O → T priority setting is correct and whether the target device supports this priority.
0x01	0x122	1	290	T → O priority is not supported.	Check whether the T → O priority setting is correct and whether the target device supports this priority.
0x01	0x123	1	291	O → T connection type is not supported.	Check whether the O → T connection type setting is correct.
0x01	0x124	1	292	T → O connection type is not supported.	Check whether the T →O connection type setting is correct.

General Fault Code (Hexadecimal)	Extended Fault Code (Hexadecimal)	General Fault Code (decimal)	Extended Fault Code (decimal)	Description	Solution
0x01	0x125	1	293	O → T redundancy owner flag is not supported.	-
0x01	0x126	1	294	Configuration length is not supported.	Configuration data length setting is incorrect.
0x01	0x127	1	295	O → T connection length is not supported.	Check whether the O → T length is set correctly.
0x01	0x128	1	296	T → O connection length is not supported.	Check whether the T → O length is set correctly.
0x01	0x129	1	297	Configuration path is invalid.	Check whether the configuration instance ID in the connection path is correct.
0x01	0x12A	1	298	Consumption path is invalid (O → T).	Check whether the consumption connection point ID in the connection path is correct.
0x01	0x12B	1	299	Production path is invalid (T → O).	Check whether the production connection point ID in the connection path is correct.
0x01	0x12C	1	300	Configuration symbol does not exist.	Check whether the EDS file is used correctly or whether the parameter configuration of the generic device is correct.
0x01	0x12D	1	301	Consumption symbol does not exist (O->T).	Check whether the EDS file is used correctly or whether the parameter configuration of the generic device is correct.
0x01	0x12E	1	302	Production symbol does not exist (T->O).	Check whether the EDS file is used correctly or whether the parameter configuration of the generic device is correct.
0x01	0x12F	1	303	The combination of configuration consumption and production application paths is not supported.	Check whether the EDS file is used correctly or whether the parameter configuration of the generic device is correct.

General Fault Code (Hexadecimal)	Extended Fault Code (Hexadecimal)	General Fault Code (decimal)	Extended Fault Code (decimal)	Description	Solution
0x01	0x130	1	304	The information in the configuration data segment is inconsistent with the consumer data format.	Check whether the EDS file is used correctly or whether the parameter configuration of the generic device is correct.
0x01	0x131	1	305	The information in the configuration data segment is inconsistent with the producer data format.	Check whether the EDS file is used correctly or whether the parameter configuration of the generic device is correct.
0x01	0x132	1	306	The target does not support empty Forward Open requests.	Check whether the EDS file is used correctly or whether the parameter configuration of the generic device is correct.
0x01	0x133	1	307	Timeout multiplier is not unacceptable.	Check whether the timeout multiplier is set correctly.
0x01	0x134	1	308	T → O connection size does not match the existing multicast connection.	Check whether the current ListenOnly length matches the previous connection.
0x01	0x135	1	309	T → O fixed/variable connection type does not match the existing multicast connection.	Check whether the current ListenOnly connection type matches the previous connection.
0x01	0x136	1	310	T → O connection priority does not match the existing multicast connection.	Check whether the current ListenOnly priority matches the previous connection.
0x01	0x137	1	311	The transfer type does not match the existing multicast connection.	Check whether the current ListenOnly transfer type matches the previous connection.
0x01	0x138	1	312	T → O production trigger mode does not match the existing multicast connection.	Check whether the current ListenOnly trigger type matches the previous connection.
0x01	0x139	1	313	T → O production inhibition time does not match the existing multicast connection.	Check whether the current ListenOnly inhibition time matches the previous connection.

General Fault Code (Hexadecimal)	Extended Fault Code (Hexadecimal)	General Fault Code (decimal)	Extended Fault Code (decimal)	Description	Solution
0x01	0x203	1	515	Connection timeout.	Check the target device status or link status.
0x01	0x204	1	516	Response timeout for non-connected transmission.	-
0x01	0x205	1	517	Parameter error in non-connected transmission service.	-
0x01	0x206	1	518	Non-connected service message is too large.	-
0x01	0x207	1	519	Non-connected consumption service is acknowledged but no response received.	-
0x01	0x301	1	769	No available buffer memory.	-
0x01	0x302	1	770	Unable to allocate the specified bandwidth for the data.	-
0x01	0x303	1	771	No available consumed connection ID filter.	-
0x01	0x304	1	772	Not configured to send scheduled priority data.	-
0x01	0x311	1	785	Port is not available.	-
0x01	0x312	1	786	Link address is invalid.	-
0x01	0x315	1	789	There is an invalid segment in the connection path.	-
0x01	0x317	1	791	Schedule is not specified.	-
0x01	0x318	1	792	Local link address is invalid.	-
0x01	0x319	1	793	Backup resources are not available.	-
0x01	0x31A	1	794	Rack connection has been established.	-
0x01	0x31B	1	795	Module connection has been established.	-

General Fault Code (Hexadecimal)	Extended Fault Code (Hexadecimal)	General Fault Code (decimal)	Extended Fault Code (decimal)	Description	Solution
0x01	0x31C	1	796	Miscellaneous: No other extended status code can indicate the connection error.	-
0x01	0x31D	1	797	Redundant connection mismatch.	-
0x01	0x31E	1	798	There are no more available user-configurable link consumer resources in the production module.	-
0x01	0x31F	1	799	There are no available user-configurable link consumer resources in the production module.	-
0x01	0x800	1	2048	Target device is offline.	Check whether the EDS file is used correctly or whether the parameter configuration of the generic device is correct.
0x01	0x801	1	2049	Incompatible multicast time correction PRI. Connection has been established with a different time correction RPI.	Check whether all devices connected to this device are configured with the same time correction RPI.
0x01	0x802	1	2050	Incorrect security connection size.	Check whether the EDS is used correctly and whether the correct connection is selected.
0x01	0x803	1	2051	Incorrect security connection format.	Check whether the EDS is used correctly and whether the correct connection is selected.
0x01	0x804	1	2052	Invalid time correction connection parameters.	Check whether the EDS is used correctly and whether the correct connection is selected.
0x01	0x805	1	2053	Incorrect EPI multiplier for Ping interval.	Check whether the correct timeout multiplier is selected.

General Fault Code (Hexadecimal)	Extended Fault Code (Hexadecimal)	General Fault Code (decimal)	Extended Fault Code (decimal)	Description	Solution
0x01	0x806	1	2054	Incorrect minimum multiplier for time coordination messages.	Check whether the EDS is used correctly and whether the correct connection is selected.
0x01	0x807	1	2055	Incorrect multiplier for network expected response time.	Check whether the EDS is used correctly and whether the correct connection is selected.
0x01	0x808	1	2056	Incorrect timeout multiplier.	Check whether the EDS is used correctly and whether the correct connection is selected.
0x01	0x809	1	2057	Incorrect maximum number of consumers.	Check whether the EDS is used correctly and whether the correct connection is selected.
0x01	0x80A	1	2058	Incorrect CPCRC.	Check whether the EDS is used correctly and whether the correct connection is selected.
0x01	0x80B	1	2059	Invalid time correction connection ID.	Check whether the EDS is used correctly and whether the correct connection is selected.
0x01	0x80C	1	2060	SCID mismatch.	SCID is not 0 or does not match the target. No additional handling is required in Type1 mode. In Type2A mode, check whether the configured SCID does not match the target; if so, modify it to match.
0x01	0x80D	1	2061	Unset TUNID.	Configure TUNID through the back-end software.
0x01	0x80E	1	2062	TUNID mismatch.	Reset the TUNID of the target device through the backend software, and reconfigure the TUNID.

General Fault Code (Hexadecimal)	Extended Fault Code (Hexadecimal)	General Fault Code (decimal)	Extended Fault Code (decimal)	Description	Solution
0x01	0x80F	1	2063	Configuration operation is not allowed.	-
0x01	0x813	1	2067	Not configured to support cross-subnet multicast.	-
0x01	0x815	1	2069	Incompatible EPI multiplier for multicast ping interval. A connection has been established using incompatible EPI multipliers for Ping intervals.	Check whether all devices connected to this device are configured with the same connection parameters.
0x01	0x816	1	2070	Incompatible multicast maximum consumer count. A connection has been established with incompatible maximum consumer count.	Check whether all devices connected to this device are configured with the same connection parameters.
0x01	0x817	1	2071	Incompatible multicast security network segment types. A connection has been established with a different security network segment types.	Check whether all devices connected to this device are configured with the same connection parameters.
0x02	0xFFFF	2	65535	Resource unavailable - Internal processing buffer unavailable.	-
0x03	0xFFFF	3	65535	Invalid parameter value.	-
0x04	0xFFFF	4	65535	Incorrect path format.	-
0x05	0xFFFF	5	65535	Target path is unknown. Check whether the request path is correct.	-
0x06	0xFFFF	6	65535	Partial transfer: Only part of the expected data was transferred.	-
0x07	0xFFFF	7	65535	Network disconnection.	-
0x08	0xFFFF	8	65535	Service is not supported.	-
0x09	0xFFFF	9	65535	Invalid property data.	-

General Fault Code (Hexadecimal)	Extended Fault Code (Hexadecimal)	General Fault Code (decimal)	Extended Fault Code (decimal)	Description	Solution
0x0A	0xFFFF	10	65535	Attributes in the Get_Attribute_List or Set_Attribute_List response have a non-zero status..	-
0x0B	0xFFFF	11	65535	Object is already in the service request status.	-
0x0C	0xFFFF	12	65535	Object cannot perform the requested service in its current mode/status.	-
0x0D	0xFFFF	13	65535	Requested instance for object creation already exists.	-
0x0E	0xFFFF	14	65535	Attribute cannot be set.	-
0x0F	0xFFFF	15	65535	Permission/authorization check failed.	-
0x10	0xFFFF	16	65535	The current mode/status of the device prohibits the requested service from being executed.	-
0x11	0xFFFF	17	65535	Response data is too large.	-
0x12	0xFFFF	18	65535	The base type is fragmented. This service fragments the base data value, i.e., it decomposes half of the REAL data.	-
0x13	0xFFFF	19	65535	The service does not provide enough data to perform the specified operation.	-
0x14	0xFFFF	20	65535	Attribute is not supported.	-
0x15	0xFFFF	21	65535	The service provides more data than expected.	-
0x16	0xFFFF	22	65535	Object instance does not exist.	-
0x17	0xFFFF	23	65535	There is a sequence-related error in the fragmentation processing of the service.	-

General Fault Code (Hexadecimal)	Extended Fault Code (Hexadecimal)	General Fault Code (decimal)	Extended Fault Code (decimal)	Description	Solution
0x18	0xFFFF	24	65535	The attribute value was not saved before the request.	-
0x19	0xFFFF	25	65535	The attribute value failed to be saved due to a fault during the attempt.	-
0x1A	0xFFFF	26	65535	Routing error: The request packet is too large.	-
0x1B	0xFFFF	27	65535	Routing error: The response packet is too large.	-
0x1C	0xFFFF	28	65535	Attribute list data is missing or incomplete.	-
0x1D	0xFFFF	29	65535	Invalid attribute value list.	-
0x1E	0xFFFF	30	65535	Embedded system error: Multiple service responses contain errors.	-
0x1F	0xFFFF	31	65535	Vendor-specific error. See the target device guide.	-
0x20	0xFFFF	32	65535	Invalid parameter: Parameter does not meet specification requirements.	-
0x21	0xFFFF	33	65535	An attempt was made to perform a write operation on a write-once medium (e.g., WORM drive, PROM) to which data has already been written, or to modify a value that cannot be changed once set.	-
0x22	0xFFFF	34	65535	Invalid response received.	-
0x25	0xFFFF	37	65535	Electronic matching item error in the path.	-
0x25	0x114	37	276	Vendor ID or product code does not match.	-
0x25	0x115	37	277	Product type does not match.	-
0x25	0x116	37	278	Version does not match.	-
0x26	0xFFFF	38	65535	Invalid path size.	-

General Fault Code (Hexadecimal)	Extended Fault Code (Hexadecimal)	General Fault Code (decimal)	Extended Fault Code (decimal)	Description	Solution
0x27	0xFFFF	39	65535	Attempt to set an attribute that is currently immutable.	-
0x28	0xFFFF	40	65535	Invalid member ID.	-
0x29	0xFFFF	41	65535	Member cannot be set.	-
0x2B	0xFFFF	43	65535	Unknown Modbus error.	-
0x2C	0xFFFF	44	65535	Attribute cannot be obtained.	-
0x2D	0xFFFF	45	65535	Instance cannot be deleted.	-
0x6A	0xFFFF	106	65535	Encapsulation protocol header contains an error.	-
0xFF	0x2105	255	8453	Specified 0 elements or data out of array range for an array.	Check whether the tag read/write length is correct.
0xFF	0x2107	255	8455	Tag type used in the request does not match the data type of the target tag.	Check whether the tag read/write parameters are correct and whether the data types match.
0x1F	0x8007	31	32775	An inaccessible variable is specified.	Check whether access to the variable on the target device is allowed.
0x1F	0x0102	31	258 8451	Attempt to write to a read-only variable or constant.	Check whether access to the variable on the target device is allowed.
0x1F	0x0104	31	260 4355	Specified length exceeds actual length.	Check whether the tag read/write length is correct.
0x20	0x800F	32	32783	Data length information in the request data is inconsistent.	Check whether the data types of the two devices for tag read/write are consistent.
0x20	0x8017	32	32791	Multiple elements were requested for a variable that is not an array.	Check whether the tag read/write parameters are correct.

General Fault Code (Hexadecimal)	Extended Fault Code (Hexadecimal)	General Fault Code (decimal)	Extended Fault Code (decimal)	Description	Solution
0x20	0x8028	32	32808	An attempt was made to write a value outside the specified range to a variable with a defined subrange, or to write an undefined value to an enumerated variable.	Check whether the tag read/write parameters are correct.
0xFF	0x3108	255	12552	Failed to read master tag variable. Check the tag variables configured for the master and slaves.	Check whether the tag read/write parameters are correct.
0xFF	0x3109	255	12553	Failed to read the length of the master tag variable. Check the tag variables configured for the master and slaves.	Check whether the tag read/write parameters are correct.
0xFF	0x310A	255	12554	Tag variable type is not supported.	Check whether the tag read/write parameters are correct.
0xFF	0x310B	255	12555	Master tag variable type mismatch during read operation.	Check whether the tag read/write parameters are correct.
0xFF	0x1000	255	4096	Redundant mode does not support sending explicit messages from the partner rack.	Disconnect the connection to this device.
0xFF	0x800	255	2048	Request timeout: Target device is offline.	Check whether the network is properly connected and whether the target device is online.
0xFF	0xFFFF	255	65535	Vendor-specific error. See the target device guide.	-
0xFF	0x2000	255	8192	The I/O coupler rejects the connection. The specific diagnostic code must be read.	Troubleshoot based on the specific error code.
0xFF	0x2001	255	8193	The I/O coupler rejects the connection due to mismatched configuration.	Check whether the configuration matches the actual device.

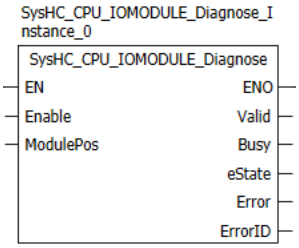
General Fault Code (Hexadecimal)	Extended Fault Code (Hexadecimal)	General Fault Code (decimal)	Extended Fault Code (decimal)	Description	Solution
0xFF	0x2002	255	8194	The I/O coupler rejects the connection because the configuration does not match the actual device.	Check whether the configuration matches the actual device.
0xFF	0x2003	255	8195	The IO coupler rejects the connection because the module parameter validation failed.	Check whether the configuration data is correct.

18.4.3.20 Fault Codes

Fault Code (Decimal)	Fault Code (Hexadecimal)	Description
61440	F000	More than 32 instances
61441	F001	Network configuration error
61442	F002	Failure to create EIP protocol stack
61443	F003	EIP protocol stack not running
61444	F004	Trigger signal error
61445	F005	Request path error
61446	F006	Connection error
61447	F007	Path conversion error
61448	F008	Error in sending class3 request
61449	F009	Data transmission exceeds limit
61450	F00A	Protocol stack shutdown error or repeated shutdown
61451	F00B	Read request sending error or repeated request
61452	F00C	Write request sending error or repeated request
61453	F00D	Waiting time after timeout too short
61454	F00E	Exceeded open connection data limit
61455	F00F	BOOL type copy error
61456	F010	Insufficient memory
61457	F011	0 element
61458	F012	Protocol stack error
61459	F013	Unsupported data type
61460	F014	Timeout period limit exceeded

Fault Code (Decimal)	Fault Code (Hexadecimal)	Description
61461	F015	Size limit of the request data exceeded
61462	F016	Array access limit exceeded
61463	F017	Received data limit exceeded

18.4.4 Local Bus



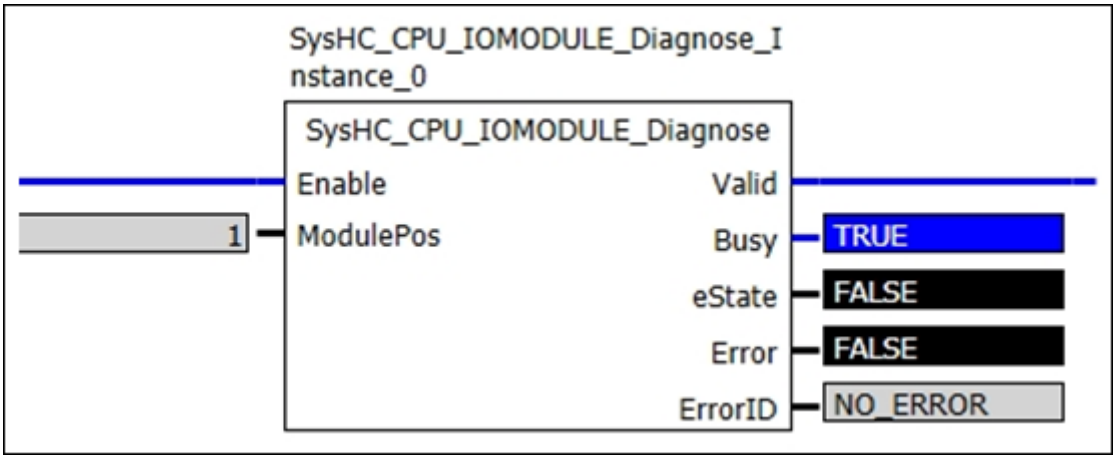
18.4.4.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.4.2 SysHC_CPU_IOMODULE_Diagnose	FB	Get the diagnostic state of local IO module	SysHCPlcInfo	Library version 1.0.0.0 and later
18.4.4.3 LBus_GetDiagMailBoxData	FB	Get diagnostic information for modules on the local bus	ExtendIo	Library version 1.1.0.0 and later
18.4.4.4 LBus_GetModuleInfo	FB	Get all information about the local bus and local I/O		Library version 1.1.0.0 and later
18.4.4.5 SysHC_GetAllGL20ModuleInfo	FB	Get basic information about all modules on the local bus		Library version 1.1.0.0 and later
18.4.4.6 SysHC_GetGL20ModuleInfo	FB	Get basic information about a specified module on the local bus		Library version 1.1.0.0 and later

18.4.4.2 SysHC_CPU_IOMODULE_Diagnose

This instruction gets the diagnostic state information of the local extended IO module.

- **Instruction format**

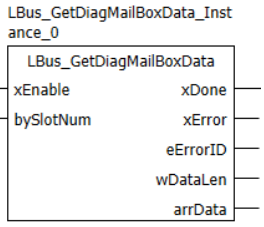


Instruction	Name	FB/FC	LD Representation	ST Representation
SysHC_CPU_IOMODULE_Diagnose	Get the diagnostic state of local IO module	FB		SysHC_CPU_IOMODULE_Diagnose_Instance_0(Enable := , ModulePos := , Valid => , Busy => , eState => , Error => , ErrorID =>);

- **Related variables**

  Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Enable	Active high	BOOL	TRUE, FALSE	FALSE	Active high.
	ModulePos	Module slot number	BYTE	Follows data type	0	Module slot number.
Output	Valid	Output active	BOOL	TRUE, FALSE	FALSE	Instruction is actively executing.
	Busy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.
	eState	Diagnostic status bit	BOOL	TRUE, FALSE	FALSE	Diagnostic status bit.
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	Set to TRUE when an error occurs.
	ErrorID	Fault code	SYS_HC_ERROR	-	NO_ERROR	See 18.4.1.37 Fault Codes.



- **Function**
  - Enable set to TRUE indicates that the function block is enabled; otherwise, all outputs are invalid.
  - Checks if the ModulePos is within the valid range. If out of range, ErrorID outputs WRONG_PARAMETER.
  - If the ModulePos is successfully matched, check the disabled status of the slave node. If disabled, ErrorID outputs FAILURE_OBATION.
  - After the parameters are matched, the communication diagnostic data of the module specified by ModulePos is acquired, and the eState is updated in real time.
- **Program example**

18.4.4.3 LBus_GetDiagMailBoxData

This instruction reads diagnostic information from the local expansion module.

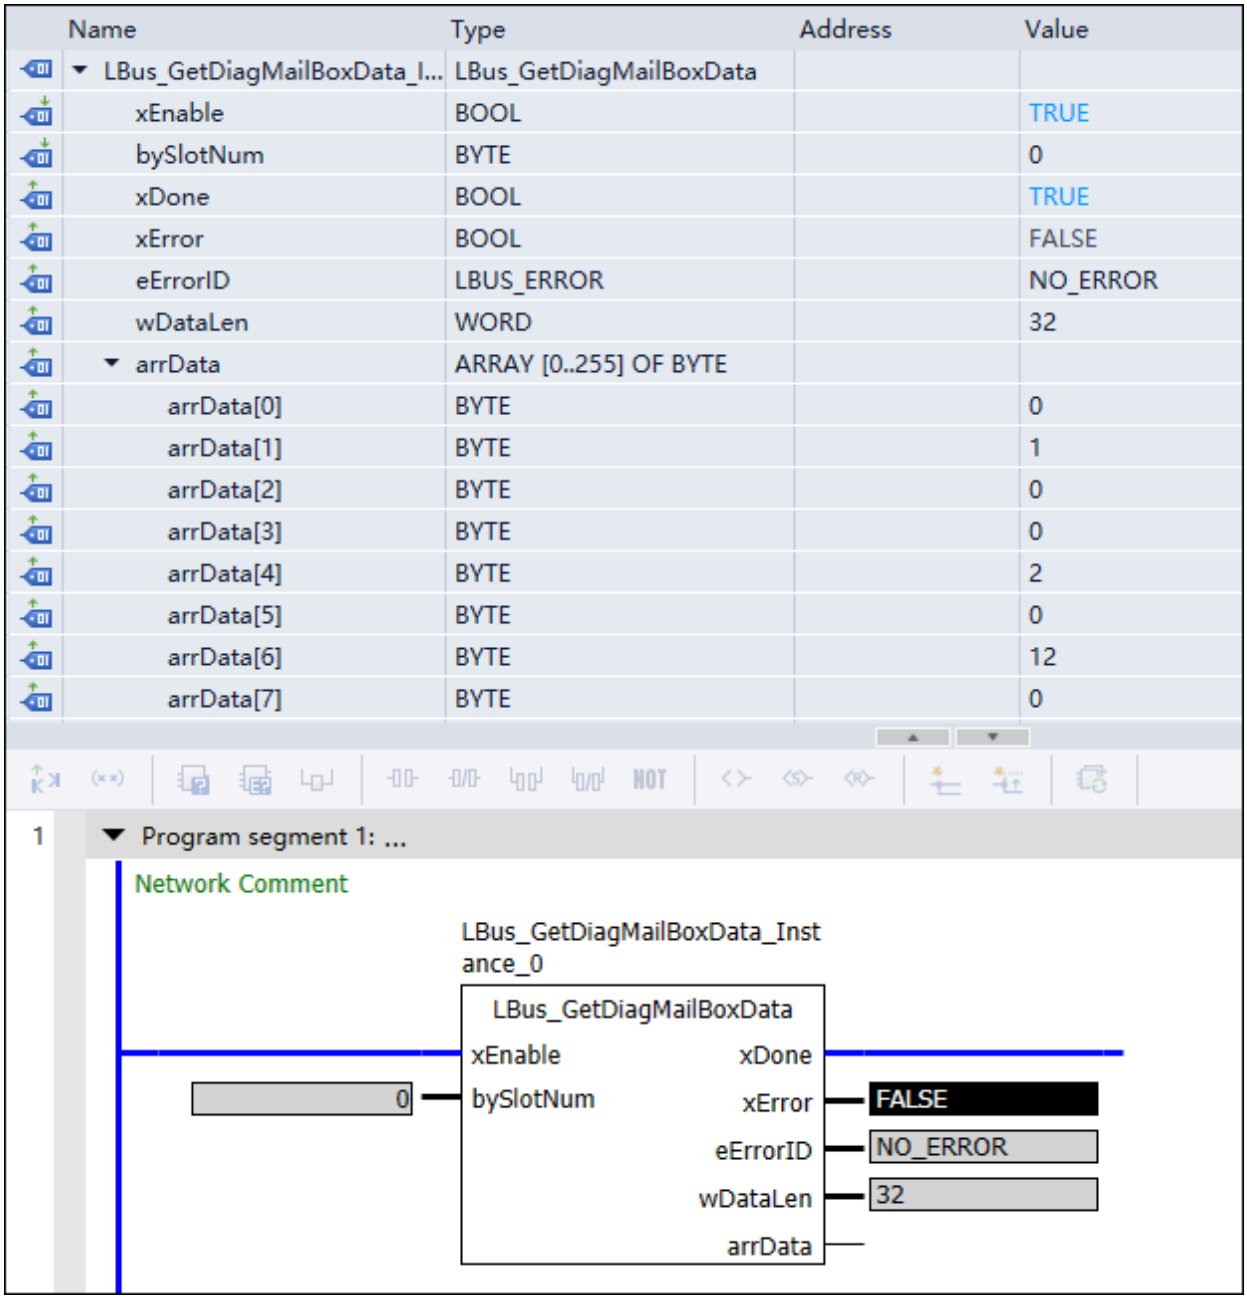
- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
LBus_GetDiagMailBoxData	Get diagnostic mailbox information of the specified module on the local bus	FB		LBus_GetDiagMailBoxData _Instance_0(xEnable := , bySlotNum := , xDone => , xError => , eErrorID => , wDataLen => , arrData =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Function block enable	BOOL	TRUE, FALSE	FALSE	Enable bit of the function block When the value of pin is TRUE, diagnostic information for the corresponding slot is read periodically.
	bySlotNum	Slot number	BYTE	[0, 31]	0	Set the slot number for which diagnostic information is to be read.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	xDone	Function block execution completion flag	BOOL	TRUE, FALSE	FALSE	Function block execution completion flag When the value of pin is TRUE, diagnostic information reading is completed.
	xError	Function block error flag	BOOL	TRUE, FALSE	FALSE	Function block fault flag.
	eErrorID	Fault code	LBUS_ERROR	-	NO_ERROR	Fault code of function block. For detail, see Fault Codes.
	wDataLen	Diagnostic data length	WORD	[0, 255]	0	Indicates the diagnostic data length of the module.
	arrData	Diagnostic mailbox data	ARRAY [0..255] OF BYTE	-	-	Indicates the diagnostic data of the module.



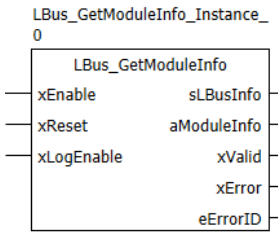
- **Function**
  This instruction reads the diagnostic mailbox data of the specified module on the local bus. After setting the slot number, enable the function block to read diagnostic data of the module.
- **Program example**

  ST:

Name	Type	Address	Value
LBus_GetDiagMailBoxData_I...	LBus_GetDiagMailBoxData		
xEnable	BOOL		TRUE
bySlotNum	BYTE		0
xDone	BOOL		TRUE
xError	BOOL		FALSE
eErrorID	LBUS_ERROR		NO_ERROR
wDataLen	WORD		32
arrData	ARRAY [0..255] OF BYTE		
arrData[0]	BYTE		0
arrData[1]	BYTE		1
arrData[2]	BYTE		0
arrData[3]	BYTE		0
arrData[4]	BYTE		2
arrData[5]	BYTE		0
arrData[6]	BYTE		12
arrData[7]	BYTE		0
arrData[8]	BYTE		0
arrData[9]	BYTE		0
arrData[10]	BYTE		0
arrData[11]	BYTE		0
arrData[12]	BYTE		0
arrData[13]	BYTE		0
arrData[14]	BYTE		0

```
LBus_GetDiagMailBoxData_Instance_0(xEnable := true,
                                   bySlotNum := 0,
                                   xDone => ,
                                   xError => ,
                                   eErrorID => ,
                                   wDataLen => ,
                                   arrData => );
```

LD:



- **Note**

  The input parameter bySlotNum is used to set the slot number for which information is to be read. If the slot number is out of the valid range, or if the slot number is within range but no module is actually mounted on the slot, the function block will report a slot number error.

18.4.4.4 LBus_GetModuleInfo

This instruction gets the status information of the PLC local bus and the modules mounted on the local bus.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
LBus_GetModuleInfo	Get all information about the local bus and local I/O	FB		LBus_GetModuleInfo_Instance_0(xEnable := , xReset := , xLogEnable := , sLBusInfo => , aModuleInfo => , xValid => , xError => , eErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Instruction enable	BOOL	TRUE, FALSE	FALSE	Enable bit of the function block. When the value of pin is TRUE, the local module information is read periodically.
	xReset	Reset output information	BOOL	TRUE, FALSE	FALSE	Pin to reset the module output information. When the value of pin is TRUE, the information in sLBusInfo and aModuleInfo is cleared, and the statistics of the local bus restart counting.
	xLogEnable	Enable debug log	BOOL	TRUE, FALSE	FALSE	Enable switch for the local bus debug log. When enabled, the low-level log information of the local modules is displayed.
Output	sLBusInfo	Bus status information	LBus_Stats	Follows data type	-	This data structure stores the operational status information of the local bus and the underlying thread.
	aModuleInfo	Module status information	ARRAY [0..31] OF LBus_ModuleStats	Follows data type	-	This data structure stores the status information of the local modules.
	xValid	Valid instruction	BOOL	TRUE, FALSE	FALSE	Data valid flag.
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Function block fault flag.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	eErrorID	Fault code	LBUS_ERROR	Follows data type	NO_ERROR	Fault code of function block. For details, see Fault Codes.

- **Function**
  - This function block obtains the status of the local bus and the status information of all modules mounted on the local bus.
  - The xReset signal only resets part of the statistics information in the protocol stack, not the protocol stack itself.
  - xReady can be used as a criterion to determine whether module data is valid. When its value is TRUE, the module I/O data is definitely valid.
  - The data type of sLBusInfo is the structure LBus_Stats, whose meaning is as follows.

Structure member	Name	Data Type	Description
xReady	Ready signal of all modules	BOOL	Status signal of all modules. When its value is TRUE, the input and output data of all modules are safe and available.
xLogStatus	Bus log status	BOOL	Status of the local bus debug log, determined by the input parameter xLogEnable.
eRunStatus	Bus running status	LBUS_RUN_STATUS	Running status of the local bus thread. 0: S_STOP (stopped). 1: S_RUN (running). 2: S_EXIT (exiting).
eBusStatus	Bus communication status	LBUS_COM_STATUS	Status of the local bus protocol stack. 0: RESET (reset state). 1: INIT (initialization state). 2: PREOP (pre-operational state). 4: SAFEOP (safe operational state). 8: OP (operational state). 128: ERROR (fault state).
bySlotNum	Number of the configured modules	BYTE	Number of modules configured on the local bus in the PLC programming software
byBusNum	Actual number of modules mounted on the bus	BYTE	Actual number of modules mounted on the local bus.

Structure member	Name	Data Type	Description
sTaskStats	Bus task information	LBus_TaskStats	Running status of the local bus thread.
sBusStats	Bus communication information	LBus_BusStats	Running status of the local bus protocol stack.

Table18-4-4-4-1 Description of the LBus_TaskStats struct type

Structure member	Name	Data Type	Description
dwInterval	Task interval	DWORD	Local bus task cycle configured in the PLC programming back end. Unit: μs.
dwCurCycleTime	Current task cycle	DWORD	Current actual running cycle in μs.
dwMinCycleTime	Minimum task cycle	DWORD	Minimum running cycle in μs.
dwMaxCycleTime	Maximum task cycle	DWORD	Maximum running cycle in μs.
dwCurRunTime	Current runtime	DWORD	Actual runtime of the local bus protocol stack in μs.
dwMinRunTime	Minimum runtime	DWORD	Minimum runtime of the local bus protocol stack in μs.
dwMaxRunTime	Maximum runtime	DWORD	Maximum runtime of the local bus protocol stack in μs.
dwLossCycleCount	Lost cycle count	DWORD	Statistical count of lost cycles for local bus tasks.

Table18-4-4-4-2 Description of the LBus_BusStats struct type

Structure member	Name	Data Type	Description
dwMailSendAddressLost	Addressed mail lost	DWORD	Count of addressed mail lost.
dwMailSendOpenDaisyChainLost	Daisy chain mail lost	DWORD	Count of lost daisy chain mail.
dwMailRecyModuleInfoLost	Mail for retrieving module information lost	DWORD	Count of lost mail for retrieving module information.
dwMailSendModuleConfigLost	Mail for setting module configuration data lost	DWORD	Count of lost mail for setting module configuration data.
dwMailRecvModuleConfigLost	Mail for retrieving module configuration data lost	DWORD	Count of lost mail for retrieving module configuration data.
dwMailRecvModuleStatusLost	Mail for retrieving module status lost	DWORD	Count of lost mail for retrieving module status.

Structure member	Name	Data Type	Description
dwMailSendModuleStatelost	Mail for setting module status lost	DWORD	Count of lost mail for setting module status.
dwMailRecvModuleDiagInfoLost	Mail for retrieving module diagnostic information lost	DWORD	Count of lost mail for retrieving module diagnostic information.
dwSyncSendFrameTotalCount	Total frames in module communication	DWORD	Count of total frames in module communication.
dwSyncFrameLostCount	Frame loss count per module	ARRAY[0..31] OF DWORD	Frame loss count per module.

◦ The data type of aModuleInfo is ARRAY [0..31] OF LBus_ModuleStats. The structure LBus_ModuleStats is defined as follows.

Structure member	Name	Data Type	Description
byIndex	Module position index	BYTE	Slot information of the module, which corresponds to the configured slot information.
xError	Module error status	BOOL	Fault flag of the module.
xDisable	Module disabled status	BOOL	Disable flag of the module.
dwConfigModule	Configuring module type	DWORD	Module type configured for the corresponding slot on the local bus in the PLC programming software.
dwMountedModule	Mounted module type	DWORD	Actual module type mounted on the corresponding slot on the local bus.
dwLogicVersion	Module logic version	DWORD	The logic software version of the module.
dwSoftwareVersion	Module software version	DWORD	The MCU software version of the module.
wModuleErrorID	Module fault code	WORD	Module fault code.
aChannelErrorID	Fault code of module channel	ARRAY [0..31] OF WORD	Fault code of channel error.

- **Note:**
  xLogEnable is used to control debug log printing on the local bus. Disable it during normal operation.

18.4.4.5 SysHC_GetAllGL20ModuleInfo

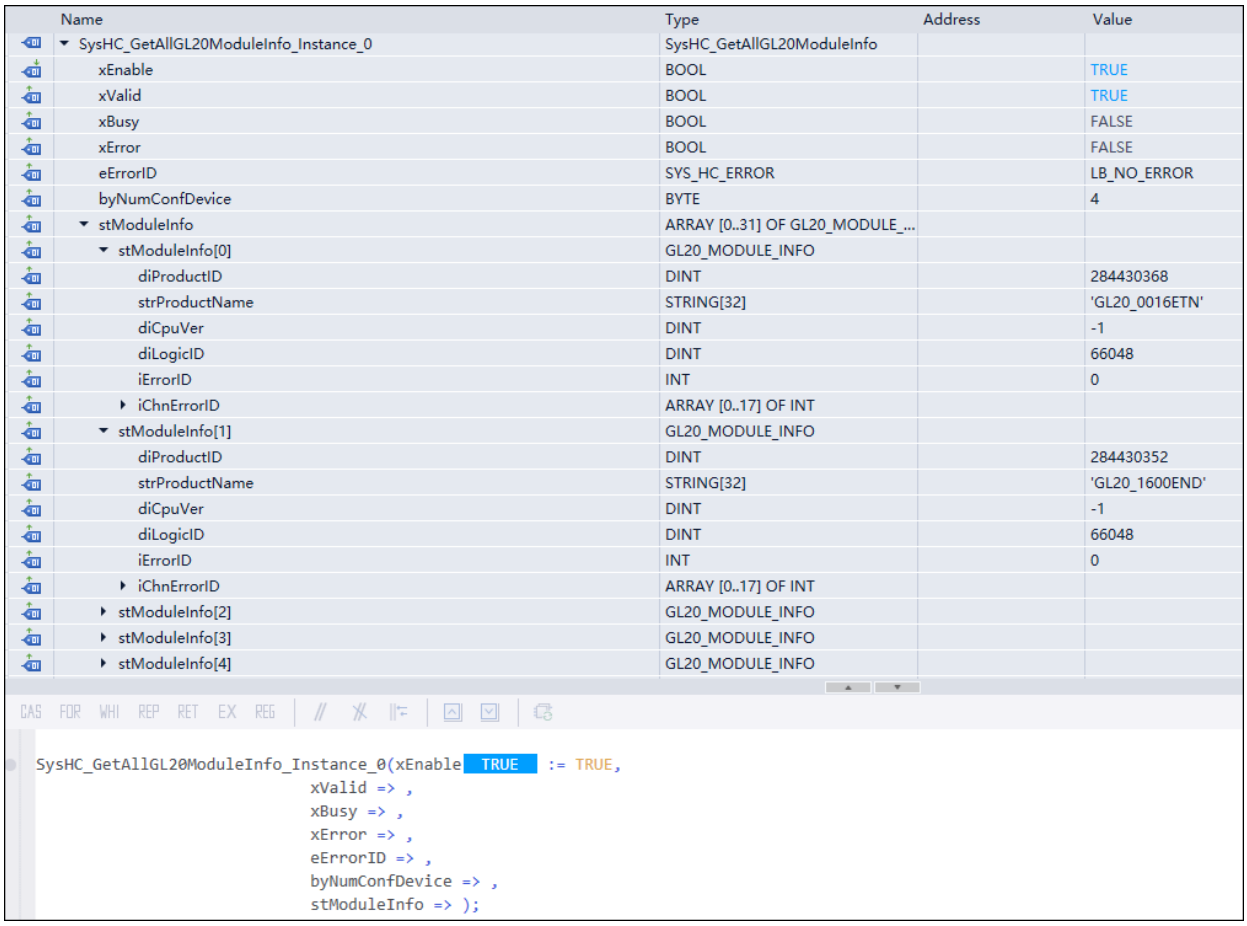
This instruction gets the status information of all modules on the local bus of the PLC.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_GetAllGL20ModuleInfo	This instruction gets basic information about all modules on the local bus.	FB		SysHC_GetAllGL20ModuleInfo_Instance_0(xEnable := , xValid => , xBusy => , xError => , eErrorID => , byNumConfDevice => , stModuleInfo =>);

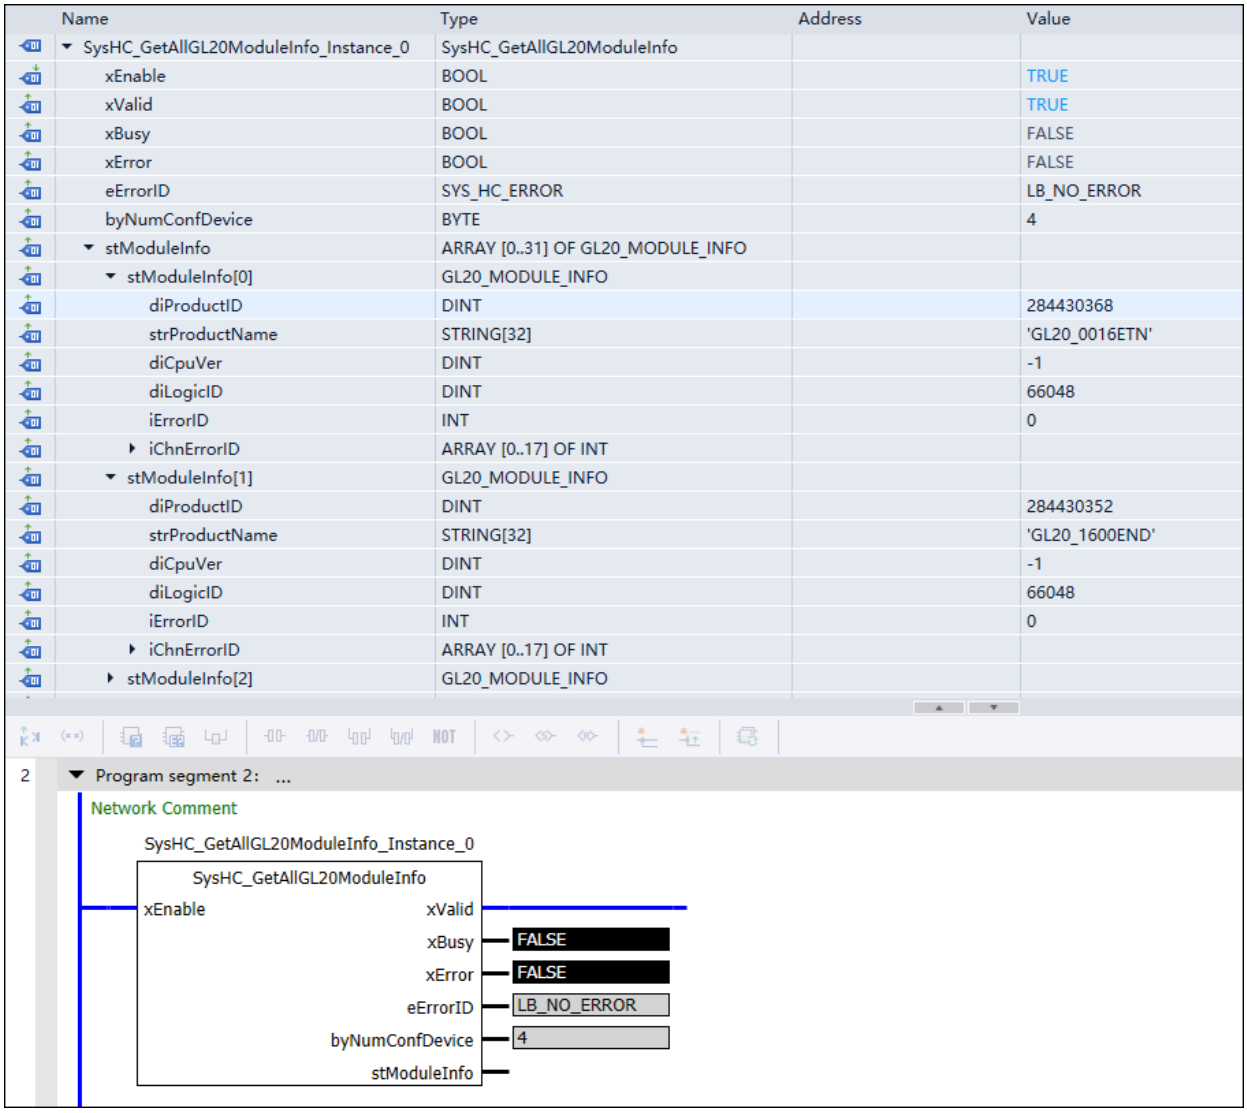
- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Function block enable	BOOL	TRUE, FALSE	FALSE	Enable bit of the function block When the value of pin is TRUE, the local module information is read periodically.
Output	xValid	Valid function block output	BOOL	TRUE, FALSE	FALSE	Function block data valid flag. When the value of pin is TRUE, the read information is valid.
	xBusy	Function block executing	BOOL	TRUE, FALSE	FALSE	Function block execution flag. When the value of pin is TRUE, the function block is reading information.
	xError	Function block execution error	BOOL	TRUE, FALSE	FALSE	Function block fault flag.
	eErrorID	Fault code of function block	SYS_HC_ERROR	Follows data type	LB_NO_ERROR	Fault code of function block. For details, see Fault Codes.
	byNumConfDevice	Number of Modules	BYTE	[0, 31]	0	Actual number of modules configured in the project.
	stModuleInfo	Module status information	ARRAY [0..31] OF GL20_MODULE_INFO	Follows data type	-	This data structure stores the status information of the local modules.



- **Function**
  - This function block is used to periodically read the status of all local modules.
  - In the output parameters, module status information is provided as a structure array, where the array index corresponds to the module slot number.
  - The data type of stModuleInfo is ARRAY [0..31] OF GL20_MODULE_INFO. The meaning of the structure GL20_MODULE_INFO is as follows.

Structure member	Name	Data Type	Description
diProductID	Module type ID	DINT	The module type on the local bus slot.
strProductName	Module name	STRING[32]	The module name on the local bus slot.
diCpuVer	CPU firmware version	DINT	The MCU software version of the module.



Structure member	Name	Data Type	Description
diLogicID	FPGA firmware version	DINT	The logic software version of the module.
iErrorID	Module fault code	INT	Module fault code. For details, see the corresponding module guide.
iChnErrorID	Channel fault code	ARRAY [0..17] OF INT	Fault code of module channel. For details, see the corresponding module guide.

- **Program example**

18.4.4.6 SysHC_GetGL20ModuleInfo

This instruction reads module information from a specified slot on the local bus.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_GetGL20ModuleInfo	Get basic information about a specified module on the local bus	FB		SysHC_GetGL20ModuleInfo_Instance_0(xEnable := , bySlotNum := , xValid => , xBusy => , xError => , eErrorID => , diProductID => , strProductName => , diCpuVer => , diLogicID => , iErrorID => , iChnErrorID =>);

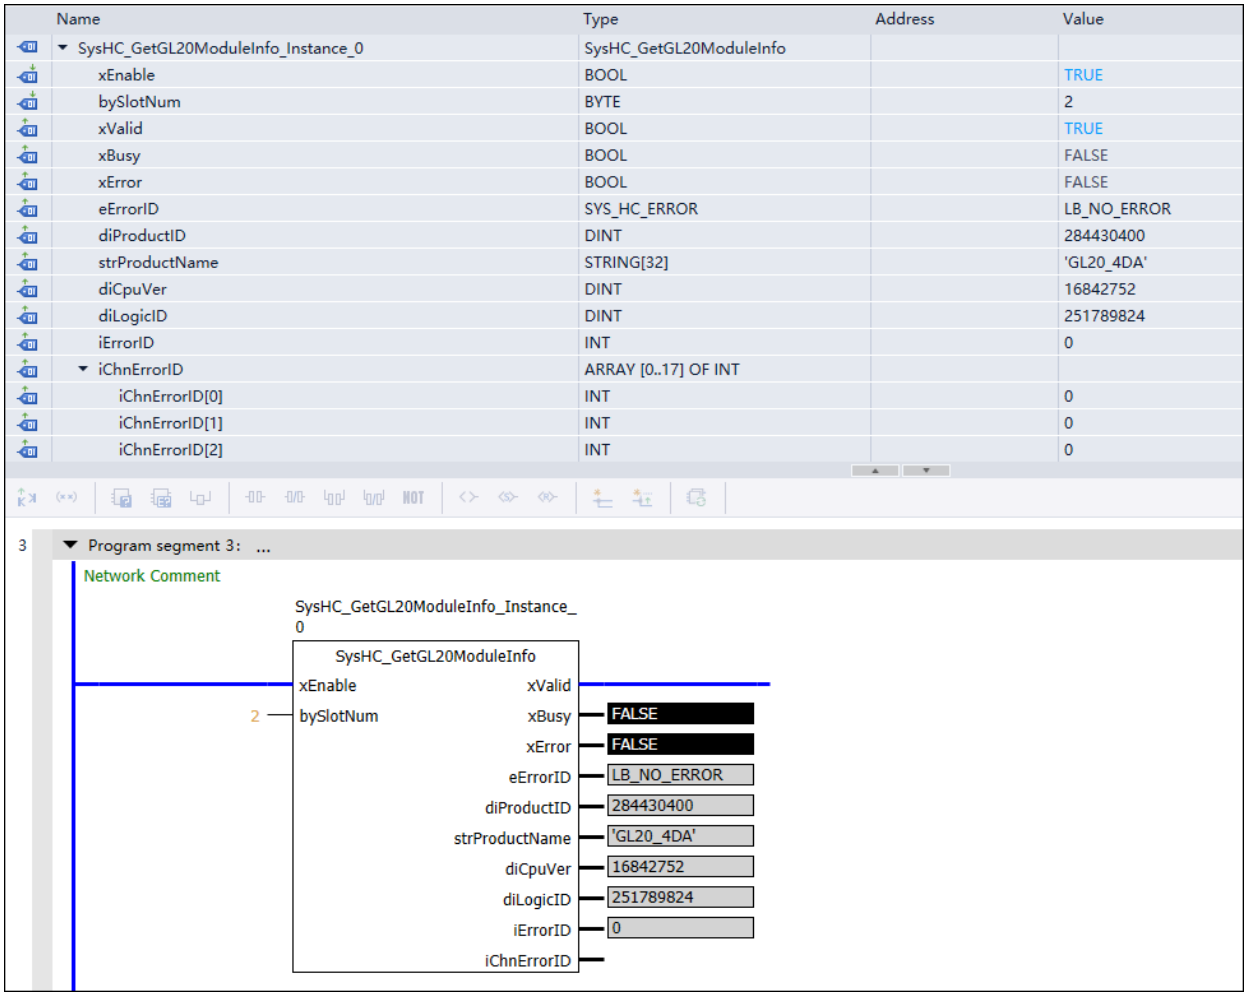
- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Function block enable	BOOL	TRUE, FALSE	FALSE	Enable bit of the function block When the value of pin is TRUE, module information for the corresponding slot is read periodically.
	bySlotNum	Slot number	BYTE	[0, 31]	0	Set the slot number for which information is to be read.
Output	xValid	Valid output	BOOL	TRUE, FALSE	FALSE	Function block data valid flag. When the value of pin is TRUE, the read information is valid.
	xBusy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Function block execution flag. When the value of pin is TRUE, the function block is reading information.
	xError	Instruction execution error	BOOL	TRUE, FALSE	FALSE	Function block fault flag.
	eErrorID	Instruction fault code	SYS_HC_ERROR	Follows data type	LB_NO_ERROR	Fault code of function block. For details, see Fault Codes.
	diProductID	Module type ID	DINT	Follows data type	-	The module type on the local bus slot.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	strProduct Name	Module name	STRING[32]	Follows data type	-	The module name on the local bus slot.
	diCpuVer	Module CPU firmware version	DINT	Follows data type	-	The MCU software version of the module.
	diLogicID	Module FPGA firmware version	DINT	Follows data type	-	The logic software version of the module.
	iErrorID	Module fault code	INT	Follows data type	-	Module fault code. For details, see the corresponding module guide.
	iChnErrorID	Channel fault code	ARRAY [0..17] OF INT	Follows data type	-	Fault code of module channel. For details, see the corresponding module guide.

- **Function description**

  This instruction reads the basic information of a specified module on the local bus. After setting the slot number, enable the function block to read module information.



- **Program example**

  ST:

Name	Type	Address	Value
SysHC_GetGL20ModuleInfo_Instance_0	SysHC_GetGL20ModuleInfo

                                   diProductID => ,
                                   strProductName => ,
                                   diCpuVer => ,
                                   diLogicID => ,
                                   iErrorID => ,
                                   iChnErrorID => );
```

LD:

- **Note**

  The input parameter bySlotNum is used to set the slot number for which information is to be read. If the slot number is out of the valid range, or if the slot number is within range but no module is actually mounted on the slot, a slot number error will be reported.

18.4.4.7 Fault Codes

- SYS_HC_ERROR

Fault code	Value	Description
LB_NO_ERROR	0	No fault
LB_NOT_SUPPORTED	1	The bus encoder axis does not support this instruction.
LB_MODULE_DISABLE	2	Module is not enabled.
LB_PARAMETER_ERROR	3	Parameter fault.
LB_SLOT_NUM_ERROR	4	Slot number error.
LB_READ_TIME_OUT	5	Read operation timeout.
LB_WRITE_TIME_OUT	6	Write operation timeout.
LB_OBTAIN_FAILURE	7	Obtainment failed.

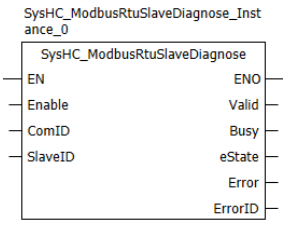
Fault code	Value	Description
LB_UNKNOWN_ERROR	255	Unknown error

- LBUS_ERROR

Fault code	Value	Description
NO_ERROR	0	No fault
NOT_READY	1	Not ready.
NOT_SUPPORTED	2	The instruction is not supported.
NOT_SUPPORTED_CURRENT_TASK	3	The current task is not supported.
INPUT_PARAMETER_INVALID	4	Invalid input parameter. The parameter must specify the corresponding slot.
MOD_TYPE_NOT_SUPPORTED	5	Module type not supported. Only array input and output are supported.
MOD_IO_TYPE_MISMATCH	6	Module input or output type does not match the instruction.
LB_STATE_MACHINE_NOT_SUPPORTED	7	The protocol state machine is not in the OP state and does not support this operation.
SLOT_NOT_EXIST	8	The module slot does not exist.
SLOT_DISABLE	9	The module slot is disabled.
SLOT_STATE_ERROR	10	Module fault state.
SLOT_DATA_READ_FAILURE	11	Module data read failed.
SLOT_DATA_WRITE_FAILURE	12	Module data write failed.
MOD_CONFIG_MORE	4097	The number of configured I/O modules is greater than the number of actual scanned I/O modules.
MOD_CONFIG_LESS	4098	The number of configured I/O modules is less than the number of actual scanned I/O modules.
MOD_CONFIG_MISMATCH	4099	The configured module type does not match the scanned module type.
MOD_CONFIG_FAILURE	4100	Failed to configure the I/O module on the protocol stack.
MOD_SET_STATE_FAILURE	4101	Failed to set the I/O module status on the protocol stack.
IOMODULE_LOSTLINK	4102	IO module is offline.
LBUS_ERR_SCAN_NO_SLOT	4103	The protocol stack failed to scan for modules.
MOD_CURRENT_OVER_LIMIT	4104	The power is overloaded because current exceeds the rated 2A of the bus.
STAT_TO_OP_TIMEOUT	4105	Timeout switching to OP state

Fault code	Value	Description
UNKNOWN	65535	Unknown error

18.4.5 ModbusRTU



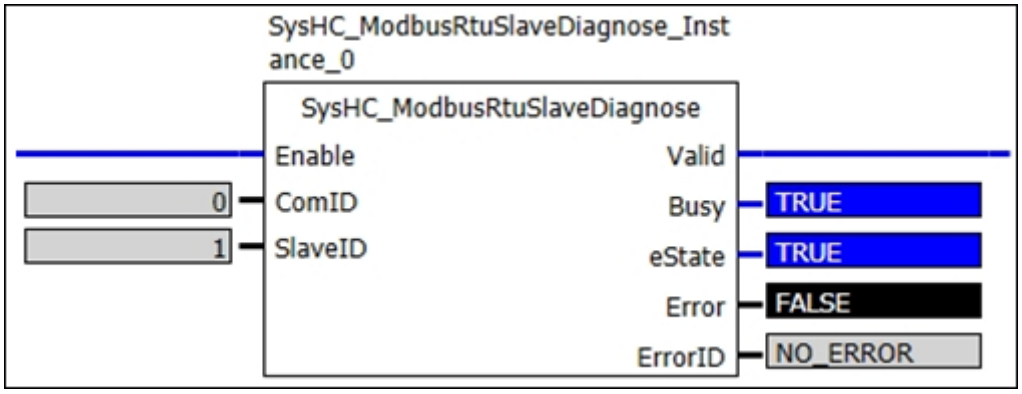
18.4.5.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.5.2 SysHC_ModbusRtuSlaveDiagnose	FB	Get the diagnostic status from the Modbus-RTU master	SysHCPlcInfo	Library version 1.0.0.0 and later
18.4.5.3 MB_Connect	FB	Establish a Modbus RTU connection	Modbus	Library version 1.0.0.0 and later
18.4.5.4 MB_Master	FB	Create Modbus RTU master communication		Library version 1.0.0.0 and later
18.4.5.5 MB_Slave	FB	Create Modbus RTU slave communication		Library version 1.0.0.0 and later

18.4.5.2 SysHC_ModbusRtuSlaveDiagnose

This instruction gets the diagnostic status information from the Modbus-RTU master.

- **Instruction format**



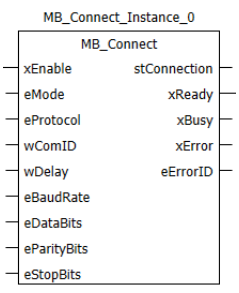
Instruction	Name	FB/FC	LD Representation	ST Representation
SysHC_ModbusRtuSlaveDiagnose	Get the diagnostic status from the Modbus-RTU master	FB		SysHC_ModbusRtuSlaveDiagnose_Instance_0(Enable :=, ComID :=, SlaveID :=, Valid =>, Busy =>, eState =>, Error =>, ErrorID =>);

- **Related variables**

Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Enable	Rising edge-triggered	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered
	ComID	Serial port number	BYTE	Follows data type	0	Serial port number. The value of ComID identifies serial ports, whose available number varies by product. For details, see relevant product guides. Take the EVO500 series as example: 0: Onboard serial port of the PLC 1: Expansion card A on the PLC 2: Expansion card B on the PLC
	SlaveID	Slave Address	BYTE	-	0	Slave address.
Output	Valid	Output active	BOOL	TRUE, FALSE	FALSE	Instruction is actively executing.
	Busy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.
	eState	Diagnostic status bit	BOOL	TRUE, FALSE	FALSE	Diagnostic status bit.
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	Set to TRUE when an error occurs.
	ErrorID	Fault code	SYS_HC_ERROR	-	NO_ERROR	See 18.4.1.37 Fault Codes.

- **Function**
  - When Enable is TRUE, the function block is activated; otherwise, all outputs are invalid.
  - Check if the input ComID is within the valid range. If out of range, ErrorID outputs COM_ID_ERROR.
  - Check if the input SlaveID matches the configured slave ID in the project. If not matched, ErrorID outputs SLAVE_ID_ERROR.
  - If both ComID and SlaveID are successfully matched, verify whether the slave node is disabled. If disabled, ErrorID outputs FAILURE_OBATION.
  - After all parameters are matched, retrieve the communication diagnostic state for the specified RTU Slave and update eState in real time.
- **Program example**



- **Precautions**
  - The value of ComID identifies serial ports, whose available number varies by product. For details, see relevant product guides. For example, on the EVO500 series, 0 represents the PLC onboard serial port, while 1 and 2 represent expansion cards A and B respectively.
  - Check the COM ports for locally or remotely mounted GL20_2S485/GL20_2SCOM modules as follows: In the project tree, double-click GL20_2S485 or GL20_2SCOM to open the configuration interface, and then check the COM number in the "General configuration" tab.

18.4.5.3 MB_Connect

This is the instruction for the configuration of Modbus protocol, which establishes a Modbus RTU connection.

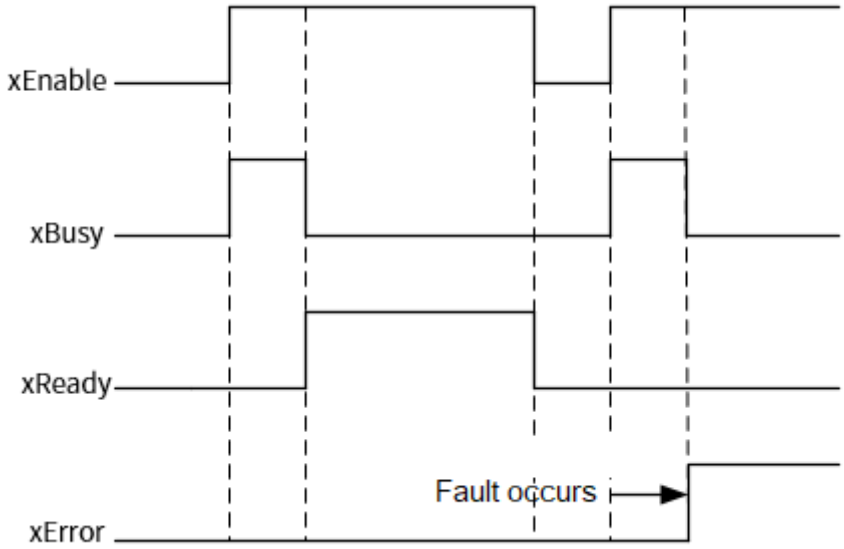
- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
MB_Connect	Establish a Modbus RTU connection	FB		MB_Connect_Instance_0(xEnable := , eMode := , eProtocol := , wComID := , wDelay := , eBaudRate := , eDataBits := , eParityBits := , eStopBits := , stConnection => , xReady => , xBusy => , xError => , eErrorID =>);

- **Related variables**

  Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Function block enable	BOOL	Follows data type	FALSE	Level triggered.
	eMode	Modbus mode	MB_MODE	Follows data type	MB_MODE.SLAVE	Modbus mode: Slave (default). MB_MODE.SLAVE: Modbus slave. MB_MODE.MASTER: Modbus master.
	eProtocol	Modbus protocol	MB_PROTOCOL	Follows data type	MB_PROTOCOL.RTU	Modbus protocol: RTU protocol (default). MB_PROTOCOL.RTU: ModbusRTU protocol. MB_PROTOCOL.ASCII: ModbusASCII protocol.
	wComID	Serial port number	WORD	Follow data type	0	COM port number. The value of wComID identifies serial ports, whose available number varies by product. For details, see relevant product guides. Take the EVO500 series as example: 0: Onboard serial port of the PLC 1: Expansion card A on the PLC 2: Expansion card B on the PLC
	wDelay	Frame interval	WORD	Follow data type	5	Modbus frame interval in ms.



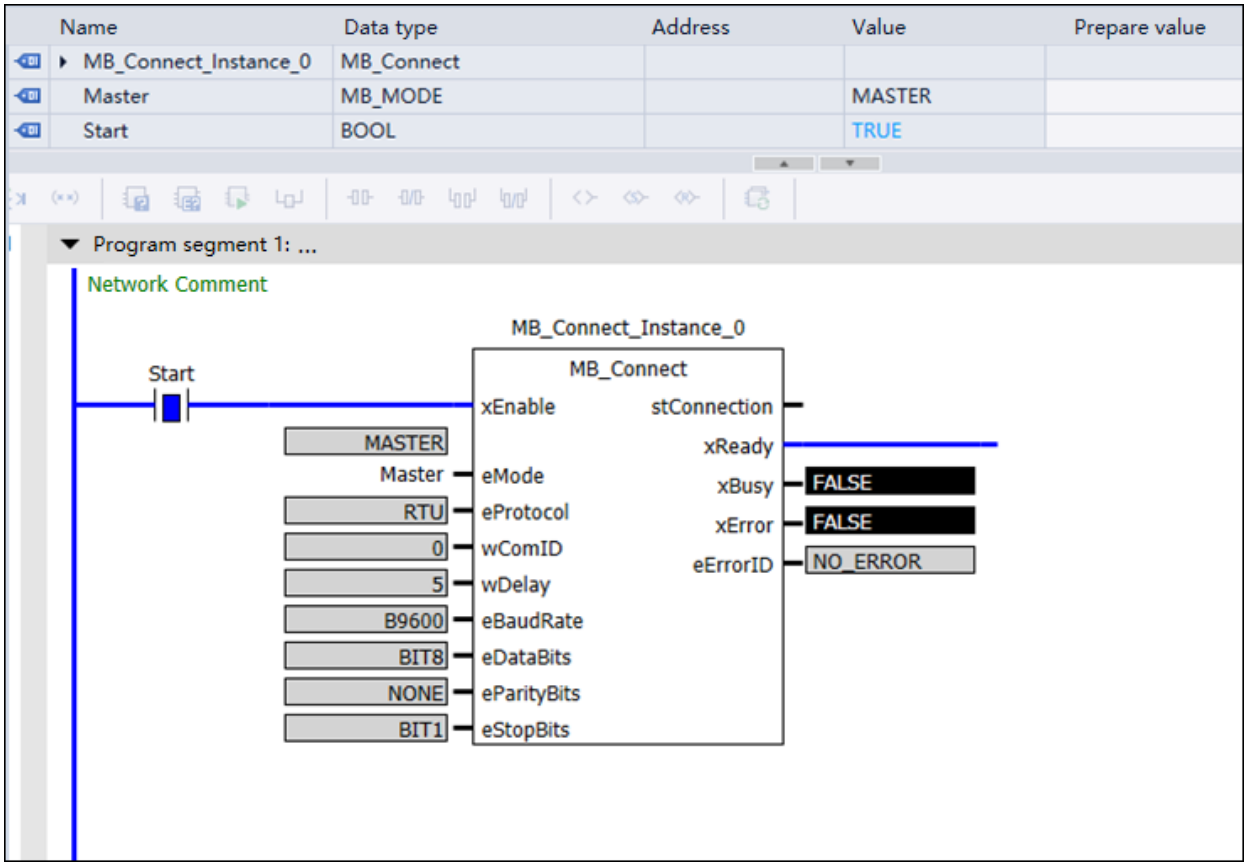
Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	eBaudRate	Baud rate	SERIAL_BAUD	Follows data type	SERIAL_BAUD. B9600	Baud rate: 9600bps (default). SERIAL_BAUD.B4800: 4800bps. SERIAL_BAUD.B9600: 9600bps. SERIAL_BAUD.B19200: 19200bps. SERIAL_BAUD.B38400: 38400bps. SERIAL_BAUD.B57600: 57600bps. SERIAL_BAUD.B115200: 115200bps.
	eDataBits	Data bit	SERIAL_DATAB ITS	Follows data type	SERIAL_DATAB ITS.BIT8	Data bits: 8 bits (default). SERIAL_DATABITS.BIT7: 7 data bits SERIAL_DATABITS.BIT8: 8 data bits
	eParityBits	Parity bit	SERIAL_PARITY BITS	Follows data type	SERIAL_PARITY BITS.NONE	Parity Nno parity (default). SERIAL_PARITYBITS.NONE: No parity SERIAL_PARITYBITS.ODD: Odd parity SERIAL_PARITYBITS.EVEN: Even parity
	eStopBits	Stop bit	SERIAL_STOPB ITS	Follows data type	SERIAL_STOPB ITS.BIT1	Stop bit:1 (default). SERIAL_STOPBITS.BIT1: 1 data bit SERIAL_STOPBITS.BIT2: 2 data bits
Output	stConnection	Connection handle	CBus_Connect ion	Follows data type	-	Connection handle.
	xReady	Instruction status	BOOL	Follows data type	FALSE	Indicates the function block is active
	xBusy	Instruction execution flag	BOOL	Follows data type	FALSE	Function block execution flag

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	xError	Error flag	BOOL	Follows data type	FALSE	Indicates the function block is faulty
	eErrorID	Fault code	CBUS_ERROR	Follows data type	NO_ERROR	Fault code of function block. For details, see 18.4.5.6 Fault Codes.

- **Function**

  This instruction is used to configure serial port and master station parameters, such as the data transmission rate.

- **Sequence diagram**



- **Program example**

  ST:

Name	Data type	Address	Value	Prepare value
MB_Connect_Instance_0	MB_Connect			
start	BOOL		TRUE	
mode	MB_MODE		SLAVE	
protocol	MB_PROTOCOL		RTU	
comid	WORD		0	
delay	WORD		0	
baudrate	SERIAL_BAUD		B4800

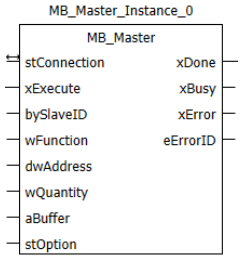
connection	CBus_Connection			

```
CAS FOR WHI REP RET EX REG
MB_Connect_Instance_0(
xEnable TRUE :=start TRUE,
eMode SLAVE :=mode SLAVE ,
eProtocol RTU := protocol RTU ,
wComID 0 := comid 0 ,
wDelay 0 := delay 0 ,
eBaudRate B4800 := baudrate B4800 ,
eDataBits BIT7 := databits BIT7 ,
eParityBits NONE := partitybits NONE ,
eStopBits BIT1 := stopbits BIT1 ,
stConnection => connection,
xReady TRUE => ready TRUE,
xBusy FALSE => busy FALSE ,
xError FALSE =>error FALSE ,
eErrorID NO_ERROR =>errorid NO_ERROR );RETURN
```

LD:



- **Precautions**
  - The connection handle of MB_Connect can only be used by either the MB_Master or MB_Slave instruction, not both.
  - Ensure that multiple instructions with the same connection handle are used in the same user task.
  - Online parameter modifications will not take effect immediately, requiring the instruction to be re-enabled.
  - The project tree and instruction configuration are mutually exclusive:
    - If a Modbus master, slave, or free serial port is configured for any serial port in the project tree, no instruction can establish a connection on the same port.
    - If a slave is configured for any serial port in the project tree, instructions cannot create a slave on any port, and only one slave is allowed to be configured via instructions.
  - The value of wComID identifies serial ports, whose available number varies by product. For details, see relevant product guides. For example, on the EVO500 series, 0 represents the PLC onboard serial port, while 1 and 2 represent expansion cards A and B respectively.
  - Check the COM ports for locally or remotely mounted GL20_2S485/GL20_2SCOM modules as follows: In the project tree, double-click GL20_2S485 or GL20_2SCOM to open the configuration interface, and then check the COM number in the "General configuration" tab.

18.4.5.4 MB_Master

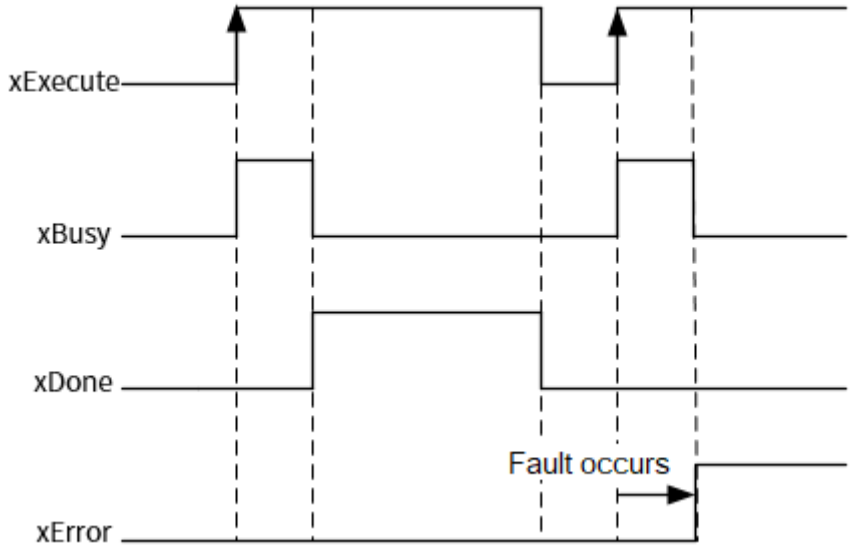
This is the Modbus master communication instruction, which creates Modbus RTU master communication.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
MB_Master	Create Modbus RTU master communication	FB		MB_Master_Instance_0(stConnection := , xExecute := , bySlaveID := , wFunction := , dwAddress := , wQuantity := , aBuffer := , stOption := , xDone => , xBusy => , xError => , eErrorID =>);

- **Related variables**

  Variable



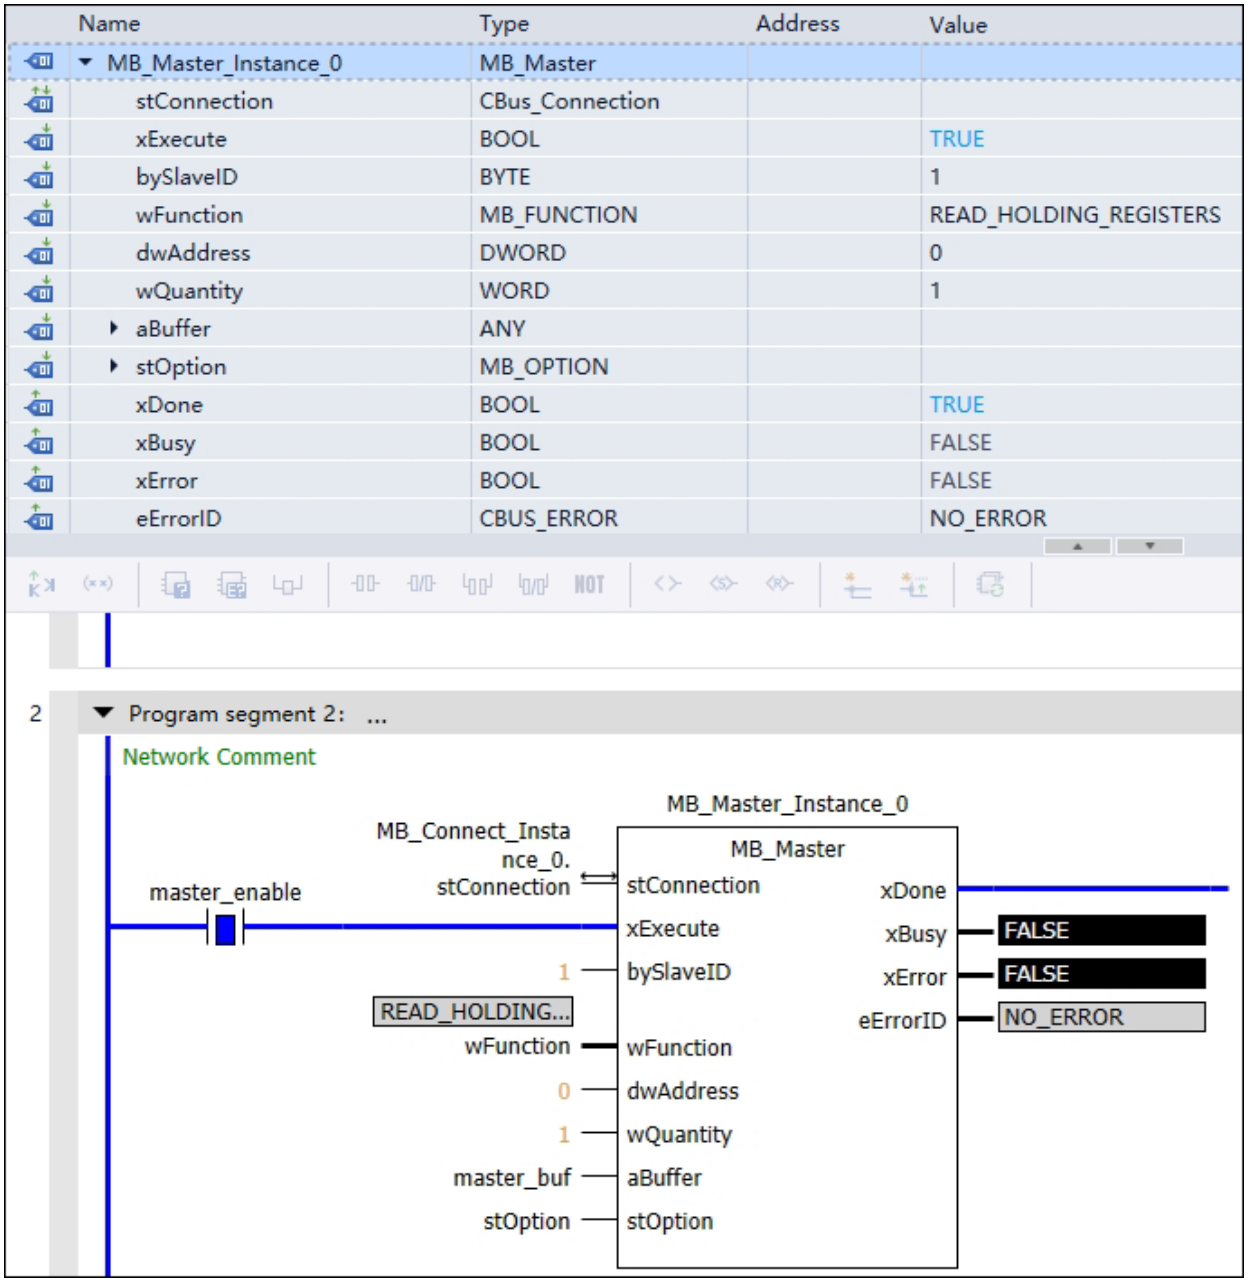
Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input/Output	stConnection	Connection handle	CBus_Connection	Follows data type	-	Connection handle.
Input	xExecute	Function block enable	BOOL	Follows data type	FALSE	Edge triggered.
	bySlaveID	Slave number	BYTE	Follows data type	1	Request access to the slave number.
	wFunction	Function code	MB_FUNCTION	Follows data type	0	Modbus function code.
	dwAddress	Slave data address	DWORD	Depends on data type	0	Starting address for access to slave data.
	wQuantity	Number of accessible address	WORD	Follow data type	0	Maximum number of function codes: - 01/02: 2000. - 03/04: 125. - 15: 1968. - 16: 123.

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	aBuffer	Read/write buffer	ANY	Follows data type	-	Modbus data buffer.
	stOption	Configuration options	MB_OPTION	Follows data type	-	Optional configuration parameters for Modbus protocol.
Output	xDone	Instruction completion flag	BOOL	Follows data type	FALSE	Function block execution completion flag
	xBusy	Instruction execution flag	BOOL	Follows data type	FALSE	Function block execution flag.
	xError	Error flag	BOOL	Follows data type	FALSE	Indicates the function block is faulty
	eErrorID	Fault code	CBUS_ERROR	Follows data type	NO_ERROR	Fault code of function block. For details, see 1 8.4.5.6 Fault Codes.

- **Function**

  This instruction initiates data transmission, sending the user-configured Modbus data frame over the serial bus.

- **Sequence diagram**



- **Program example**

                     wFunctionREAD_HOLDING_REGIST... := wFunctionREAD_HOLDING_REGIST...,
                     dwAddress 0 := dwAddress 0,
                     wQuantity 1 := wQuantity 1,
                     aBuffer := master_buf,
                     stOption := stOption,
                     xDone TRUE => m_done TRUE,
                     xBusy FALSE => m_busy FALSE,
                     xError FALSE => m_error FALSE,
                     eErrorID NO_ERROR => m_errorid NO_ERROR );
```

  LD:

- **Precautions**
  - It must be used in conjunction with the MB_Connect instruction, and the eMode must be set to MASTER.
  - The connection handle configured by the MB_Connect instruction supports use by one or multiple MB_Master instances.
  - It is recommended to process the MB_Connect and MB_Master instructions within the same user task and program cycle. If processed in different priority tasks, operational errors may occur due to priority interruptions.
  - When the MB_Master instruction is in the xBusy set state, repeated instructions will be ignored until xDone or xError is set.
  - The MB_Master instruction cannot be executed during startup, diagnostic, safe mode, or in the event of a time error.
  - The bySlaveID slave address only supports standard station addresses: 1 to 247, with 0 reserved for broadcast.
  - Function code and number of accessible addresses
    - Function code: READ_COILS/ READ_DISCRETE_INPUTS, the maximum number of accessible addresses supported is 2000.

- Function code: WRITE_MULTIPLE_COILS, the maximum number of accessible addresses supported is 1968.
- Function code: READ_HOLDING_REGISTERS/ READ_INPUT_REGISTERS, the maximum number of accessible addresses supported is 125.
- Function code: WRITE_MULTIPLE_REGISTERS, the maximum number of accessible addresses supported is 123.

◦ Data types loaded by aBuffer:

- Supported types:

  One-dimensional array.

  Data types of the arrays/variables:

  Access coil data: BYTE.

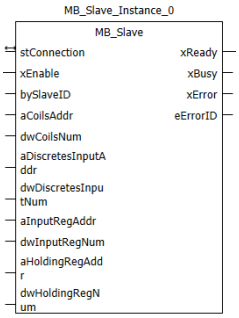
  Access register data: WORD, DWORD, INT, UINT, DINT, UDINT, REAL.

- Unsupported types

  Multidimensional arrays.

  64-bit data types: LWORD, LINT, ULINT, and LREAL.

  Special types: STRING, WSTRING, TIME, TIME_OF_DAY(TOD), DATE, DATE_AND_TIME(DT), POINTER, and STRUCT.



◦ aBuffer cannot be directly set to I/Q/M direct variables. It must be mapped to the above supported variables or array data via AT mapping.

◦ Online parameter modifications will not take effect immediately, requiring the instruction to be re-enabled.

18.4.5.5 MB_Slave

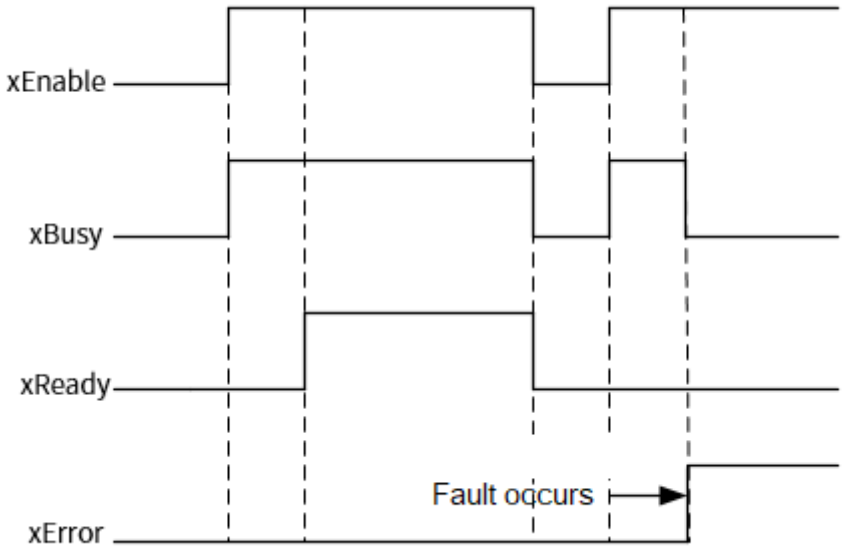
This is the Modbus slave communication instruction, which creates Modbus RTU slave communication.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
MB_Slave	Create Modbus RTU slave communication	FB		MB_Slave_Instance_0(stConnection := , xEnable := , bySlaveID := , aCoilsAddr := , dwCoilsNum := , aDiscretesInputAddr := , dwDiscretesInputNum := , aInputRegAddr := , dwInputRegNum := , aHoldingRegAddr := , dwHoldingRegNum := , xReady => , xBusy => , xError => , eErrorID =>);

- **Related variables**

Variable



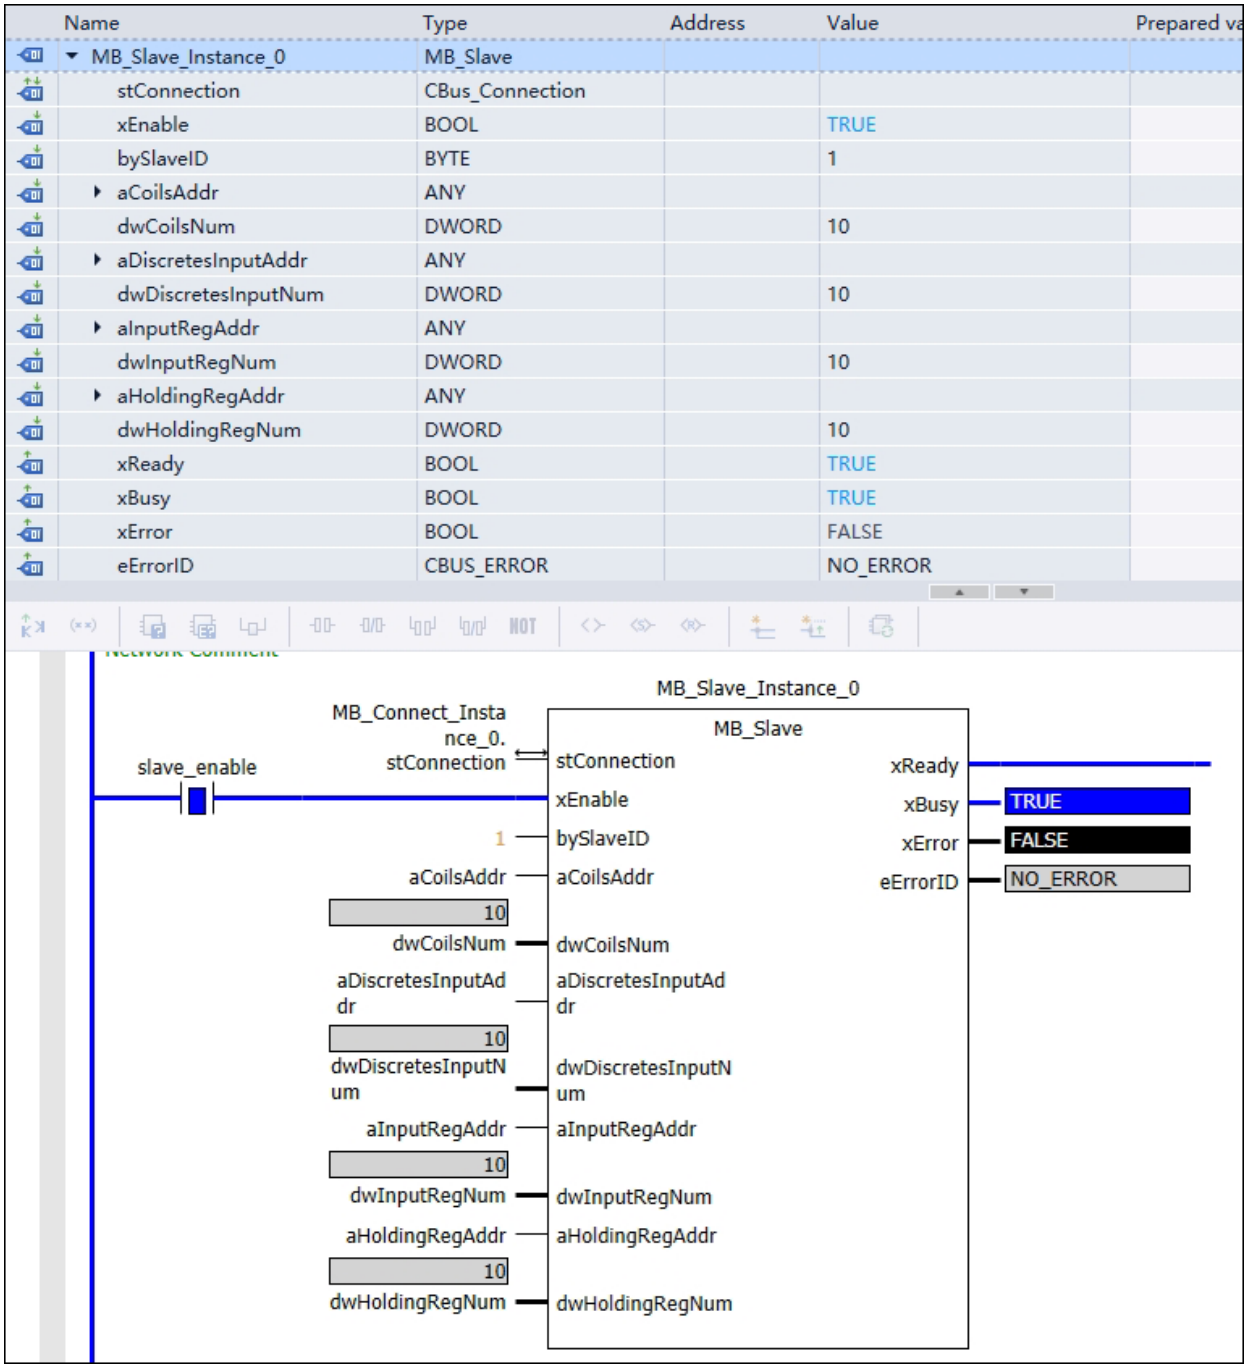
Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input/Output	stConnection	Connection handle	CBus_Connection	Follows data type	-	Connection handle.
Input	xEnable	Function block enable	BOOL	Follows data type	FALSE	Level triggered
	bySlaveID	Slave number	BYTE	Follows data type	1	Modbus slave number.
	aCoilsAddr	Coil data area	ANY	Follows data type	-	Supported function codes: 0x01/0x05/0x0F.
	dwCoilsNum	Number of coils	DWORD	Depends on data type	0	Number of accessible coils.

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	aDiscretesInputAddr	Discrete input data area	ANY	Follows data type	-	Supported function code: 0x02.
	dwDiscretesInputNum	Number of discrete inputs	DWORD	Depends on data type	0	Number of accessible discrete inputs.
	aInputRegAddr	Input register data area	ANY	Follows data type	-	Supported function code: 0x04.
	dwInputRegNum	Number of input registers	DWORD	Depends on data type	0	Number of accessible input registers.
	aHoldingRegAddr	Holding register data area	ANY	Follows data type	-	Supported function codes: 0x03/0x06/0x10.
	dwHoldingRegNum	Number of holding registers	DWORD	Depends on data type	0	Number of accessible holding registers.
Output	xReady	Instruction status	BOOL	Follows data type	FALSE	Indicates the function block is active
	xBusy	Instruction execution flag	BOOL	Follows data type	FALSE	Function block execution flag
	xError	Error flag	BOOL	Follows data type	FALSE	Indicates the function block is faulty
	eErrorID	Fault code	CBUS_ERROR	Follows data type	NO_ERROR	Fault code of function block. For details, see 18.4.5.6 Fault Codes.

- **Function**

This instruction allows any master to perform Modbus requests and return response frames.

- **Sequence diagram**



- **Program example**

ST:

Name	Type	Address	Value
MB_Slave_Instance_0	MB_Slave		
stConnection	CBus_Connection		
xEnable	BOOL		TRUE
bySlaveID	BYTE		1
aCoilsAddr	ANY		
dwCoilsNum	DWORD		10
aDiscretesInputAddr	ANY		
dwDiscretesInputNum	DWORD		10
aInputRegAddr	ANY		
dwInputRegNum	DWORD		10
aHoldingRegAddr	ANY		
dwHoldingRegNum	DWORD		10
xReady	BOOL		TRUE
xBusy	BOOL		TRUE
xError	BOOL		FALSE
eErrorID	CBUS_ERROR		NO_ERROR

```
MB_Slave_Instance_0(stConnection := MB_Connect_Instance_0.stConnection,
                    xEnable TRUE  := xEnable TRUE ,
                    bySlaveID  1  := bySlaveID  1 ,
                    aCoilsAddr := aCoilsAddr,
                    dwCoilsNum  10  := dwCoilsNum  10 ,
                    aDiscretesInputAddr := aDiscretesInputAddr,
                    dwDiscretesInputNum  10  := dwDiscretesInputNum  10 ,
                    aInputRegAddr := aInputRegAddr,
                    dwInputRegNum  10  := dwInputRegNum  10 ,
                    aHoldingRegAddr := aHoldingRegAddr,
                    dwHoldingRegNum  10  := dwHoldingRegNum  10 ,
                    xReady TRUE  => s_ready TRUE ,
                    xBusy TRUE  => s_busy TRUE ,
                    xError FALSE  => s_error FALSE ,
                    eErrorID NO_ERROR  => s_errorid NO_ERROR );
```

LD:

- **Precautions**
  - It must be used in conjunction with the MB_Connect instruction, and the eMode must be set to SLAVE.
  - The connection handle of the MB_Connect instruction can be used by only one instance of MB_Slave.
  - It is recommended that MB_Connect and MB_Slave instructions be processed within the same user task and the same program cycle. If they are executed in tasks with different priorities, operational errors may occur due to priority interrupts.
  - When the MB_Slave instruction is active and accessible, xReady/xBusy will be set. If an error occurs, xError is set and eErrorID displays the corresponding error code.
  - The MB_Slave can still be accessed even when the PLC mode switch is set to STOP.
  - Access area description:

Data Area Variable	Area Name	Supported Function Code	Accessible Area Size	Supported Data Type
aCoilsAddr	Coil data area	READ_COILS(01) WRITE_SINGLE_COIL(05) WRITE_MULTIPLE_COILS(15)	1 to 65536	BYTE, ARRAY
aDiscretesInputAddr	Discrete input data area	READ_DISCRETE_INPUTS(02)	1 to 65536	
aInputRegAddr	Input register data area	READ_INPUT_REGISTERS(04)	1 to 65536	WORD, DWORD, INT, UINT, DINT, UDINT, REAL, ARRAY
aHoldingRegAddr	Holding register data area	READ_HOLDING_REGISTERS(03) WRITE_SINGLE_REGISTER(06) WRITE_MULTIPLE_REGISTERS(16)	1 to 65536	

- Unsupported types for access area:

  Multidimensional arrays.
  64-bit data types: LWORD, LINT, ULINT, and LREAL.
  Special types: STRING, WSTRING, TIME, TIME_OF_DAY(TOD), DATE, DATE_AND_TIME(DT), POINTER, and STRUCT.

- Access areas cannot be directly set to I/Q/M direct variables. They must be mapped to the above supported variables or array data via AT mapping.
- Access areas can be freely combined. Unused access areas can be left empty, but all four access areas cannot be empty at the same time.
- Online parameter modifications will not take effect immediately, requiring the instruction to be re-enabled.

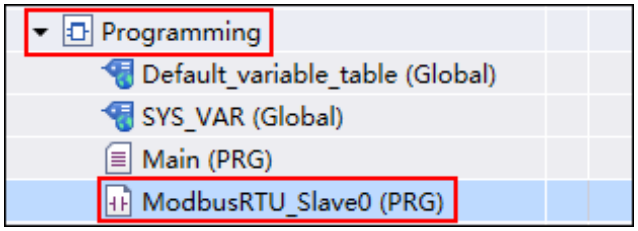
18.4.5.6 Fault Codes

Fault code	Value	Description
NO_ERROR	0	No error.
CONNECT_FAILED	200	Failed to create connection
CONNECT_MODE_INVALID	201	Connection mode invalid
CONNECTION_INVALID	202	Connection handle invalid
CONNECTION_OCCUPY	203	Connection handle occupied
CONNECTION_MODIFY	204	Connection handle modification error
MEMORY_ADDR_INVALID	205	Memory address invalid
MEMORY_OUT_OF_BOUNDS	206	Memory access out of bounds
DATA_DIM_INVALID	207	Data dimension invalid (only one-dimensional supported)

Fault code	Value	Description
DATA_ADDR_INVALID	208	Invalid data address.
DATA_TYPE_INVALID	209	Data type invalid
DATA_VALUE_INVALID	210	Data value invalid
SEND_FAILED	211	Data sending failed
RECV_FAILED	212	Data reception failed
RECV_TIMEOUT	213	Data reception timeout
SERIAL_COM_INVALID	300	COM port invalid
SERIAL_COM_UNPREADY	301	COM port not ready
SERIAL_COM_USED	302	COM occupied
SERIAL_BAUDRATE_ERR	303	Incorrect COM baud rate configuration
SERIAL_DATABITS_ERR	304	Incorrect configuration of COM data bit
SERIAL_PARITY_ERR	305	Incorrect configuration of COM parity bit
SERIAL_STOPBITS_ERR	306	Incorrect configuration of COM stop bit
MB_CONFIG_ERR	400	Configuration of Modbus failed
MB_FUNC_CODE_INVALID	401	Invalid Modbus function code
MB_QUANTITY_INVALID	402	Invalid Modbus address quantity
MB_RETRY_TIMES_INVALID	403	Invalid Modbus retransmission count (0 to15) configuration
MB_SLAVE_ID_INVALID	404	Invalid Modbus slave response station ID
MB_SLAVE_ADDR_ILLEGAL	405	Illegal Modbus slave response address
MB_SLAVE_DATA_ILLEGAL	406	Illegal Modbus slave response data
MB_MAPPING_MEM_ILLEGAL	407	Illegal Modbus slave mapping address
MB_MAPPING_NUM_INVALID	408	Invalid Modbus slave mapping size
MB_RTU_DATABITS7_ILLEGAL	409	Illegal ModbusRTU 7-bit data configuration
MB_ASC_DATABITS8_ILLEGAL	410	Illegal ModbusASCII 8-bit data configuration
MB_TCP_CONNECT_FAILED	500	ModbusTCP connection failed
MB_TCP_IP_ADDR_INVALID	501	Invalid ModbusTCP IP address
MB_TCP_ETHER_ID_INVALID	502	Invalid ModbusTCP Ethernet port configuration is invalid.
MB_TCP_DELAY_POLL_INVALID	503	Invalid ModbusTCP frame interval (1 to 1000).
MB_SLAVE_CONFIGURED	504	Modbus slave already configured
UNKNOWN	65535	Unknown error

18.4.5.7 Example of ModbusRTU Communication Instruction Usage

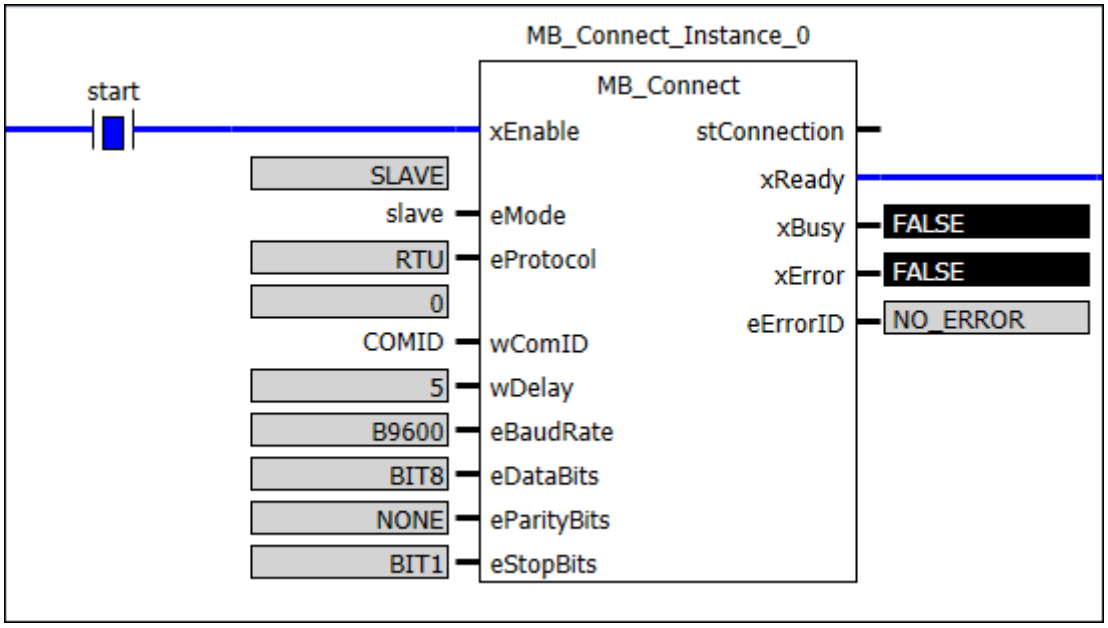
Two EVO523 controllers for Modbus RTU communication: PLC Master Com0 as Modbus RTU Master and PLC Slave Com0 as Modbus RTU Slave.



ModbusRTU slave configuration

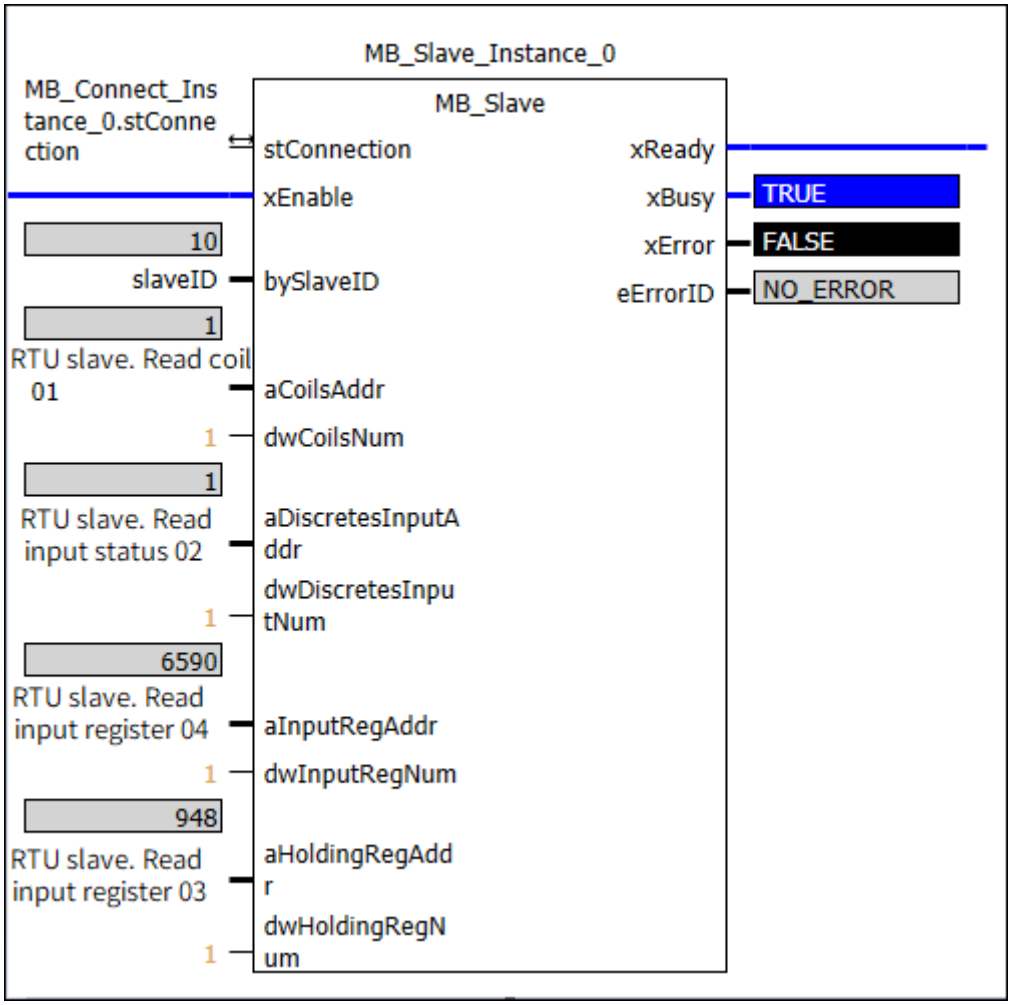
Prerequisites

- A project has been created and the device added. For specific operations, see 7 Project Deployment.
- The Modbus library has been referenced. For the reference operations, see 12.3 Library Reference.



Procedure

1. Select the PLC_SLAVE Device and click on "Programming" in the left project tree to create a POU of type PRG (either ST or LD language is acceptable; ST language is used as an example).

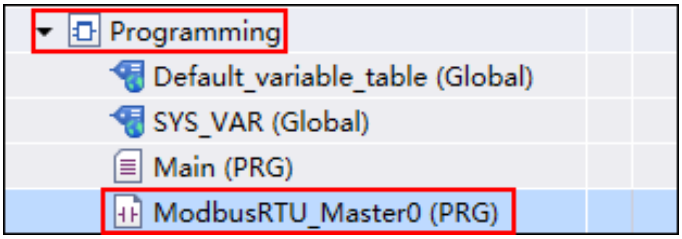


2. Add the "MB_TCP_Connect" instruction: Double-click to open the POU interface, select the "MB_Connect" instruction from the right Toolbox, and then double-click or drag it directly to the program editing area to create an instruction instance object.

3. Select SLAVE as the instruction mode, configure parameters (serial port number, frame interval, baud rate, etc.), and create a slave connection handle. Compile and download the program, enable the instruction after the device goes online, and observe the instruction pin status. The handle is successfully created when xReady is set to TRUE.

4. Switch the device to Offline mode, add the "MB_Slave" instruction by selecting it from the right-hand toolbox and double-clicking or dragging it to the program editing area. Configure parameters such as the slave ID, coil address, and number of coils. The stConnection pin needs to be passed the slave station connection handle created by the MB_Connect instruction.

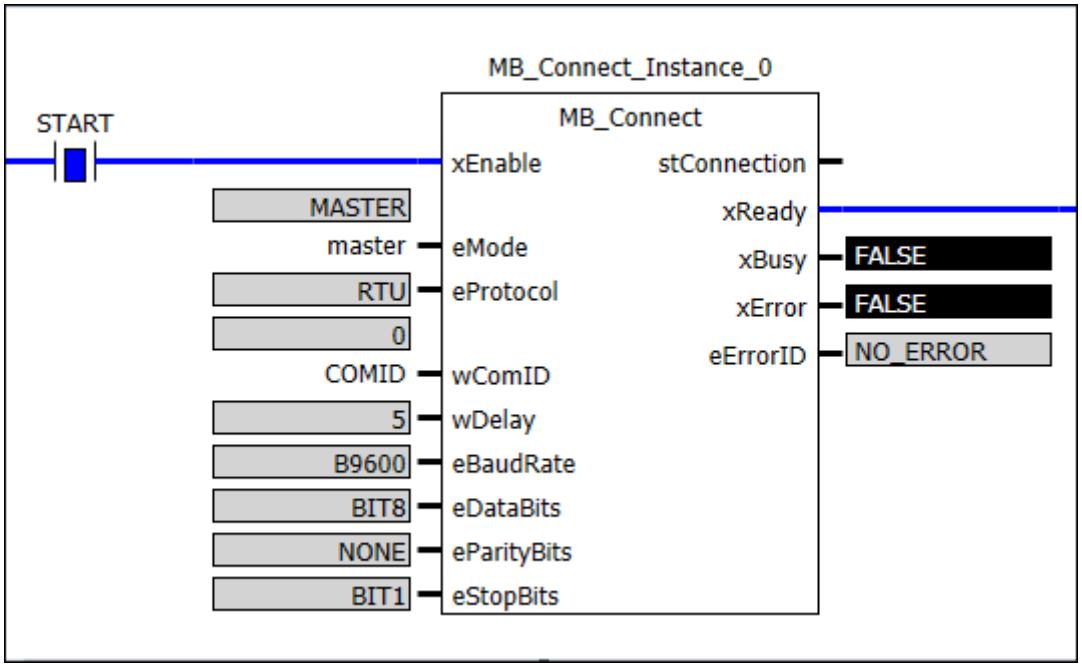
5. Declare variables in the program to serve as data buffers for reading coils, discrete inputs, input registers, and holding registers (assigned to aCoilsAddr, aDiscretesInputAddr, aInputRegAddr, and aHoldingRegAddr, respectively). Then, set the number of coil register to 1. Compile and download the program, switch the device to Online mode, run the device, enable the instruction, and observe the instruction pin status. xReady and xBusy set to TRUE indicate successful slave creation.



ModbusRTU master configuration

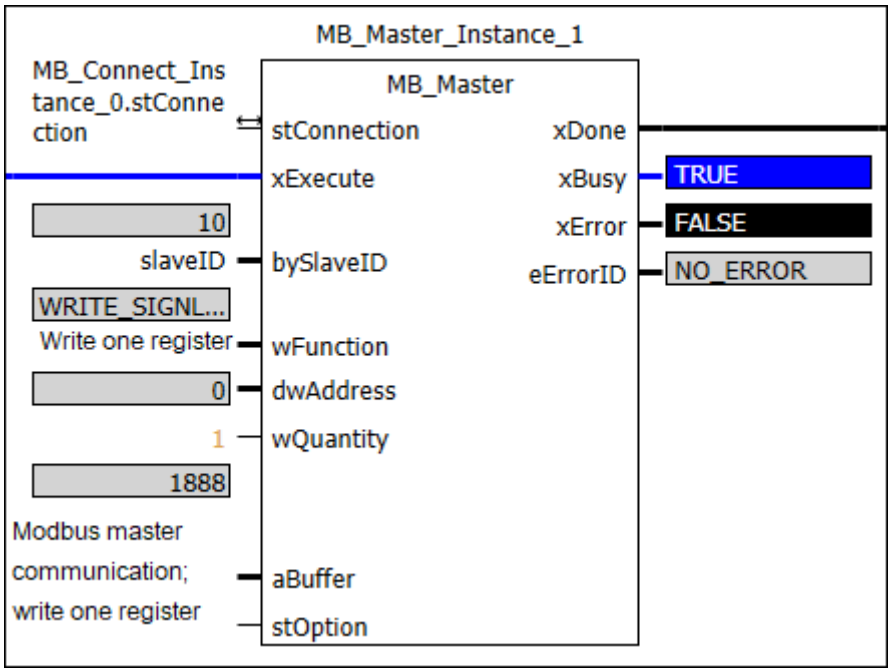
Prerequisites

- A project has been created and the device added. For specific operations, see 7 Project Deployment.
- The Modbus library has been referenced. For the reference operations, see 12.3 Library Reference.



Procedure

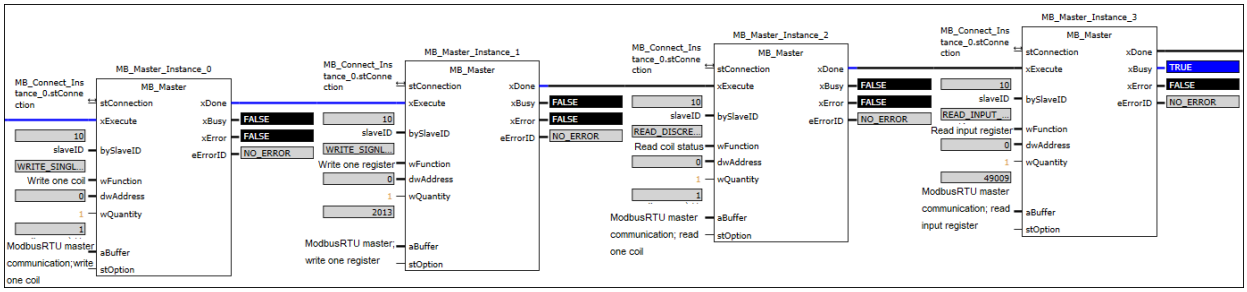
1. Select the PLC_MASTER Device and click on "Programming" in the left project tree to create a POU of type PRG (either ST or LD language is acceptable; ST language is used as an example).



2. Add the "MB_TCP_Connect" instruction: Double-click to open the POU interface, select the "MB_Connect" instruction from the right Toolbox, and then double-click or drag it directly to the program editing area to create an instruction instance object.

3. Set the instruction mode to MASTER. Configure the master port parameters based on the slave port settings to create a master connection handle. Then, compile and download the program. After switching the device to online mode, enable the instruction and observe its pin status. The master handle is successfully created when xReady is set to TRUE.

4. Switch the device to Offline mode, add the "MB_Master" instruction by selecting it from the right-hand toolbox and double-clicking or dragging it into the program editor area. Pass the master connection handle to the stConnection pin, configure the slave ID, select the function code for writing a single holding register, add a variable for writing a single register with data type DWORD, connect this variable to the aBuffer pin, and set wQuantity to 1. Compile and download the program, then switch the device to Online mode and run the device.



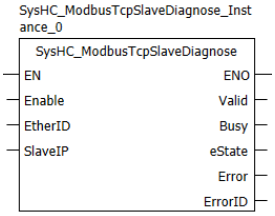
5. Modify the value of the variable connected to the aBuffer pin online. Apply a rising-edge signal to the instruction trigger. Observe the instruction pin status: xBusy changes from TRUE to FALSE and xDone is set to TRUE. Check the value of the read-register variable in the PLC_Slave device. If it matches the value written by the master-side register variable, the communication is successful.

Configuration of multiple ModbusRTU masters

The MB_Master instruction is rising edge-triggered. Each trigger executes only one communication transaction, and each instruction can be configured with only one function code. If you need continuous communication with multiple function codes, use the following configuration.

Drag multiple MB_Master instructions into the POU and connect them in series. The xReady pin of each instruction serves as the trigger signal for the next one, and the inverted xDone pin of the last instruction is fed back as the trigger signal for the first instruction. All instructions share the same master connection handle on their stConnection pins, and each is configured with the slave ID, function code, coil/register address, and quantity.

18.4.6 ModbusTCP



18.4.6.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.6.2 SysHC_ModbusTcpSlaveDiagnose	FB	Obatin Modbus-TCP master diagnostic status information	SysHCPlcInfo	Library version 1.0.0.0 and later
18.4.6.3 SysHC_ModbusTcpDeviceDiagnose	FB	Get Modbus-TCP as slave diagnostic status information		Library version 1.0.0.0 and later
18.4.6.4 MB_TCP_Connect	FB	Establish a Modbus TCP connection	Modbus	Library version 1.0.0.0 and later
18.4.6.5 MB_Server	FB	Create a Modbus TCP server		Library version 1.0.0.0 and later
18.4.6.6 MB_Client	FB	Create Modbus TCP client		Library version 1.0.0.0 and later

18.4.6.2 SysHC_ModbusTcpSlaveDiagnose

This instruction gets the diagnostic state information from the Modbus-TCP master.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
SysHC_ModbusTcpSlaveDiagnose	Obatin Modbus-TCP master diagnostic status information	FB		SysHC_ModbusTcpSlaveDiagnose_Instance_0(Enable :=, EtherID :=, SlaveIP :=, Valid =>, Busy =>, eState =>, Error =>, ErrorID =>);

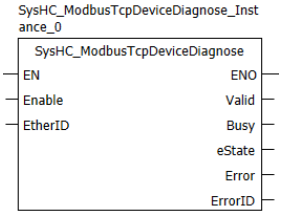
- **Related variables**

  Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Enable	Rising edge-triggered	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered
	EtherID	Network port ID	BYTE	-	0	Network port ID number.
	SlaveIP	Slave IP address	STRING	-	-	Slave IP address.
Output	Valid	Output active	BOOL	TRUE, FALSE	FALSE	Instruction is actively executing.
	Busy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.
	eState	Diagnostic status bit	BOOL	TRUE, FALSE	FALSE	Diagnostic status bit.
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	Set to TRUE when an error occurs.
	ErrorID	Fault code	SYS_HC_ERROR	-	NO_ERROR	See 18.4.1.37 Fault Codes.

- **Function**
  - Enable set to TRUE indicates that the function block is enabled; otherwise, all outputs are invalid.
  - Check if EtherID is supported on the device; if not supported, set ErrorID to ETHER_ID_ERROR.

- Input SlaveIP is a string type; if the SlaveIP parameter is valid and matches the configured Slave IP, it outputs normally; otherwise, ErrorID outputs SLAVE_IP_ERROR.
- If all the above conditions are met, it will check the disabled status of the slave node; if disabled, ErrorID outputs FAILURE_OBATION.
- After completing the parameter matching, obtain the current TCP Slave communication diagnosis to update the eState status in real time.



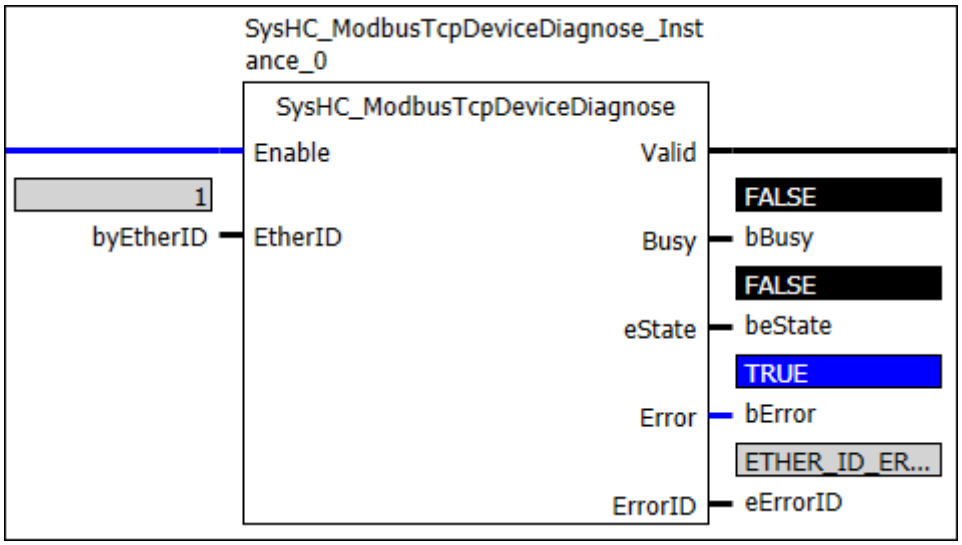
- **Program example**

18.4.6.3 SysHC_ModbusTcpDeviceDiagnose

This instruction gets the diagnostic state information from the Modbus-TCP slave.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
SysHC_ModbusTcpDeviceDiagnose	Get Modbus-TCP as slave diagnostic status information	FB		SysHC_ModbusTcpDeviceDiagnose_Instance_0(Enable :=, EtherID :=, Valid =>, Busy =>, eState =>, Error =>, ErrorID =>);

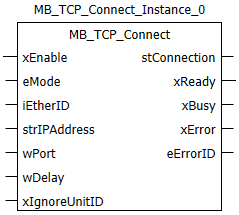


- **Related variables**

Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Enable	Rising edge-triggered	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	EtherID	Network port ID	BYTE	-	0	Network port ID number.
Output	Valid	Output active	BOOL	TRUE, FALSE	FALSE	Instruction is actively executing.
	Busy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Instruction is executing.
	eState	Diagnostic status bit	BOOL	TRUE, FALSE	FALSE	Diagnostic status bit.
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	Set to TRUE when an error occurs.
	ErrorID	Fault code	SYS_HC_ERROR	-	NO_ERROR	See 18.4.1.37 Fault Codes.



- **Function**
  - When Enable is TRUE, the function block is activated; otherwise, all outputs are invalid.
  - Checks whether the input EtherID is supported on the device. If not, ErrorID outputs ETHER_ID_ERROR.
  - When acting as a TCP slave, if the node is in a disabled state, ErrorID outputs FAILURE_OBATION.
  - After successful parameter matching, the eState status is updated in real time based on the current status of the specified Ethernet port.
- **Program example**

18.4.6.4 MB_TCP_Connect

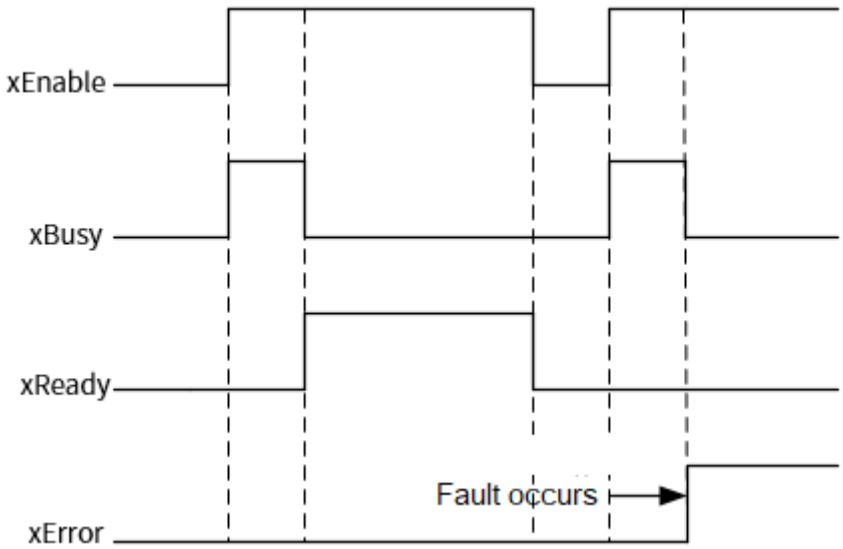
This is the instruction for Modbus TCP protocol parameter configuration, which establishes a Modbus TCP connection.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
MB_TCP_Connect	Establish a Modbus TCP connection	FB		MB_TCP_Connect_Instance_0(xEnable := , eMode := , iEtherID := , strIPAddress := , wPort := , wDelay := , xIgnoreUnitID := , stConnection => , xReady => , xBusy => , xError => , eErrorID =>);

- **Related variables**

  Variable



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Function block enable	BOOL	Follows data type	FALSE	FALSE: Disable network connection. TRUE: Enable network connection.
	eMode	Modbus TCP mode	MB_TCP_MODE	Follows data type	MB_TCP_MODE.SERVER	Modbus TCP Mode: Server (default). MB_TCP_MODE.CLIENT: Modbus TCP client. MB_TCP_MODE.SERVER: Modbus TCP server.
	iEtherID	Network port ID	INT	Follows data type	-1	Network port ID: -1: Automatic. 0: Ethernet port A. It changes in incremental mode.
	strIPAddress	IP address	STRING	Follows data type	''	IP Address.
	wPort	Terminal name	WORD	Follow data type	502	Port.
	wDelay	Frame interval	WORD	Follows data type	1	ModbusTCP frame interval.
	xIgnoreUnitID	Ignore unit_id	BOOL	Follows data type	FALSE	FALSE: Enable unit_id filtering. TRUE: Disable unit_id filtering.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	stConnection	Connection handle	CBus_Connection	Follows data type	-	Connection handle.
	xReady	Instruction status	BOOL	Follows data type	FALSE	Indicates the function block is active
	xBusy	Instruction execution flag	BOOL	Follows data type	FALSE	Function block execution flag
	xError	Error flag	BOOL	Follows data type	FALSE	Indicates the function block is faulty
	eErrorID	Fault code	CBUS_ERROR	Follows data type	NO_ERROR	Fault code of function block. For details, see 18.4.5.6 Fault Codes.

- **Function**

  This instruction allows modification of TCP parameters (such as frame intervals) during operation.

- **Sequence diagram**

- **Program example**

  LD:

- **Precautions**
  - It must be used in conjunction with the MB_TCP_Connect instruction, and the eMode must be set to SERVER.
  - The connection handle of the MB_TCP_Connect instruction supports only one MB_Server instance.
  - It is recommended that the MB_TCP_Connect and MB_Server instructions be processed within the same user task and program cycle. If they are in different priority tasks, operational errors may occur due to priority interruptions.
  - When the MB_Server instruction is in an active and accessible status, xReady/xBusy will be set. If there is an error, xError will be set, and eErrorID will display the error code.
  - MB_Server service requests still support access when the PLC DIP switch is set to the STOP position.
  - If the StrIPAddress of MB_TCP_Connect is empty, any remote Modbus TCP client is allowed to connect and access the configured data area. If a valid IP address is input in StrIPAddress, the IP filtering function is enabled, allowing only the remote ModbusTCP client with that IP address to access.
  - Access area description:

Data Area Variable	Area Name	Supported Function Code	Accessible Area Size	Supported Data Type
aCoilsAddr	Coil data area	READ_COILS(01) WRITE_SINGLE_COIL(05) WRITE_MULTIPLE_COILS(15)	1 to 65536	BOOL, BYTE, ARRAY
aDiscretesInputAddr	Discrete input data area	READ_DISCRETE_INPUTS(02)	1 to 65536	
aInputRegAddr	Input register data area	READ_INPUT_REGISTERS(04)	1 to 65536	WORD, DWORD, INT, UINT, DINT, UDINT, REAL, ARRAY
aHoldingRegAddr	Holding register data area	READ_HOLDING_REGISTERS(03) WRITE_SINGLE_REGISTER(06) WRITE_MULTIPLE_REGISTERS(16)	1 to 65536	

- Unsupported types for access area:

  Multidimensional arrays.

  64-bit data types: LWORD, LINT, ULINT, and LREAL.

  Special types: STRING, WSTRING, TIME, TIME_OF_DAY(TOD), DATE, DATE_AND_TIME(DT), POINTER, and STRUCT.

- Access areas cannot be directly set to I/Q/M direct variables. They must be mapped to the above supported variables or array data via AT mapping.
- Access areas can be freely combined. Unused access areas can be left empty, but all four access areas cannot be empty at the same time.
- Online parameter modifications will not take effect immediately, requiring the instruction to be re-enabled.

18.4.6.6 MB_Client

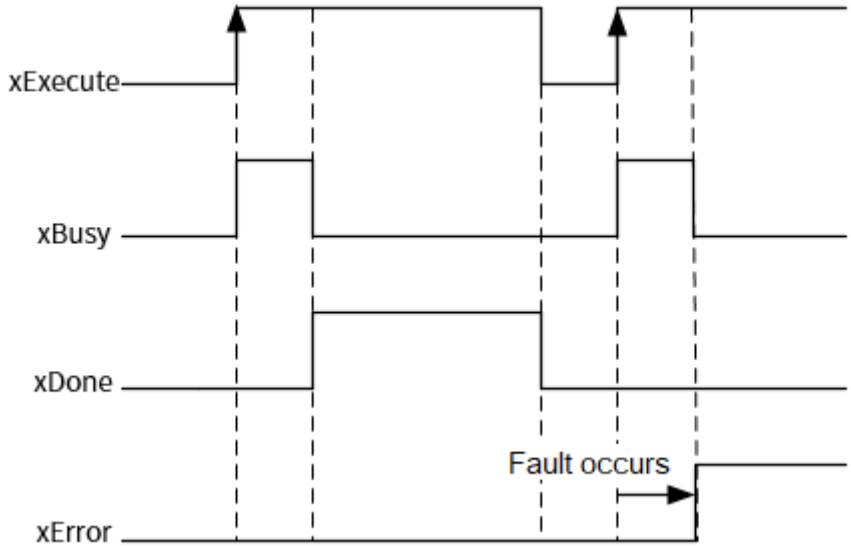
This is the Modbus TCP client communication instruction, which creates a Modbus TCP client.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
MB_Client	Create Modbus TCP client	FB		MB_Client_Instance_0(stConnection := , xExecute := , byUnitID := , wFunction := , dwAddress := , wQuantity := , aBuffer := , stOption := , xDone => , xBusy => , xError => , eErrorID =>);

- **Related variables**

  Variable



Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input/Output	stConnection	Connection handle	CBus_Connection	Follows data type	-	Connection handle.
Input	xExecute	Function block enable	BOOL	Follows data type	FALSE	Edge triggered.
	byUnitID	Slave number	BYTE	Follows data type	1	Request access to the slave number.
	wFunction	Function code	MB_FUNCTION	Follows data type	0	Modbus function code.
	dwAddress	Slave data address	DWORD	Depends on data type	0	Starting address for access to slave data.

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	wQuantity	Number of accessible address	WORD	Follow data type	0	Maximum number of function codes: - 01/02: 2000. - 03/04: 125. - 15: 1968. - 16: 123.
	aBuffer	Read/write buffer	ANY	Follows data type	-	Modbus data buffer.
	stOption	Configuration options	MB_OPTION	Follows data type	-	Optional configuration parameters for Modbus protocol.
Output	xDone	Instruction completion flag	BOOL	Follows data type	FALSE	Function block execution completion flag
	xBusy	Instruction execution flag	BOOL	Follows data type	FALSE	Function block execution flag.
	xError	Error flag	BOOL	Follows data type	FALSE	Indicates the function block is faulty
	eErrorID	Fault code	CBUS_ERROR	Follows data type	NO_ERROR	Fault code of function block. For details, see 18.4.5.6 Fault Codes.

- **Function**

  This function initiates data transmission by transmitting the Modbus data frame over TCP.

- **Sequence diagram**

- **Program example**

  ST:

Name	Data type	Address	Value	Prepare value
MB_Client_Instance_0	MB_Client			
stConnection	CBus_Connection			
xExecute	BOOL		TRUE	
byUnitID	BYTE		1	
wFunction	MB_FUNCTION		READ_COILS	
dwAddress	DWORD		0	
wQuantity	WORD		1	
aBuffer	ANY			
stOption	MB_OPTION			
xDone	BOOL		TRUE	
xBusy	BOOL		FALSE	
xError	BOOL		FALSE	
eErrorID	CBUS_ERROR		NO_ERROR	
eStatus	CBUS_STATE		FINISH	
xBool	INT		0	

```
MB_Client_Instance_0(
stConnection := stConnection,
xExecute TRUE := xEnable1 TRUE ,
byUnitID 1 := 1,
wFunctionREAD_CO... := 1,
dwAddress 0 := 0,
wQuantity 1 := 1,
aBuffer := aBuffer0,
stOption := stOption0,
xDone TRUE => xDone TRUE ,
xBusy FALSE => xError FALSE ,
xError FALSE =>xError FALSE ,
eErrorID NO_ERROR => eErrorID NO_ERROR );RETURN
```

  LD:

Name	Data type	Address	Value	Prepare value
MB_Client_Instance_1	MB_Client			
xReady_1	BOOL		FALSE	
xBusy_1	BOOL		TRUE	
xError_1	BOOL		FALSE	
eErrorID_1	CBUS_ERROR		NO_ERROR	
stOption0	MB_OPTION			
aBuffer0	ARRAY [0..100] OF BYTE			
xDone	BOOL		FALSE	
wFunction	MB_FUNCTION		READ_COILS	

- **Precautions**
  - It must be used in conjunction with the MB_TCP_Connect instruction, and the eMode must be set to CLIENT.
  - Connection handle configured by the MB_TCP_Connect instruction, supports one or more MB_Client instances.
  - It is recommended to process the MB_TCP_Connect and MB_Client instructions within the same user task and program cycle. If processed in different priority tasks, operational anomalies may occur due to priority interruptions.
  - When the MB_Client instruction is in the xBusy set status, repeated instructions will be ignored until xDone or xError is set.
  - The MB_Client instruction cannot be executed in startup, diagnostic, safety modes, or under time error conditions.
  - byUnitID supports only standard station addresses: 1~255, 0 is used for broadcasting.
  - Function code and number of accessible addresses
    - Function code: READ_COILS/ READ_DISCRETE_INPUTS, the maximum number of accessible addresses supported is 2000.
    - Function code: WRITE_MULTIPLE_COILS, the maximum number of accessible addresses supported is 1968.

- Function code: READ_HOLDING_REGISTERS/ READ_INPUT_REGISTERS, the maximum number of accessible addresses supported is 125.
- Function code: WRITE_MULTIPLE_REGISTERS, the maximum number of accessible addresses supported is 123.

◦ Data types loaded by aBuffer:

- Supported types:

  One-dimensional array.

  Data types of the arrays/variables:

  Access coil data: BYTE.

  Access register data: WORD, DWORD, INT, UINT, DINT, UDINT, REAL.

- Unsupported types

  Multidimensional arrays.

  64-bit data types: LWORD, LINT, ULINT, and LREAL.

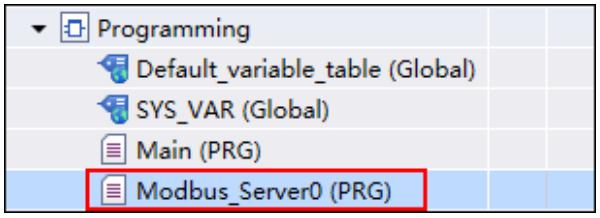
  Special types: STRING, WSTRING, TIME, TIME_OF_DAY(TOD), DATE, DATE_AND_TIME(DT), POINTER, and STRUCT.

◦ aBuffer cannot be directly set to I/Q/M direct variables. It must be mapped to the above supported variables or array data via AT mapping.

◦ Online parameter modifications will not take effect immediately, requiring the instruction to be re-enabled.

18.4.6.7 Example of ModbusTCP Communication Instruction Usage

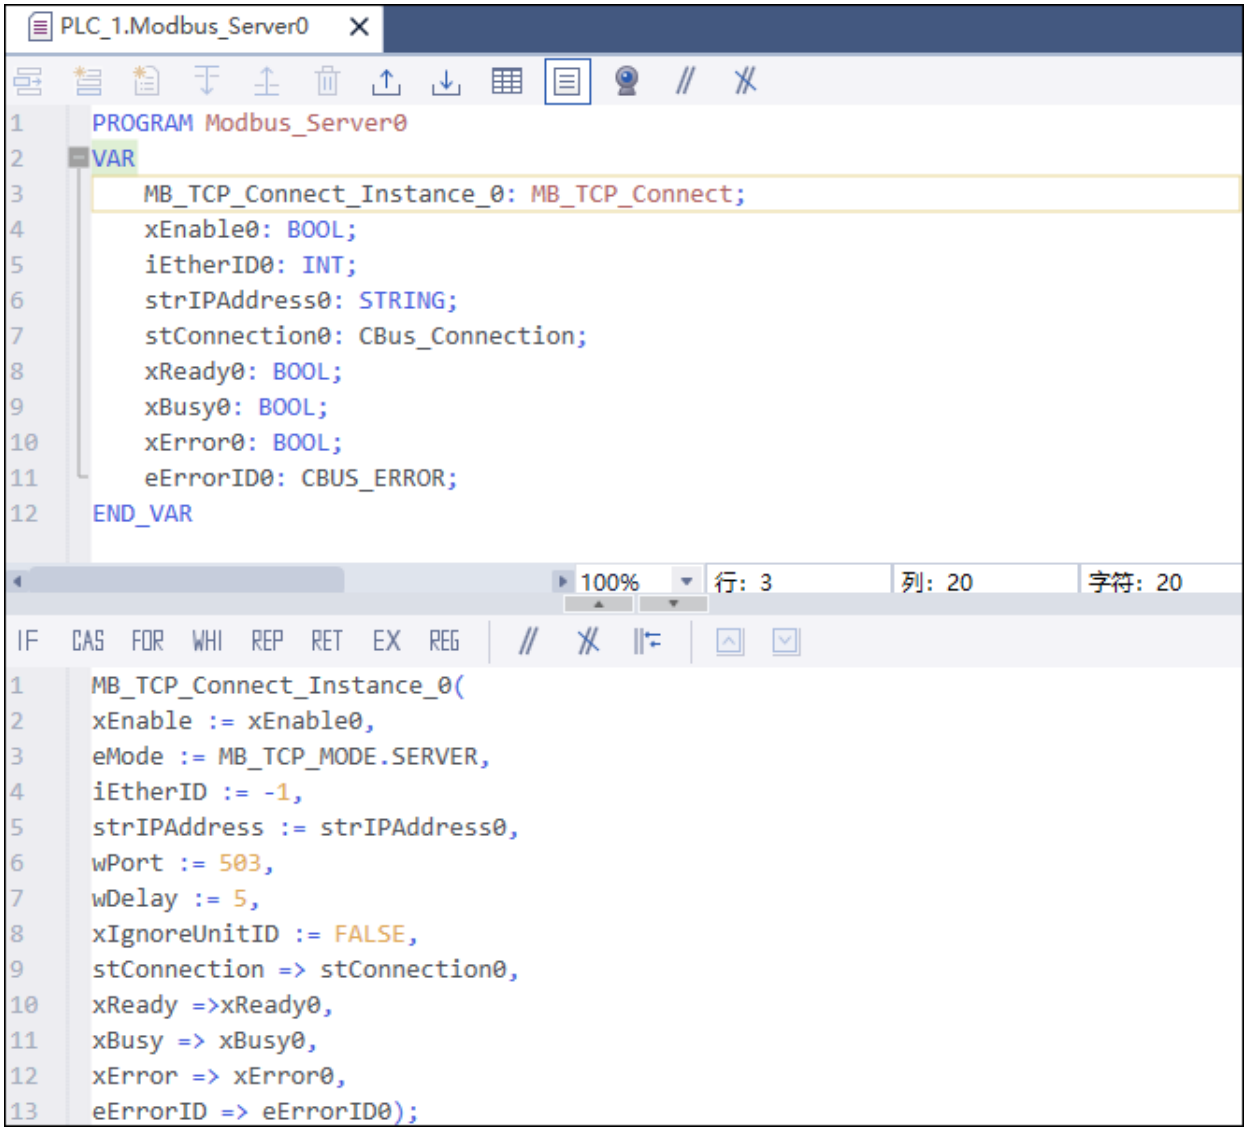
Example of ModbusTCPServer communication instruction usage



This section takes the ModbusTCPServer communication instruction as an example. An EVO820 controller is employed as the Modbus TCP server, and the NetAssist acts as the Modbus TCP client.

Prerequisites

- A project has been created and the device added. For specific operations, see 7 Project Deployment.
- The Modbus library has been referenced. For the reference operations, see 12.3 Library Reference.



Procedure

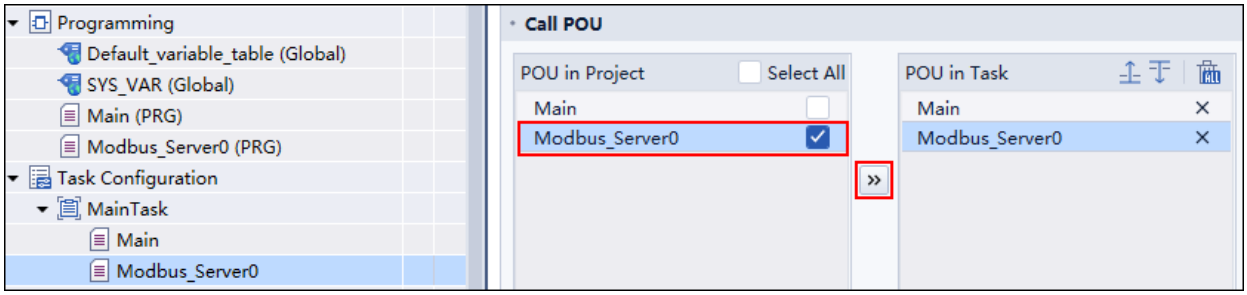
1. Click "Programming" in the left project tree to create a POU of PRG type, with ST and LD languages both supported. This section takes the ST language as an example.

2. Add the "MB_TCP_Connect" instruction: Double-click to open the POU interface, select the "MB_TCP_Connect" instruction from the right Toolbox, and then double-click or drag it directly to the program editing area to create an instruction instance object.

3. In the table view/text view variable declaration editor, add variables, set properties such as variable name and data type, and configure the instruction-related pins. The text view variable declaration editor is used as an example below.

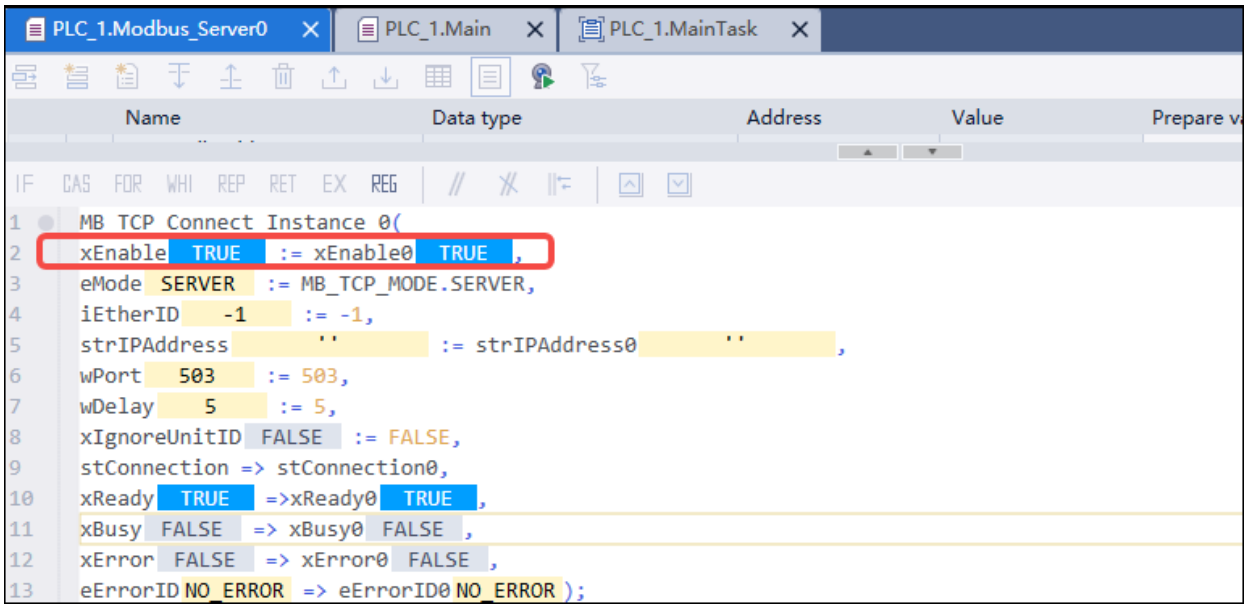
NOTE

eMode of current example MB_Server instruction is set to MB_TCP_MODE.SERVER.



4. Add the "MB_Server" instruction: Double-click to open the POU interface, select the "MB_Server" instruction from the right Toolbox, and then double-click or drag it directly to the program editing area to create an instruction instance object.

5. In the table view/text view variable declaration editor, add variables, set properties such as variable name and data type, and configure the instruction-related pins. The text view variable declaration editor is used as an example.



NOTE

stConnection must use the output parameter stConnection0 of the "MB_TCP_Connect" instruction.

6. Call Modbus_Server0 in MainTask, download it to the controller, and start its operation.

7. Open the iFA software, switch to the online mode, and set the xEnable pin of the "MB_TCP_Connect" instruction to TRUE to start the Modbus connection.

8. Open the iFA software, switch to the online mode, and set the XEnable pin of the "MB_Server" instruction to TRUE to start the Modbus service.

9. Open the NetAssist. In its network settings, select TCP_Client, configure the Remote Host Address to match the device's IP address (e.g., 192.168.1.88), and configure the Remote Host Port number to match the port number (e.g., 503). Then click "Connect".

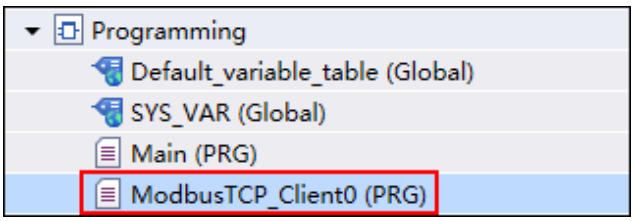
10. Open the NetAssist, select "MODBUS Debugger" as the debugging tool, choose the "Modbus Instruction" panel in the right-side menu bar, configure the corresponding information, and then click "Send".

11. The transmitted and received data can be viewed in the NetAssist. For easier observation, convert the values into hexadecimal for viewing and sending.

Result

Normal communication and data exchange between the EVO820 controller and the NetAssist.

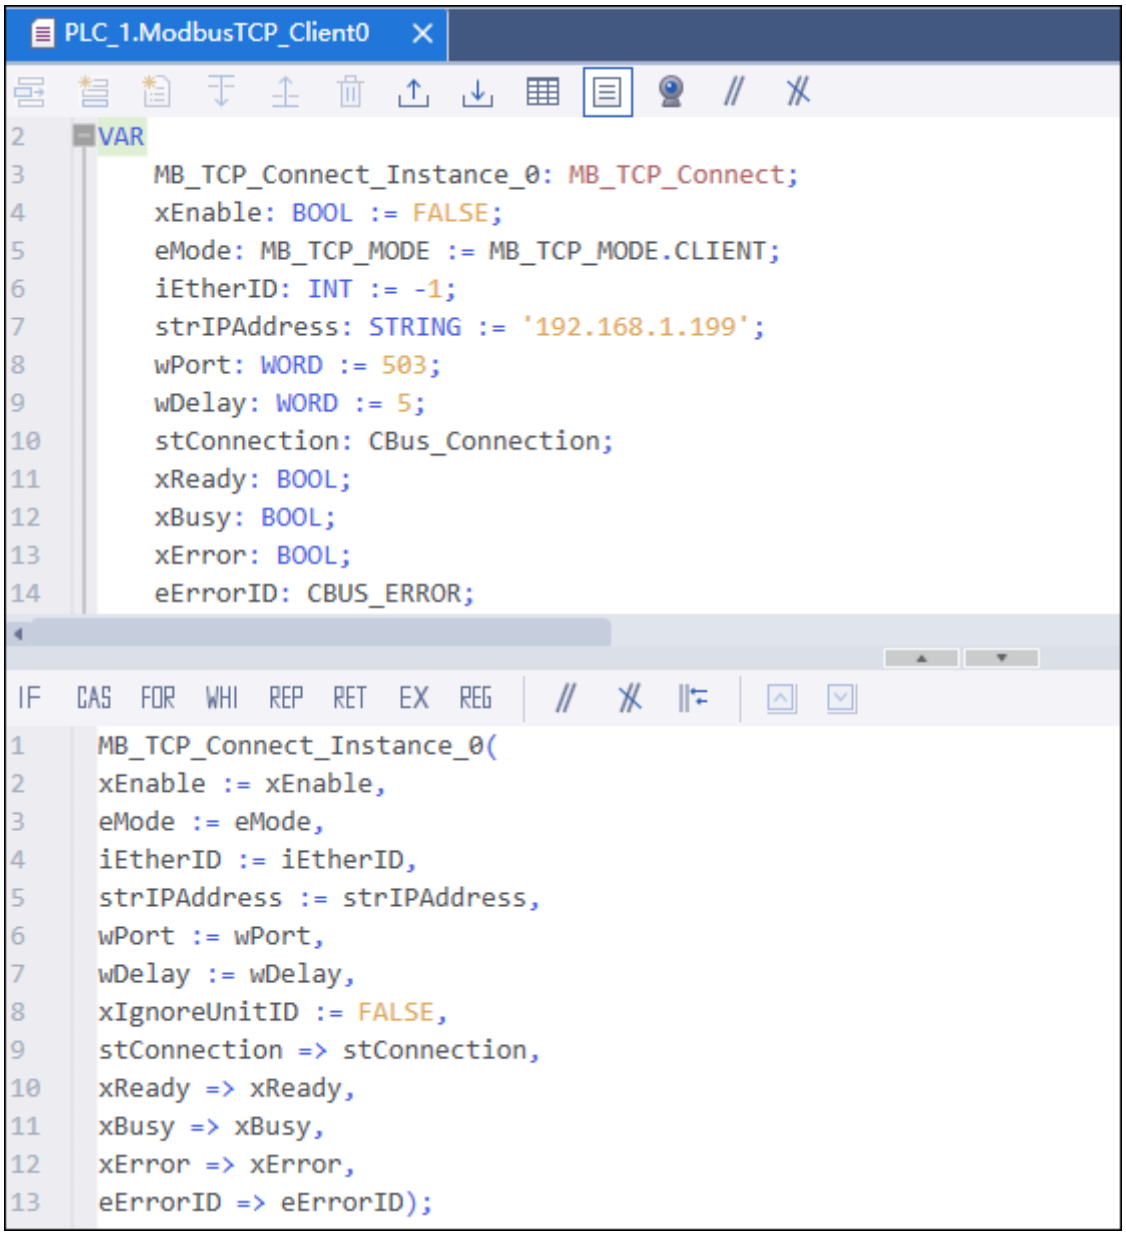
Example of ModbusTCPClient communication instruction usage



This section takes the ModbusTCPClient communication instruction as an example. An EVO820 controller is employed as the Modbus TCP client, and the NetAssist acts as the Modbus TCP client.

Prerequisites

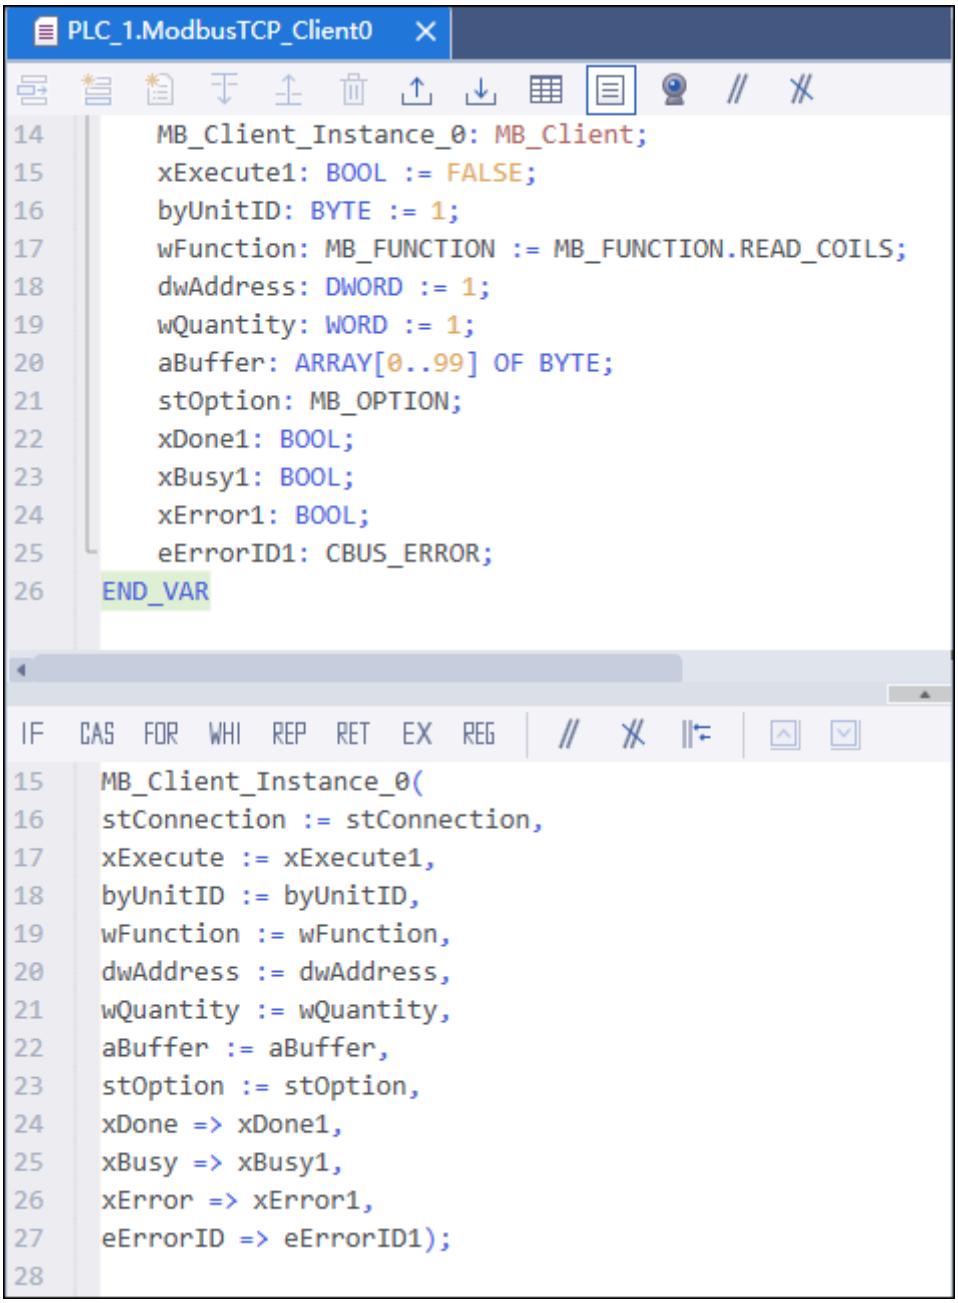
- A project has been created and the device added. For specific operations, see 7 Project Deployment.
- The Modbus library has been referenced. For the reference operations, see 12.3 Library Reference.



Procedure

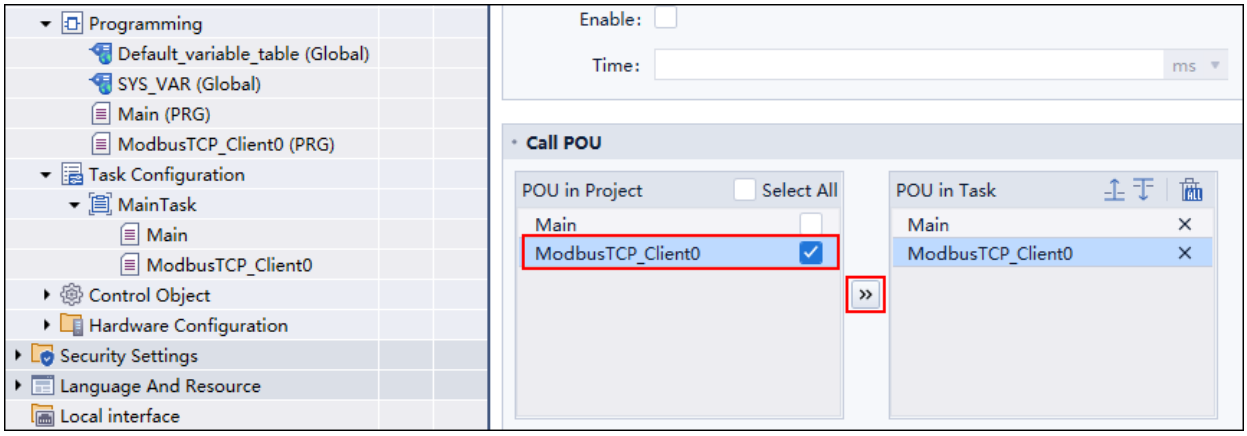
1. Click "Programming" in the left project tree to create a POU of PRG type, with ST and LD languages both supported. This section takes the ST language as an example.

2. Add the "MB_TCP_Connect" instruction: Double-click to open the POU interface, select the "MB_TCP_Connect" instruction from the right Toolbox, and then double-click or drag it directly to the program editing area to create an instruction instance object.



3. In the table view/text view variable declaration editor, add variables, set properties such as variable name and data type, and configure the instruction-related pins. The text view variable declaration editor is used as an example.

> NOTE
>
> eMode of current example MB_Client instruction is set to MB_TCP_MODE.CLIENT.



4. Add the "MB_CLIENT" instruction: Double-click to open the POU interface, select the "MB_CLIENT" instruction from the right Toolbox, and then double-click or drag it directly to the program editing area to create an instruction instance object.

5. In the table view/text view variable declaration editor, add variables, set properties such as variable name and data type, and configure the instruction-related pins. The text view variable declaration editor is used as an example.

> NOTE
>
> stConnection must use the output parameter stConnection of the "MB_TCP_Connect" instruction.

6. Call ModbusTCP_Client0 in MainTask, download it to the controller, and start its operation.

7. Open the NetAssist, select TCP_Server as protocol type in network settings, configure the correct Local Host Address (same network segment as device IP), set local port to 503, and then click "Open" to start the service.

7. Open the iFA software, switch to the online mode, and set the xEnable pin of the "MB_TCP_Connect" instruction to TRUE to eatablish the Modbus connection.

```
MB_TCP_Connect_Instance_0(
xEnable TRUE := xEnable TRUE,
eMode CLIENT := eMode CLIENT,
iEtherID -1 := iEtherID -1,
strIPAddress '192.168.1.199' := strIPAddress '192.168.1.199',
wPort 503 := wPort 503,
wDelay 503 := wPort 503,
xIgnoreUnitID FALSE := FALSE,
stConnection => stConnection,
xReady TRUE => xReady TRUE,
xBusy FALSE => xBusy FALSE,
xError FALSE => xError FALSE,
eErrorID NO_ERROR => eErrorID NO_ERROR );
```

9. Open the NetAssist and configure automatic data responses.

Configure the return information for the first packet of auto-response data. The received data is as follows: 00 01 00 00 00 06 01 01 00 01 00 01

Configure the corresponding response data as: 00 01 00 00 00 04 01 01 01 00

Then start the automatic response.

10. Open the iFA software, switch to the online mode, configure the corresponding parameters of the "MB_Client" instruction, and then set the xExecute pin from FALSE to TRUE to start the Modbus client for transmitting data.

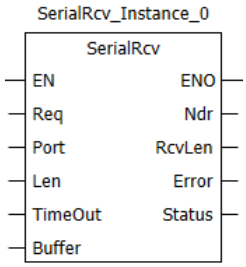
```
MB_Client_Instance_0(
stConnection := stConnection,
xExecute TRUE := xExecute1 TRUE ,
byUnitID 1 := byUnitID 1 ,
wFunctionREAD_CO... := wFunctionREAD_CO...,
dwAddress 1 := dwAddress 1
wQuantity 1 := wQuantity 1 ,
aBuffer := aBuffer,
stOption := stOption,
xDone TRUE => xDone1 TRUE ,
xBusy FALSE => xBusy1 FALSE ,
xError FALSE => xError1 FALSE ,
eErrorID NO_ERROR => eErrorID1 NO_ERROR );
```

11. The transmitted and received data can be viewed in the NetAssist. For easier observation, convert the values into hexadecimal for viewing and sending.

Result

Normal communication and data exchange between the EVO820 controller client and the NetAssist.

18.4.7 Free Serial Port



18.4.7.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.7.2 SerialRcv	FB	Serial port freeport reception	SerialCom	Library version 1.1.0.0 and later
18.4.7.3 SerialSend	FB	Serial port free port data sending instruction		Library version 1.1.0.0 and later
18.4.7.4 SerialRcvV2	FB	Serial port freeport reception		Library version 1.2.0.0 and later
18.4.7.5 SerialSendV2	FB	Serial port free port data sending instruction		Library version 1.2.0.0 and later
18.4.7.6 Serial_Connect	FB	Create a serial port connection	Modbus	Library version 1.2.0.0 and later
18.4.7.7 Serial_Recv	FB	Receive serial port data		Library version 1.2.0.0 and later
18.4.7.8 Serial_Recv_By_Idle_Time	FB	Receive serial port data during bus idle time		Library version 1.2.0.0 and later
18.4.7.9 Serial_Recv_Ch	FB	Receive serial port data with start/end character		Library version 1.2.0.0 and later
18.4.7.10 Serial_Send	FB	Send serial port data		Library version 1.2.0.0 and later

18.4.7.2 SerialRcv

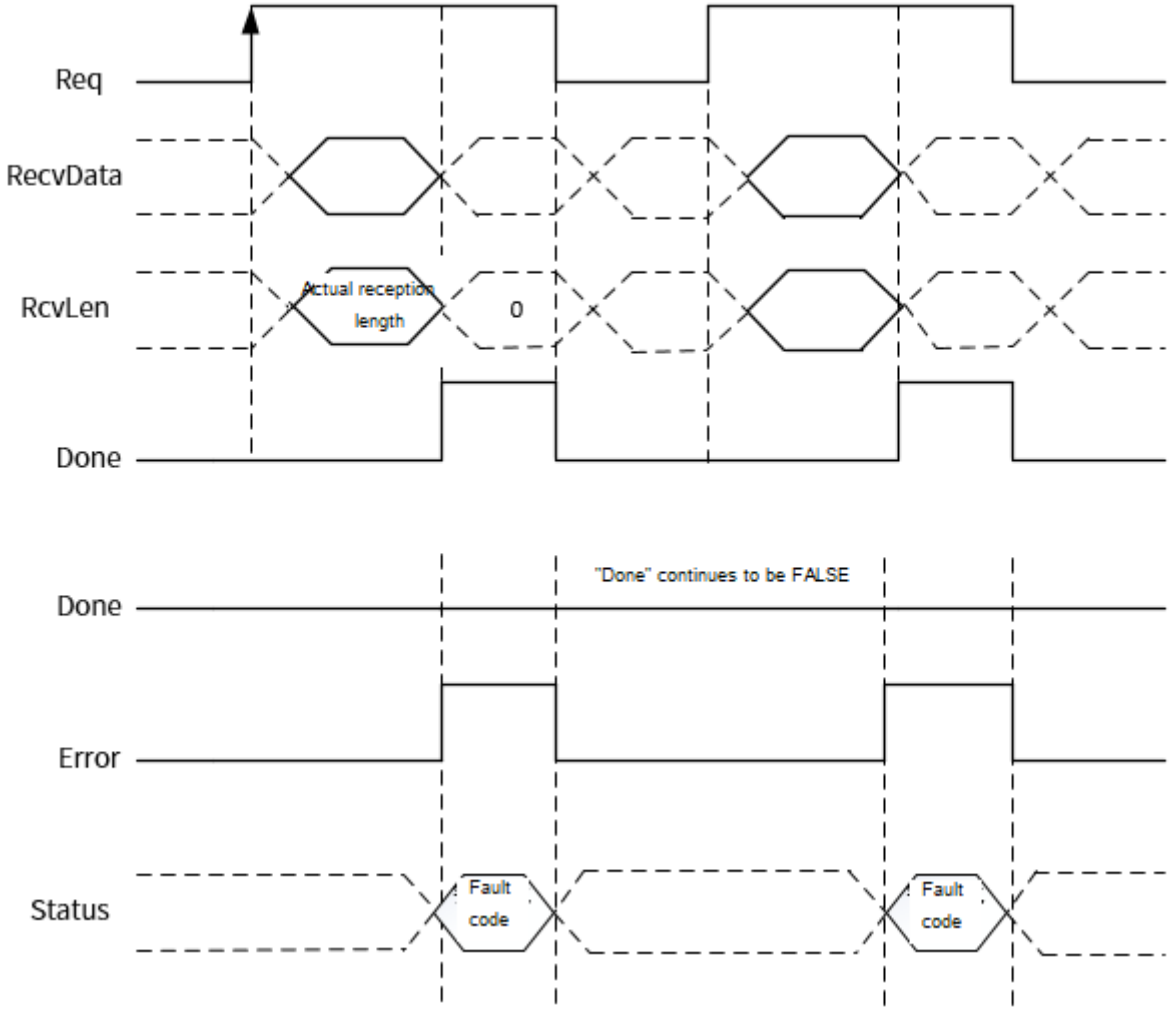
This instruction receives data through serial ports by using freeport.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SerialRcv	Serial port freeport reception	FB		SerialRcv_Instance_0(Req := , Port := , Len := , TimeOut := , Buffer := , Ndr => , RcvLen => , Error => , Status =>);

- **Related variables**

Variable



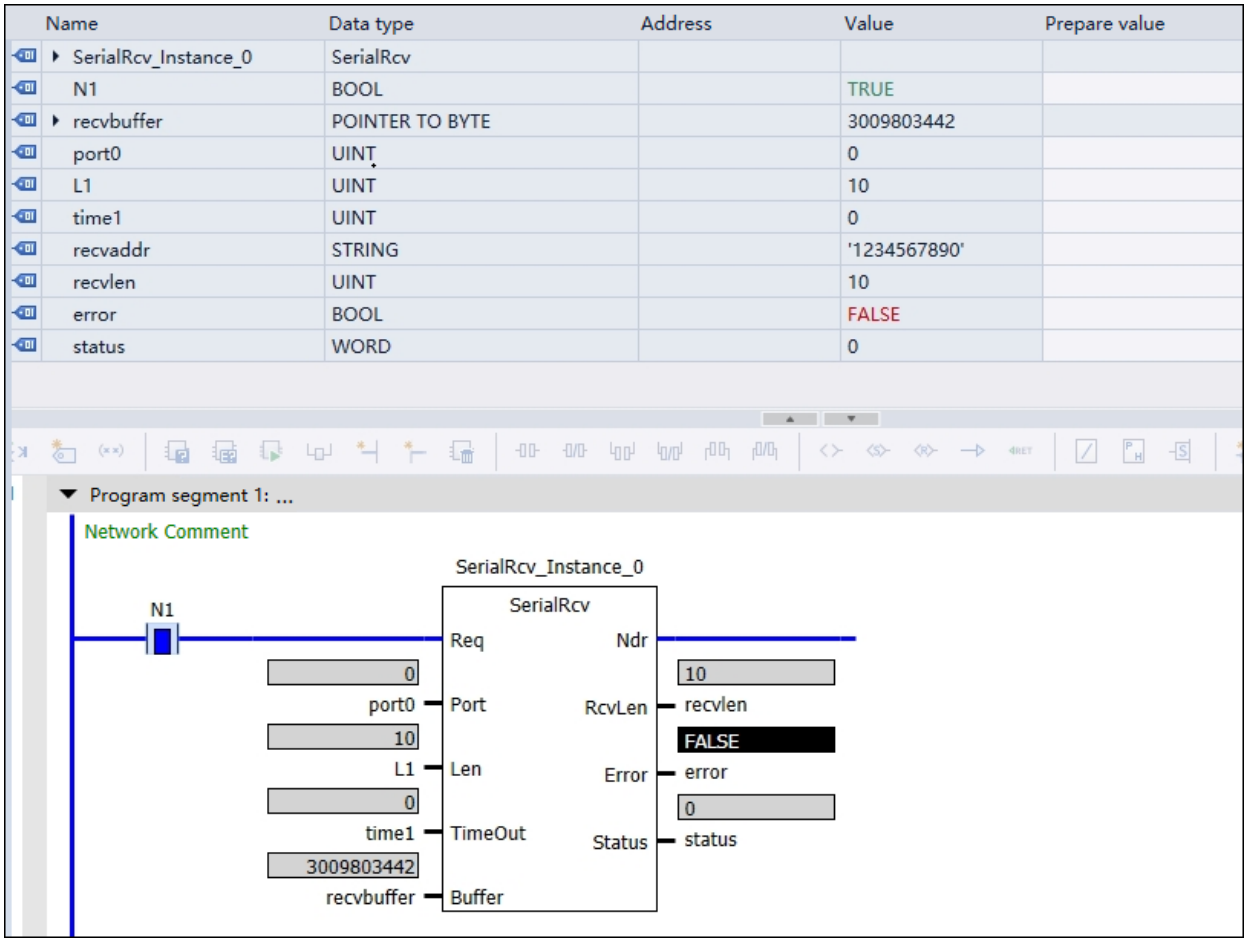
Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Req	Data enable start bit	BOOL	Follows data type	FALSE	Enable start bit, active at high level.
	Port	Communication port	UINT	Follows data type	0	Serial port number configured through the software interface. 0: Built-in COM port of the PLC. 1: Expansion card A on the PLC 2: Expansion card B on the PLC
	Len	Received data length	UINT	1 to 1024	1024	Received data length.
	TimeOut	Timeout period	UINT	Follows data type	0	Timeout period in ms, with a default value of 0 indicating no timeout.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	Buffer	Data reception buffer	POINTER TO BYTE	Follows data type	-	Pointer to the received data buffer.
Output	Ndr	Completion flag	BOOL	Follows data type	FALSE	Completion flag: FALSE: Reception not started or in progress. TRUE: Reception done.
	RcvLen	Received data length	UINT	1 to 1024	0	Actual length of received data.
	Error	Error flag	BOOL	Follows data type	FALSE	Error flag: 0: No error. 1: Reception error.
	Status	Status flag	WORD	Follow data type	1000	See Status code.

- **Function**

  This is the serial port free port data reception instruction.

- **Sequence diagram**



- **Program example**

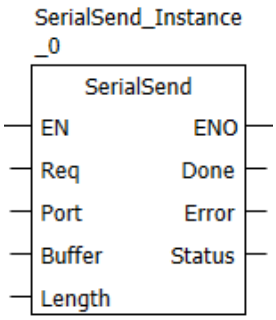
  ST:

Name	Data type	Address	Value	Prepare value
SerialRcv_Instance_0	SerialRcv			
recvbuffer	POINTER TO BYTE		3009802426	
port0	UINT		0	
L1	UINT		10	
time1	UINT		0	
recvaddr	STRING		'1234567890'	
recvlen	UINT		10	
error	BOOL		FALSE	
status	WORD		0	
done	BOOL		TRUE	

```
SerialRcv_Instance_0(
Req TRUE := TRUE,
Port 0 := port0 0 ,
Len 10 := L1 10 ,
TimeOut 0 := time1 0 ,
Buffer 3009802426 := recvbuffer 3009802426 ,
Ndr TRUE => done TRUE ,
RcvLen 10 =>recvlen 10 ,
Error FALSE => error FALSE ,
Status 0 => status 0 );RETURN
```

  LD:

- **Precautions**
  - The actual length of received byte and baud rate are related to the task cycle. If the task cycle is shorter than the time required to receive the bytes, only part of the data may be received, because the baud rate determines the time needed to receive one byte of data.
  - Ensure that the size of data reception area is greater than or equal to the received byte length; otherwise, there is a risk of memory access out of bounds.
- **Status code**



Status code	Note
0	Done
1000	Function not activated
1001	Serial port number error
1007	Reception address error
1008	No data
2000	Numbers of bytes received error
2001	Incorrect buffer parameter
3000	Data being received
3001	Data reception timeout

Status code	Note
3002	Data reception failed

18.4.7.3 SerialSend

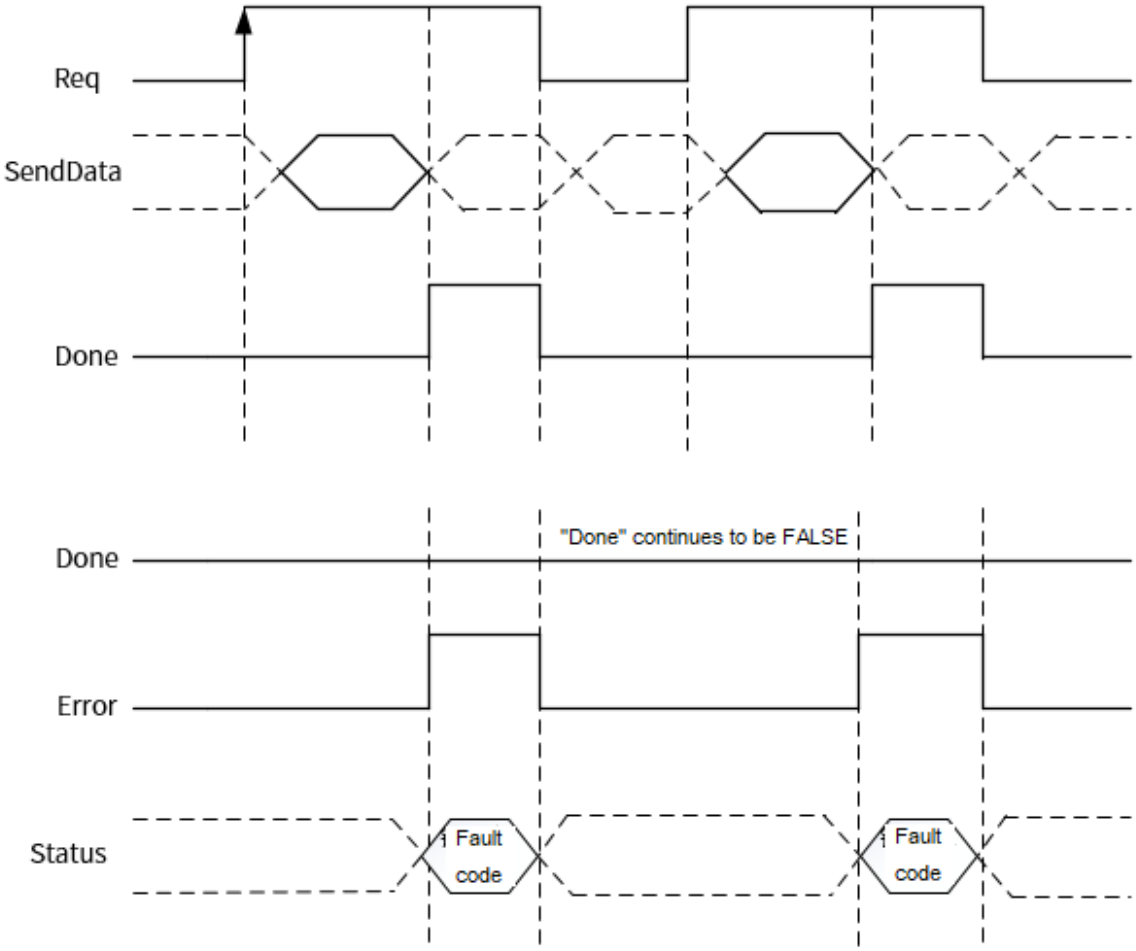
This is the serial port free port data sending instruction.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SerialSend	Serial port free port data sending instruction	FB		SerialSend_Instance_0(Req := , Port := , Buffer := , Length:=, Done => , Error => , Status =>);

- **Related variables**

Variable



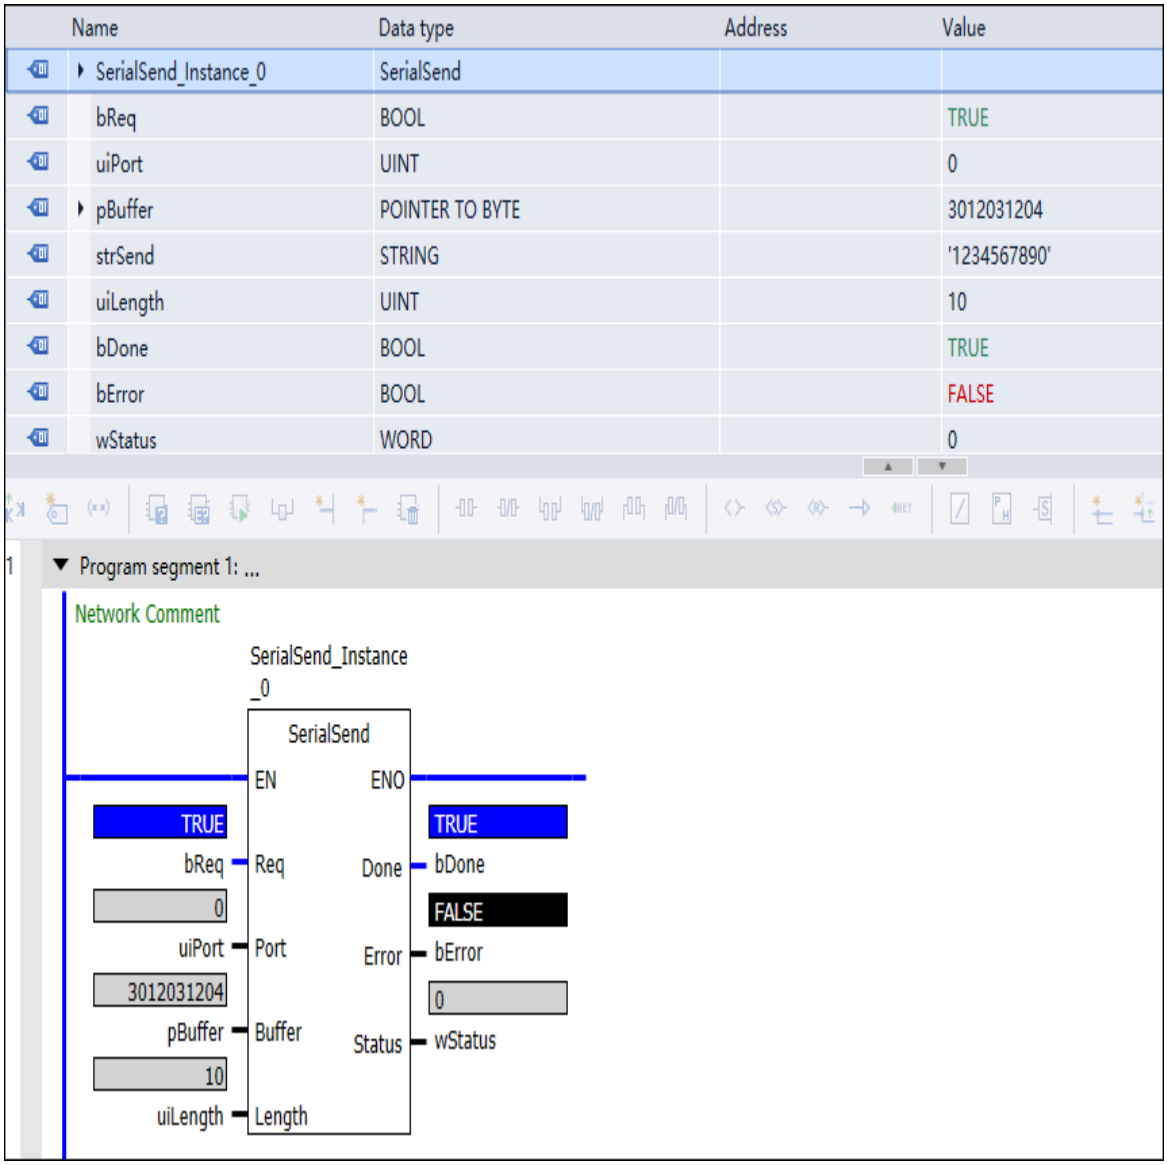
Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Req	Enable start bit to send data	BOOL	Follows data type	FALSE	Enable start bit, active on rising edge.
	Port	Communication port	UINT	Follows data type	0	Serial port number configured through the software interface. 0: Built-in COM port of the PLC. 1: Expansion card A on the PLC 2: Expansion card B on the PLC
	Buffer	Data transmission buffer	POINTER TO BYTE	Follows data type	-	Pointer to the sending data buffer.
	Length	Transmit data length	UINT	1 to 1024	1024	Receive and transmit data length.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	Done	Completion flag	BOOL	Follows data type	FALSE	Completion flag: FALSE: Sending not started or in progress. TRUE: Sending done.
	Error	Error flag	BOOL	Follows data type	FALSE	Error flag: 0: No error. 1: Sending error.
	Status	Status flag	WORD	Follow data type	1000	See Status code.

- **Function**

  This is the serial port free port data sending instruction.

- **Sequence diagram**



- **Program example**

  ST:

Name	Data type	Address	Value
SerialSend_Instance_0	SerialSend		
bReq	BOOL		TRUE
uiPort	UINT		0
pBuffer	POINTER TO BYTE		3012031068
strSend	STRING		'1234567890'
uiLength	UINT		10
bDone	BOOL		TRUE
bError	BOOL		FALSE
wStatus	WORD		0

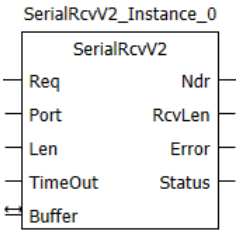
```
SerialSend_Instance_0(
Req TRUE := bReq TRUE,
Port 0 := uiPort 0,
Buffer 3012031068 := pBuffer 3012031068,
Length 10 := uiLength 10,
Done TRUE => bDone TRUE,
Error FALSE => bError FALSE,
Status 0 => wStatus 0 );RETURN
```

LD:

- **Precautions**

  The actual length of sent byte and baud rate are related to the task cycle. If the task cycle is shorter than the time required to send the bytes, only part of the data may be sent, because the baud rate determines the time needed to send one byte of data.

- **Status code**



Status code	Note
0	Done
1000	Function not activated
1001	Serial port number error
1007	Sending address error
2000	Number of bytes sent error
2001	Incorrect buffer parameter
3000	Data being sent

Status code	Note
3002	Data sending failed

18.4.7.4 SerialRcvV2

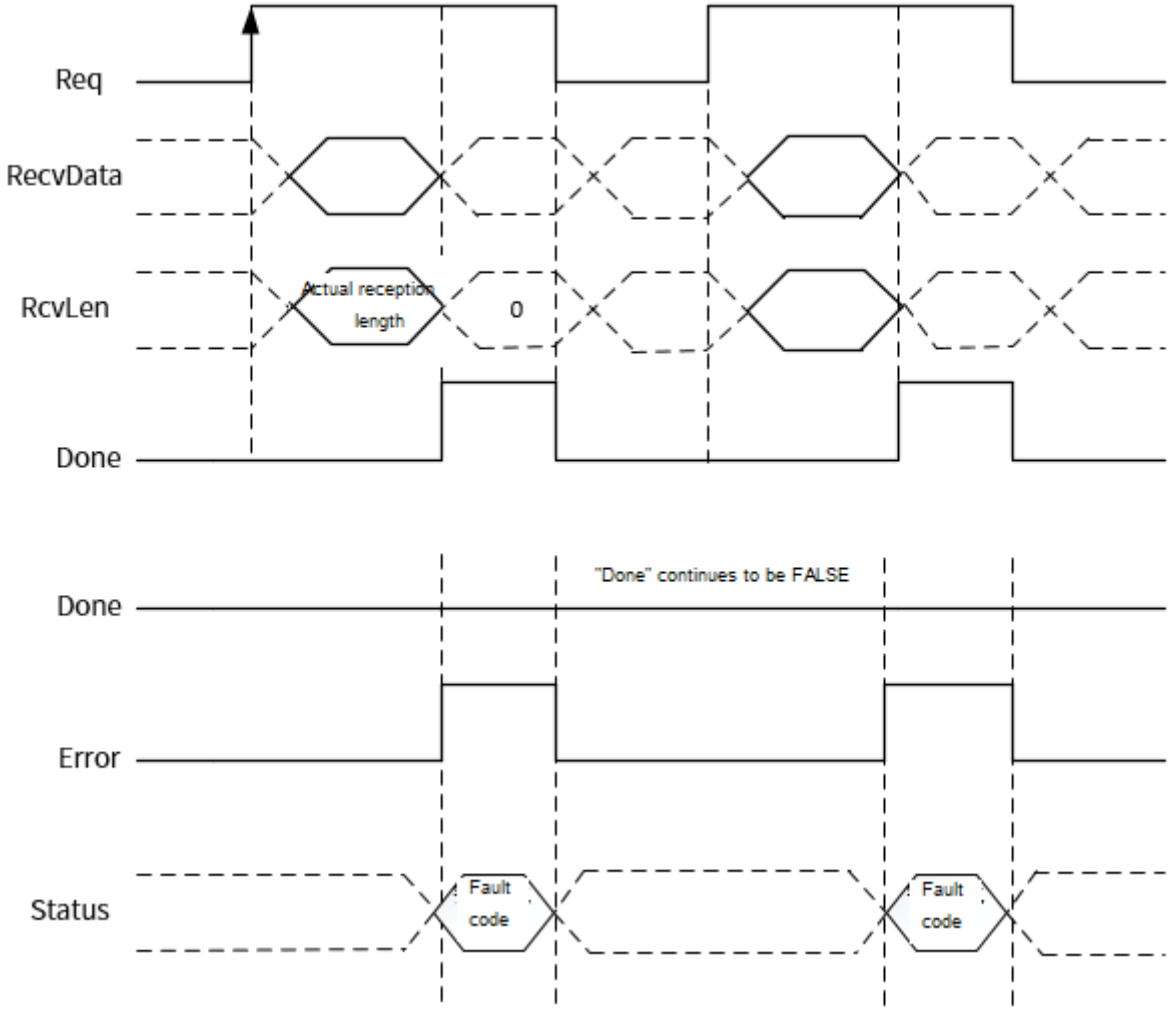
This instruction receives data through serial ports by using freeport.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SerialRcvV2	Serial port freeport reception	FB		SerialRcvV2_Instance_0(Req := , Port := , Len := , TimeOut := , Buffer := , Ndr => , RcvLen => , Error => , Status =>);

- **Related variables**

Variable



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Req	Data enable start bit	BOOL	Follows data type	FALSE	Enable start bit, active at high level.
	Port	Communication port	UINT	Follows data type	0	Serial port number configured through the software interface. 0: Built-in COM port of the PLC. 1: Expansion card A on the PLC 2: Expansion card B on the PLC
	Len	Received data length	UINT	1 to 1024	1024	When Len = 0, it indicates receiving data of indefinite length, and the maximum size of received data is determined by the Data. When Len > 0, it indicates receiving data of fixed length, with a range of 1 to 1024 bytes.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	TimeOut	Timeout period	UINT	Follows data type	0	Timeout period in ms, with a default value of 0 indicating no timeout.
Input/ Output	Buffer	Data reception buffer	ARRAY[*] OF BYTE	Follows data type	-	Data reception buffer.
Output	Ndr	Completion flag	BOOL	Follows data type	FALSE	Completion flag: FALSE: Reception not started or in progress. TRUE: Reception done.
	RcvLen	Received data length	UINT	1 to 1024	0	Actual length of received data.
	Error	Error flag	BOOL	Follows data type	FALSE	Error flag: 0: No error. 1: Reception error.
	Status	Status flag	WORD	Follow data type	1000	See Status code.

- **Function**

  This instruction receives data through serial ports by using freeports.

- **Sequence diagram**

- **Program example**

  ST:

Name	Data type	Address	Value	Prepare value
SerialRcvV2_Instance_1	SerialRcvV2			
N2	BOOL		TRUE

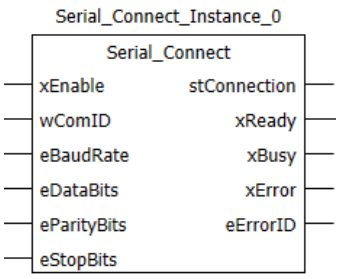
Done   TRUE    => done1  TRUE   ,
Error  FALSE   => error1 FALSE  ,
Status   0     => status1   0    );
```

LD:

Name	Data type	Address	Value	Prepare value
SerialSendV2_Instance_0	SerialSendV2			
N1	BOOL		TRUE	
SerialRcvV2_Instance_0	SerialRcvV2			
N2	BOOL		FALSE	
P0	UINT		0	
L1	UINT		10	
P1	UINT		1	
L2	UINT		0	
T0	UINT		0	
sendbuff	ARRAY [1..20] OF BYTE			
recvbuff	ARRAY [1..20] OF BYTE			

- **Precautions**

The actual length of sent byte and baud rate are related to the task cycle. If the task cycle is shorter than the time required to send the bytes, only part of the data may be sent, because the baud rate determines the time needed to send one byte of data.



- **Status code**

Status code	Note
0	Done
1000	Function not activated
1001	Serial port number error
1007	Sending address error
2000	Number of bytes sent error
2001	Incorrect buffer parameter
3000	Data being sent
3002	Data sending failed

18.4.7.6 Serial_Connect

This instruction establishes a connection via the serial port using a free protocol.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
Serial_Connect	Create a serial port connection	FB		Serial_Connect_Instance_0(xEnable := , wComID := , eBaudRate := , eDataBits := , eParityBits := , eStopBits := , stConnection => , xReady => , xBusy => , xError => , eErrorID =>);

- **Related variables**

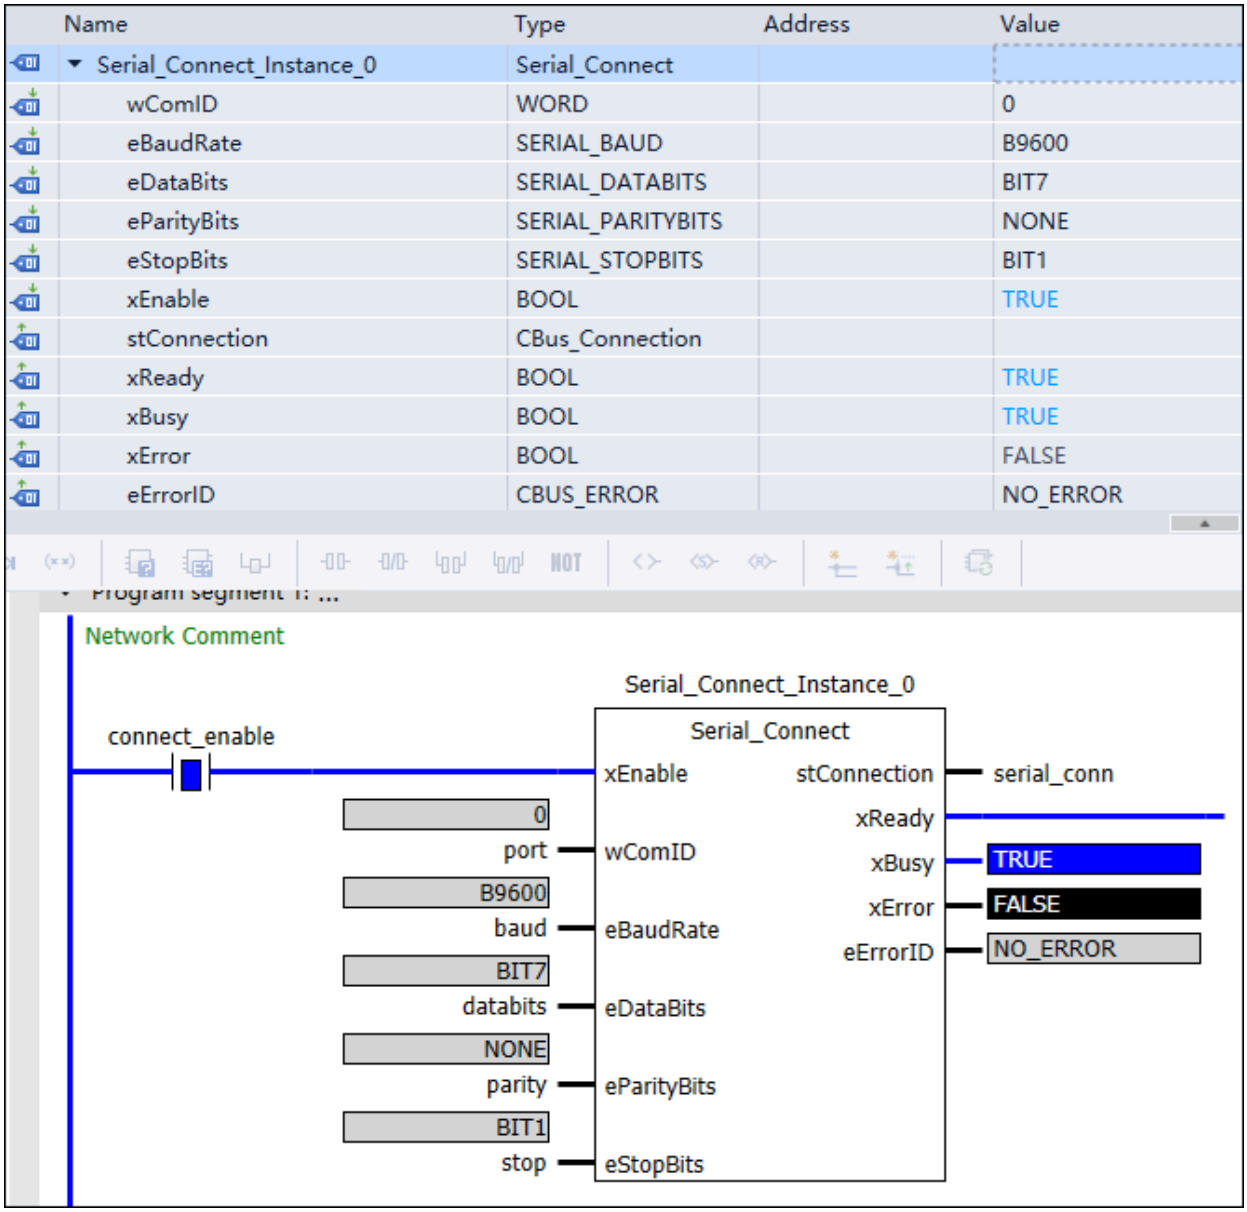
Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Function block enable	BOOL	Follows data type	FALSE	Level triggered

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	wComID	Serial port number	WORD	Follow data type	0	COM port number. The value of wComID identifies serial ports, whose available number varies by product. For details, see relevant product guides. Take the EVO500 series as example: 0: Onboard serial port of the PLC 1: Expansion card A on the PLC 2: Expansion card B on the PLC
	eBaudRate	Baud rate	SERIAL_BAUD	Follows data type	SERIAL_BAUD.B9600	Baud rate, unit: bps SERIAL_BAUD.B4800: 4800bps. SERIAL_BAUD.B9600: 9600bps. SERIAL_BAUD.B19200: 19200bps. SERIAL_BAUD.B38400: 38400bps. SERIAL_BAUD.B57600: 57600bps. SERIAL_BAUD.B115200: 115200bps.
	eDataBits	Data bit	SERIAL_DATABITS	Follows data type	SERIAL_DATABITS.BIT8	Data bit SERIAL_DATABITS.BIT7: 7 data bits SERIAL_DATABITS.BIT8: 8 data bits

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	eParityBits	Parity bit	SERIAL_PARITYBITS	Follows data type	SERIAL_PARITYBITS.NONE	Parity bit SERIAL_PARITYBITS.NONE: No parity SERIAL_PARITYBITS.ODD: Odd parity SERIAL_PARITYBITS.EVEN: Even parity
	eStopBits	Stop bit	SERIAL_STOPBITS	Follows data type	SERIAL_STOPBITS.BIT1	Stop bit SERIAL_STOPBITS.BIT1: 1 data bit SERIAL_STOPBITS.BIT2: 2 data bits
Output	stConnection	Connection handle	CBus_Connection	Follows data type	-	Connection handle.
	xReady	Instruction status	BOOL	Follows data type	FALSE	Indicates the function block is active
	xBusy	Instruction execution flag	BOOL	Follows data type	FALSE	Function block execution flag
	xError	Error flag	BOOL	Follows data type	FALSE	Indicates the function block is faulty
	eErrorID	Fault code	CBUS_ERROR	Follows data type	0	Fault code of function block. For details, see 18.4.5.6 Fault Codes.

- **Function**

  You can open the serial port to modify the baud rate, parity and other parameters during operation.



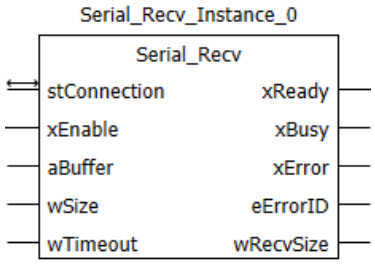
- **Program example**

  ST:

Name	Type	Address	Value
Serial_Connect_Instance_0	Serial_Connect		
wComID	WORD		0
eBaudRate	SERIAL_BAUD		B4800
eDataBits	SERIAL_DATABITS		BIT7
eParityBits	SERIAL_PARITYBITS		NONE
eStopBits	SERIAL_STOPBITS		BIT1
xEnable	BOOL		TRUE
stConnection	CBus_Connection		
xReady	BOOL		TRUE
xBusy	BOOL		TRUE
xError	BOOL		FALSE

```
                                    eErrorID NO_ERROR => area_errorid NO_ERROR );
Serial_Connect_Instance_0(xEnable TRUE := connect_enable TRUE ,
                          wComID 0 := port 0 ,
                          eBaudRate B4800 := baud B4800 ,
                          eDataBits BIT7 := databits BIT7 ,
                          eParityBits NONE := parity NONE ,
                          eStopBits BIT1 := stop BIT1 ,
                          stConnection => serial_conn,
                          xReady TRUE => connect_ready TRUE ,
                          xBusy TRUE => connect_busy TRUE ,
                          xError FALSE => connect_error FALSE ,
                          eErrorID NO_ERROR => connect_errorid NO_ERROR );
```

LD:



- **Precautions**
  - The connection handle of Serial_Connect handle can only be used by one instruction (Serial_Recv, Serial_Send, Serial_Recv_Ch, or Serial_Recv_By_Idle_Time) at the same time.
  - Ensure that multiple instructions with the same connection handle are used in the same user task.
  - Online parameter modifications will not take effect immediately, requiring the instruction to be re-enabled.
  - The value of wComID identifies serial ports, whose available number varies by product. For details, see relevant product guides. For example, on the EVO500 series, 0 represents the PLC onboard serial port, while 1 and 2 represent expansion cards A and B respectively.
  - Check the COM ports for locally or remotely mounted GL20_2S485/GL20_2SCOM modules as follows: In the project tree, double-click GL20_2S485 or GL20_2SCOM to open the configuration interface, and then check the COM number in the "General configuration" tab.

18.4.7.7 Serial_Recv

This instruction receives data through serial ports by using free protocols. It receives fixed-byte data, and terminate reception once the length of received bytes reach the preset value.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
Serial_Recv	Receive serial port data	FB		Serial_Recv_Instance_0(st Connection := , xEnable := , aBuffer := , wSize := , wTimeout := , xReady => , xBusy => , xError => , eErrorID => , wRecvSize =>);

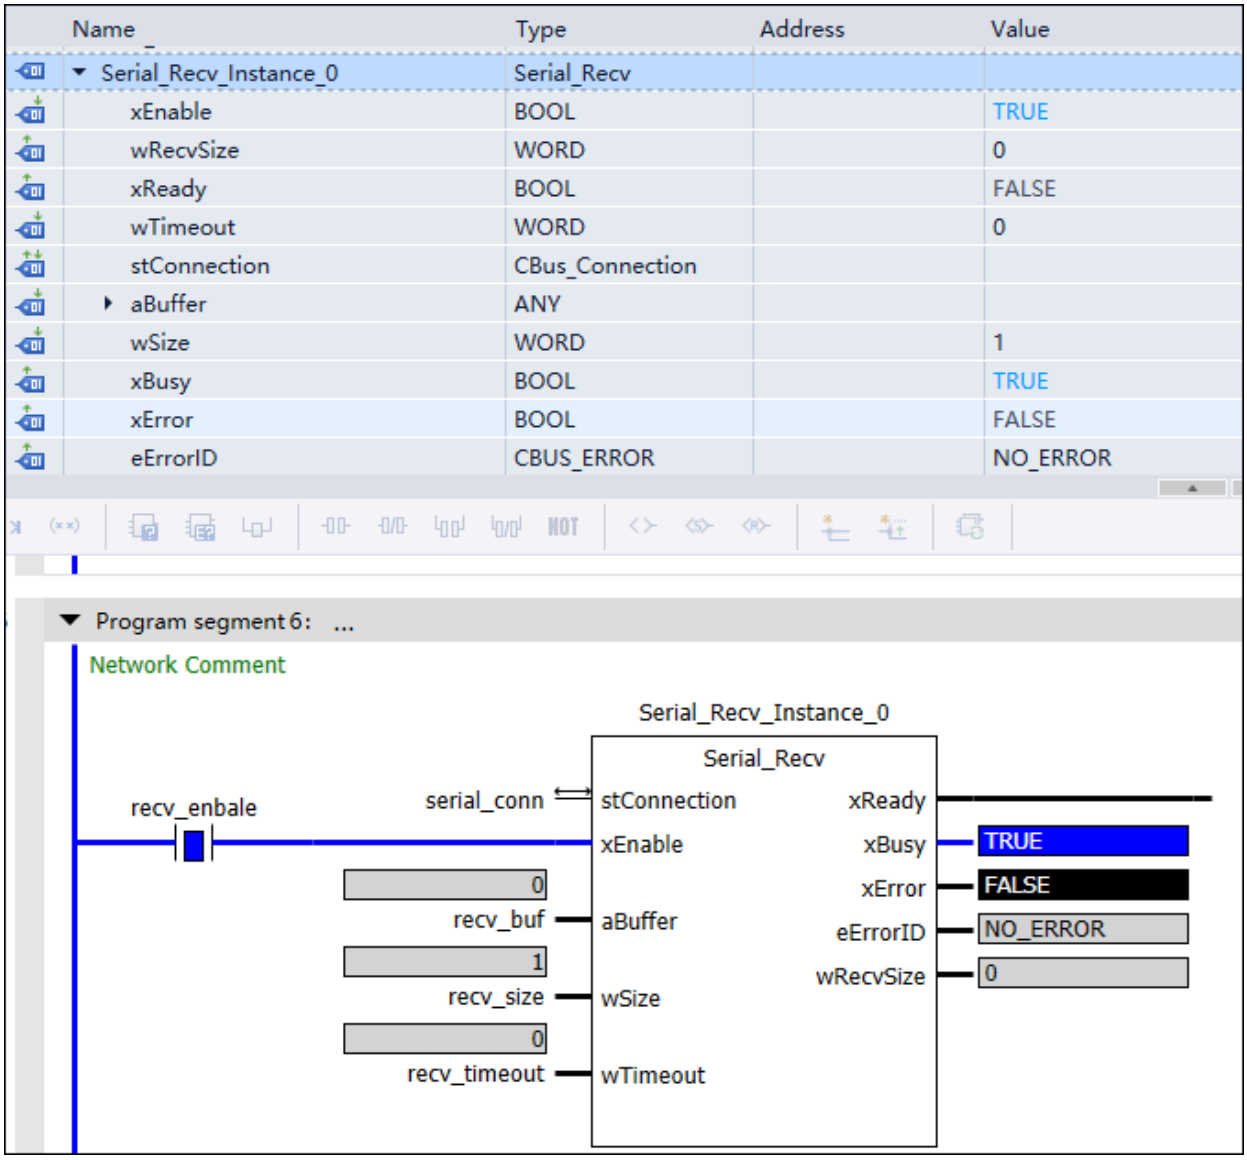
- **Related variables**

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input/Output	stConnection	Connection handle	CBus_Connection	Follows data type	-	Connection handle.
Input	xEnable	Function block enable	BOOL	TRUE, FALSE	FALSE	Level triggered
	aBuffer	Receive buffer	ANY	Follows data type	-	Serial port reception buffer
	wSize	Number of bytes to receive	WORD	Follow data type	0	Number of data bytes to receive from the serial port
	wTimeout	Timeout interval (ms)	WORD	Follow data type	0	Timeout interval of serial port data
Output	xReady	Instruction status	BOOL	TRUE, FALSE	FALSE	Indicates the function block is active
	xBusy	Instruction execution flag	BOOL	TRUE, FALSE	FALSE	Function block execution flag
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Indicates the function block is faulty

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	eErrorID	Fault code	CBUS_ERROR	Follows data type	-	Fault code of function block. For details, see 1 8.4.5.6 Fault Codes.
	wRecvSize	Number of received bytes	WORD	Follow data type	0	Number of data bytes received from the serial port

- **Function**

  This instruction receives and stores serial port data in reception buffer. The serial port stays in receiving state continuously. When wRecvSize is set to wSize, the data reception completes. xReady will be set to one cycle and reset in the next cycle. wRecvSize will be cleared to zero, and then a new reception begins.



- **Program example**

  ST:

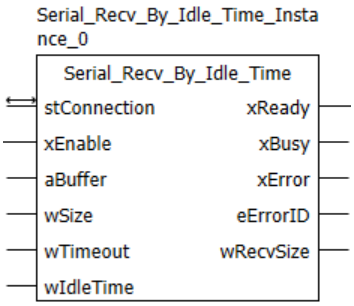
Name	Type	Address	Value
Serial_Recv_Instance_0	Serial_Recv		
xEnable	BOOL		TRUE
wRecvSize	WORD		0
xReady	BOOL		FALSE
wTimeout	WORD		0
stConnection	CBus_Connection		
aBuffer	ANY		
wSize	WORD		1
xBusy	BOOL		TRUE
xError	BOOL		FALSE
eErrorID	CBUS_ERROR		NO_ERROR

```
Serial_Recv_Instance_0(stConnection := serial_conn,
                       xEnable TRUE  := recv_enbale TRUE ,
                       aBuffer := recv_buf  0 ,
                       wSize  1  := recv_size  1 ,
                       wTimeout  0  := recv_timeout  0 ,
                       xReady FALSE  => recv_ready1 FALSE ,
                       xBusy TRUE  => recv_busy1 TRUE ,
                       xError FALSE  => recv_error1 FALSE ,
                       eErrorID NO_ERROR  => recv_errorid1 NO_ERROR ,
                       wRecvSize  0  => recv_rsize1  0 );
```

  LD:

- **Precautions**
  - It must be used with the Serial_Connect instruction.
  - The reception does not stop by timeout when wTimeout is set to 0. If a timeout interval is set, timeout timing starts on reception failure or idle serial bus.
    - If there is still no data when the timeout interval expires, an error will be reported for receiving timeout.
    - If timeout not reached and serial data is received, reset timeout.
  - When wRecvSize is set to wSize, the data reception is complete, xReady will be set to one cycle and reset in the next cycle, and wRecvSize will be cleared.
  - Data types loaded by aBuffer:
    - Supported types:
      - One-dimensional array.
      - Data types of arrays/variables: BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, and REAL.
    - Unsupported types:
      - Multidimensional arrays.
      - 64-bit data types: LWORD, LINT, ULINT, and LREAL.

- Special types: STRING, WSTRING, TIME, TIME_OF_DAY(TOD), DATE, DATE_AND_TIME(DT), POINTER, and STRUCT.



◦ aBuffer cannot be directly set to I/Q/M direct variables. It must be mapped to the above supported variables or array data via AT mapping.

◦ Online parameter modifications do not take effect immediately. It is necessary to re-enable the instruction.

18.4.7.8 Serial_Recv_By_Idle_Time

This instruction receives data through serial ports by using free protocols, and determines reception completion based on bus idle time.

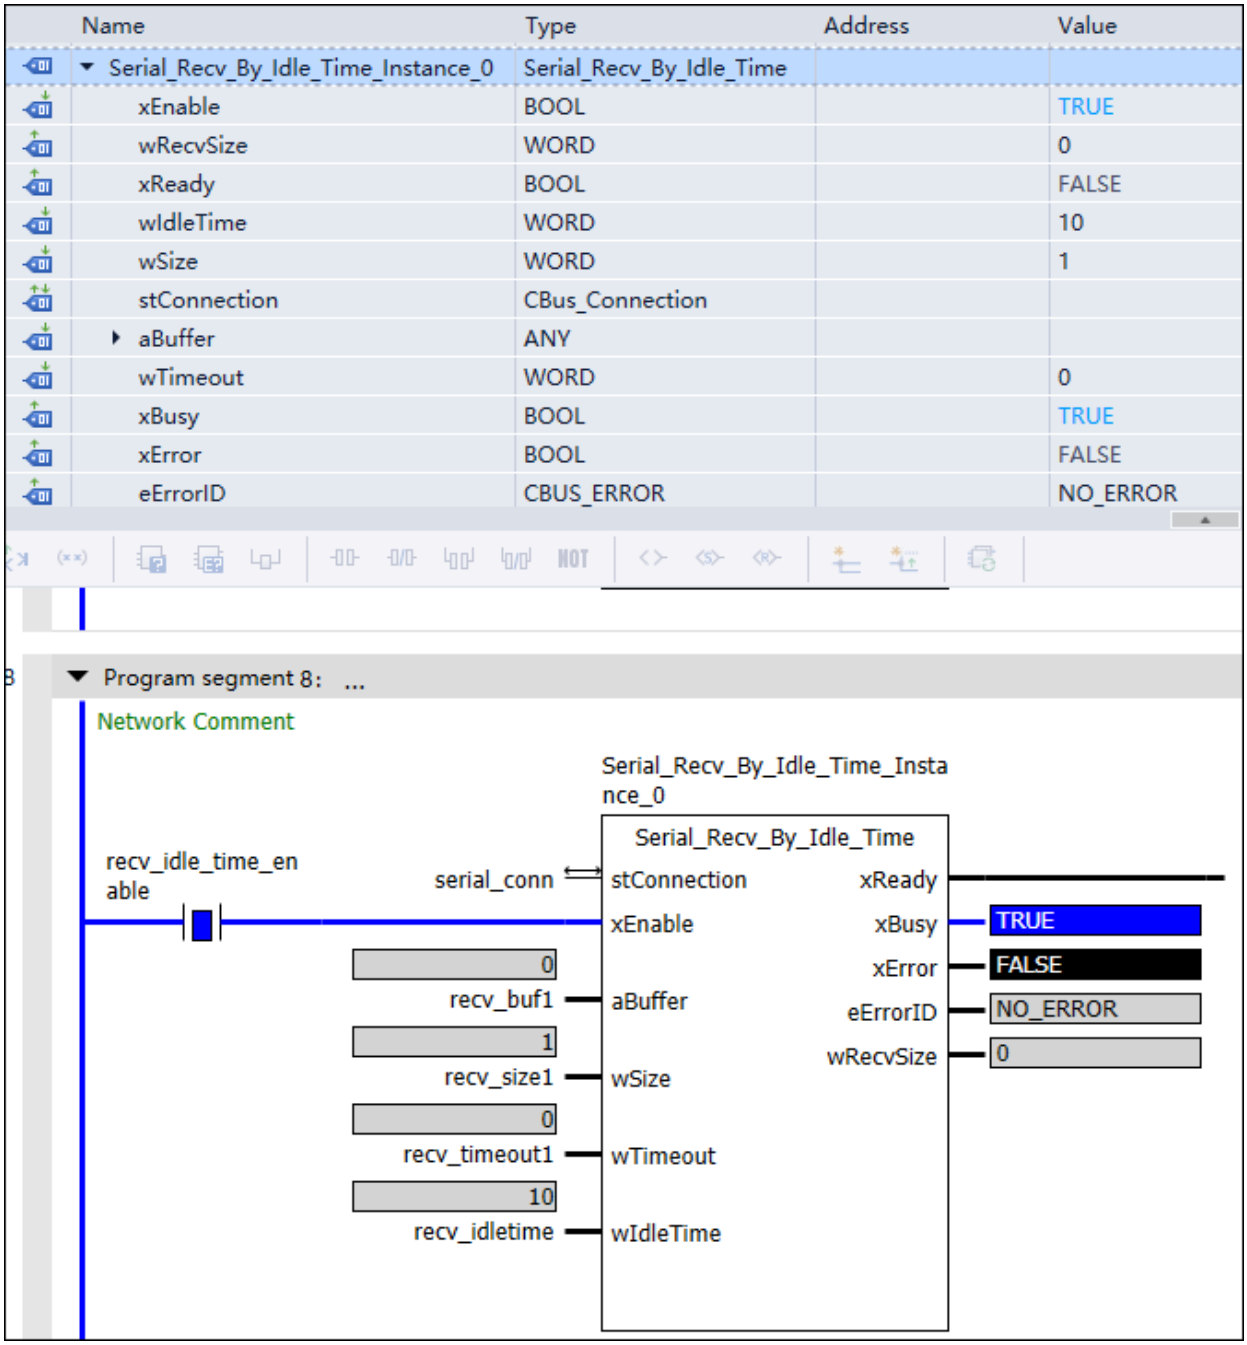
- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
Serial_Recv_By_Idle_Time	Receive serial port data during bus idle time	FB		Serial_Recv_By_Idle_Time_Instance_0(stConnection := , xEnable := , aBuffer := , wSize := , wTimeout := , wIdleTime := , xReady => , xBusy => , xError => , eErrorID => , wRecvSize =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input/ Output	stConnection	Connection handle	CBus_Connection	Follows data type	-	Connection handle.
Input	xEnable	Function block enable	BOOL	TRUE, FALSE	FALSE	Level triggered
	aBuffer	Receive buffer	ANY	Follows data type	-	Serial port reception buffer
	wSize	Number of bytes to receive	WORD	Follow data type	0	Number of data bytes to receive from the serial port
	wTimeout	Timeout interval (ms)	WORD	Follow data type	0	Timeout interval of serial port data

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	wIdleTime	Bus idle time (ms)	WORD	Follow data type	0	Indicates the serial port bus idle time (ms)
Output	xReady	Instruction status	BOOL	TRUE, FALSE	FALSE	Indicates the function block is active
	xBusy	Instruction execution flag	BOOL	TRUE, FALSE	FALSE	Function block execution flag
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Indicates the function block is faulty
	eErrorID	Fault code	CBUS_ERROR	Follows data type	0	Fault code of function block. For details, see 18.4.5.6 Fault Codes.
	wRecvSize	Number of received bytes	WORD	Follow data type	0	Indicates the number of data bytes already received from the serial port



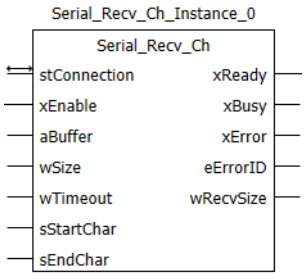
- **Function**
  After data reception, if no new data is received beyond wIdleTime (ms), xReady is set to indicate that the reception is complete and the next reception cycle begins.
- **Program example**

  ST:

Name	Type	Address	Value
Serial_Recv_By_Idle_Time_Instance_0	Serial_Recv_By_Idle_Time		
xEnable	BOOL		TRUE
wRecvSize	WORD		0
xReady	BOOL		FALSE
wIdleTime	WORD		2
wSize	WORD		1
stConnection	CBus_Connection		
aBuffer	ANY		
wTimeout	WORD		0
xBusy	BOOL		TRUE
xError	BOOL		FALSE
eErrorID	CBUS_ERROR		NO_ERROR

```
Serial_Recv_By_Idle_Time_Instance_0(stConnection := serial_conn,
                                    xEnable TRUE  := recv_idle_time_enable TRUE ,
                                    aBuffer := recv_buf1  0 ,
                                    wSize  1  := recv_size1  1 ,
                                    wTimeout  0  := recv_timeout1  0 ,
                                    wIdleTime  2  := recv_idletime  2 ,
                                    xReady FALSE  => recv_ready3 FALSE ,
                                    xBusy TRUE  => recv_busy3 TRUE ,
                                    xError FALSE  => recv_error3 FALSE ,
                                    eErrorID NO_ERROR  => recv_errorid3 NO_ERROR ,
                                    wRecvSize  0  => recv_rsize3  0 );
```

LD:



- **Precautions**
  - It must be used with the Serial_Connect instruction.
  - The reception does not stop by timeout when wTimeout is set to 0. If a timeout interval is set, timeout timing starts on reception failure or idle serial bus.
    - If there is still no data when the timeout interval expires, an error will be reported for receiving timeout.
    - If timeout not reached and serial data is received, reset timeout.
  - When wRecvSize is set to wSize, the data reception is complete, xReady will be set to one cycle and reset in the next cycle, and wRecvSize will be cleared.
  - Data types loaded by aBuffer:
    - Supported types:
      - One-dimensional array.
      - Data types of arrays/variables: BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, and REAL.

- Unsupported types:
  - Multidimensional arrays.
  - 64-bit data types: LWORD, LINT, ULINT, and LREAL.
  - Special types: STRING, WSTRING, TIME, TIME_OF_DAY(TOD), DATE, DATE_AND_TIME(DT), POINTER, and STRUCT.
- aBuffer cannot be directly set to I/Q/M direct variables. It must be mapped to the above supported variables or array data via AT mapping.
- Online parameter modifications do not take effect immediately. It is necessary to re-enable the instruction.
- The task cycle time must be less than or equal to wIdleTime. Otherwise, the instruction will not work effectively.
- The wIdleTime value must be estimated based on the baud rate and the amount of data sent. For example, at a baud rate of 115200, 80 bytes take approximately 7 to 8 ms to complete reception. If the communication partner sends data every 10 ms, set wIdleTime to less than 2 ms. Otherwise, if the next data frame arrives before a sufficiently long idle time (i.e., within 10 ms), the received data may be incorrect.

18.4.7.9 Serial_Recv_Ch

This instruction receives data through serial ports by using free protocols. The reception starts only when a start character is detected in the received data, and stops when an end character is detected.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
Serial_Recv_Ch	Receive serial port data with start/end character	FB		Serial_Recv_Ch_Instance_0(stConnection := , xEnable := , aBuffer := , wSize := , wTimeout := , sStartChar := , sEndChar := , xReady => , xBusy => , xError => , eErrorID => , wRecvSize =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input/ Output	stConnection	Connection handle	CBus_Connection	Follows data type	-	Connection handle.

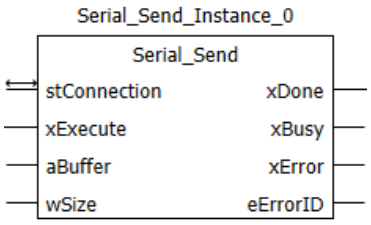
stConnection	CBus_Connection		
aBuffer	ANY		
wTimeout	WORD		0
xBusy	BOOL		TRUE
xError	BOOL		FALSE
eErrorID	CBUS_ERROR		NO_ERROR

```
Serial_Recv_Ch_Instance_0(stConnection := serial_conn,
                          xEnable TRUE  := recv_ch_enable TRUE ,
                          aBuffer := recv_ch_buf,
                          wSize    10    := recv_ch_size    10    ,
                          wTimeout  0    := recv_ch_timeout  0    ,
                          sStartChar  '12'  := startchar  '12'  ,
                          sEndChar  '34'  := endchar  '34'  ,
                          xReady FALSE => recv_ready2 FALSE ,
                          xBusy TRUE => recv_busy2 TRUE ,
                          xError FALSE => recv_error2 FALSE ,
                          eErrorID NO_ERROR => recv_errorid2 NO_ERROR ,
                          wRecvSize  0    => recv_rsize2  0    );
```

LD:



- **Precautions**
  - It must be used with the Serial_Connect instruction.
  - The reception does not stop by timeout when wTimeout is set to 0. If a timeout interval is set, timeout timing starts on reception failure or idle serial bus.
    - If there is still no data when the timeout interval expires, an error will be reported for receiving timeout.
    - If timeout not reached and serial data is received, reset timeout.
  - When wRecvSize is set to wSize, the data reception is complete, xReady will be set to one cycle and reset in the next cycle, and wRecvSize will be cleared.
  - Data types loaded by aBuffer:
    - Supported types:
      - One-dimensional array.
      - Data types of arrays/variables: BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, and REAL.
    - Unsupported types:
      - Multidimensional arrays.
      - 64-bit data types: LWORD, LINT, ULINT, and LREAL.
      - Special types: STRING, WSTRING, TIME, TIME_OF_DAY(TOD), DATE, DATE_AND_TIME(DT), POINTER, and STRUCT.

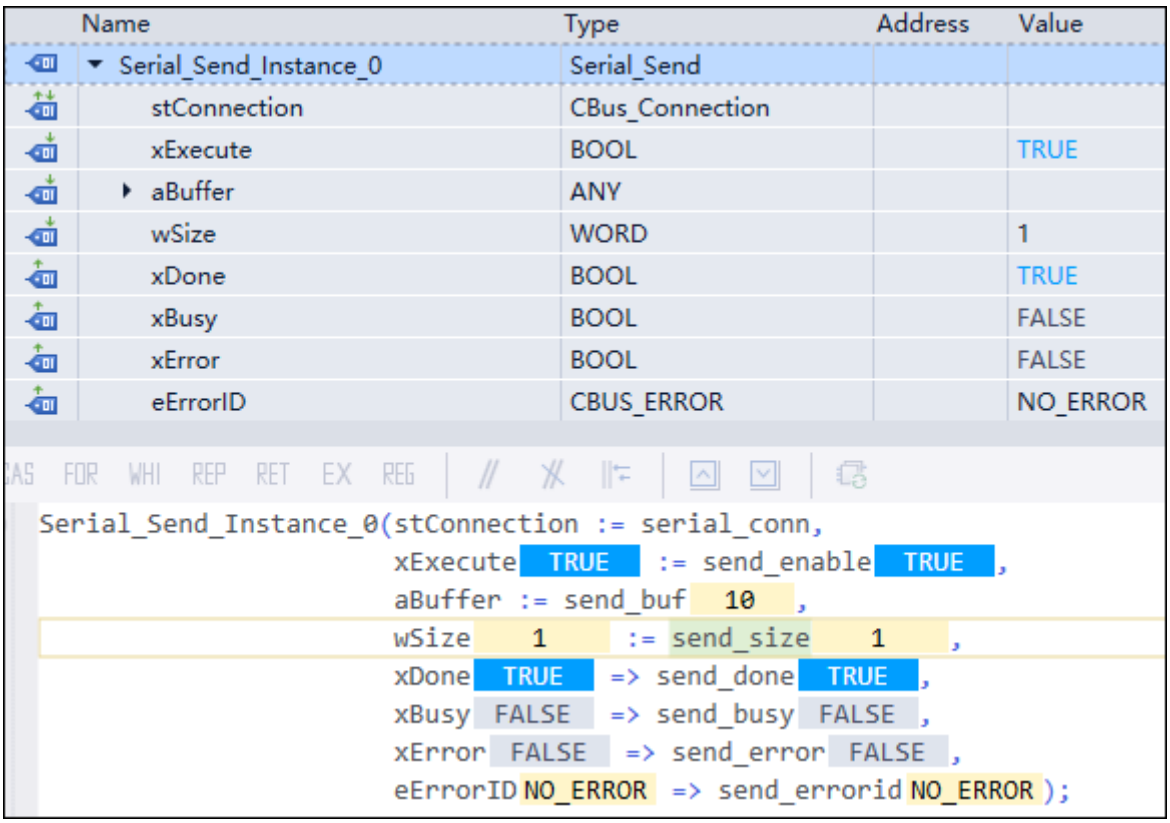
- aBuffer cannot be directly set to I/Q/M direct variables. It must be mapped to the above supported variables or array data via AT mapping.
- Online parameter modifications do not take effect immediately. It is necessary to re-enable the instruction.

18.4.7.10 Serial_Send

This instruction send commands via serial port free protocol.

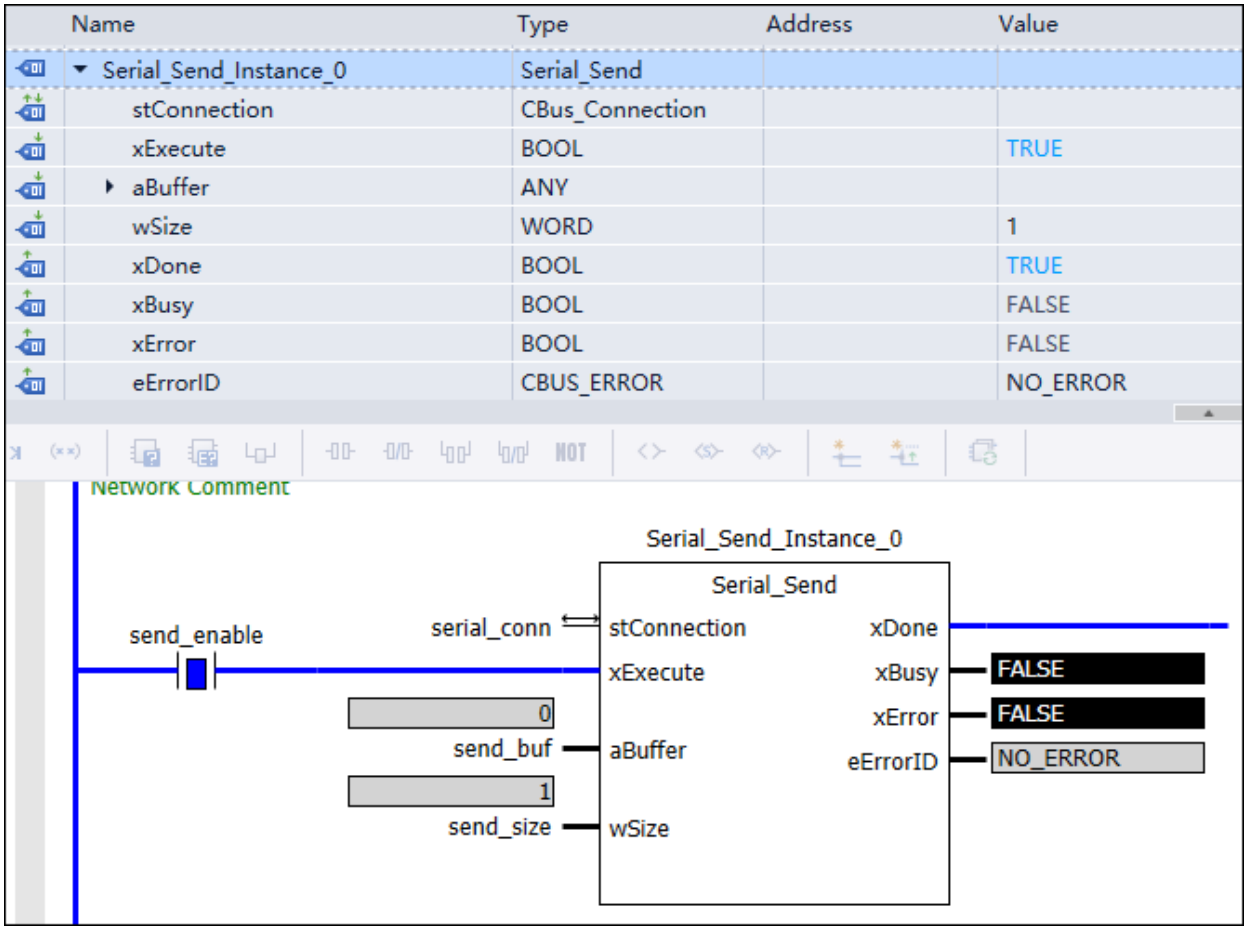
- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
Serial_Send	Send serial port data	FB		Serial_Send_Instance_0(stConnection := , xExecute := , aBuffer := , wSize := , xDone => , xBusy => , xError => , eErrorID =>);



- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input/ Output	stConnection	Connection handle	CBus_Connection	Follows data type	-	Connection handle.
Input	xExecute	Function block enable	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered
	aBuffer	Send buffer	ANY	Follows data type	-	Serial port transmission buffer
	wSize	Number of bytes to transmit	WORD	Follow data type	0	Number of bytes to transmit by serial port
Output	xDone	Done flag	BOOL	TRUE, FALSE	FALSE	Function block execution completion flag
	xBusy	Instruction execution flag	BOOL	TRUE, FALSE	FALSE	Function block execution flag
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Indicates the function block is faulty



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	eErrorID	Fault code	CBUS_ERROR	Follows data type	0	Fault code of function block. For details, see 18.4.5.6 Fault Codes.

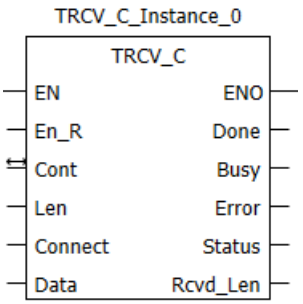
- **Function**
  This instruction starts data transmission to send data in the transmission buffer by using the serial port bus.
- **Program example**

  ST:

  LD:

- **Precautions**
  - It must be used with the Serial_Connect instruction.
  - Data types loaded by aBuffer:
    - Supported types:
      - One-dimensional array.
      - Data types of arrays/variables: BYTE, WORD, DWORD, SINT, USINT, INT, UINT, DINT, UDINT, and REAL.
    - Unsupported types:
      - Multidimensional arrays.
      - 64-bit data types: LWORD, LINT, ULINT, and LREAL.
      - Special types: STRING, WSTRING, TIME, TIME_OF_DAY(TOD), DATE, DATE_AND_TIME(DT), POINTER, and STRUCT.
  - aBuffer cannot be directly set to I/Q/M direct variables. It must be mapped to the above supported variables or array data via AT mapping.
  - Online parameter modifications do not take effect immediately. It is necessary to re-enable the instruction.
  - The send and recv instructions (Serial_Recv, Serial_Recv_Ch, and Serial_Recv_By_Idle_Time) can be used at the same time. However, data corruption may occur on the half-duplex RS485 interface, so it is not recommended to use two types of instructions simultaneously in RS485 mode.
    Concurrent use is allowed for RS232 interface.

18.4.8 Free Network Port



18.4.8.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.8.2 TRCV_C	FB	Network port freeport reception	NetFreePort	Applicable to library version 1.0.0.0
18.4.8.3 TSEND_C	FB	Ethernet free port data sending instruction		Applicable to library version 1.0.0.0
18.4.8.4 TRCV_CV2	FB	Network port freeport reception		Library version 1.1.0.0 and later
18.4.8.5 TSEND_CV2	FB	Ethernet free port data sending instruction		Library version 1.1.0.0 and later

18.4.8.2 TRCV_C

This instruction receives data through network ports by using freeports.

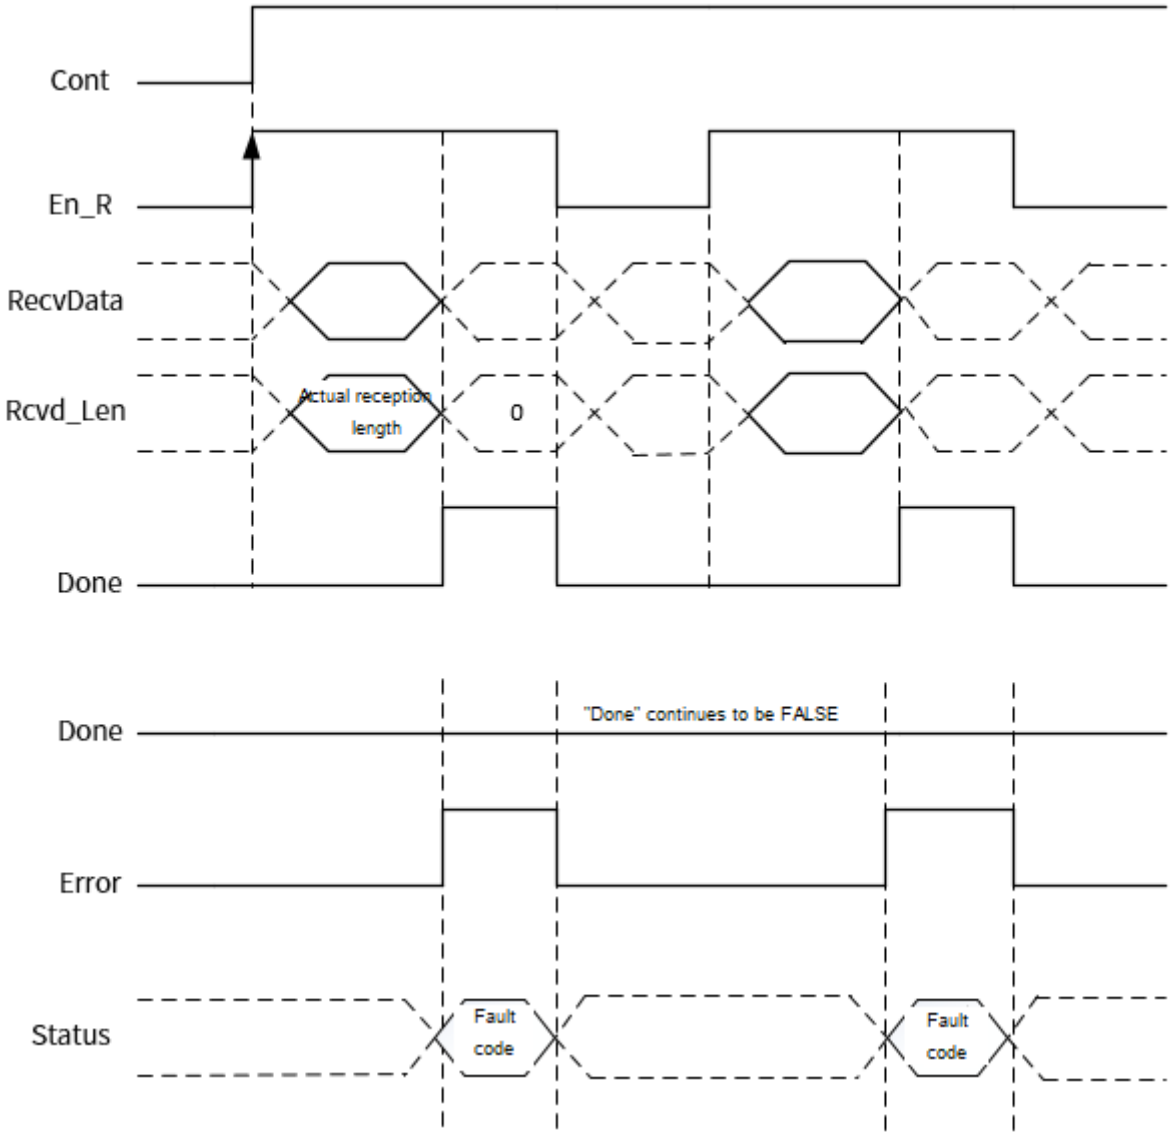
- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
TRCV_C	Network port freeport reception	FB		TRCV_C_Instance_0(En_R := , Cont := , Len := , Connect := , Data := , Done => , Busy =>, Error => , Status => , Rcvd_Len =>);

- **Related variables**

  Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	En_R	Enable start bit to receive data	BOOL	Follows data type	FALSE	Enable start bit, active at high level.
Input/ Output	Cont	Control communication connection	BOOL	Follows data type	FALSE	Control communication connection: FALSE: Disconnect the communication connection. TRUE: Establish the communication connection and maintain it after data is received.
Input	Len	Received data length	UDINT	Follows data type	1024	The maximum length of data to be received (1 to 1024 bytes).
	Connect	Connection description structure	Tcont_Ip_v4	Follows data type	-	For connection description structure, see details in the Function description below.
	Data	Data reception buffer	POINTER TO BYTE	Follows data type	-	Pointer to the received data buffer.
Output	Done	Completion flag	BOOL	Follows data type	FALSE	Completion flag: FALSE: Sending not started or in progress. TRUE: Sending done.
	Busy	Reception status	BOOL	Follows data type	FALSE	Status parameter: FALSE: Data reception done or not started. TRUE: Data reception not done.
	Error	Error flag	BOOL	Follows data type	FALSE	Error flag: FALSE: No error TRUE: Reception error.
	Status	Status flag	WORD	Follow data type	1000	See Status code.
	Rcvd_Len	Received data length	UDINT	Follows data type	0	Actual amount of received data.



- **Function**

  When using the receive function block, set instruction reception frequency over 2x sending frequency to ensure data consistency per cycle; otherwise, reception delay occurs.

The Tcont_Ip_v4 structure is shown in the table below.

Parameter	Type	Note
ID	WORD	Module ID: One connection corresponds to one ID, and each Module ID value is unique (value range: 1 to 4095).
ConnectionType	BYTE	Connection type: 11: TCP 19: UDP
ActiveEstablished	BOOL	Identifier of connection establishment type: FALSE: Passive connection TRUE: Active connection
RemoteAddress	ARRAY[0..3] OF BYTE	It is the IP of remote connection partner. For example, 192.168.0.1, where addr[1] = 192, addr[2] = 168, addr[3] = 0, addr[4] = 1. Broadcasting is not supported. IP is invalid for TCP passive connection.
RemotePort	UINT	It is the port number of remote connection partner (range: 1 to 49151) with a default value of 2000, recommended to use port numbers after 2000 (except for dedicated port numbers).
LocalPort	UINT	It is the local port number (range: 1 to 49151) with a default value of 2000, recommended to use port numbers after 2000 (except for dedicated port numbers).

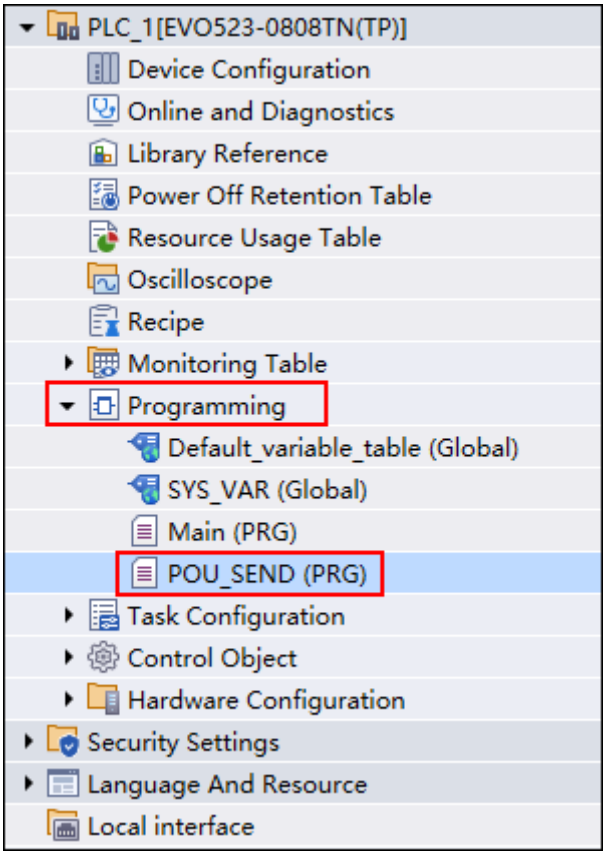
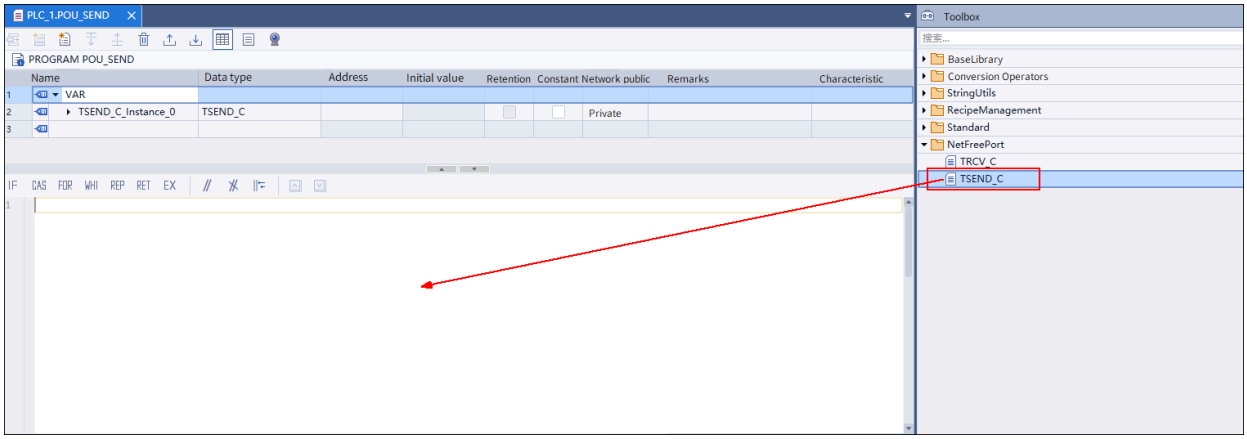
18.4.8.6 Example of Free Port Communication Instruction Usage



This section takes the TSEND_C Ethernet free port data sending instruction as an example. An EVO523 controller serves as the TCP client, and a commissioning assistant acts as the TCP server.

Prerequisites



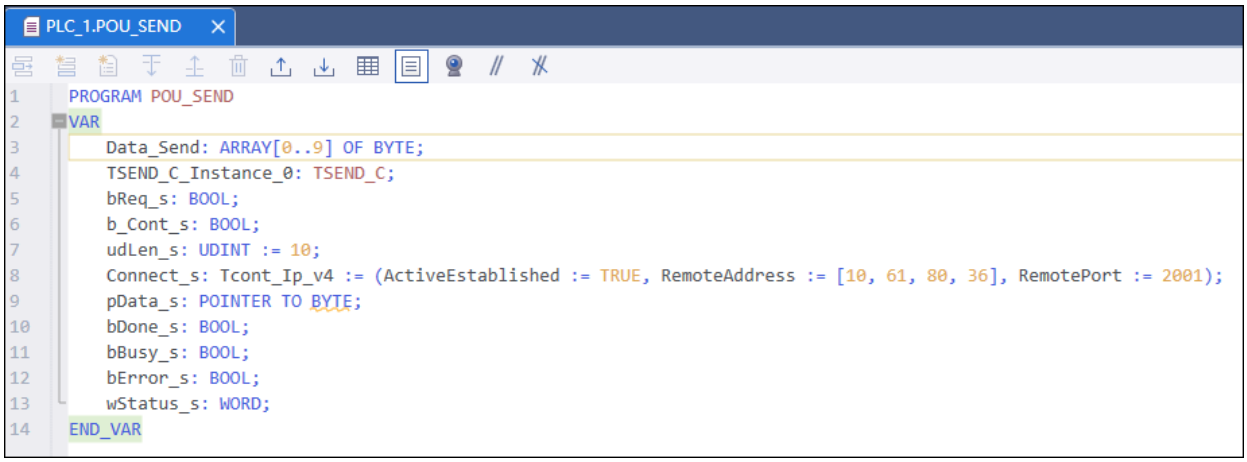
- A project has been created and the device added. For specific operations, see 7 Project Deployment.
- The NetFreePort library has been referenced. For reference operations, see 12.3 Library Reference.

Procedure

1. Click "Programming" in the left project tree to create a POU of PRG type, with ST and LD languages both supported. This section takes the ST language as an example.

2. Double-click to open the POU interface, select the "TSEND_C" instruction from the right Toolbox, and then double-click or drag it directly to the program editing area to create an instruction instance object.

3. In the table view/text view variable declaration editor, add variables, set properties such as variable name and data type, and configure the instruction-related pins. The text view variable declaration editor is used as an example below.

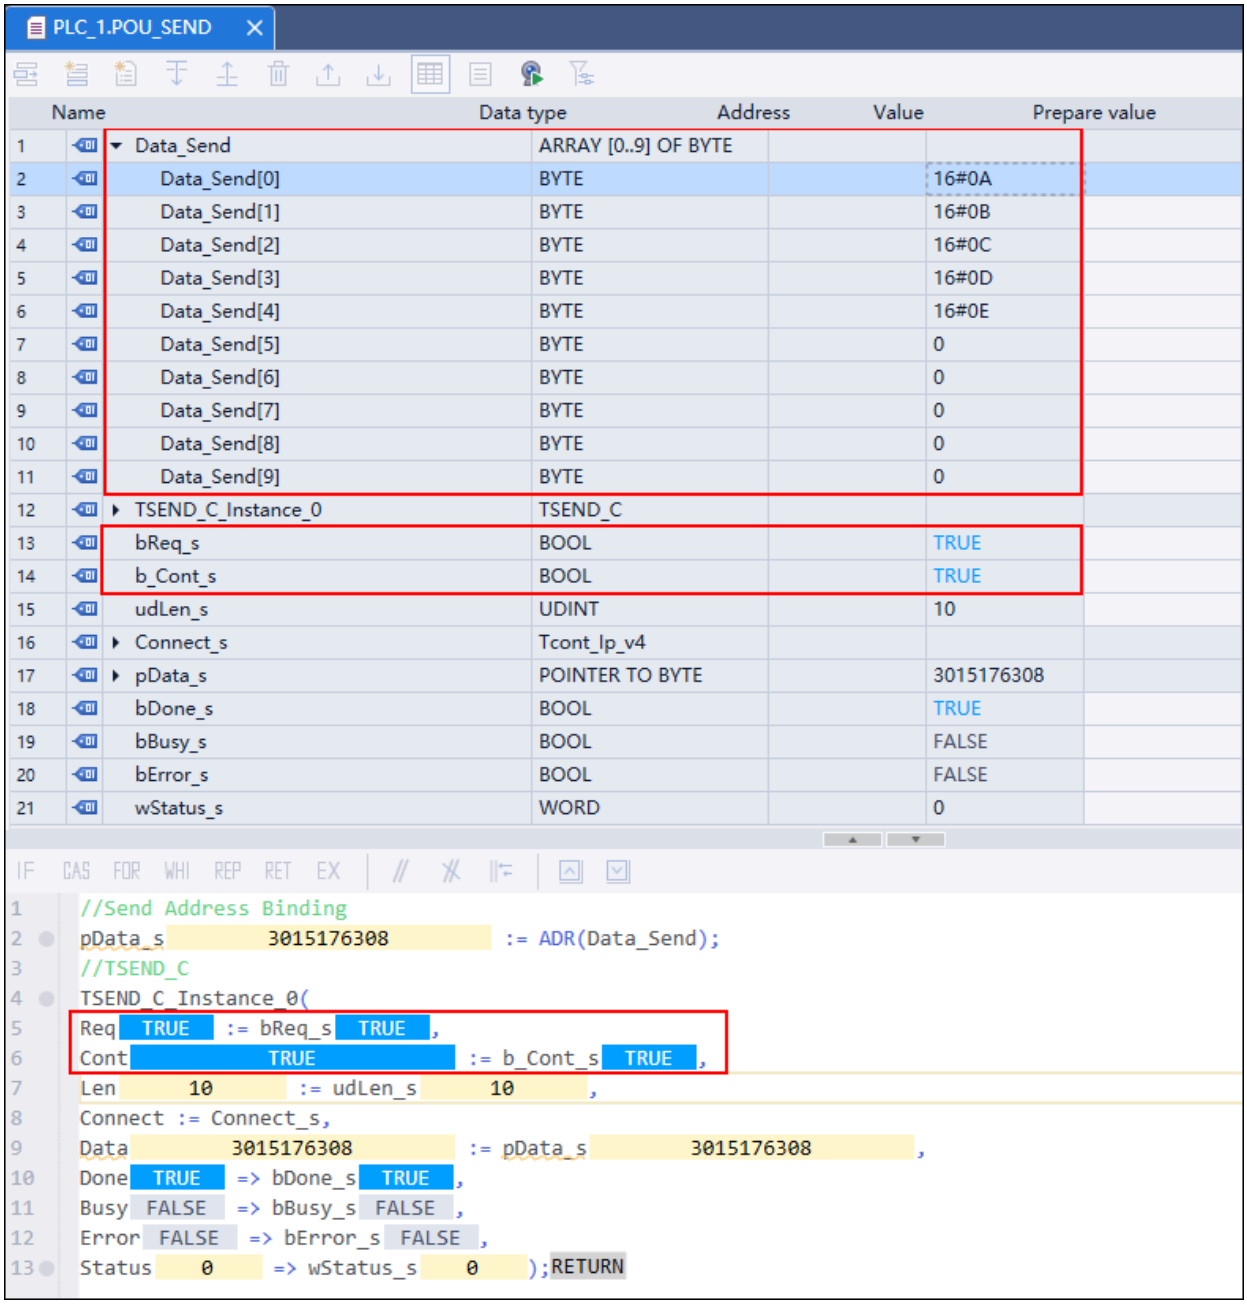


NOTE

To facilitate the direct input of data to send in variables, the ADR instruction can be used to bind the pointer of the data to the actual variable address. In the example above, a BYTE-type array of length 10 is defined. Set the array length according to actual needs.

Note:

- **The binding of the pointer to the variable address (i.e., the ADR instruction highlighted in the red in the program) must be placed before the sending instruction; otherwise, it may result in sending data error for the first time.**
- **The warning in the variable declaration area stating "It is not recommended to define or use pointer-type variables" can be ignored and does not affect functionality.**



4. To configure the connection, specify the value of the instruction's Connect pin. For detailed parameter descriptions, see 18.4.8.3 TSEND_C.

5. Call POU_SEND in MainTask, download it to the controller, and start its operation.

6. Open the commissioning assistant, select the TCP Server mode. The local IP address must be consistent with the IP configured in Connect.RemoteAddress, and the port number must be consistent with Connect.RemotePort. Then, open the connection.

7. Open the iFA software and switch to the online mode. Write a value into Data_Send (i.e., the variable bound to the pointer), set the Cont pin to TRUE, and trigger the Req pin simultaneously to establish a connection. After the connection is successfully established, one data sending can be completed (one sending per rising edge).

8. In the commissioning assistant, the data sent can be viewed. For easier observation, configure the variable declaration editor to convert and send values in hexadecimal format.

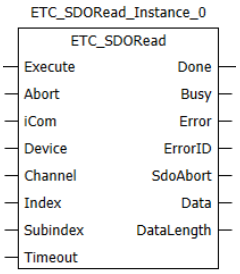
NOTE

During commissioning, pay attention to the status code of Status, and see 18.4.8.3 TSEND_C for details.

Result

Normal communication and data sending between the EVO523 controller and the commissioning assistant.

18.4.9 EtherCAT



18.4.9.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.9.2 ETC_SDORead	FB	Read parameters from EtherCAT slave	EtherCAT	Library versions 1.3.0.0 and earlier
18.4.9.3 ETC_SDOWrite	FB	Write parameters to EtherCAT slave		Library versions 1.3.0.0 and earlier
18.4.9.4 ETC_COE_SdoRead	FB	Read parameters from EtherCAT slave		Library versions 1.4.0.0 and later
18.4.9.5 ETC_COE_SdoWrite	FB	Write parameters to EtherCAT slave		Library versions 1.4.0.0 and later
18.4.9.6 ETC_ClearSlavesErrorCounter	FB	Clear EtherCAT slave error frame count		Library version 1.2.0.0 and later
18.4.9.7 ETC_DisableDevice	FB	Disable EtherCAT device		Library version 1.2.0.0 and later
18.4.9.8 ETC_GetCouplerInfo	FB	Read EtherCAT coupler information		Library version 1.2.0.0 and later
18.4.9.9 ETC_GetMasterinfo	FB	Get EtherCAT master information		Library version 1.2.0.0 and later
18.4.9.10 ETC_GetSlaveInfo	FB	Get EtherCAT slave information		Library version 1.2.0.0 and later
18.4.9.11 ETC_SlaveReset	FB	Reset EtherCAT slave (resettable axis communication)		Library versions 1.4.0.0 and later
18.4.9.12 ETC_MasterRestart	FB	Restart EtherCAT master		Library versions 1.4.0.0 and later
18.4.9.13 ETC_MasterDiagnose	FB	Get EtherCAT master diagnosis information		Library versions 1.4.0.0 and later

18.4.9.2 ETC_SDORead

This instruction reads parameters from an EtherCAT slave. Based on the slave address, index, and subindex parameters configured on the pins, it obtains data from an entry in the corresponding object dictionary and outputs the data via the output pins.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
ETC_SDORead	Read parameters from EtherCAT slave	FB		ETC_SDORead_Instance_0(Execute := , Abort := , iCom := , Device := , Channel := , Index := , Subindex := , Timeout := , Done => , Busy => , Error => , ErrorID => , SdoAbort => , Data => , DataLength =>);

- **Related variables**

Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Execute	BOOL	TRUE, FALSE	FALSE	Rising edge triggered.
	Abort	Abort	BOOL	TRUE, FALSE	FALSE	If it is set to "TRUE", the write process is aborted.
	iCom	Number of masters	BYTE	Follows data type	1	Number of EtherCAT masters: If only one EtherCAT master is used, iCom is '1'. When multiple masters are used, the value is 1 for the first master, 2 for the second master, and so on.
	Device	Slave physical address	UINT	Follow data type	-	If the automatic configuration mode of the master is disabled, the slave can be set to a specific address. The freely chosen address must be input here. If auto-configuration is enabled, the first slave will receive address 1001. The current slave address can always be verified in the EtherCAT address check.
	Channel	Reserved	BYTE	Follow data type	1	Reserved.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	Index	Object dictionary index	WORD	Follow data type	-	Object dictionary index.
	Subindex	Object dictionary subindex	BYTE	Follow data type	-	Object dictionary subindex.
	Timeout	Timeout period	UDINT	Follow data type	-	Timeout period in ms. If the write parameter is not executed within this time, an error message will be generated.
Output	Done	Done	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is done.
	Busy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing.
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
	ErrorID	Fault code	ETC_SDO_ERROR	-	ETC_NO_ERROR	See 18.4.9.14 ETC_SDO_ERROR: ETC Fault Codes for details.
	SdoAbort	SDO fault code	UDINT	Follow data type	-	If a fault occurs in the device, more information about the fault can be obtained with this output variable. For details, see 18.4.9.17 SDO Fault Codes.
	Data	Read data	DWORD	Follow data type	-	The parameter data read will be copied into this 4-byte value.
	DataLength	Number of bytes read	BYTE	Follow data type	-	Number of bytes read.

- **Function**

  This instruction performs a CoE read operation. Based on the slave address, index, and subindex parameters configured on the pins, it retrieves data from an entry in the corresponding object dictionary and outputs the data via the output pins.

- **Program example**

  Taking one of the slaves as an example, the slave address is 1006, with an index of 0x6060 and a subindex of 0.

LD:

18.4.9.3 ETC_SDOWrite

This instruction writes parameters to an EtherCAT slave. Based on the slave address, index, and subindex parameters configured on the pins, it writes a specific value to an entry in the corresponding object dictionary.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
ETC_SDOWrite	Write parameters to EtherCAT slave	FB		ETC_SDOWrite_Instance_0(Execute := , Abort := , iCom := , Device := , Channel := , Index := , Subindex := , Timeout := , Data := , DataLength := , Done => , Busy => , Error => , ErrorID => , SdoAbort =>);

- **Related variables**

  Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Execute	BOOL	TRUE, FALSE	FALSE	Rising edge triggered.
	Abort	Abort	BOOL	TRUE, FALSE	FALSE	If it is set to "TRUE", the write process is aborted.
	iCom	Number of masters	BYTE	Follows data type	1	Number of EtherCAT masters: If only one EtherCAT master is used, iCom is '1'. When multiple masters are used, the value is 1 for the first master, 2 for the second master, and so on.
	Device	Slave physical address	UINT	Follow data type	-	If the automatic configuration mode of the master is disabled, the slave can be set to a specific address. The freely chosen address must be input here. If automatic configuration is enabled, the first slave will receive address 1001. The current slave address can always be verified in the EtherCAT address check.
	Channel	Reserved	BYTE	Follows data type	1	Reserved.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	Index	Object dictionary index	WORD	Follows data type	-	Object dictionary index.
	Subindex	Object dictionary subindex	BYTE	Follows data type	-	Object dictionary subindex.
	Timeout	Timeout period	UDINT	Follows data type	-	Timeout period in ms. If the write parameter is not executed within this time, an error message will be generated.
	Data	Data to be written	DWORD	Follows data type	-	This parameter contains 4 bytes of data to be written.
	DataLength	Number of bytes to be written	BYTE	Follows data type	-	Number of bytes to be written.
Output	Done	Done	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is done.
	Busy	Instruction executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing.
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
	ErrorID	Fault code	ETC_SDO_ERROR	-	ETC_NO_ERROR	See 18.4.9.14 ETC_SDO_ERROR: ETC Fault Codes for details.
	SdoAbort	SDO fault code	UDINT	Follows data type	-	If a fault occurs in the device, more information about the fault can be obtained with this output variable. For details, see 18.4.9.17 SDO Fault Codes.

- **Function**

  This instruction performs a CoE write operation. Based on the slave address, index, and subindex parameters configured on the pins, it writes a specific value to the corresponding object dictionary.

- **Program example**

  Taking one of the slaves as an example, the slave address is 1006, with an index of 0x6060 and a subindex of 0.

18.4.9.7 ETC_DisableDevice

This instruction disables EtherCAT devices, and supports disabling slave devices as well as coupler modules separately.

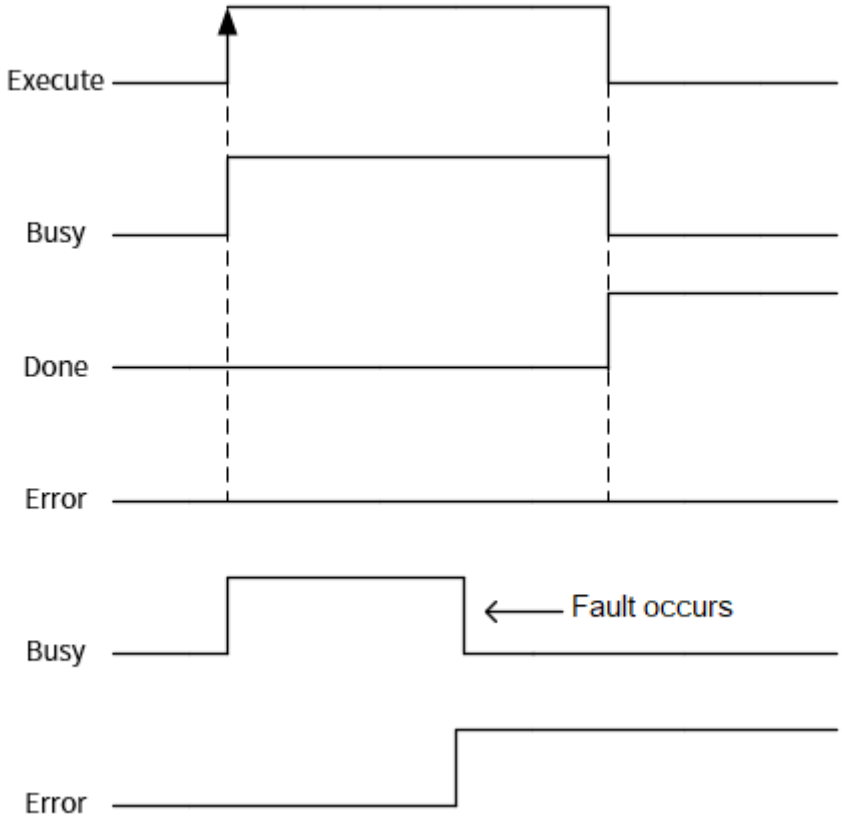
- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
ETC_DisableDevice	Disable EtherCAT device	FB		ETC_DisableDevice_Instance_0(Execute := , iCom := , SlaveAddr := , DisableSlave := , DisableModuleSlot := , Done => , Busy => , Error => , ErrorID =>);

- **Related variables**

  Variable

Input / Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Function block execution	BOOL	TRUE, FALSE	FALSE	Rising edge triggered.
	iCom	Number of EtherCAT masters	BYTE	Follows data type	1	Number of EtherCAT masters: If only one EtherCAT master is used, iCom is '1'. When multiple masters are used, the value is 1 for the first master, 2 for the second master, and so on.
	SlaveAddr	Slave Address	UINT	1 to 65535	0	Slave address.
	DisableSlave	Slave disable	BOOL	TRUE, FALSE	FALSE	FALSE: Disable the slave disable function and enable the module disable function. TRUE: Enable the slave disable function and disable the module disable function.
	DisableModuleSlot	Module slot disabling	LWORD	Follows data type	0	The slot length is 8 bytes (64 bits) and one bit represents one slot. Set to 1 if the slot is disabled. The module close to the coupler corresponds to the lower data bits.
Output	Done	FB execution done	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the function block execution is done.
	Busy	Function block executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE while the function block is executing.



Input / Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
	ErrorID	Fault code	ETC_STD_ERROR	-	0	See 18.4.9.15 ETC_STD_ERROR: ETC Fault Codes.

- **Function**

  This instruction disables EtherCAT slave and coupler module.

> NOTE
>
> The EVO500/700 series PLC only supports the module disable function from version V1.4 and later.

- **Sequence diagram**

- **Program example**

  ST:

Name	Data type	Address	Value
ETC_DisableDevice_Instance_0	ETC_DisableDevice		
execute	BOOL		TRUE
icom	BYTE		1
slaveaddr	UINT		1001
done	BOOL		TRUE
busy	BOOL		FALSE
error	BOOL		FALSE
errorid	ETC_STD_ERROR		ETC_NO_ERROR
DisableSlave	BOOL		TRUE
DisableModuleSlot	LWORD		0

```
ETC_DisableDevice_Instance_0(
Execute TRUE := execute TRUE ,
iCom 1 := icom 1 ,
SlaveAddr 1001 := slaveaddr 1001 ,
DisableSlave TRUE := DisableSlave TRUE ,
DisableModuleSlot 0 := DisableModuleSlot 0 ,
Done TRUE => done TRUE ,
Busy FALSE => busy FALSE ,
Error FALSE => error FALSE ,
ErrorIDETC_NO_ER... => erroridETC_NO_ER...);RETURN
```

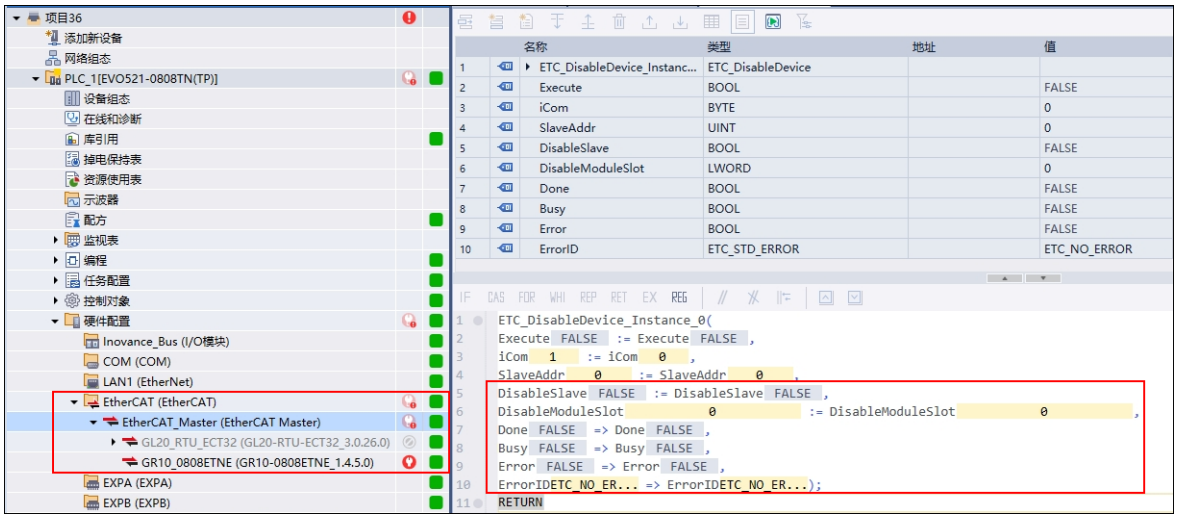
LD:

Name	Data type	Address	Value
ETC_DisableDevice_Instance_0	ETC_DisableDevice		
execute	BOOL		TRUE
icom	BYTE		1
slaveaddr	UINT		1001
done	BOOL		FALSE
busy	BOOL		FALSE
error	BOOL		FALSE
errorid	ETC_STD_ERROR		ETC_NO_ERROR
DisableSlave	BOOL		TRUE
DisableModuleSlot	LWORD		0

- **Precautions**
  - Enable the slave disable function

    After successful execution of this function block, DisableSlave is set to TRUE to enable the EtherCAT

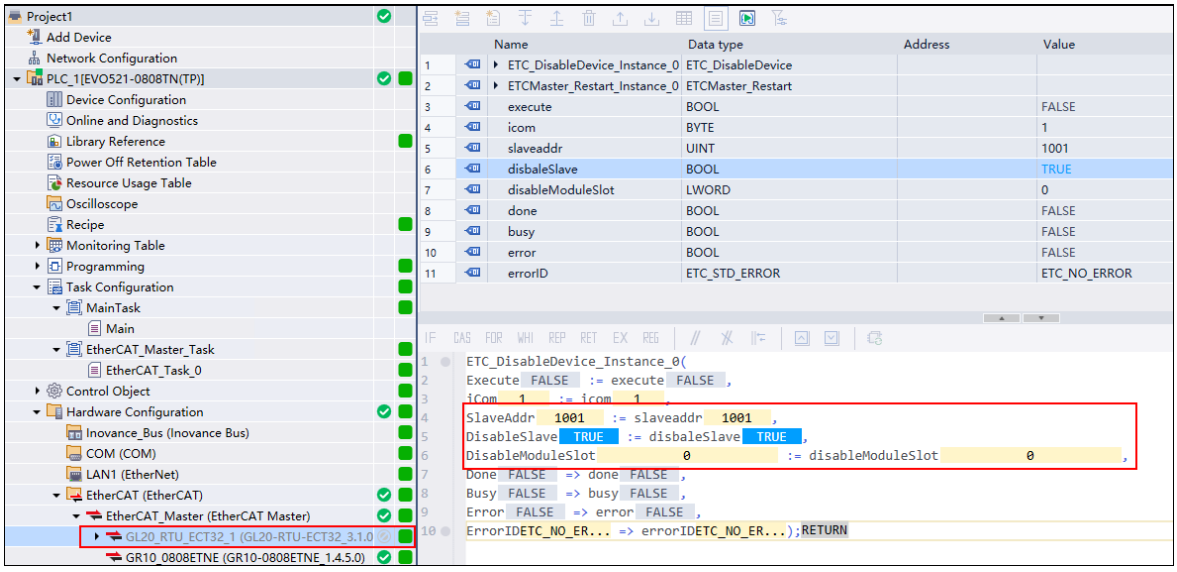
slave disable function. The activation behavior of this instruction varies depending on the firmware version.



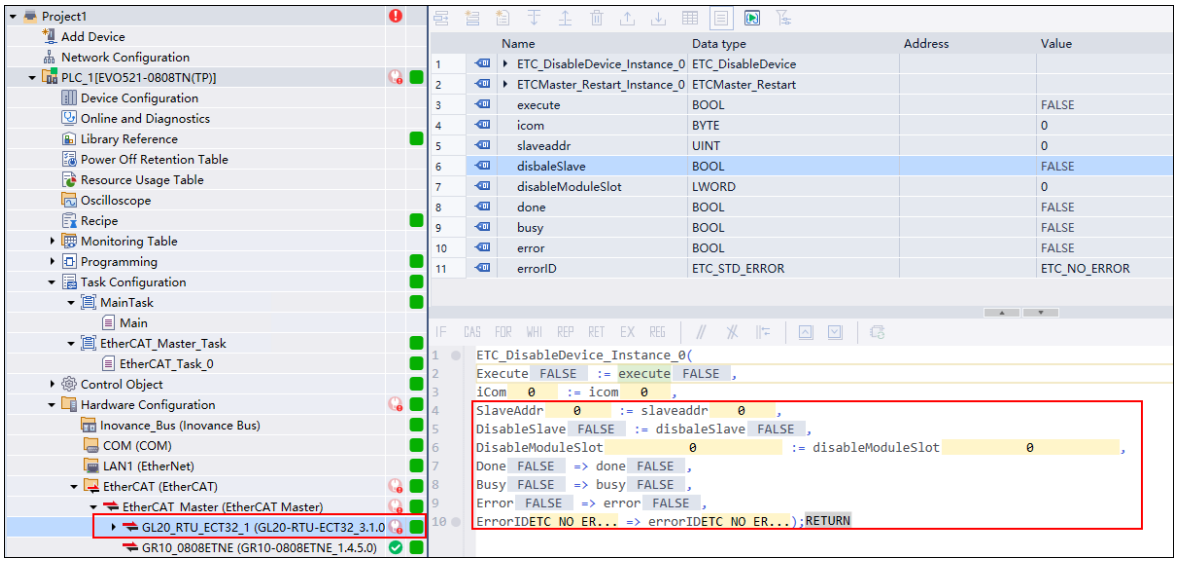
For devices with firmware higher than V1.4 (V1.4 excluded):

If the instruction is executed in the first scan cycle of the EtherCAT_Master_Task, the slave disable function takes effect immediately during the EtherCAT startup phase without EtherCAT master restart.

If the instruction is not executed in the first scan cycle of EtherCAT_Master_Task or is executed in other non-EtherCAT_Master_Task tasks, restart the master via ETC_MasterRestart for the disable function to take effect.

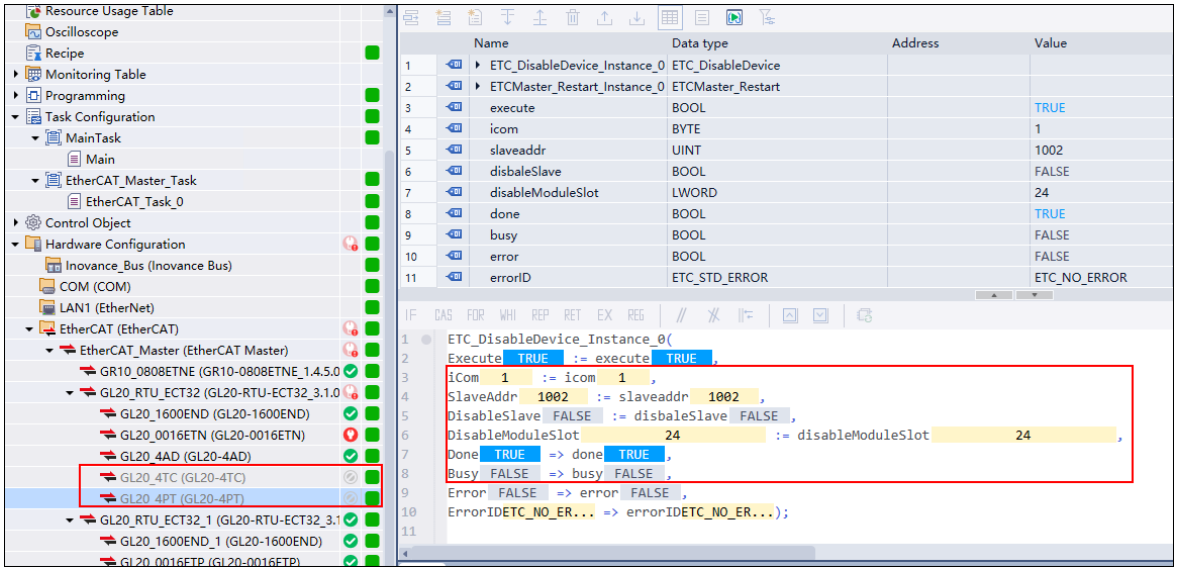


For devices with firmware lower than V1.4, after enabling the slave disable function, perform a PLC hot reset for the disable function to take effect. Click "Online > Hot reset" in the menu bar to perform reset, and then the disable function takes effect.



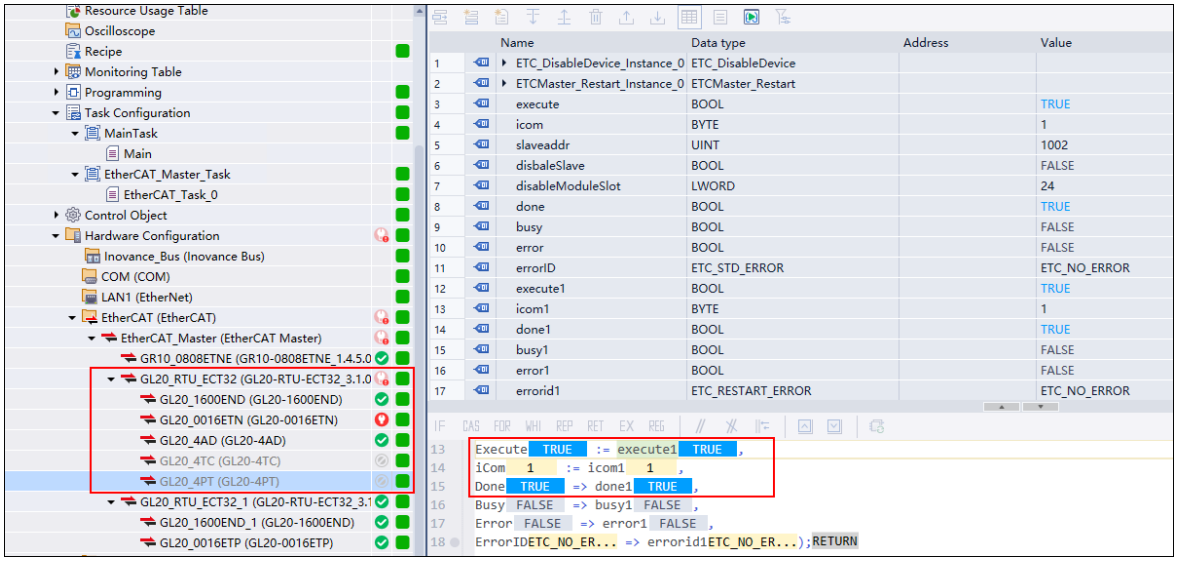
◦ Disable the salve disable function

To disable a slave, a falling edge of the disable instruction must be triggered. Set SlaveAddr to 1001 and DisableSlave to TRUE to enable the first slave. Trigger a falling edge of Execute with its value changing from FALSE to TRUE then back to FALSE.



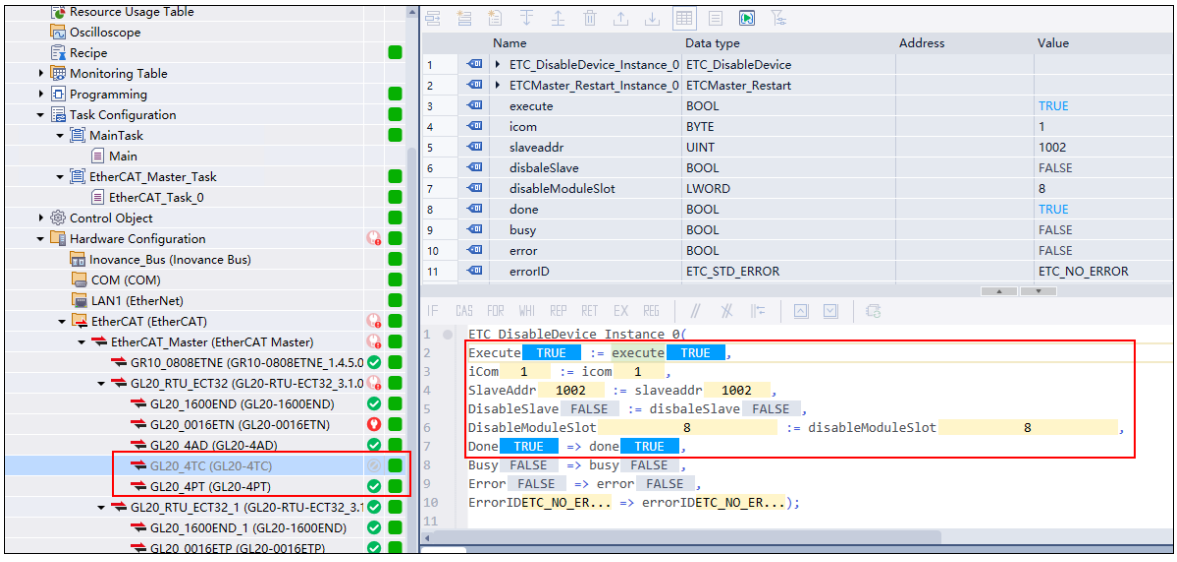
For devices with firmware higher than V1.4 (V1.4 excluded), after the slave disable instruction is disabled, restart the master via ETC_MasterRestart for the disable function to take effect.

For devices with firmware lower than V1.4, click "Online > Hot reset" in the menu bar to perform reset, and then the disable function is canceled.

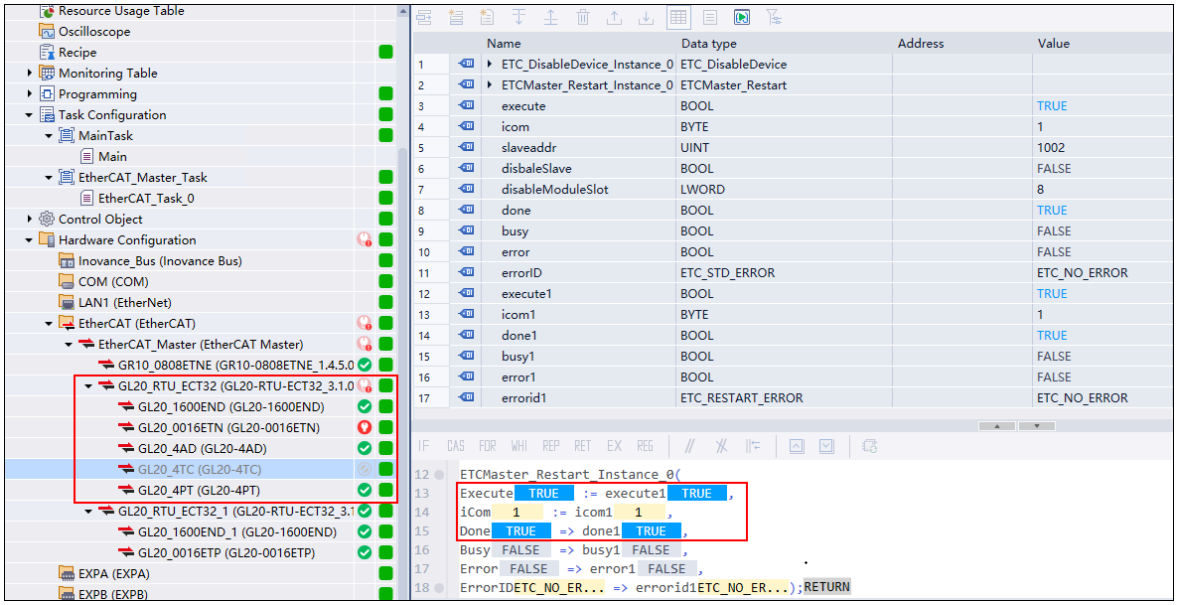


- Enable the module disable function

  Set SlaveAddr to the sequential address of the coupler slave and DisableSlave to FALSE. Assign target slot numbers to DisableModuleSlot where each bit corresponds to one slot. A value of 24 for DisableModuleSlot disables the fourth and fifth slots. Ensure that the instruction is triggered on a rising edge after the input parameters are configured.

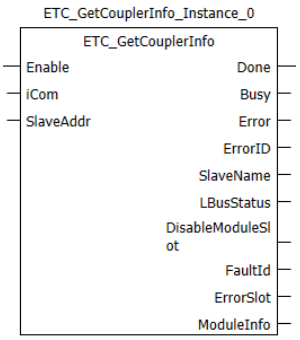


After the instruction execution, trigger the ECTMaster_Restart instruction and wait for the slave re-initialization.



- Module slot disabling deactivation

  Input the sequential address of the coupler slave in Slaveaddr, set DisableSlave to FALSE, and input the slots to be deactivated in DisableModuleSlot (each bit represents one slot). Ensure that the instruction is triggered on a rising edge after the input parameters are configured.



After the instruction execution, trigger the ECTMaster_Restart instruction and wait for the slave re-initialization.

18.4.9.8 ETC_GetCouplerInfo

This instruction reads information of the GL20-RTU-ECT slave and local modules in EtherCAT.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
ETC_GetCouplerInfo	Read EtherCAT coupler information	FB		ETC_GetCouplerInfo_Instance_0(Enable := , iCom := , SlaveAddr := , Done => , Busy => , Error => , ErrorID => , SlaveName => , LBusStatus => , DisableModuleSlot => , FaultId => , ErrorSlot => , ModuleInfo =>);

- **Related variables**

Variable

Input / Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Enable	Function block execution	BOOL	TRUE, FALSE	FALSE	Active High.

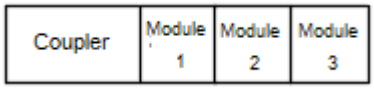
Input / Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	iCom	Number of EtherCAT masters	BYTE	Follows data type	1	Number of EtherCAT masters: If only one EtherCAT master is used, iCom is '1'. When multiple masters are used, the value is 1 for the first master, 2 for the second master, and so on.
	SlaveAddr	Slave Address	UINT	1 to 65535	0	Slave address.
Output	Done	FB execution done	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the function block execution is done.
	Busy	Function block executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE while the function block is executing.
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	TRUE when a fault occurs.
	ErrorID	Fault code	ETC_STD_ERROR	-	0	See 18.4.9.15 ETC_STD_ERROR: ETC Fault Codes.
	SlaveName	Slave name	STRING	Follows data type	-	Slave device name.
	LBusStatus	Local bus status of coupler	UINT	0 to 255	0	See the Local bus status of coupler table.
	DisableModuleSlot	Module disable slot	LWORD	Follows data type	0	The slot length is 8 bytes (64 bits) and one bit represents one slot. Set to 1 if the slot is disabled. The module close to the coupler corresponds to the lower data bits.
	FaultId	Configuration fault code	UINT	Follows data type	0	See the Configuration fault code of coupler table.
	ErrorSlot	Module fault slot	LWORD	Follows data type	0	The slot length is 8 bytes (64 bits) and one bit represents one slot. Set to 1 if there is a slot fault. The module close to the coupler corresponds to the lower data bits. (Output module fault location is subject to the network hardware topology.)

Input / Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	ModuleInfo	Module information	ARRAY [0..63] OF ETC_StructModuleInfo	-	-	See the Coupler module information.

- **Function**
  - Local bus status of coupler table

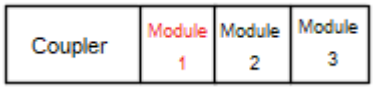
Status value	Description
0x01	Local bus initialization.
0x02	Local bus pre-operational status.
0x04	Local bus safe-operational status
0x08	Local bus operational status.
0x10	Switchover from safe-operational to operational status.
0x20	Switchover from operational status to safe-operational status.
0x41	DNM/2SCOM-MDB waiting for configuration parameter distribution.
0x80	Local bus error.

  - Configuration fault code of coupler table



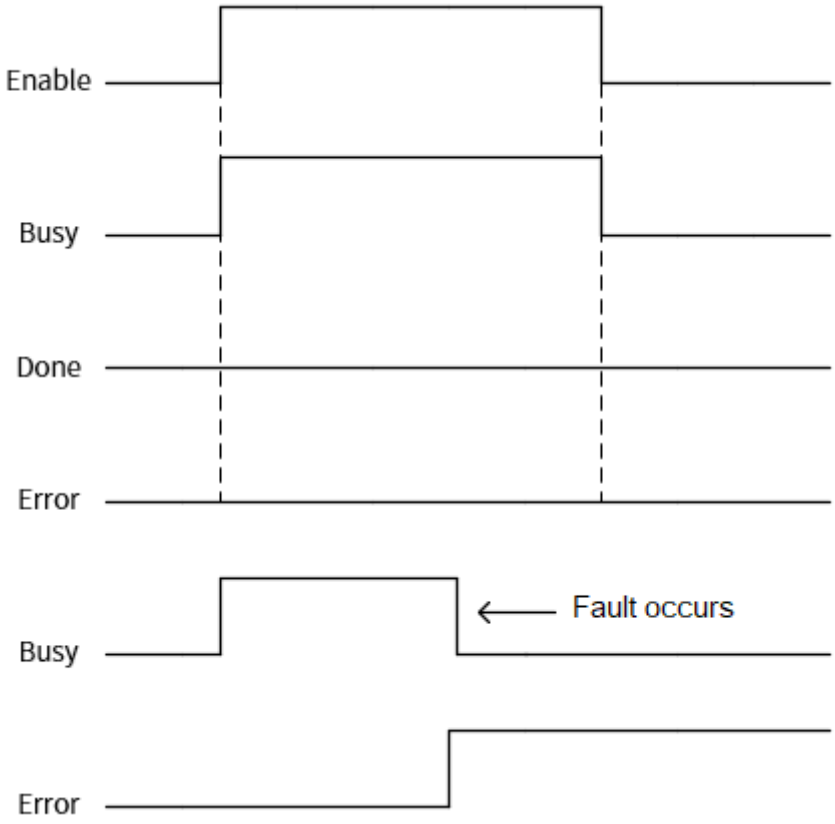
Fault ID	Description
0x0000	Configuration is consistent.
0x1000	No expansion module scanned.
0x1001	The number of configured I/O modules is greater than the number of actual scanned I/O modules.
0x1002	The number of configured I/O modules is less than the number of actual scanned I/O modules.
0x1003	The type of configured I/O modules is inconsistent with that of actual scanned I/O modules.

  - Coupler module information (ETC_StructModuleInfo structure)



Variable	Data Type	Description
ModuleName	STRING	Module type.
SlotError	BOOL	Whether the module has failed, TRUE indicates a failure.
ModuleErrorCode	UINT	Module fault ID. For details, see 18.4.9.18 IO Fault Codes.

Variable	Data Type	Description
ChannelErrorCode	ARRAY [0..128] OF UINT	IO channel fault ID. The array sub-index corresponds to the channel number, see 18.4.9.18 IO Fault Codes.



◦ Array sub-index corresponds to the actual connected module slot number. As shown in the figure below, three modules are actually connected: astModuleInfo[0] represents module 1, astModuleInfo[1] represents module 2, astModuleInfo[2] represents module 3.

If two modules are actually connected, module 1 is disabled. Then astModuleInfo[0] represents module 2 and astModuleInfo[1] represents module 3.

3	iCom	BYTE		1
4	Done	BOOL		TRUE
5	Busy	BOOL		FALSE
6	Error	BOOL		FALSE
7	ErrorID	ETC_RESTART_ERROR		ETC_NO_ERROR
8	execute	BOOL		TRUE
9	com	BYTE		1
10	done	BOOL		TRUE
11	busy	BOOL		FALSE
12	error1	BOOL		FALSE
13	errorid	ETC_RESTART_ERROR		ETC_NO_ERROR

18.4.9.13 ETC_MasterDiagnose

This instruction gets the EtherCAT master diagnostic information.

> **NOTE**
>
> When the EtherCAT library version is 1.4.0.0 or later, SysHC_ETCMasterDiagnose is renamed to ETC_MasterDiagnose with unchanged functionality. It is recommended to use of the latest version.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
ETC_MasterDiagnose	Get EtherCAT master diagnosis information	FB		ETC_MasterDiagnose_Instance_0(Enable := , iCom := , Valid => , Busy => , eState => , Error => , ErrorID =>);

- **Related variables**

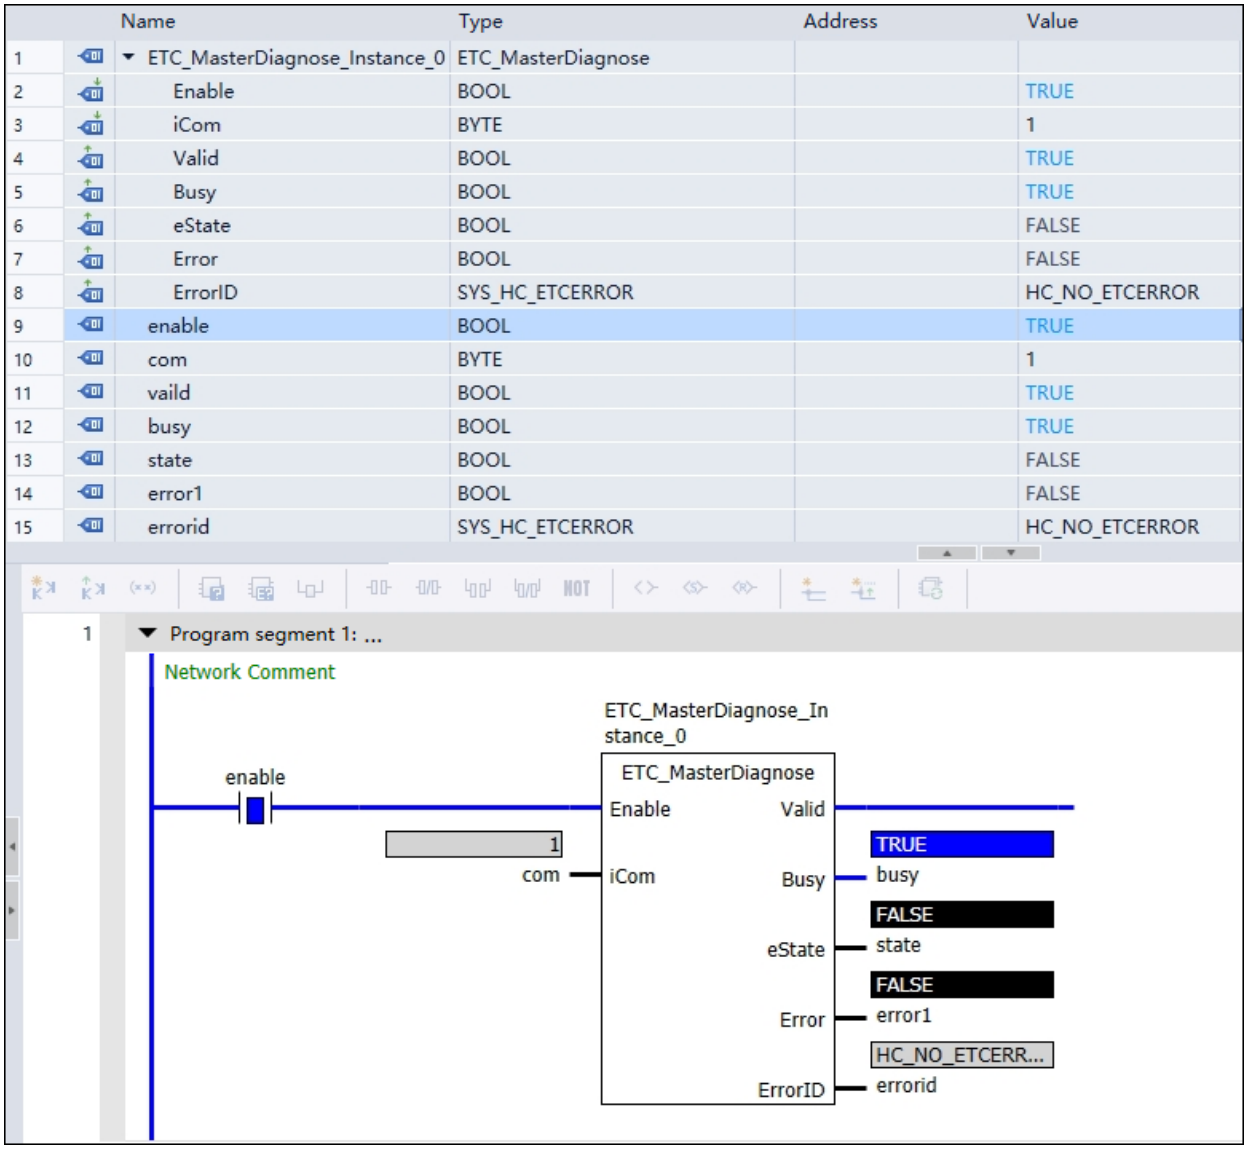
Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Enable	Execute	BOOL	TRUE, FALSE	FALSE	Active High.
	iCom	Master identifier	BYTE	Follows data type	1	Number of EtherCAT masters: If only one EtherCAT master is used, iCom is '1'. When multiple masters are used, the value is 1 for the first master, 2 for the second master, and so on.
Output	Valid	Completed	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is done.
	Busy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing.
	eState	Diagnostic status bit	BOOL	TRUE, FALSE	FALSE	This is diagnostic status bit. eState is set when the EtherCAT master has a communication error, synchronization deviation exceeds the set threshold, or a slave is in a non-OP state.
	Error	Faulty status	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction execution failed.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	ErrorID	Fault code	SYS_HC_ETCERROR	-	HC_NO_ETCERROR	0: HC_NO_ETCERROR: No error. 1: HC_ETCMASTER_ERROR: Master not found.

- **Function**

  This instruction gets the EtherCAT master diagnostic information.



- **Program example**

  ST:

	Name	Type	Address	Value
1	ETC_MasterDiagnose_Instance_0	ETC_MasterDiagnose		
2	Enable	BOOL		TRUE
3	iCom	BYTE		1
4	Valid	BOOL		TRUE
5	Busy	BOOL		TRUE
6	eState	BOOL		FALSE
7	Error	BOOL		FALSE
8	ErrorID	SYS_HC_ETCERROR		HC_NO_ETCERROR
9	enable	BOOL		TRUE
10	com	BYTE		1
11	vaild	BOOL		TRUE
12	busy	BOOL		TRUE
13	state	BOOL		FALSE
14	error1	BOOL		FALSE
15	errorid	SYS_HC_ETCERROR		HC_NO_ETCERROR

```
1  ETC_MasterDiagnose_Instance_0(Enable TRUE := enable TRUE,
2                                iCom 1 := com 1,
3                                Valid TRUE => vaild TRUE,
4                                Busy TRUE => busy TRUE,
5                                eState FALSE => state FALSE,
6                                Error FALSE => error1 FALSE,
7                                ErrorIDHC_NO_ETCER... => erroridHC_NO_ETCER...);
8                               RETURN
```

  LD:

	Name	Type	Address	Value
1	ETC_MasterDiagnose_Instance_0	ETC_MasterDiagnose		
2	Enable	BOOL		TRUE

18.4.9.14 ETC_SDO_ERROR: ETC Fault Codes

See the table below for the fault code ID of instruction.

Fault code	Value	Description
ETC_NO_ERROR	0	No fault
ETC_FIRST_ERROR	1000	The cause of the error is stored in the output of SdoAbort.
ETC_OTHER_ERROR	1001	Check if the master and slave exist.
ETC_DATA_OVERFLOW	1002	Byte size > 4.
ETC_TIME_OUT	1003	Timeout.
ETC_FIRST_MF	2000	Reserved.
ETC_LAST_ERROR	2100	Reserved.

18.4.9.15 ETC_STD_ERROR: ETC Fault Codes

Fault code	Value	Description
ETC_NO_ERROR	0	No error.

Fault code	Value	Description
ETC_CFG_NOSLAVE_ERROR	1	Slave configuration not generated.
ETC_CFG_NOMASTER_ERROR	2	Master index does not exist.
ETC_CFG_LOOPNET_ERROR	3	Network topology is a loop.
ETC_CO_GETSLAVE_ERROR	4	Current slave not found.
ETC_OTHER_ERROR	5	Other errors.
ETC_MD_PDO_NOT_MAPPED_ERROR	6	Diagnostic PDO not checked.
ETC_MD_UNSUPPORTED_DEVICE_ERROR	7	This slave device is not supported.
ETC_MD_SDO_READ_ERROR	8	Failed to read slave diagnostic information, requiring function block reset.
ETC_MD_ISNOT_OPERATIAL ERROR	9	Slave status has not reached operational status.
ETC_DD_DISABLED_ERROR	10	Module has been disabled via the backend, requiring backend disable to be canceled.
ETC_DD_WRONG_CALL_TIME_ERROR	11	The function block is not placed in the first line of the EtherCAT task, requiring the protocol stack to be restarted.
ETC_OLD_DATED_VERSION_ERROR	12	The EtherCAT version is too low to support this function block.
ETC NOT_IN_ETC_TASK_ERROR	13	This function block call is not under the EtherCAT task.
ETC UNCHECKED AUTOCONFIG_ERROR	14	The automatic master/slave configuration is not checked, requiring this optionto be selected.
ETC_DD_OBJECT_ERROR	15	Multiple instance calls of the function block are disabled, but the disablement is invalid.

18.4.9.16 ETC_CO_ERROR: ETC Fault Codes

Fault code	Value	Description
ETC_CO_NO_ERROR	0	No fault
ETC_CO_FIRST_ERROR	1	The cause of the error is stored in SdoAbort. For details, see 18.4.9.17 SDO Fault Codes.
ETC_CO_OTHER_ERROR	2	Check if the master and slaves exist.
ETC_CO_DATA_OVERFLOW	3	szSize exceeds the available size of ReadBuffer.
ETC_CO_TIME_OUT	4	Timeout.
ETC_CO_INPUT_INVALID	5	Invalid input parameters.
ETC_CO_FIRST_MF	32	Reserved.
ETC_CO_LAST_ERROR	256	Reserved.

18.4.9.17 SDO Fault Codes

SDO Access Fault Code	Description
0x00000002	Slave state inaccessible.
0xFFFFFFFF	Master or slave information not found.
0x05030000	Switch bit not changed.
0x05040000	SDO protocol timeout
0x05040001	Client/server command specifier not valid or unknown.
0x05040005	Insufficient memory.
0x06010000	Unsupported access to an object.
0x06010001	Attempt to read a write-only object.
0x06010002	Attempt to write to a read-only object.
0x06020000	Object does not exist in the object directory.
0x06040041	object cannot be mapped to PDO.
0x06040042	The number and length of the objects to be mapped would exceed PDO range.
0x06040043	General parameter incompatibility reason.
0x06040047	General incompatibility issue within the device.
0x06060000	Access failed due to a hardware error.
0x06070010	Data type and service parameter length mismatch.
0x06070012	Data type mismatch, length of service parameter too high.
0x06070013	Data type mismatch, length of service parameter too low.
0x06090011	Sub-index does not exist.
0x06090030	Parameter value out of range.
0x06090031	Written parameter value too high.
0x06090032	Written parameter value too low.
0x06090036	Maximum value is less than minimum value.
0x08000000	General error
0x08000020	Data cannot be transmitted/stored to application.
0x08000021	Data cannot be transmitted/stored to application due to local control.
0x08000022	Data cannot be transmitted or stored to the application due to the current device status.
0x08000023	Object dictionary dynamic generation fails or no object dictionary is present.

18.4.9.18 IO Fault Codes

Fault Code	Description
Communication Protocol Conversion Module Fault	

Fault Code	Description
0x1000	The number of scanned expansion modules is 0.
0x1001	The number of I/O modules configured is more than the number of I/O modules actually scanned.
0x1002	The number of I/O modules configured is less than the number of I/O modules actually scanned.
0x1003	The type of I/O modules configured is inconsistent with that of the I/O modules actually scanned.
0x1004	IO module configuration failed.
0x1005	I/O module status switch failed.
0x1006	IO module is offline.
Module configuration data fault.	
0x2004	The number of sub-modules on serial port 0/1 of the 2SCOM-MDB module exceeds 15.
0x2005	The process data of the 2SCOM-MDB module exceeds 480 bytes.
0x2010	The baud rate of the RS485 module channel is configured incorrectly.
0x2011	The communication mode of the RS485 module channel is configured incorrectly.
0x2012	The data bit-related parameters of the RS485 module channel is configured incorrectly.
0x2013	The data packet size of the RS485 module channel is configured incorrectly.
0x2014	The message interval of the RS485 module channel is configured incorrectly.
0x2015	The sending buffer of the RS485 module channel is configured incorrectly.
0x2016	The receiving buffer of the RS485 module channel is configured incorrectly.
0x2020	The baud rate of the CAN module channel is configured incorrectly.
0x2021	The communication mode of the CAN module channel is configured incorrectly.
0x2022	The data bit-related parameters of the CAN module channel is configured incorrectly.
0x2023	The buffer size of the CAN module channel is configured incorrectly.
0x2024	The heartbeat interval of the CAN module channel is configured incorrectly.
0x2025	The standard frame upper limit of the CAN module channel is configured incorrectly.
0x2026	The standard frame lower limit of the CAN module channel is configured incorrectly.
0x2030	The serial port parameters of the 2SCOM/2SCOM-MDB module channel are configured incorrectly.
0x2031	The data packet size is incorrectly configured for the channels of the 2SCOM module.
0x2032	The timeout parameter is incorrectly configured for the channels of the 2SCOM module.

Fault Code	Description
0x2033	The port protocol of the 2SCOM/2SCOM-MDB module channel is configured incorrectly.
0x2040	Incorrect Modbus slave address
0x2100	The CH0 preset value is out of range.
0x2101	The CH0 counter is configured incorrectly.
0x2102	The CH0 signal type is not supported.
0x2103	The CH0 counter limit is configured incorrectly.
0x2104	The CH0 unit pulse increment is configured incorrectly.
0x2105	The CH0 time base of the speed measurement is configured incorrectly.
0x2106	The CH0 input filter parameter is configured incorrectly.
0x2107	The CH0 frequency sampling time is configured incorrectly.
0x2108	The CH0 reset function is configured incorrectly.
0x2109	The CH0 preset function is configured incorrectly.
0x210A	The CH0 comparison 0 function is configured incorrectly.
0x210B	The CH0 comparison 1 function is configured incorrectly.
0x210C	The CH0 comparison 2 function is configured incorrectly.
0x210D	The CH0 comparison 3 function is configured incorrectly.
0x210E	The CH0 probe 0 function is configured incorrectly.
0x210F	The CH0 probe 1 function is configured incorrectly.
0x2110	The CH0 probe 2 function is configured incorrectly.
0x2111	The CH0 probe 3 function is configured incorrectly.
0x2112	The CH0 DO0 parameter is configured incorrectly.
0x2113	The CH0 DO1 parameter is configured incorrectly.
0x2114	The CH0 DO2 parameter is configured incorrectly.
0x2115	The CH0 DO3 parameter is configured incorrectly.
0x2116	The CH0 D10 parameter is configured incorrectly.
0x2117	The CH0 DI1 parameter is configured incorrectly.
0x2118	The CH0 DI2 parameter is configured incorrectly.
0x2119	The CH0 DI3 parameter error is configured incorrectly.
0x2200 to 0x2219	The CH1 is the same as CH0.
0x2300-0x2319	The CH2 is the same as CH0.
0x2400-0x2419	The CH3 is the same as CH0.
IO module fault	
0x5001	Power supply overvoltage.
0x5002	Power supply undervoltage.

Fault Code	Description
0x5003	External 24 V power failure.
0x5004	ADC device configuration parameter fault.
0x5011	Chip overheating.
0x5021	ADC device failure.
0x5022	ADC device failure.
0x5031	Reference channel failure.
IO module fault	
0x6001	Channel open-circuit.
0x6002	Channel short-circuit.
0x6003	Channel data exceeds upper limit.
0x6004	Channel data exceeds lower limit.
0x6005	Channel data overflow.
0x6006	Channel data underflow.
0x6007	Channel overload.
0x6008	Channel overcurrent.
0x6009	Channel configuration data fault.
0x6010	The sending buffer of the RS485 module channel is full.
0x6011	The receiving buffer of the RS485 module channel is full.
0x6012	The transmitting frame counter value of the RS485 module channel is faulty.
0x6013	The receiving frame segnum value of the RS485 module channel is faulty.
0x6014	Noise detected on the RS485 module channel.
0x6015	Parity bit fault detected on the RS485 module channel.
0x6020	The sending buffer of the CAN module channel is full.
0x6021	The receiving buffer of the CAN module channel is full.
0x6022	The receiving frame counter value of the CAN module channel is faulty.
0x6023	The bus load ratio of the CAN module exceeds 30%.
0x6024	The value of TEC of the CAN module exceeds 127.
0x6025	The value of REC of the CAN module exceeds 127.
0x6030	24 V output fault of SSI module channel.
0x6031	Communication fault of SSI module channel.
0x6032	Data error of SSI module channel.
0x6040	The sending buffer of the 2SCOM module channel is full.
0x6041	The receiving buffer of the 2SCOM module channel is full.
0x6042	The receiving frame counter value of the 2SCOM module channel is faulty.
0x6043	The receiving frame segnum value of the 2SCOM module channel is faulty.

Fault Code	Description
0x6044	Noise detected on the 2SCOM/2SCOM-MDB module channel.
0x6045	Parity bit fault detected on the 2SCOM/2SCOM-MDB module channel.
0x6046	Submodules of the 2SCOM-MDB module channel are configured incorrectly.
0x6050	Channel overcurrent.
0x6051	Switch OFF open-circuit.
0x6052	Switch ON open-circuit.
0x6053	Short-circuit to VDD.
0x6054	Overload.
0x6060	M: Modbus response parameter mismatch.
0x6061	M: Modbus slave ID mismatch.
0x6062	M: Modbus response address mismatch.
0x6063	M: Modbus response data length mismatch.
0x6064	M: Modbus communication timeout.
0x6065	M: Modbus CRC check error.
0x6066	Illegal function code.
0x6067	Illegal data address.
0x6068	Illegal data value.
0x6069	Slave device fault.
0x6800	CH0 phase A open-circuit.
0x6801	CH0 phase B open-circuit.
0x6802	CH0 frequency out of limit.
0x6803	CH0 count value overflow.
0x6804	CH0 count value underflow.
0x6805	Number/stepsize limit of CH0 comparison 0 function exceeded
0x6806	Number/stepsize limit of CH0 comparison 1 function exceeded
0x6807	Number/stepsize limit of CH0 comparison 2 function exceeded
0x6808	Number/stepsize limit of CH0 comparison 3 function exceeded
0x6809	Hold time/pulse number of CH0 comparison 0 output function is configured incorrectly.
0x680A	Hold time/pulse number of CH0 comparison 1 output function is configured incorrectly.
0x680B	Hold time/pulse number of CH0 comparison 2 output function is configured incorrectly.
0x680C	Hold time/pulse number of CH0 comparison 3 output function is configured incorrectly.

Fault Code	Description
0x680D	Start/stop position and stepsize direction of CH0 comparison 0 output function is configured incorrectly.
0x680E	Start/stop position and stepsize direction of CH0 comparison 1 output function is configured incorrectly.
0x680F	Start/stop position and stepsize direction of CH0 comparison 2 output function is configured incorrectly.
0x6810	Start/stop position and stepsize direction of CH0 comparison 3 output function is configured incorrectly.
0x6811	CH0 comparison 0 limit exceeded
0x6812	CH0 comparison 1 limit exceeded
0x6813	CH0 comparison 2 limit exceeded
0x6814	CH0 comparison 3 limit exceeded
0x6815	CH0 comparison 0 type fault
0x6816	CH0 comparison 1 type fault
0x6817	CH0 comparison 2 type fault
0x6818	CH0 comparison 3 type fault
0x6819	Control mode fault of CH0 comparison 0 output function
0x681A	Control mode fault of CH0 comparison 1 output function
0x681B	Control mode fault of CH0 comparison 2 output function
0x681C	Control mode fault of CH0 comparison 3 output function
0x681D	CH0 DO0 short-circuit fault.
0x681E	CH0 DO1 short-circuit fault.
0x681F	CH0 DO2 short-circuit fault.
0x6820	CH0 DO3 short-circuit fault.
0x6900-0x6920	The CH1 is the same as CH0.
0x6A00-0x6A20	The CH2 is the same as CH0.
0x6B00-0x6B20	The CH3 is the same as CH0.

18.4.10 CANBus

18.4.10.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.10.12 CANBus_CtrlDevState	FB	Switch control device status	CANBus	Library version 1.0.0.0 and later
18.4.10.13 CANBus_DevRxMsg	FB	Device receives messages		Library version 1.0.0.0 and later

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.10.14 CANBus_DevRxMultiMsg	FB	Device receives multiple frame messages		Library version 1.0.0.0 and later
18.4.10.15 CANBus_DevTxMsg	FB	Device transmitting messages		Library version 1.0.0.0 and later
18.4.10.16 CANBus_GetDevDiagInfo	FB	Obtain device diagnostic information		Library version 1.0.0.0 and later
18.4.10.17 CANBus_GetIoDrvVer	FB	Get the version information of the CmpDrvCANBus component		Library version 1.0.0.0 and later
18.4.10.18 CANBus_SetDevBaud	FB	Set baud rate of device		Library version 1.0.0.0 and later

18.4.10.2 CANBus_CmpDrvVer_t: Version of the Drive Component Used by CANBus

Variable	Data Type	Description
dwCmpDrvID	DWORD	Component ID.
dwCmpDrvVer	DWORD	Component version number.
dwCmpDrvDate	DWORD	Component creation date

18.4.10.3 CANBus_DiagInfo_t: CANBus Diagnostic Information Structure

Variable	Data Type	Description
xEnableFlag	BOOL	Enable flag. FALSE: Disable. TRUE: Enable.
xErrorFlag	BOOL	Error flag. FALSE: Normal. TRUE: Error.
uiNetId	UINT	Network ID of the CANBus device.
eStateType	18.4.10.11 CANBus_StateType_Enum: Enumeration of CANBus State	Operating state of the CANBus device.
eErrorType	18.4.10.8 CANBus_ErrorType_Enum: Enumeration of CANBus Error	Error type of the CANBus device.
uiBaudrate	UINT	Bus baud rate of CAN in kbps.
uiBusload	UINT	Bus load rate of CAN in ‰.
uiTxErrCnt	UINT	Transmit error counter TEC.

Variable	Data Type	Description
uiRxErrCnt	UINT	Receive error counter REC.
udiTxMsgNumInQueue	UDINT	Number of frames to be transmitted in the queue.
udiTxMsgNumFinish	UDINT	Number of transmitted frames.
udiTxBitCntPerSecond	UDINT	Transmit bit counter per second.
udiRxMsgNuminQueue	UDINT	Number of receive frames in the queue.
udiRxMsgNumFinish	UDINT	Number of received frames.
udiRxBitCntPerSecond	UDINT	Receive bit counter per second.

18.4.10.4 CANBus_FrameMsg_t: CANBus Frame Message Structure

Variable	Data Type	Description
xExtFlag	BOOL	Extended frame flag. FALSE: Standard frame. TRUE: Extended frame.
xRtrFlag	BOOL	Remote frame flag. FALSE: Data frame. TRUE: Remote frame.
dwCanId	DWORD	CANID. Standard frame: Lower 11 bits valid; Extended frame: All 29 bits valid.
usiDataLen	USINT	Data Length: 0 to 8 for data frames, and 0 for remote frames.
abyDataStr	ARRAY[0..7] OF BYTE	Data Area: The maximum number of bytes in the CAN frame data area is 8.

18.4.10.5 CANBus_RxFilter_t: CANBus Receive Frame Filter Structure

Variable	Data Type	Description
xExtFlag	BOOL	Extended frame flag. FALSE: Standard frame. TRUE: Extended frame.
xRtrFlag	BOOL	Remote frame flag. FALSE: Data frame. TRUE: Remote frame.

Variable	Data Type	Description
dwCanId	DWORD	CAN identifier. Standard frame: Lower 11 bits are valid (Bit 10~0); Extended frame: Lower 29 bits are valid (Bit 28~0).
xFilterFlag	BOOL	Enable flag for filter mechanism. FALSE: Disable filter mechanism and receive frames by single ID. TRUE: Enable filter mechanism.
xFilterExt	BOOL	Extended frame filtering. FALSE: Disable xExtFlag filter. TRUE: Enable xExtFlag filter.
xFilterRtr	BOOL	Remote frame filtering. FALSE: Disable xRtrFlag filter. TRUE: Enable xRtrFlag filter.
dwFilterCanId	DWORD	CANID bitwise filtering. bitn=FALSE: Disable filtering on dwCanId.bit n. bitn=TRUE: Enable filtering on dwCanId.bit n.

18.4.10.6 CANBus_BaudrateType_Enum: CANBus Baud Rate Enumeration

Variable	Value	Description
CANBUS_BAUDRATE_10KBPS	10	Baud rate is 10 kbps.
CANBUS_BAUDRATE_20KBPS	20	Baud rate is 20 kbps.
CANBUS_BAUDRATE_50KBPS	50	Baud rate is 50 kbps.
CANBUS_BAUDRATE_100KBPS	100	Baud rate is 100 kbps.
CANBUS_BAUDRATE_125KBPS	125	Baud rate is 125 kbps.
CANBUS_BAUDRATE_250KBPS	250	Baud rate is 250 kbps.
CANBUS_BAUDRATE_500KBPS	500	Baud rate is 500 kbps.
CANBUS_BAUDRATE_800KBPS	800	Baud rate is 800 kbps.
CANBUS_BAUDRATE_1000KBPS	1000	Baud rate is 1000 kbps.

18.4.10.7 CANBus_CtrlCmdType_Enum: CANBus Control Command Enumeration

Variable	Value	Description
CANBUS_CTRLCMD_INVALID	0	Invalid command.
CANBUS_CTRLCMD_RESTART	1	Restart CANBus.
CANBUS_CTRLCMD_START	2	Start CANBus.
CANBUS_CTRLCMD_STOP	3	Stop CANBus.
CANBUS_CTRLCMD_CLEAR	4	Clear CANBus parameters.

18.4.10.8 CANBus_ErrorType_Enum: CANBus Error Enumeration

Variable	Value	Description
CANBUS_ERR_OK_NOERR	0	Normal or no error.
CANBUS_ERR_CFG_ERR	1	Configuration error.
CANBUS_ERR_DRV_ILLEGAL_ERR	2	Driver class illegal error.
CANBUS_ERR_DRV_NO_ACK_ERR	3	Driver class no response error.
CANBUS_ERR_DRV_BUSOFF_ERR	4	Driver class bus shutdown error.
CANBUS_ERR_BUS_LOAD_OV_ERR	5	High bus load error.
CANBUS_ERR_TX_BUSY_ERR	16	Transmission busy error.
CANBUS_ERR_TX_TIMEOUT_ERR	17	Transmisson timeout error.
CANBUS_ERR_TX_BUFF_FULL_ERR	18	Transmit buffer full error.
CANBUS_ERR_RX_BUFF_EMPTY_ER R	32	Reception buffer empty error.
CANBUS_ERR_RX_BUFF_FULL_ERR	33	Reception buffer full error.
CANBUS_ERR_OTHER_UNDEF_ERR	65535	Undefined errors.

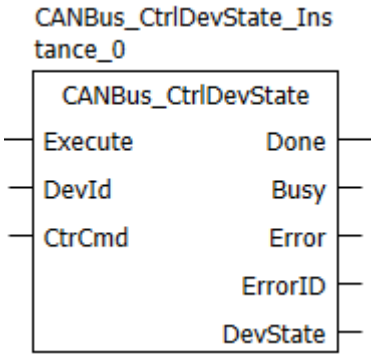
18.4.10.9 CANBus_FBErrorType_Enum: CANBus Function Block Error Enumeration

Variable	Value	Description
CANBUS_FBERR_NO_ERROR	0	Function block operates normally or there is no error.
CANBUS_FBERR_EXE_FAILED	1	Function block execution failed.
CANBUS_FBERR_INVAILD_DEVICEID	2	Invalid device ID, which is not enabled.
CANBUS_FBERR_DEVICE_FAULT	3	There is a fault with the device.
CANBUS_FBERR_WRONG_PARAME TER	4	The input parameters of the function block are incorrect.
CANBUS_FBERR_BUSY_ERROR	5	Function block is busy.

Variable	Value	Description
CANBUS_FBERR_ABORT_ERROR	6	Function block abort error.
CANBUS_FBERR_TIME_OUT_ERROR	7	Function block timeout error.
CANBUS_FBERR_POINTER_NULL	8	Function block null pointer error.
CANBUS_FBERR_BUFF_FULL	9	Function block buffer full error.
CANBUS_FBERR_UNKNOWN_ERRO R	255	Function block unknown error.

18.4.10.10 CANBus_FBStateType_Enum: CANBus Function Block State Enumeration

Variable	Value	Description
CANBUS_FBSTATE_DORMANT	0	Function block is waiting for startup.
CANBUS_FBSTATE_EXECUTING	1	Function block operates periodically.
CANBUS_FBSTATE_ABORTING	2	Function block aborts operation.
CANBUS_FBSTATE_DONE	3	Function block has completed operation.
CANBUS_FBSTATE_ERROR	4	Function block has an operation error.
CANBUS_FBSTATE_RESETTING	5	Function block is resetting.



18.4.10.11 CANBus_StateType_Enum : CANBus State Enumeration

Variable	Value	Description
CANBUS_STATE_UNKNOWN	0	Unknown
CANBUS_STATE_INITIALIZE	1	Initializing
CANBUS_STATE_RUNNING	2	Operating with the position system restored.
CANBUS STATE STOPPING	3	Stopped
CANBUS STATE FAULTRUN	4	Fault running
CANBUS STATE_FAULTSTOP	5	Fault stopped

18.4.10.12 CANBus_CtrlDevState

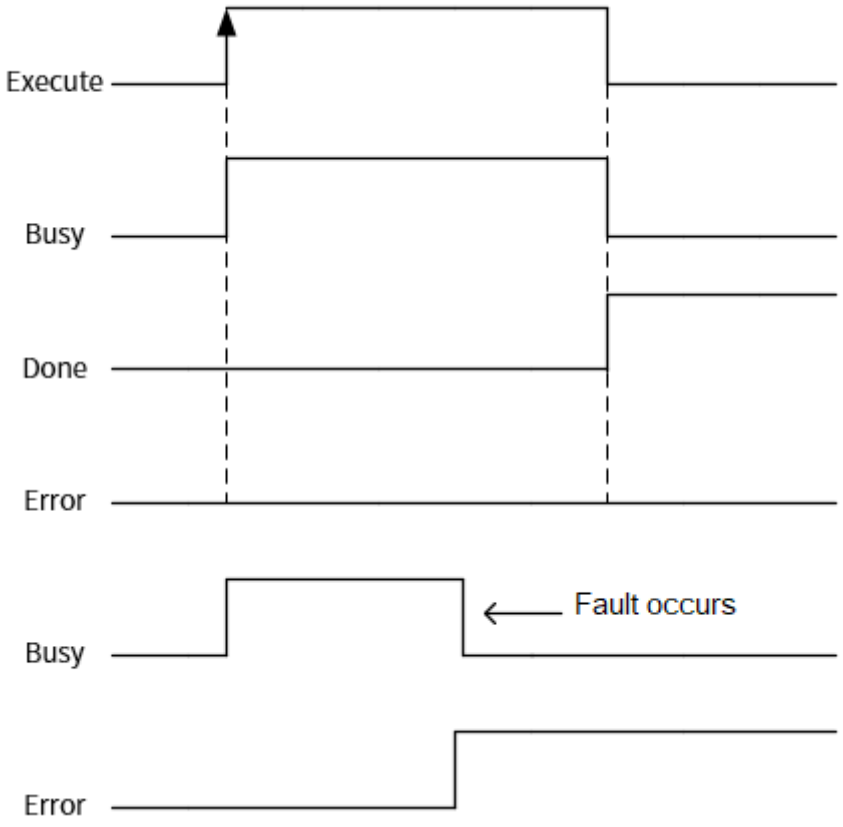
This instruction switches control device status.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
CANBus_CtrlDevState	Switch control device status	FB		CANBus_CtrlDevState_Instance_0(Execute := , DevId := , CtrCmd := , Done => , Busy => , Error => , ErrorID => , DevState =>);

- **Related variables**

  Variable



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Function block enable	BOOL	Follows data type	FALSE	Function block enable.
	DevId	Network ID of the CANBus device.	UINT	Follow data type	-	The device ID must correspond to the network ID of the CANBus device.
	CtrCmd	Instruction for control device status switching	18.4.10.7 CANBus_CtrlCmdType_Enum: Enumeration of CANBus Control Command	Follows data type	-	Instruction for control device status switching.
Output	Done	Instruction completion flag	BOOL	Follows data type	FALSE	Function block completion flag.
	Busy	Instruction execution flag	BOOL	Follows data type	FALSE	Function block execution flag.
	Error	Error flag	BOOL	Follows data type	FALSE	Function block error flag.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	ErrorID	Fault code	18.4.10.9 CANBus_FB ErrorType_Enum: Enumeration of CANBus Function Block Error	Follows data type	-	Fault code of function block. See Fault description.
	DevState	Device state	18.4.10.11 CANBus_StateType_Enum: Enumeration of CANBus State	Follows data type	-	Device status.

- **Function**

  This instruction controls the state of the device, which is determined by18.4.10.7 CANBus_CtrlCmdType_Enum: Enumeration of CANBus Control Command.

- **Sequence diagram**

- **Program example**

  ST:

Name	Data type	Address	Value
CANBus_CtrlDevState_Instan...	CANBus_CtrlDevState		
execute	BOOL		TRUE
devid	UINT		1
ctrcmd	CANBUS_CTRLCMDTYPE_ENUM		CANBUS_CTRLCMD_R...
done	BOOL		TRUE
busy	BOOL		FALSE

```

LD:

- **Fault description**

  When an error occurs, find the corresponding error via ErrorID, and locate the root cause of the error.

Fault code	Value	Description	Troubleshooting Method
CANBUS_FBERR_NO_ERROR	0x0000	Function block operates normally or there is no error.	Function block executes normally.
CANBUS_FBERR_EXE_FAILED	0x0001	Function block execution failed.	-
CANBUS_FBERR_INVAILD_DEVICEID	0x0002	Invalid device ID, which is not enabled.	Invalid input DevID.
CANBUS_FBERR_DEVICE_FAULT	0x0003	There is a fault with the device.	The device is starting up.
CANBUS_FBERR_WRONG_PARAMETER	0x0004	The input parameters of the function block are incorrect.	Invalid input CtrlCmd.
CANBUS_FBERR_BUSY_ERROR	0x0005	Function block is busy.	-

Fault code	Value	Description	Troubleshooting Method
CANBUS_FBERR_ABORT_ERROR	0x0006	Function block abort error.	-
CANBUS_FBERR_TIME_OUT_ERROR	0x0007	Function block timeout error.	-
CANBUS_FBERR_POINTER_NULL	0x0008	Function block null pointer error.	-
CANBUS_FBERR_BUFF_FULL	0x0009	Function block buffer full error.	-
CANBUS_FBERR_UNKNOWN_ERROR	0x00FF	Function block unknown error.	-

- **Precautions**

  If the function block instruction input is CANBUS_CTRLCMD_CLEAR (clear CANBus parameters), the following information will be cleared after the function block is triggered: (1) Current load rate (2) Internal receiving and sending buffers of the protocol stack (3) Receive function blocks.

  The data in items (1) and (2) will be automatically overwritten by the operation results, while item (3) requires the receive function blocks to be restarted manually.

18.4.10.13 CANBus_DevRxMsg

This instruction allows the device to receive messages.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
CANBus_DevRxMsg	Device receives messages	FB		CANBus_DevRxMsg_Instance_0(Enable := , DevId := , RxFilterMsg := , Done => , Busy => , Error => , ErrorID => , FrameCnt => , RxMsg =>);

- **Related variables**

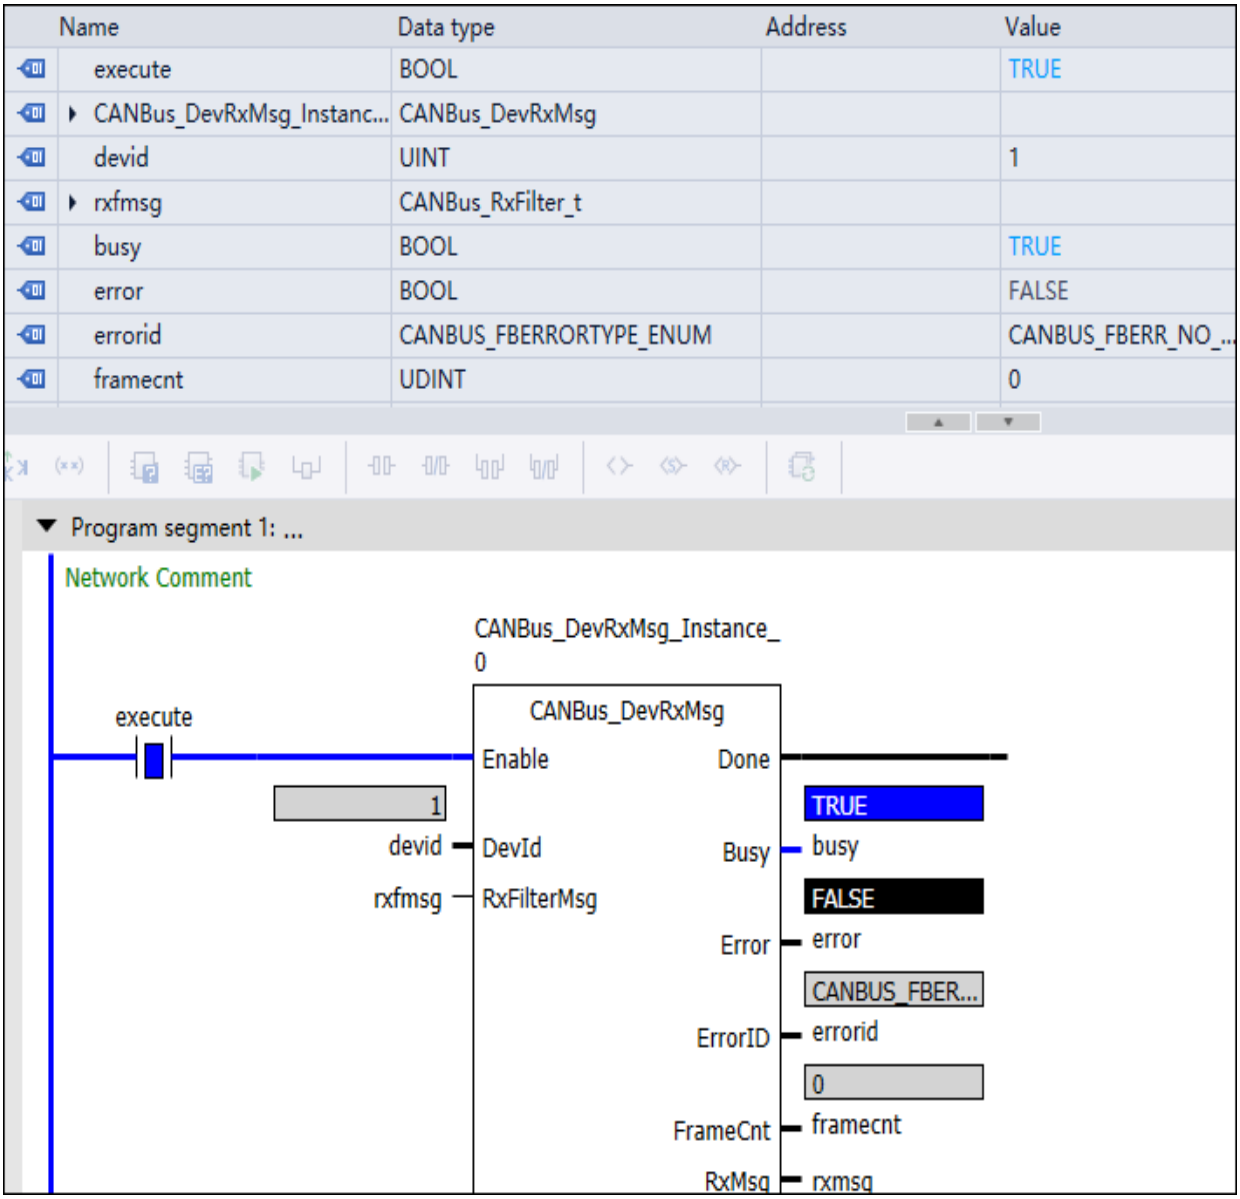
  Variable

Input / Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Enable	Function block enable flag	BOOL	Follows data type	FALSE	Function block enable flag TRUE: Active at high level FALSE: Stop/Reset at low level
	DevId	Network ID of the CANBus device.	UINT	Follow data type	-	The device ID must correspond to the network ID of the CANBus device.
	RxFilterMsg	Setting of receiving filtered messages	18.4.10.5 CANBus_RxFilter_t: Structure of CANBus Receive Frame Filter	Follows data type	-	Set reception parameters and filtering parameters.
Output	Done	Instruction completion flag	BOOL	Follows data type	FALSE	Function block completion flag.
	Busy	Instruction execution flag	BOOL	Follows data type	FALSE	Function block execution flag.
	Error	Error flag	BOOL	Follows data type	FALSE	Function block error flag.
	ErrorID	Fault code	18.4.10.9 CANBus_FBErrorType_Enum: Enumeration of CANBus Function Block Error	Follows data type	-	Fault code of function block. See Fault description.
	FrameCnt	Frame counter	UDINT	Follows data type	-	Frame counter that indicates the number of received qualified frames.
	RxMsg	Received messages	18.4.10.4 CANBus_FrameMsg_t: Structure of the CANBus Frame Message	Follows data type	-	Stores the received qualified CAN frame messages. (Only the latest received CAN frame is buffered)

- **Function**

  When the function block is enabled, it receives CAN data from the network number corresponding to DevId. The filtering is determined by RxFilterMsg. Received qualified CAN frames are counted in FrameCnt, and the messages of the latest qualified CAN frame is stored in RxMsg.

- **Sequence diagram**



- **Program example**

  ST:

	Name	Data type	Address	Value
	CANBus_DevRxMsg_Instance...	CANBus_DevRxMsg

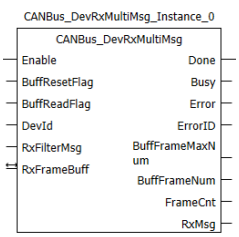
CANBUS_FBERR_BUFF_FULL	0x0009	Function block buffer full error.	-
CANBUS_FBERR_UNKNOWN_ERROR	0x00FF	Function block unknown error.	-



- **Precautions**

  At the same time, a maximum of 128 instantiated receive function blocks are supported, including CANBus_DevRxMsg and CANBus_DevRxMultiMsg.

18.4.10.14 CANBus_DevRxMultiMsg

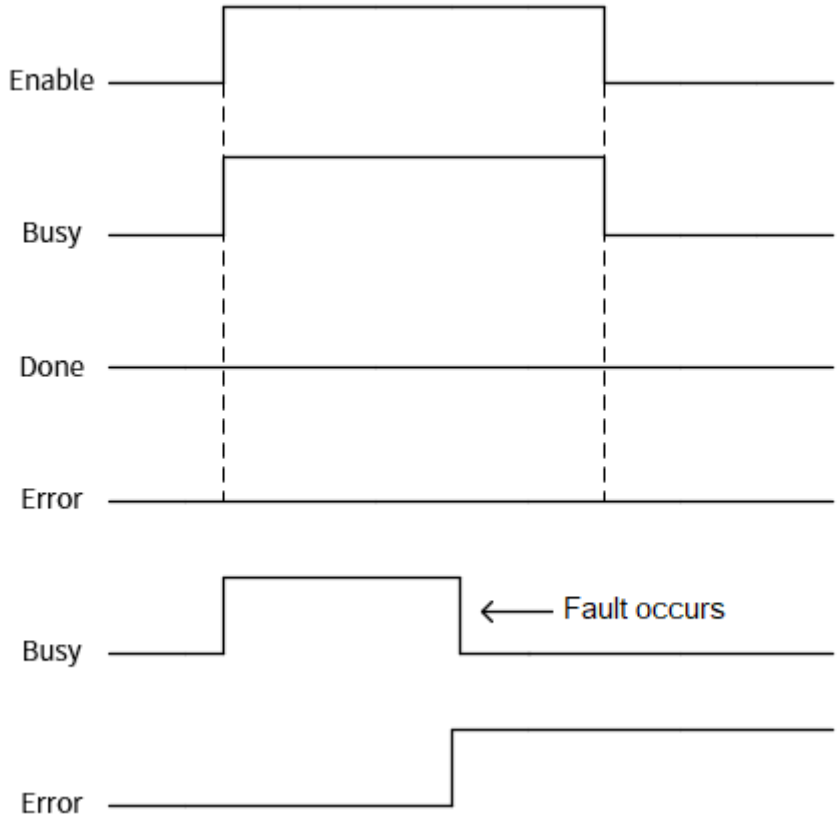
This instruction allows the device to receive multiple frame messages.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
CANBus_DevRxMultiMsg	Device receives multiple frame messages	FB		CANBus_DevRxMultiMsg_Instance_0(Enable := , BuffResetFlag := , BuffReadFlag := , DevId := , RxFilterMsg := , RxFrameBuff := , Done => , Busy => , Error => , ErrorID => , BuffFrameMaxNum => , BuffFrameNum => , FrameCnt => , RxMsg =>);

- **Related variables**

  Variable



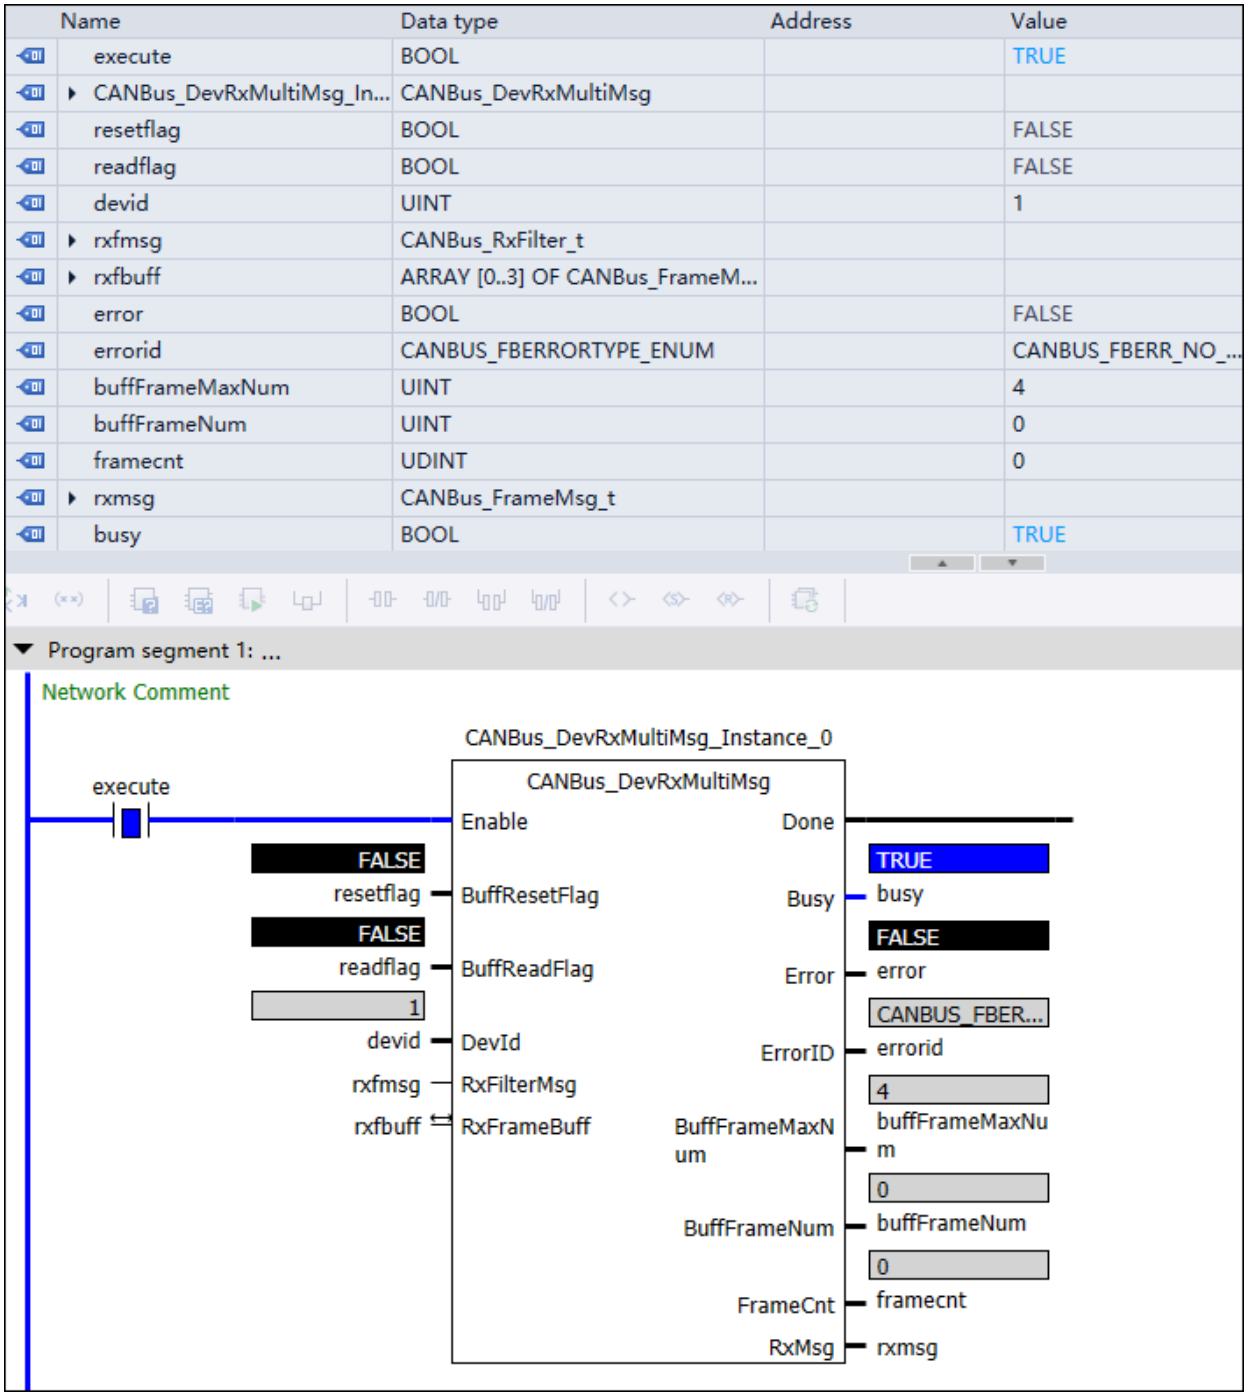
Input / Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Enable	Function block enable flag	BOOL	Follows data type	FALSE	Function block enable flag TRUE: Active at high level FALSE: Stop/Reset at low level
	BuffResetFlag	Buffer reset flag	BOOL	Follows data type	-	Buffer reset flag. TRUE: Clears the buffer. The buffer starts filling from the beginning, and the function block is automatically reset.
	BuffReadFlag	Buffer read flag	BOOL	Follows data type	-	Buffer read flag. TRUE:The application layer reads data from the buffer, preventing the function block from writing to the buffer.
	DevId	Network ID of the CANBus device.	UINT	Follow data type	-	The device ID must correspond to the network ID of the CANBus device.
	RxFilterMsg	Setting of receiving filtered messages	18.4.10 CANBus_RxFilter_t: Structure of CANBus Receive Frame Filter	Follows data type	-	Set receive parameters and filter parameters.
Input / Output	RxFrameBuff	Received frame buffer	ARRAY[*] OF 18.4.10.4 CANBus_FrameMsg_t: Structure of the CANBus frame message	Follows data type	-	A one-dimensional variable-length array of structures, with the number of array elements not exceeding 65,535.
Output	Done	Instruction completion flag	BOOL	Follows data type	FALSE	Function block completion flag.
	Busy	Instruction execution flag	BOOL	Follows data type	FALSE	Function block execution flag.
	Error	Error flag	BOOL	Follows data type	FALSE	Function block error flag.

Input / Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	ErrorID	Fault code	18.4.10.9 CANBus_FBErrorType_Enum: Enumeration of CANBus Function Block Error	Follows data type	-	Fault code of function block. See Fault description.
	BuffFrameMaxNum	Maximum bumber of received buffer frames	UINT	Follow data type	-	Maximum number of received buffer frames. 0: No buffer. >0 - Maximum number of buffered frames.
	BuffFrameNum	Number of received buffer frames	UINT	Follow data type	-	Number of received buffer frames, which is less than BuffFrameMaxNum. Clear and re-count automatically after the buffer is full.
	FrameCnt	Frame counter	UDINT	Follows data type	-	Frame counter that indicates the number of received qualified frames.
	RxMsg	Received messages	18.4.10.4 CANBus_FrameMsg_t: Structure of the CANBus Frame Message	Follows data type	-	Stores the received qualified CAN frame messages. (Only the latest received CAN frame is buffered)

- **Function**

  When the function block is enabled, it receives CAN data from the network number corresponding to DevId. The filtering is determined by RxFilterMsg. Received qualified CAN frames are counted in FrameCnt, and the messages of the latest qualified CAN frame is stored in RxMsg.

- **Sequence diagram**



- **Program example**

  ST:

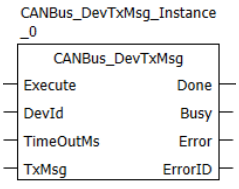
RETURN
```

LD:

- **Fault description**

When an error occurs, find the corresponding error via ErrorID, and locate the root cause of the error.

Fault code	Value	Description	Troubleshooting Method
CANBUS_FBERR_NO_ERROR	0x0000	Function block operates normally or there is no error.	Function block executes normally.
CANBUS_FBERR_EXE_FAILED	0x0001	Function block execution failed.	-
CANBUS_FBERR_INVAILD_DEVICEID	0x0002	Invalid device ID, which is not enabled.	Invalid input DevID.
CANBUS_FBERR_DEVICE_FAULT	0x0003	There is a fault with the device.	-
CANBUS_FBERR_WRONG_PARAMETER	0x0004	The input parameters of the function block are incorrect.	Maximum buffer size is 0.



Fault code	Value	Description	Troubleshooting Method
CANBUS_FBERR_BUSY_ERROR	0x0005	Function block is busy.	Function block instance limit exceeded.
CANBUS_FBERR_ABORT_ERROR	0x0006	Function block abort error.	-
CANBUS_FBERR_TIME_OUT_ERROR	0x0007	Function block timeout error.	-
CANBUS_FBERR_POINTER_NULL	0x0008	Function block null pointer error.	Input/output parameters or buffer address not specified.
CANBUS_FBERR_BUFF_FULL	0x0009	Function block buffer full error.	Reception buffer full.
CANBUS_FBERR_UNKNOWN_ERROR	0x00FF	Function block unknown error.	-

- **Precautions**
  - At the same time, a maximum of 128 instantiated receive function blocks are supported, including CANBus_DevRxMsg and CANBus_DevRxMultiMsg.
  - When reading the buffer, the BuffReadFlag flag can be set to prevent new data from overwriting the data in the buffer. It is important to note that during the buffer reading process, the internal register only stores the most recently received message. Therefore, this flag should be set for the shortest possible time and reset in a timely manner to avoid frame loss during reception.

18.4.10.15 CANBus_DevTxMsg

This instruction allows the device to transmit messages.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
CANBus_DevTxMsg	Device transmitting messages	FB		CANBus_DevTxMsg_Instance_0(Execute := , DevId := , TimeOutMs := , TxMsg := , Done => , Busy => , Error => , ErrorID =>);

- **Related variables**

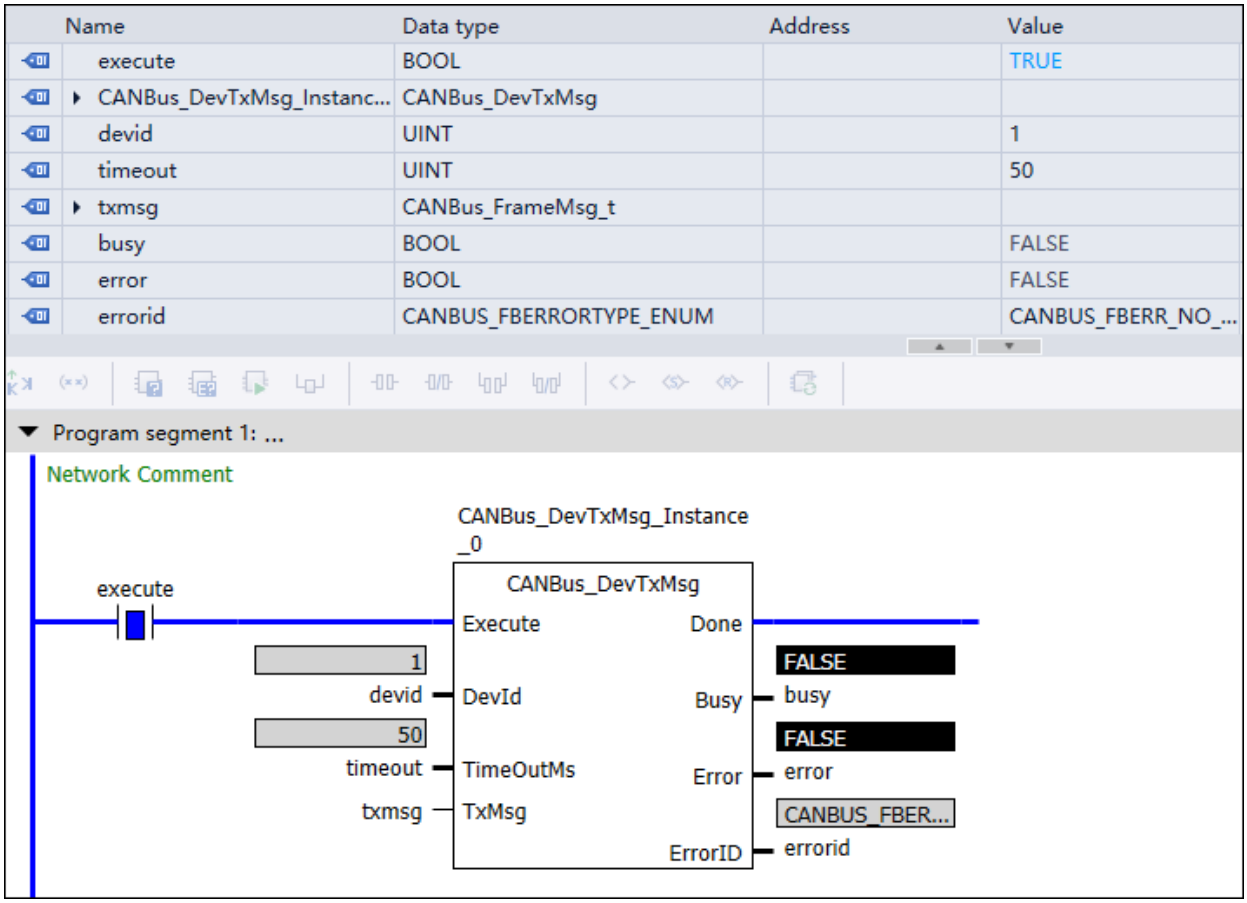
  Variable

Input / Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Function block trigger flag	BOOL	Follows data type	FALSE	Function block trigger flag. TRUE: Triggered on rising edge. FALSE: Stop/reset on falling edge.
	DevId	Network ID of the CANBus device.	UINT	Follow data type	-	The device ID must correspond to the network ID of the CANBus device.
	TimeOutMs	Timeout period	UINT	Follow data type	-	Transmitting timeout in ms.
	TxMsg	Transmit messages	18.4.10.4 CANBus_FrameMsg_t: Structure of the CANBus Frame Message	Follows data type	-	Transmitted message, including the extended frame flag, remote frame flag, CAN ID, data length and data.
Output	Done	Instruction completion flag	BOOL	Follows data type	FALSE	Function block completion flag.
	Busy	Instruction execution flag	BOOL	Follows data type	FALSE	Function block execution flag.
	Error	Error flag	BOOL	Follows data type	FALSE	Function block error flag.
	ErrorID	Fault code	18.4.10.9 CANBus_FBErrorType_Enum: Enumeration of CANBus Function Block Error	Follows data type	-	Fault code of function block. See Fault description.

- **Function**

  When the function block is triggered, it transmits one frame of CAN data to the network number corresponding to the DevId. The content of the transmission is determined by TxMsg.

- **Sequence diagram**



- **Program example**

  ST:

	Name	Data type	Address	Value
	CANBus_DevTxMsg_Instanc...	CANBus_DevTxMsg		
	execute	BOOL		TRUE
	devid	UINT		1
	timeout	UINT		50
	txmsg	CANBus_FrameMsg_t		
	done	BOOL		TRUE
	busy	BOOL		FALSE
	error	BOOL		FALSE
	errorid	CANBUS_FBERRORTYPE_ENUM		CANBUS_FBERR_NO_...

```
CANBus_DevTxMsg_Instance_0(
Execute TRUE := execute TRUE,
DevId 1 := devid 1,
TimeOutMs 50 := timeout 50,
TxMsg := txmsg,
Done TRUE => done TRUE,
Busy FALSE => busy FALSE,
Error FALSE => error FALSE,
ErrorIDCANBUS_FBERR_NO_ER... => erroridCANBUS_FBERR_NO_ER...);RETURN
```

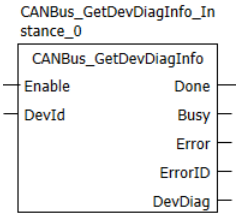
  LD:

- **Fault description**

  When an error occurs, find the corresponding error via ErrorID, and locate the root cause of the error.

Fault code	Value	Description	Troubleshooting Method
CANBUS_FBERR_NO_ERROR	0x0000	Function block operates normally or there is no error.	Function block executes normally.
CANBUS_FBERR_EXE_FAILED	0x0001	Function block execution failed.	-
CANBUS_FBERR_INVAILD_DEVICEID	0x0002	Invalid device ID, which is not enabled.	Invalid input DevID.
CANBUS_FBERR_DEVICE_FAULT	0x0003	There is a fault with the device.	Device is not running or has a fault.
CANBUS_FBERR_WRONG_PARAMETER	0x0004	The input parameters of the function block are incorrect.	CANID is invalid, whosedata length exceeds limit (data frame greater than 8 and remote frame greater than 0).
CANBUS_FBERR_BUSY_ERROR	0x0005	Function block is busy.	Tranmission request conflict.
CANBUS_FBERR_ABORT_ERROR	0x0006	Function block abort error.	-
CANBUS_FBERR_TIME_OUT_ERROR	0x0007	Function block timeout error.	Transmission failed due to timeout.
CANBUS_FBERR_POINTER_NULL	0x0008	Function block null pointer error.	-

Fault code	Value	Description	Troubleshooting Method
CANBUS_FBERR_BUFF_FULL	0x0009	Function block buffer full error.	-
CANBUS_FBERR_UNKNOWN_ERROR	0x00FF	Function block unknown error.	-



- **Precautions**

  If the timeout period is set to 0, the function block defaults to using a 50ms detection period for transmission timeout during operation.

18.4.10.16 CANBus_GetDevDiagInfo

This instruction gets the diagnostic information of the device.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
CANBus_GetDevDiagInfo	Get device diagnostic information	FB		CANBus_GetDevDiagInfo_Instance_0(Enable := , DevId := , Done => , Busy => , Error => , ErrorID => , DevDiag =>);

Fault code	Value	Description	Troubleshooting Method
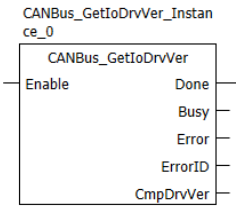
CANBUS_FBERR_BUFF_FULL	0x0009	Function block buffer full error.	-
CANBUS_FBERR_UNKNOWN_ERROR	0x00FF	Function block unknown error.	-



- **Precautions**

  The parameters in the CmpDrvVer structure are uniformly in hexadecimal format.

18.4.10.18 CANBus_SetDevBaud

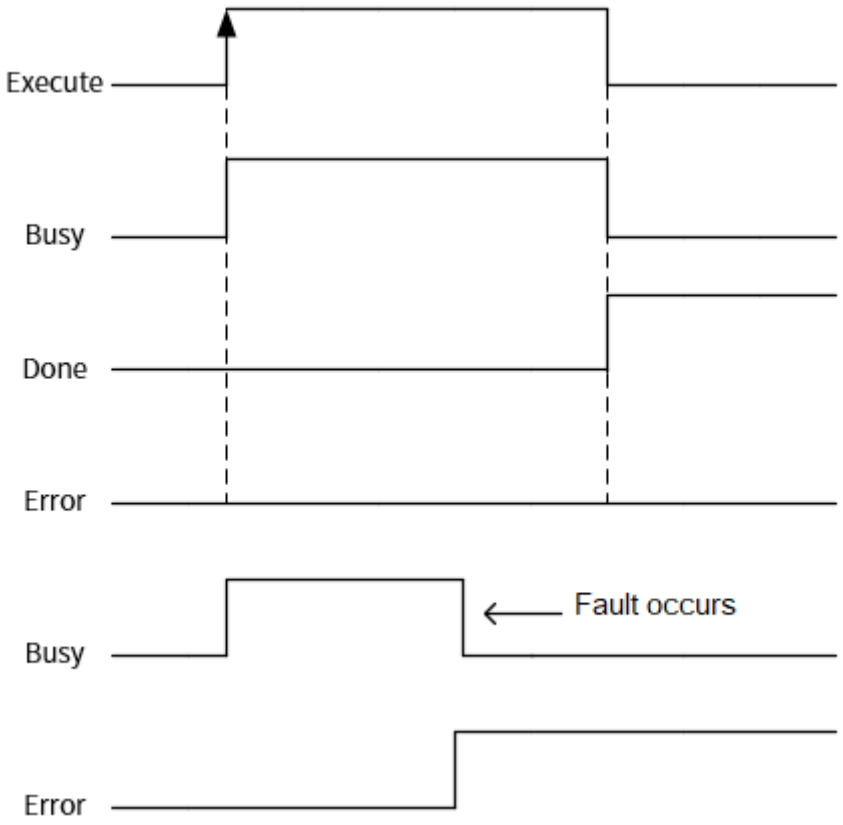
This instruction sets the baud rate of the device.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
CANBus_SetDevBaud	Set baud rate of device	FB		CANBus_SetDevBaud_Instance_0(Execute := , DevId := , SetBaud := , Done => , Busy => , Error => , ErrorID => , RunBaud =>);

- **Related variables**

Variable



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Function block enable flag	BOOL	Follows data type	FALSE	Function block enable flag TRUE: Active at high level FALSE: Stop/Reset at low level
	DevId	Network ID of the CANBus device.	UINT	Follow data type	-	The device ID must correspond to the network ID of the CANBus device.
	SetBaud	CAN bus setting baud rate	18.4.10.6 CANBus_BaudrateType_Enum: Enumeration of CANBus Baud Rate	Follows data type	-	CAN bus setting baud rate in kbps.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	Done	Instruction completion flag	BOOL	Follows data type	FALSE	Function block completion flag.
	Busy	Instruction execution flag	BOOL	Follows data type	FALSE	Function block execution flag.
	Error	Error flag	BOOL	Follows data type	FALSE	Function block error flag.
	ErrorID	Fault code	18.4.10.9 CANBus_FBErrorType_Enum: Enumeration of CANBus Function Block Error	Follows data type	-	Fault code of function block. See Fault description.
	RunBaud	CAN bus running baud rate	UINT	Follow data type	-	CAN bus running baud rate.

- **Function**

  When the function block is triggered, change the CAN port baud rate of the network number corresponding to DevId.

- **Sequence diagram**

- **Program example**

  ST:

	Name	Data type	Address	Value
	CANBus_SetDevBaud_Insta...	CANBus_SetDevBaud		
	execute	BOOL		TRUE
	devid	UINT		1
	setbaud	CANBUS_BAUDRATETYPE_ENUM		CANBUS_BAUDRATE...
	done	BOOL		TRUE
	busy	BOOL		FALSE
	error	BOOL		FALSE
	errorid	CANBUS_FBERRORTYPE_ENUM		CANBUS_FBERR_NO_...
	runbaud	UINT		10

```
CANBus_SetDevBaud_Instance_0(
Execute TRUE := execute TRUE,
DevId 1 := devid 1,
SetBaudCANBUS_BAUDRATE_10K... := setbaudCANBUS_BAUDRATE_10K...,
Done TRUE => done TRUE,
Busy FALSE => busy FALSE,
Error FALSE => error FALSE,
ErrorIDCANBUS_FBERR_NO_ER... => erroridCANBUS_FBERR_NO_ER...,
RunBaud 10 => runbaud 10 );
RETURN
```

LD:

	Name	Data type	Address	Value
	execute	BOOL		TRUE
	CANBus_SetDevBaud_Insta...	CANBus_SetDevBaud		
	devid	UINT		1
	setbaud	CANBUS_BAUDRATETYPE_ENUM		CANBUS_BAUDRATE...
	busy	BOOL		FALSE
	error	BOOL		FALSE
	errorid	CANBUS_FBERRORTYPE_ENUM		CANBUS_FBERR_NO_...
	runbaud	UINT		10

- **Fault description**

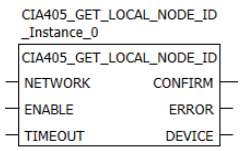
  When an error occurs, find the corresponding error via ErrorID, and locate the root cause of the error.

Fault code	Value	Description	Troubleshooting Method
CANBUS_FBERR_NO_ERROR	0x0000	Function block operates normally or there is no error.	Function block executes normally.
CANBUS_FBERR_EXE_FAILED	0x0001	Function block execution failed.	-
CANBUS_FBERR_INVAILD_DEVICEID	0x0002	Invalid device ID, which is not enabled.	Invalid input DevID.
CANBUS_FBERR_DEVICE_FAULT	0x0003	There is a fault with the device.	-
CANBUS_FBERR_WRONG_PARAMETER	0x0004	The input parameters of the function block are incorrect.	Baud rate input error.
CANBUS_FBERR_BUSY_ERROR	0x0005	Function block is busy.	-
CANBUS_FBERR_ABORT_ERROR	0x0006	Function block abort error.	-
CANBUS_FBERR_TIME_OUT_ERROR	0x0007	Function block timeout error.	-
CANBUS_FBERR_POINTER_NULL	0x0008	Function block null pointer error.	-
CANBUS_FBERR_BUFF_FULL	0x0009	Function block buffer full error.	-
CANBUS_FBERR_UNKNOWN_ERROR	0x00FF	Function block unknown error.	-

- **Precautions**
  - The baud rate modification function block currently only supports changing the baud rate of the CAN ports on the PLC body or expansion card. It does not support changing the baud rate of ports expanded by the CAN module.
  - SetBaud sets the CAN bus baud rate. An enumeration type is used to prevent the input of baud rates not supported by the device.

18.4.11 CIA405

18.4.11.1 Instruction List



Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.11.2 CIA405_GET_LOCAL_NODE_ID	FB	Get the CANopen node ID of the controller	CIA405	Library version 1.0.0.0 and later
18.4.11.3 CIA405_GET_STATE	FB	Obtain the status of the CANopen device		Library version 1.0.0.0 and later
18.4.11.4 CIA405_NMT	FB	Device NMT state management		Library version 1.0.0.0 and later

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.11.5 CIA405_RECV_EMCY_DEV	FB	Get device EMCY message		Library version 1.0.0.0 and later
18.4.11.6 CIA405_SDO_READ4	FB	Read up to 4 bytes of a CANopen object		Library version 1.0.0.0 and later
18.4.11.7 CIA405_SDO_WRITE4	FB	Write up to 4 bytes of a CANopen object		Library version 1.0.0.0 and later
18.4.11.8 COP_GET_MST_STATISTICS	FB	Obtain statistics		Library version 1.0.0.0 and later

18.4.11.2 CIA405_GET_LOCAL_NODE_ID

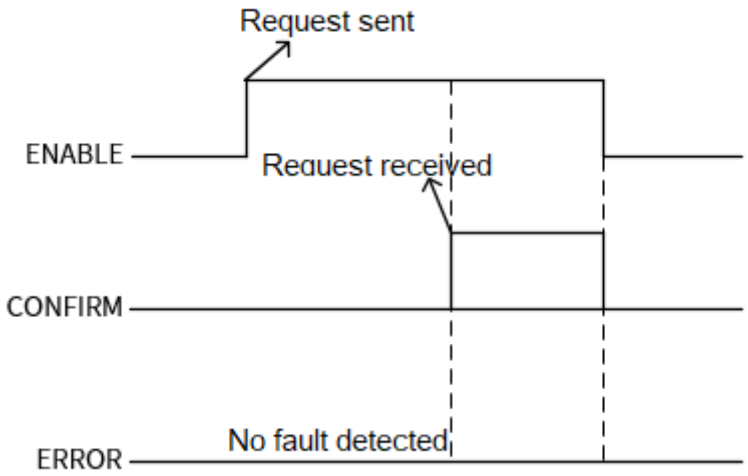
This instruction gets the CANopen node ID of the controller.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
CIA405_GET_LOCAL_NODE_ID	Get the CANopen node ID of the controller	FB		CIA405_GET_LOCAL_NODE_ID_Instance_0(NETWORK := , ENABLE := , TIMEOUT := , CONFIRM => , ERROR => , DEVICE =>);

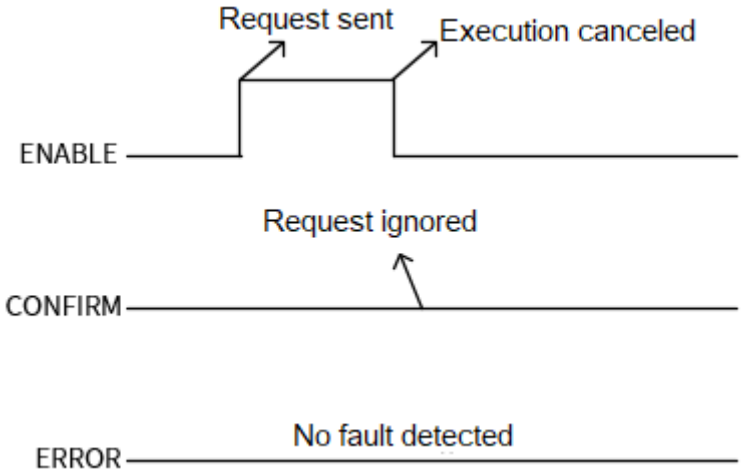
- **Related variables**

Variable



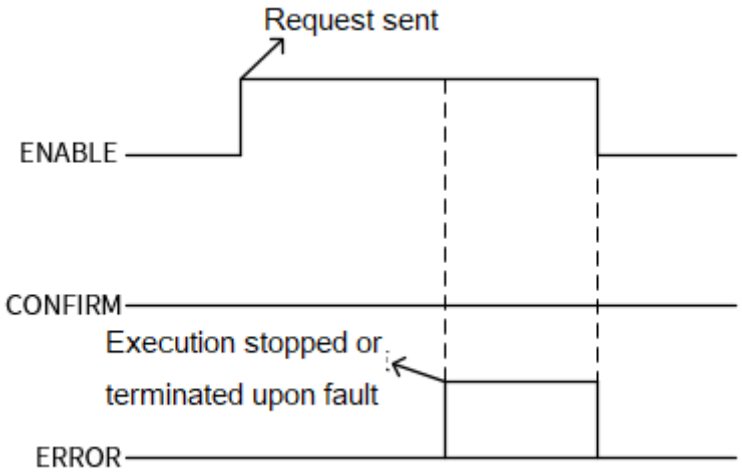
Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	NETWORK	CAN network number	USINT	Follows data type	-	The CAN port executed by the function block corresponds to the CAN port number of the host.
	ENABLE	Enable	BOOL	Follows data type	FALSE	Level-triggered, controls the ON/OFF execution of the function block.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	TIMEOUT	Maximum execution time	UDINT	Follows data type	-	Maximum execution time in ms. If the timeout is reached before a response is received, execution will be aborted with a timeout error. 0 (factory setting) = Disable timeout. 1...65535 = Timeout value.
Output	CONFIRM	FB completion flag	BOOL	Follows data type	FALSE	Function block completion flag.
	ERROR	Function block error message	CIA405_CANOPEN_KERNEL_ERROR	Follows data type	-	Function block error message. For details, see 18.4.11.9 Fault Codes.
	DEVICE	CANopen node ID of the controller	CIA405_DEVICE	Follows data type	-	CANopen node ID of the controller. 0 = Invalid. 1...127 = Controller node ID.



- **Function**

  This function block returns the CANopen node ID of the controller on the specified CAN bus interface.



- **Sequence diagram**
  - If a response is generated for the current request and no errors are detected, the CONFIRM is immediately set to TRUE and remains TRUE (provided that the function block is called with ENABLE = TRUE). If the function block is called with ENABLE is reset to FALSE, the CONFIRM will be reset to FALSE, and the function block can restart execution.

  - If the function block is called with ENABLE reset to FALSE before the current execution completes, the execution will be canceled. Responses to cancellation requests may have already been sent or will arrive later, but these responses will be ignored at this time.

- If the current execution is aborted due to an SDO abort message or completes due to an error detected, the ERROR will be set to a non-zero value (for more information on the detected fault codes, see 18.4.11.9 Fault Codes). If the function block is called with ENABLE reset to FALSE, the ERROR will be reset to 0, and the function block can restart execution.

- **Program example**

device	USINT (0..127)		127

18.4.11.3 CIA405_GET_STATE

This instruction obtains the status of the CANopen device.

- **Instruction format**

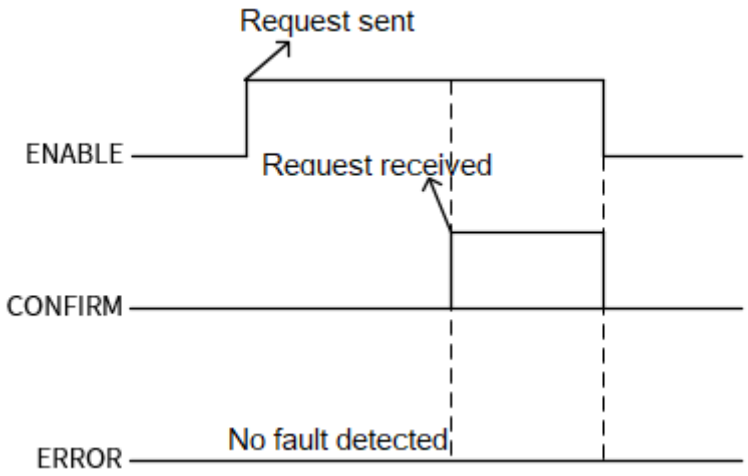
Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
CIA405_GET_STATE	Obtain the status of the CANopen device	FB		CIA405_GET_STATE_Instance_0(NETWORK := , ENABLE := , TIMEOUT := , DEVICE := , CONFIRM => , ERROR => , STATE =>);

- **Related variables**

  Variable

Input / Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	NETWORK	CAN network number	USINT	Follows data type	-	The CAN port executed by the function block corresponds to the CAN port number of the host.
	ENABLE	Enable	BOOL	Follows data type	FALSE	Level-triggered, controls the ON/OFF execution of the function block.
	TIMEOUT	Maximum execution time	UDINT	Follows data type	-	Maximum execution time in ms. If the timeout is reached before a response is received, execution will be aborted with a timeout error. 0 (factory setting) = Disable timeout. 1...65535 = Timeout value.
	DEVICE	CANopen node ID of the controller	CIA405_DEVICE	Follows data type	-	CANopen node ID of the controller. 0 = Invalid. 1...127 = Controller node ID.
Output	CONFIRM	FB completion flag	BOOL	Follows data type	FALSE	Function block completion flag.
	ERROR	Function block error message	CIA405_CANOPEN_KERNEL_ERROR	Follows data type	-	Function block error message. For details, see 18.4.11.9 Fault Codes.

Input / Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	STATE	CANopen kernel state	CIA405_DEVICE_STATE	Follows data type	-	Current state of the CANopen kernel. For details, see Function description.

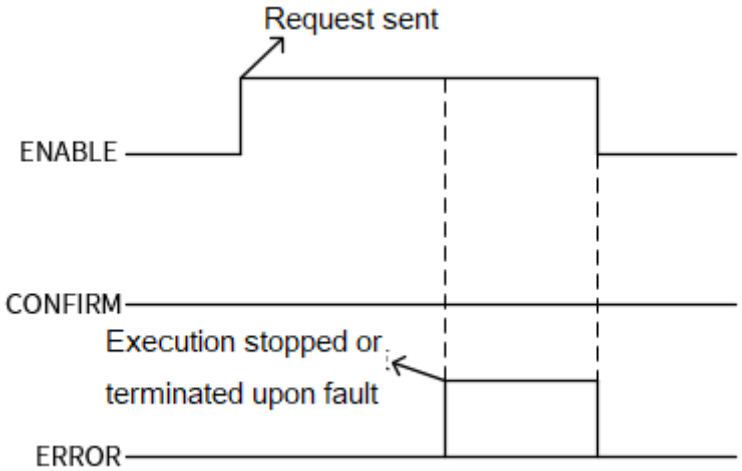


- **Function**

  This instruction returns the current NMT state of the specified CANopen device when either heartbeat or node protection is active.

  The data type of "STATE" is the CIA405_Device_STATE enumeration, with enumeration values defined as follows.

Variable	Value	Description
INIT	0	Initializing
RESET_COMM	1	Reset communication
RESET_APP	2	Reset application
PRE_OPERATION	3	Pre-operational
STOPPED	4	Stopped
OPERATIONAL	5	Normal operation
UNKNOWN	6	Unknown NMT Node protection or heartbeat of the selected device is not active, or the controller is not a heartbeat consumer.
NOT_AVAIL	7	NMT not available Node protection or heartbeat of the selected device is active, but the device did not correctly report its NMT state before the timeout.



- **Sequence diagram**
  - If a response is generated for the current request and no errors are detected, the CONFIRM is immediately set to TRUE and remains TRUE (provided that the function block is called with ENABLE = TRUE). If the function block is called with ENABLE is reset to FALSE, the CONFIRM will be reset to FALSE, and the function block can restart execution.

◦ If the function block is called with ENABLE reset to FALSE before the current execution completes, the execution will be canceled. Responses to cancellation requests may have already been sent or will arrive later, but these responses will be ignored at this time.

◦ If the current execution is aborted due to an SDO abort message or completes due to an error detected, the ERROR will be set to a non-zero value (for more information on the detected fault codes, see 18.4.11.9 Fault Codes). If the function block is called with ENABLE reset to FALSE, the ERROR will be reset to 0, and the function block can restart execution.

state	CIA405_DEVICE_STATE		OPERATIONAL	

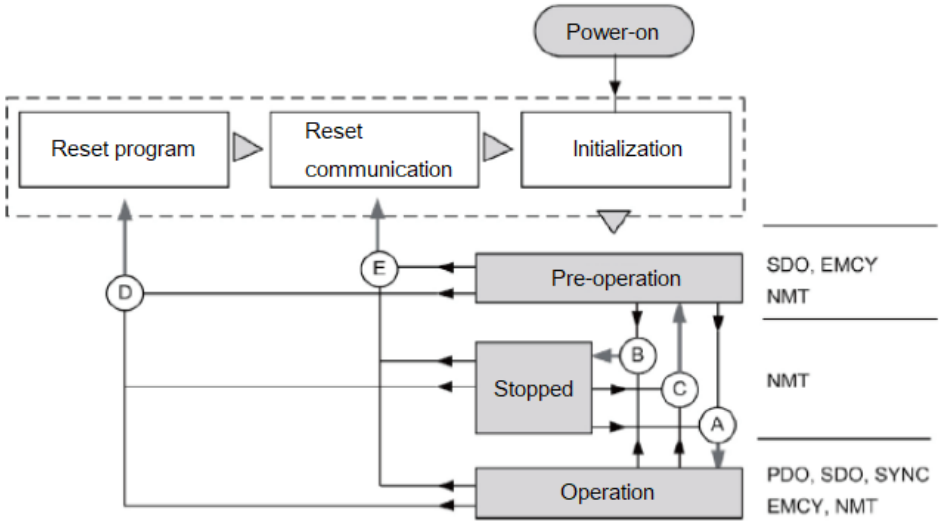
18.4.11.4 CIA405_NMT

This instruction involves device NMT state management.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
CIA405_NMT	Device NMT state management	FB		CIA405_NMT_Instance_0(NETWORK := , ENABLE := , TIMEOUT := , STATE := , DEVICE := , CONFIRM => , ERROR =>);

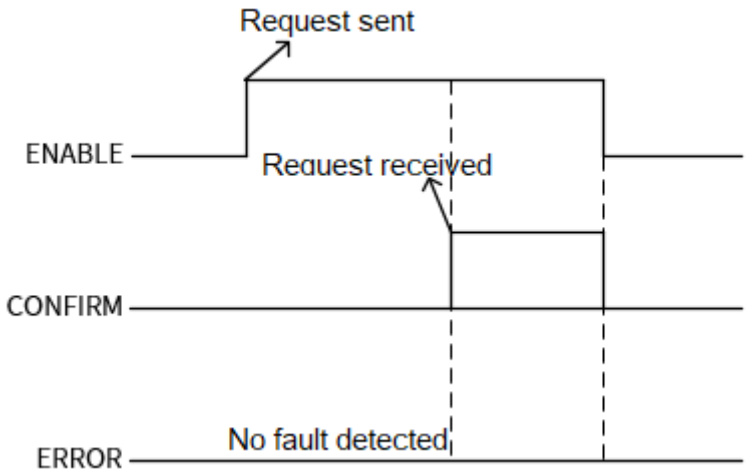


- **Related variables**

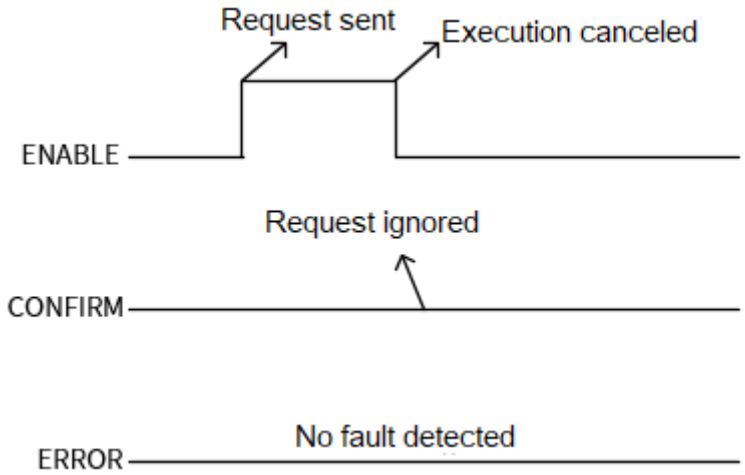
Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	NETWORK	CAN network number	USINT	Follows data type	-	The CAN port executed by the function block corresponds to the CAN port number of the host.
	ENABLE	Enable	BOOL	Follows data type	FALSE	Level-triggered, controls the ON/OFF execution of the function block.
	TIMEOUT	Maximum execution time	UDINT	Follows data type	-	Maximum execution time in ms. If the timeout is reached before a response is received, execution will be aborted with a timeout error. 0 (factory setting) = Disable timeout. 1...65535 = Timeout value.
	STATE	Requested NMT state	CIA405_TRANSITION_STATE	Follows data type	-	Requested NMT status transition. For details, see Function description.
	DEVICE	Target device node ID	CIA405_DEVICE	Follows data type	-	CANopen target device node ID. 0 = All NMT slave devices. 1...127 = Target device node ID.
Output	CONFIRM	FB completion flag	BOOL	Follows data type	FALSE	Function block completion flag.
	ERROR	Function block error message	CIA405_CANOPEN_KERNEL_ERROR	Follows data type	-	Function block error message. For details, see 18.4.11.9 Fault Codes.

- **Function**

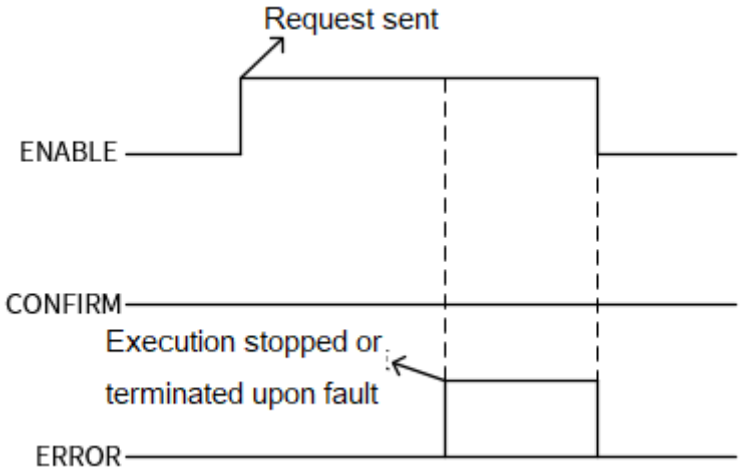


The NMT state machine describes the initialization and state of NMT slaves during main operations. The figure below shows the NM states, the associated available communication objects (PDO, SDO, SYNC, EMCY, and NMT), and the five state transitions (A to E).



The data type of "STATE" is the CIA405_TRANSITION_STATE enumeration, with enumeration values defined as follows.

Variable Name	Value	Description
STOP_REMOTE_NODE	4	Switch to stop state. (Transition B)
START_REMOTE_NODE	5	Switch to operational state. (Transition A)
RESET_NODE	6	Switch to the reset application state. Load the saved data from the device configuration file and automatically switch from reset communication to pre-operational state. (Transition D)
RESET_COMMUNICATION	7	Switch to the reset communication state. Load the persisted data from the communication configuration file and automatically switch to the pre-operational state. (Transition E)
ENTER_PRE_OPERATIONAL	127	Switch to the pre-operational state. (Transition C)
ALL_EXCEPT_NMT_AND_SENDER	2048	Not implemented. (Invalid parameter)



- **Sequence diagram**
  - If a response is generated for the current request and no errors are detected, the CONFIRM is immediately set to TRUE and remains TRUE (provided that the function block is called with ENABLE = TRUE). If the function block is called with ENABLE is reset to FALSE, the CONFIRM will be reset to FALSE, and the function block can restart execution.

- If the function block is called with ENABLE reset to FALSE before the current execution completes, the execution will be canceled. Responses to cancellation requests may have already been sent or will arrive later, but these responses will be ignored at this time.

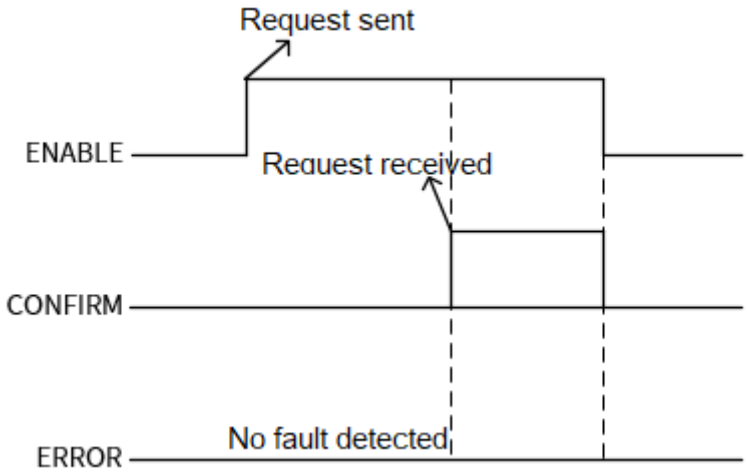
	ERROR INFO	EMCY information	CIA405_EMCY_ERROR	Follows data type	-	EMCY information

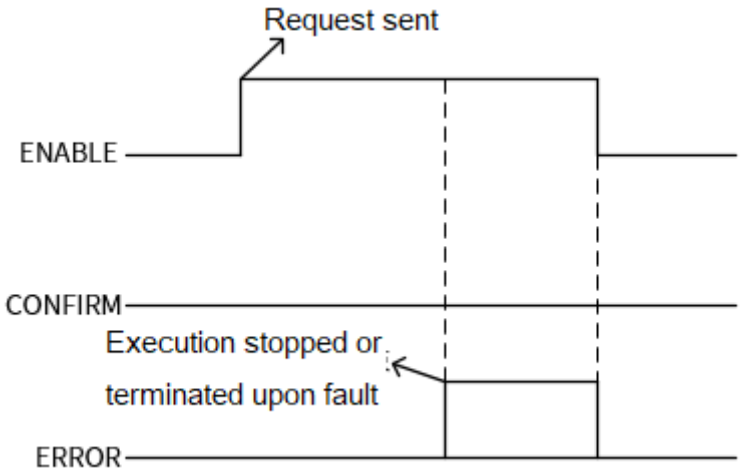


- **Function**

  This function block returns the last stored emergency (EMCY) message received from the specified CANopen device.

  "ERRORINFO" is of the structured data type CIA405_EMCY_ERROR, with the meanings of the structure members defined as follows.

Variable Name	Data Type	Description
EMCY_ERROR_CODE	WORD	Error code of the EMCY message.
ERROR_REGISTER	BYTE	Error register (bit field) of the EMCY message.
ERROR_FIELD	ARRAY [0..4] OF BYTE	Manufacturer-specific error field of the EMCY message.



- **Sequence diagram**
  - If a response is generated for the current request and no errors are detected, the CONFIRM is immediately set to TRUE and remains TRUE (provided that the function block is called with ENABLE = TRUE). If the function block is called with ENABLE is reset to FALSE, the CONFIRM will be reset to FALSE, and the function block can restart execution.

  - If the function block is called with ENABLE reset to FALSE before the current execution completes, the execution will be canceled. Responses to cancellation requests may have already been sent or will arrive later, but these responses will be ignored at this time.

18.4.11.6 CIA405_SDO_READ4

This instruction reads up to 4 bytes of a CANopen object.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
CIA405_SDO_READ4	Read up to 4 bytes of a CANopen object	FB		CIA405_SDO_READ4_Instance_0(NETWORK := , ENABLE := , TIMEOUT := , DEVICE := , CHANNEL := , INDEX := , SUBINDEX := , CONFIRM => , ERROR => , DATA => , DATALENGTH => , ERRORINFO =>);

- **Related variables**

Variable

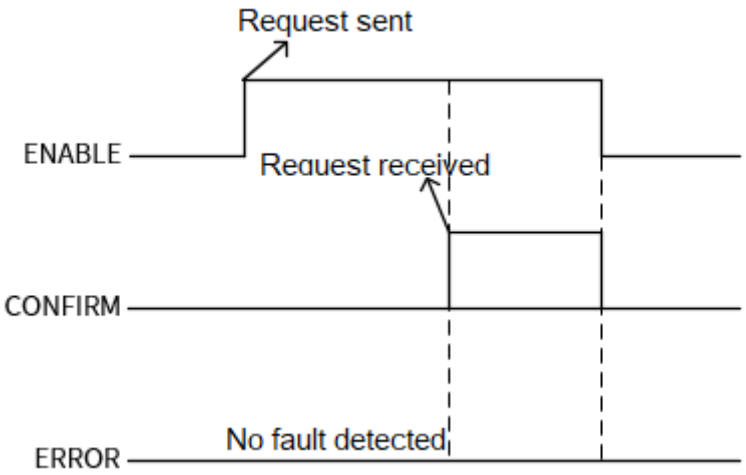
Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	NETWORK	CAN network number	USINT	Follows data type	-	The CAN port executed by the function block corresponds to the CAN port number of the host.
	ENABLE	Enable	BOOL	Follows data type	FALSE	Level-triggered, controls the ON/OFF execution of the function block.
	TIMEOUT	Maximum execution time	UDINT	Follows data type	-	Maximum execution time in ms. If the timeout is reached before a response is received, execution will be aborted with a timeout error. 0 (factory setting) = Disable timeout. 1...65535 = Timeout value.
	DEVICE	CANopen device node ID	CIA405_DEVICE	Follows data type	-	CANopen device node ID. 0 (default value) = local device (controller). 1...127 = device node ID.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	CHANNEL	SDO channel number	USINT	Follows data type	-	SDO channel number. Default value = 1.
	INDEX	Object Index	WORD	Follows data type	-	Object index. Range: 0000 (hexadecimal)...FFFF (hexadecimal)
	SUBINDEX	Object subindex	BYTE	Follows data type	-	Object subindex. Range: 00 (hexadecimal)… FF (hexadecimal).
Output	CONFIRM	FB completion flag	BOOL	Follows data type	FALSE	Function block completion flag.
	ERROR	Function block error message	CIA405_CANOPEN_KERNEL_ERROR	Follows data type	-	Function block error message. For details, see 18.4.11.9 Fault Codes.
	DATA	Data reception	ARRAY [1..4] OF BYTE	Follows data type	-	Receives the data array read from the slave device object.
	DATALENGTH	Size of the read object	USINT	Follows data type	-	Size of the read object in bytes.
	ERRORINFO	SDO abort message	CIA405_SDO_ERROR	Follows data type	-	When ERROR = 1, return SDO abort message content (size is 4 bytes).

- **Function**

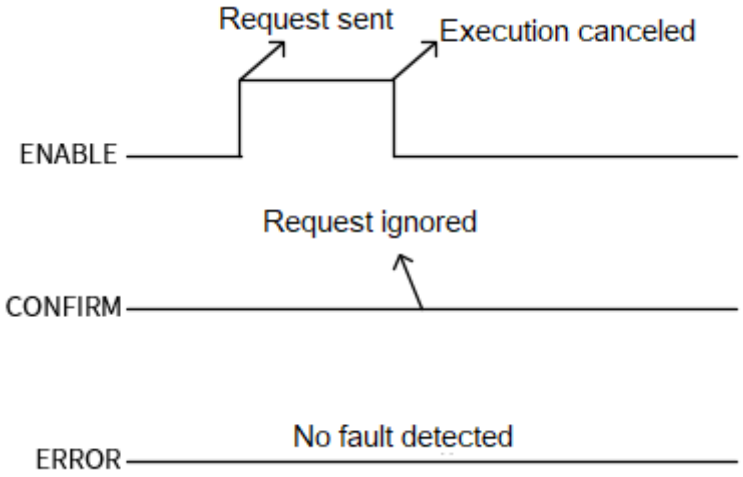
  This instruction reads up to 4 bytes of a CANopen object from the specified device via an SDO message.

  The table below shows the object size and the corresponding contents of the DATA array.



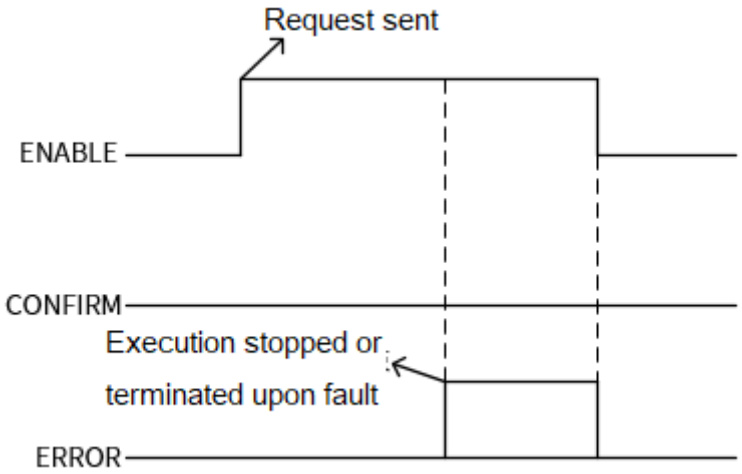
Example of Object Size	DATALENGTH	DATA(1)	DATA(2)	DATA(3)	DATA(4)
1 byte 01 (hexadecimal)	1	01 (hexadecimal)	Invalid	Invalid	Invalid
2 bytes 01 23 (hexadecimal)	2	LSB 23 (hexadecimal)	MSB 01 (hexadecimal)	Invalid	Invalid
3 bytes 01 23 45 (hexadecimal)	3	LSB 45 (hexadecimal)	23 (hexadecimal)	MSB 01 (hexadecimal)	Invalid

Example of Object Size	DATALENGTH	DATA(1)	DATA(2)	DATA(3)	DATA(4)
4 bytes 01 23 45 67 (hexadecimal)	4	LSB 67 (hexadecimal)	45 (hexadecimal)	23 (hexadecimal)	MSB 01 (hexadecimal)



NOTE

LSB = Least Significant Byte; MSB = Most Significant Byte.



- **Sequence diagram**
  - If a response is generated for the current request and no errors are detected, the CONFIRM is immediately set to TRUE and remains TRUE (provided that the function block is called with ENABLE = TRUE). If the function block is called with ENABLE is reset to FALSE, the CONFIRM will be reset to FALSE, and the function block can restart execution.

  - If the function block is called with ENABLE reset to FALSE before the current execution completes, the execution will be canceled. Responses to cancellation requests may have already been sent or will arrive later, but these responses will be ignored at this time.

	error	CIA405_CANOPEN_KERNEL_...		CANOPEN_KERN...
	data	ARRAY [1..4] OF BYTE		
	datalength	USINT		4
	errorinfo	CIA405_SDO_ERROR		NO_ERROR

```
CIA405_SDO_READ4_Instance_0(
NETWORK  1     := network  1     ,
ENABLE  TRUE   := enable  TRUE  ,
TIMEOUT  50    := timeout  50    ,
DEVICE  1      := device  1      ,
CHANNEL  1     := channel  1     ,
INDEX  4101    := index  16#1005 ,
SUBINDEX  0    := subindex  0    ,
CONFIRM  TRUE  => confirm  TRUE  ,
ERRORCANOPEN_KERNEL_NO_ER... => errorCANOPEN_KERNEL_NO_ER...,
DATA => data,
DATALENGTH  4  => datalength  4  ,
ERRORINFO NO_ERROR  => errorinfo NO_ERROR );
RETURN
```

  LD:

- **Precautions**

  The following specific parameters must be passed to the function block:

  1) Device node ID.

  2) SDO client/server channel (only one channel is defined by default).

  3) CANopen object index/subindex.

  If the read operation completes successfully, the function block returns the size of the read object, and the data is provided in a 4-byte array.

18.4.11.7 CIA405_SDO_WRITE4

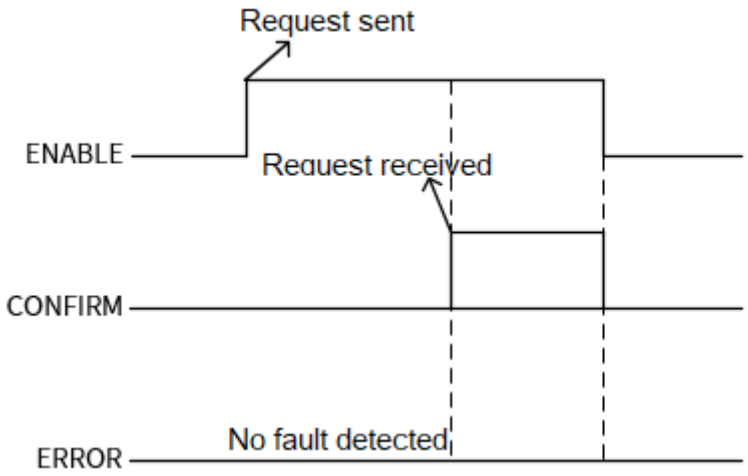
This instruction writes up to 4 bytes of a CANopen object.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
CIA405_SDO_WRITE4	Write up to 4 bytes of a CANopen object	FB		CIA405_SDO_WRITE4_Instance_0(NETWORK := , ENABLE := , TIMEOUT := , DEVICE := , CHANNEL := , INDEX := , SUBINDEX := , DATA := , DATALENGTH := , CONFIRM => , ERROR => , ERRORINFO =>);

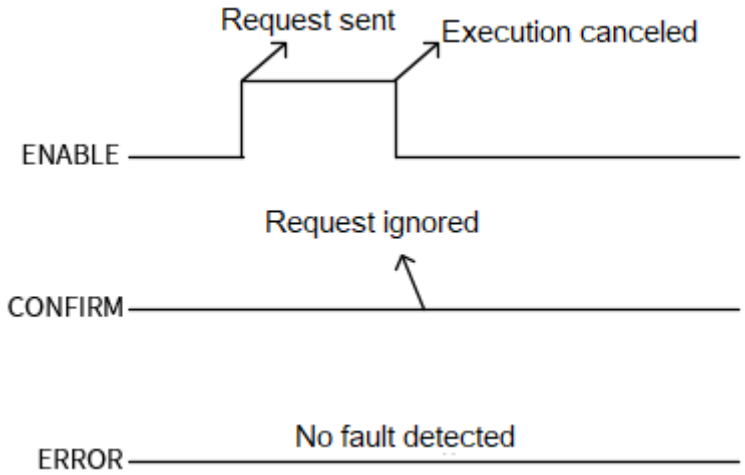
- **Related variables**

Variable



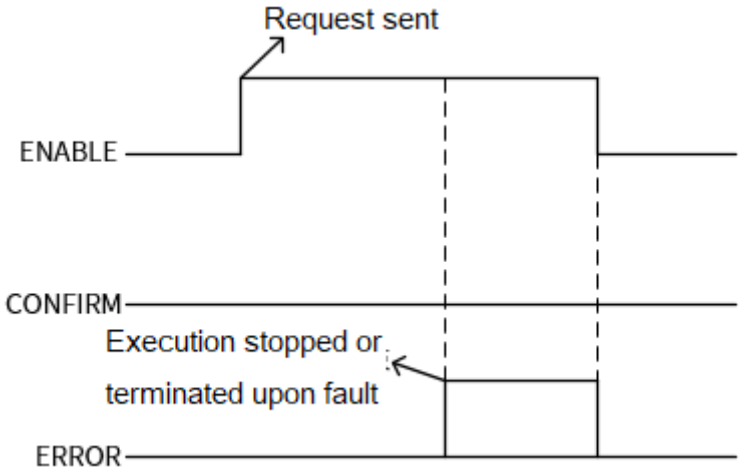
Input / Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	NETWORK	CAN network number	USINT	Follows data type	-	The CAN port executed by the function block corresponds to the CAN port number of the host.
	ENABLE	Enable	BOOL	Follows data type	FALSE	Level-triggered, controls the ON/OFF execution of the function block.
	TIMEOUT	Maximum execution time	UDINT	Follows data type	-	Maximum execution time in ms. If the timeout is reached before a response is received, execution will be aborted with a timeout error. 0 (factory setting) = Disable timeout. 1...65535 = Timeout value.
	DEVICE	CANopen device node ID	CIA405_DEVICE	Follows data type	-	CANopen device node ID. 0 (default value) = local device (controller). 1...127 = device node ID.
	CHANNEL	SDO channel number	USINT	Follows data type	-	SDO channel number. Default value = 1.

Input / Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	INDEX	Object Index	WORD	Follows data type	-	Object index. Range: 0000 (hexadecimal)...FFFF (hexadecimal)
	SUBINDEX	Object subindex	BYTE	Follows data type	-	Object subindex. Range: 00 (hexadecimal)… FF (hexadecimal).
	DATA	Received data	ARRAY [1..4] OF BYTE	Follows data type	-	Array used to store the object value data to be written.
	DATALENGTH	Size of the written object	USINT	Follows data type	-	Size of the written object to in bytes.
Output	CONFIRM	FB completion flag	BOOL	Follows data type	FALSE	Function block completion flag.
	ERROR	Function block error message	CIA405_CANOPEN_KERNEL_ERROR	Follows data type	-	Function block error message. For details, see 18.4.11.9 Fault Codes.
	ERRORINFO	SDO abort message	CIA405_SDO_ERROR	Follows data type	-	When ERROR = 1, return SDO abort message content (size is 4 bytes).



- **Function**

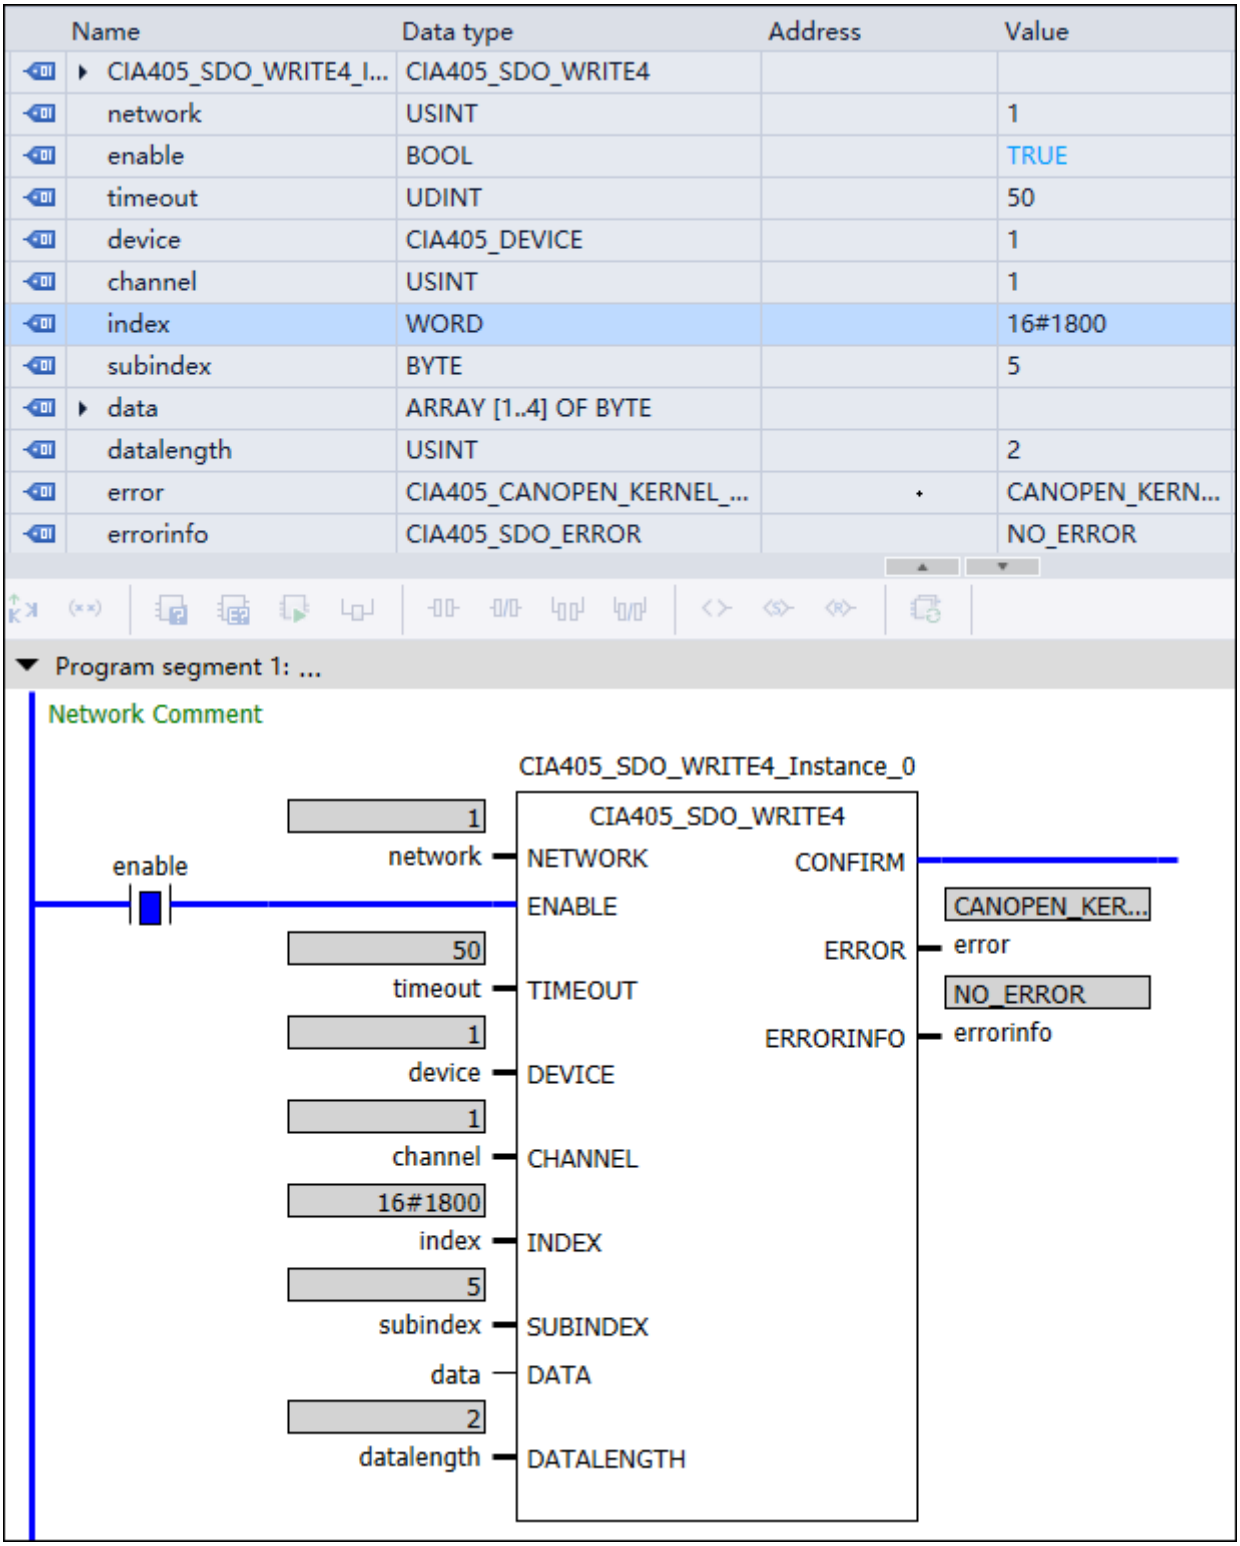
  This instruction writes up to 4 bytes of a CANopen object from the specified device via an SDO message.



- **Sequence diagram**
  - If a response is generated for the current request and no errors are detected, the CONFIRM is immediately set to TRUE and remains TRUE (provided that the function block is called with ENABLE = TRUE). If the function block is called with ENABLE is reset to FALSE, the CONFIRM will be reset to FALSE, and the function block can restart execution.

- If the function block is called with ENABLE reset to FALSE before the current execution completes, the execution will be canceled. Responses to cancellation requests may have already been sent or will arrive later, but these responses will be ignored at this time.

- If the current execution is aborted due to an SDO abort message or completes due to an error detected, the ERROR will be set to a non-zero value (for more information on the detected fault codes, see 18.4.11.9 Fault Codes). If the function block is called with ENABLE reset to FALSE, the ERROR will be reset to 0, and the function block can restart execution.



- **Program example**

  ST:

Name	Data type	Address	Value
CIA405_SDO_WRITE4_I...	CIA405_SDO_WRITE4

```

LD:

- **Precautions**

  The following specific parameters must be passed to the function block:

  1) Device node ID.

  2) SDO client/server channel (only one channel is defined by default).

  3) CANopen object index/subindex.

  4) The value to be written.

  5) The number of bytes to be written.

18.4.11.8 COP_GET_MST_STATISTICS

This instruction obtains statistics.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
COP_GET_MST_STATISTICS	Obtain statistics	FB		COP_GET_MST_STATISTICS_Instance_0 (NETWORK := , ENABLE := , RESET := , CONFIRM => , LOAD => , RXCOUNT => , TXCOUNT => , RXTXCOUNT => , RXCOUNTPERSECOND => , TXCOUNTPERSECOND =>);

- **Related variables**

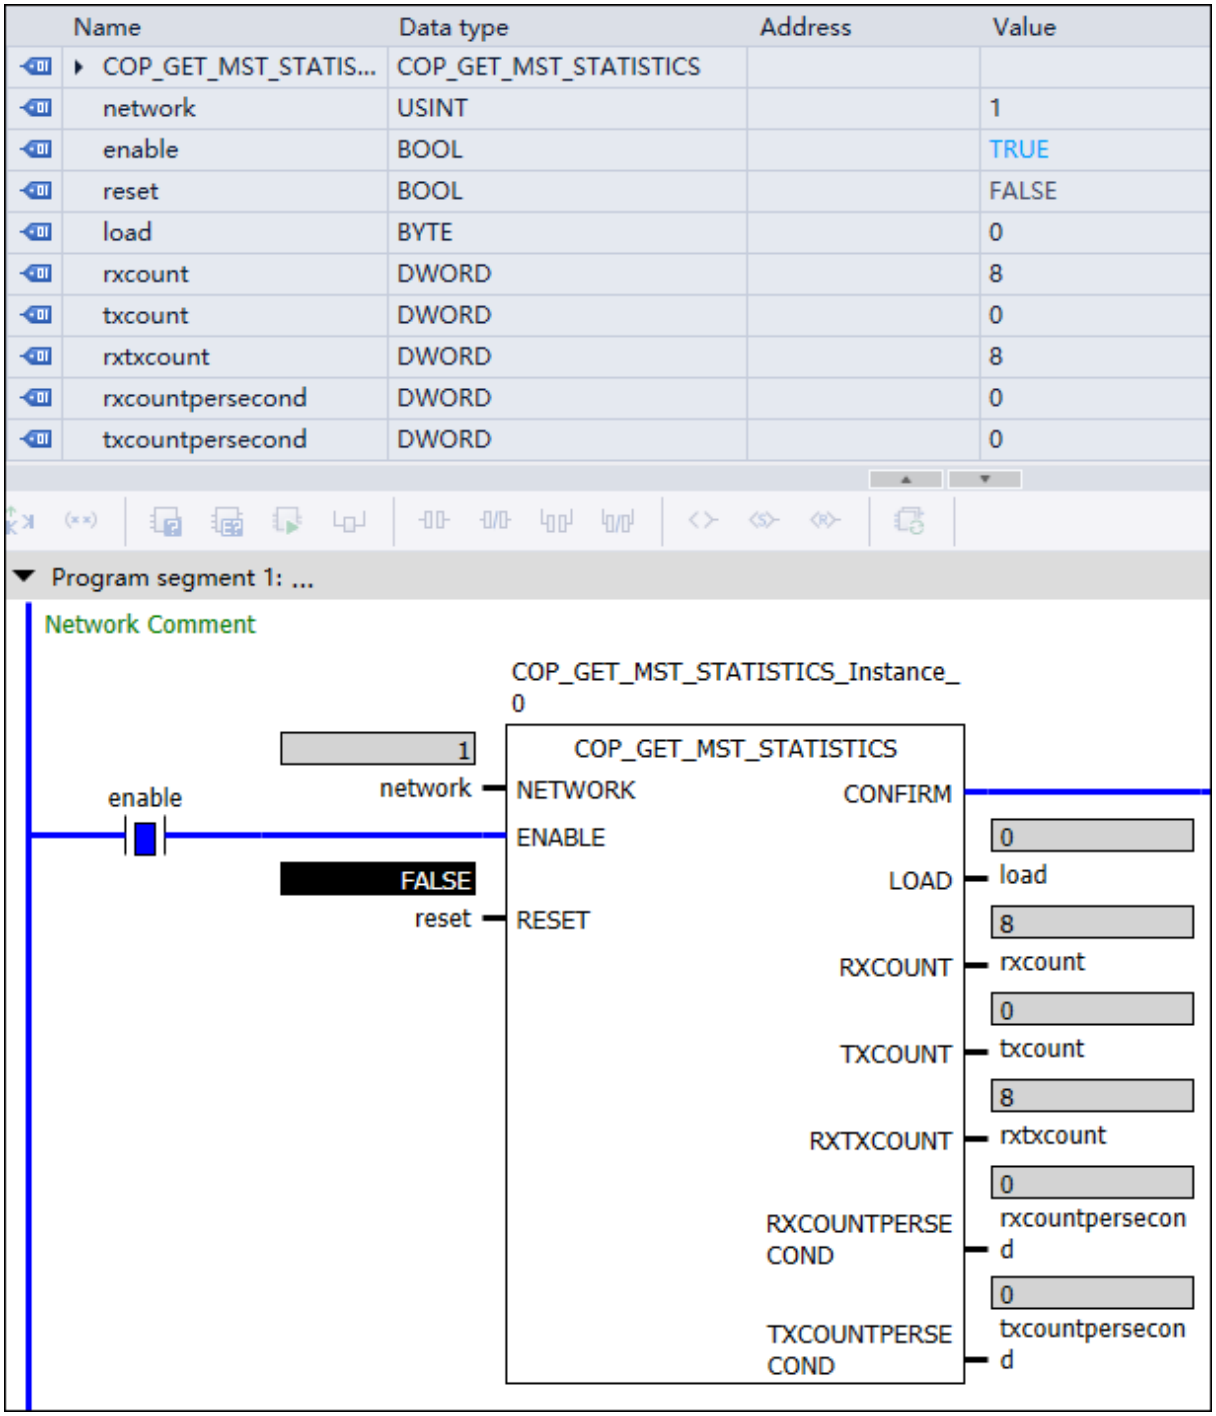
Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	NETWORK	CAN network number	USINT	Follows data type	-	The CAN port executed by the function block corresponds to the CAN port number of the host.
	ENABLE	Enable	BOOL	Follows data type	FALSE	Level-triggered, controls the ON/OFF execution of the function block.
	RESET	Clear the values of current output parameters	BOOL	Follows data type	FALSE	Clear the values of current output parameters.
Output	CONFIRM	FB completion flag	BOOL	Follows data type	FALSE	Function block done flag.
	LOAD	Network load rate	BYTE	Follows data type	-	Network load rate
	RXCOUNT	Count of received frames	DWORD	Follows data type	-	Count of received frames
	TXCOUNT	Count of sent frames	DWORD	Follows data type	-	Count of sent frames

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	RXTXCOUNT	Count of sent and received frames	DWORD	Follows data type	-	Count of sent and received frames
	RXCOUNTPERSECOND	Count of received frame per second	DWORD	Follows data type	-	Count of received frame per second, **currently not supported**.
	TXCOUNTPERSECOND	Transmitted frame count per second	DWORD	Follows data type	-	Transmitted frame count per second, **currently not supported**.

- **Function**

  This instruction obtains statistics.



- **Program example**

  ST:

RXCOUNTPERSECOND   0   => rxcountpersecond   0   ,
TXCOUNTPERSECOND   0   => txcountpersecond   0   );RETURN
```

  LD:

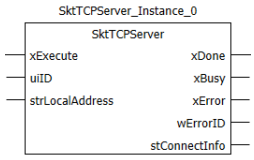
18.4.11.9 Fault Codes

Fault code	Value	Description
CANOPEN_KERNEL_NO_ERROR	0	No error detected by the CANopen kernel.

Fault code	Value	Description
CANOPEN_KERNEL_OTHER_ERROR	1	If the ERROR = 01 (hexadecimal), an error has been detected. If other error codes are present on the function block, the ERROR contains more specific information. Example: CIA405 .SDO_READ and CIA405.SDO_WRITE function blocks: CIA405.SDO_READ and CIA405.SDO_WRITE function blocks: The ERRORINFO output contains the content of the SDO abort message. CIA405 .RECV_EMCY and CIA405.RECV_EMCY_DEV function blocks: The ERRORINFO output contains the content of the received EMCY message. If an emergency message is provided in the ERRORINFO output, then the ERROR = 1 and the CONFIRM = 0. CIA405 .GET_CANOPEN_KERNEL_STATE function block: The value 01 (hexadecimal) will never be provided, as no other error codes are output.
CANOPEN_KERNEL_DATA_OVERFLOW	2	Overflow in the transmit or receive buffer of the CANopen object.
CANOPEN_KERNEL_TIMEOUT	3	Function block execution timeout.
CANOPEN_KERNEL_CANBUS_OFF	16	CANopen node disconnected from the CAN bus.
CANOPEN_KERNEL_CAN_ERROR_PASSIVE	17	The CANopen node is in error passive state: the node can communicate but is not allowed to transmiterror flags upon error detection.
CANOPEN_INTERNAL_FB_ERROR	33	Manufacturer-specific error code. Note: Values from 21 to FF (hexadecimal) are reserved for device manufacturer use.

18.4.12 Free TCP

18.4.12.1 Instruction List



Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.12.2 SktTCPServer	FB	Create TCP server communication service	TcpUdpFreeProtocol	Library version 1.0.0.0 and later
18.4.12.3 SktTCPClient	FB	Create TCP client communication service		Library version 1.0.0.0 and later
18.4.12.4 SktTCPSend	FB	Send TCP data		Library version 1.0.0.0 and later
18.4.12.5 SktTCPRecv	FB	Receive TCP data		Library version 1.0.0.0 and later

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.12.6 SktTCPGetStatus	FB	This instruction gets TCP connection status.		Library version 1.0.0.0 and later
18.4.12.7 SktTCPClearBuffer	FB	Clear TCP protocol stack buffer		Library version 1.0.0.0 and later
18.4.12.8 SktTCPRecv_C	FB	Receive TCP data (integrating the functions of creation, closure, and status acquisition)		Library version 1.0.0.0 and later
18.4.12.9 SktTCPSend_C	FB	Send TCP data (integrating the functions of creation, closure, and status acquisition)		Library version 1.0.0.0 and later
18.4.12.10 SktClose	FB	Close TCP communication service		Library version 1.0.0.0 and later

18.4.12.2 SktTCPServer

This instruction creates TCP server communication.

- **Instruction format**

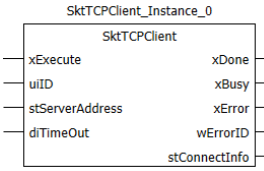
Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SktTCPServer	Create TCP server communication service	FB		SktTCPServer_Instance_0(x Execute := , uiID := , strLocalAddress := , xDone => , xBusy => , xError => , wErrorID => , stConnectInfo =>);

- **Related variables**

Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Trigger execution	BOOL	TRUE, FALSE	FALSE	Execution starts on the rising edge and must remain at a high level during the entire process.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	uiID	ID number	UINT	1 to 256	0	Each connection corresponds to an ID number.
	stLocalAddress	Local IP address	ADDRESS	-	-	Local IP address and port number, used for listening to connection requests. Port number range: 2000 to 65535.
Output	xDone	Done	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is done and the connection has been successfully established.
	xBusy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing, waiting for connection requests.
	xError	Execution error	BOOL	TRUE, FALSE	FALSE	Error flag that is set to TRUE when an instruction execution error occurs.
	wErrorID	Fault ID	WORD	-	0	Outputs an error ID greater than 0 when the instruction execution error occurs. For details, see 18.4.12.11 Fault Codes.
	stConnectInfo	Connection information	TCP_CONNECT_INFO	-	-	Outputs the local and remote IP addresses and ports upon successful connection establishment.



- **Function**
  - Before enabling the instruction (xExecute=TRUE), input the stLocalAddress to set the server's IP address and port number, and the uiID to specify the ID range from 1 to 256, for subsequent calls to SktTCPSend, SktTCPRecv, SktTCPGetStatus, SktTCPClearBuffer, and SktClos instructions.
  - During the instruction execution, xExecute=TRUE is maintained, waiting for connection requests from client.
  - After a successful connection is established, the instruction execution ends (xDone=TRUE) and stConnectInfo outputs the IP addresses and port numbers of both connected parties.
  - If an error occurs during instruction execution, xError is set to TRUE, and wErrorID outputs an error code to explain the cause of the error.

- **Precautions**
  - After a successful connection, uiID will no longer be bound to the instruction. To close the connection and release the ID, the SktClose instruction must be called.
  - In on-site applications, multiple tasks should not call the same instance of SktTCPServer.

18.4.12.3 SktTCPClient

This instruction creates TCP client communication.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SktTCPClient	Create TCP client communication service	FB		SktTCPClient_Instance_0(xExecute := , uiID := , stServerAddress := , diTimeOut := , xDone => , xBusy => , xError => , wErrorID => , stConnectInfo =>);

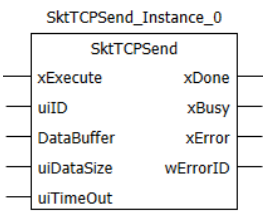
- **Related variables**

  Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Trigger execution	BOOL	TRUE, FALSE	FALSE	Execution starts on the rising edge and must remain at a high level during the entire process.
	uiID	ID number	UINT	1 to 256	0	Each connection corresponds to an ID number.
	stServerAddress	Remote server address	ADDRESS	-	-	The IP address and port number of the remote server are used to specify the target server to be accessed. Port number range: 2000 to 65535.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	diTimeOut	Connection timeout period	DINT	50 to 3000	50	Time to wait after initiating a connection request in ms.
Output	xDone	Done	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is done and the connection has been successfully established.
	xBusy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing, waiting for connection requests.
	xError	Execution error	BOOL	TRUE, FALSE	FALSE	Error flag that is set to TRUE when an instruction execution error occurs.
	wErrorID	Fault ID	WORD	-	0	Outputs an error ID greater than 0 when the instruction execution error occurs. For details, see 18.4.12.11 Fault Codes.
	stConnectInfo	Connection information	TCP_CONNECT_INFO	-	-	Outputs the local and remote IP addresses and ports upon successful connection establishment.

- **Function**
  - Before enabling the instruction (xExecute=TRUE), input the stServerAddress to set the IP address and port number of the target server to be accessed; input uiID to specify the ID range 1 to 256 for subsequent calls to SktTCPSend, SktTCPRecv, SktTCPGetStatus, SktTCPClearBuffer, and SktClose instructions; input the timeout period, which is generally the default value, but can be adjusted appropriately based on network environment.
  - During the instruction execution (xExecute=TRUE maintained), a connection request is initiated to the target server.



- After a successful connection is established, the instruction execution ends (xDone=TRUE) and stConnectInfo outputs the IP addresses and port numbers of both connected parties.
- If an error occurs during instruction execution, xError is set to TRUE, and wErrorID outputs an error code to explain the cause of the error.

- **Precautions**
  - After a successful connection, uiID will no longer be bound to the instruction. To close the connection and release the ID, the SktClose instruction must be called.
  - In on-site applications, multiple tasks should not call the same instance of SktTCPClient.

18.4.12.4 SktTCPSend

This instruction sends TCP data.

- **Instruction format**

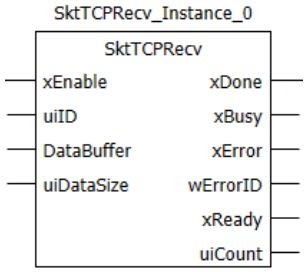
Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SktTCPSend	Send TCP data	FB		SktTCPSend_Instance_0(xExecute := , uiID := , DataBuffer := , uiDataSize := , uiTimeOut := , xDone => , xBusy => , xError => , wErrorID =>);

- **Related variables**

Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Trigger execution	BOOL	TRUE, FALSE	FALSE	Data sending is triggered on a rising edge.
	uiID	ID number	UINT	1 to 256	0	Each connection corresponds to an ID number.
	DataBuffer	Sending data buffer	ANY	-	-	It supports any data type, with array types limited to a maximum of three dimensions.
	uiDataSize	Size of sent data	UINT	1 to 8192	0	Size of sent data in byte.

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	uiTimeOut	Sending timeout	UINT	1 to 1000	50	Sending timeout in ms.
Output	xDone	Done	BOOL	TRUE, FALSE	FALSE	Set to TRUE when data sending is done.
	xBusy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing, waiting for connection requests.
	xError	Execution error	BOOL	TRUE, FALSE	FALSE	Error flag that is set to TRUE when an instruction execution error occurs.
	wErrorID	Fault ID	WORD	-	0	Outputs an error ID greater than 0 when the instruction execution error occurs. For details, see 18.4.1 2.11 Fault Codes.



- **Function**
  - Before instruction execution (xEnable=TRUE), input uiID to specify the ID number (created by SktTCPClient and SktTCPServer instruction). Input uiDataSize (in Byte) to specify the size of sent data, which must not exceed the size of DataBuffer or a maximum of 8192 bytes. Input the sending timeout uiTimeOut in ms (default: 50). Generally, the default value can be used, but it can be appropriately increased when the network is congested.
  - During instruction execution, xExecute=TRUE is maintained.
  - After instruction execution, set xDone to TRUE.
  - If an error occurs during instruction execution, xError is set to TRUE, and wErrorID outputs an error code to explain the cause of the error.
- **Precautions**

  In on-site applications, multiple tasks should not call the same instance of SktTCPSend.

18.4.12.5 SktTCPRecv

This instruction receives TCP data.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SktTCPRecv	Receive TCP data	FB		SktTCPRecv_Instance_0(x Enable := , uiID := , DataBuffer := , uiDataSize := , xDone => , xBusy => , xError => , wErrorID => , xReady => , uiCount =>);

- **Related variables**

  Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Enable	BOOL	TRUE, FALSE	FALSE	Input TRUE to execute reception and FALSE to exit reception.
	uiID	ID number	UINT	1 to 256	0	Each connection corresponds to an ID number.
	DataBuffer	Data reception buffer	ANY	-	-	It supports any data type, with array types limited to a maximum of three dimensions.
	uiDataSize	Size of received data	UINT	0 to 8192	0	Size of received data in byte. • Input > 0: Fixed-length reception mode. The maximum size must not exceed 8192 Bytes, nor exceed the actual size of received buffer. • Input = 0: Standard mode.

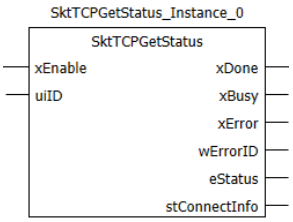
Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	xDone	Reserved	BOOL	TRUE, FALSE	FALSE	Always FALSE.
	xBusy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing, waiting for connection requests.
	xError	Execution error	BOOL	TRUE, FALSE	FALSE	Error flag that is set to TRUE when an instruction execution error occurs.
	wErrorID	Fault ID	WORD	-	0	Outputs an error ID greater than 0 when the instruction execution error occurs. For details, see 18.4.12.11 Fault Codes.
	xReady	Reception completion flag	BOOL	TRUE, FALSE	FALSE	Set to TRUE when data reception is done and maintain this state for one task cycle.
	uiCount	Actual size of received data	UINT	0 to 8192	0	Outputs the actual size of received data in Byte when xReady = TRUE and maintains this state for one task cycle.

- **Function**
  - SktTCPRecv is the data reception instruction based on the TCP protocol. It operates in two modes, determined by the value of uiDataSize: standard mode (uiDataSize = 0) and fixed-length reception mode (uiDataSize > 0).

Mode	uiDataSize	Description
Standard mode	0	In standard mode, after data is received in the current execution cycle, the reception completion flag xReady is set to TRUE, and the actual size of received data uiCount is output. The maximum reception size is determined by the input buffer DataBuffer.
Fixed-length reception mode	1 to 8192	In fixed-length reception mode, the reception completion flag xReady is set to TRUE, and the actual size of received data uiCount is output only when the data size matches the specified reception size (uiDataSize = uiCount).

  - Before the instruction execution (xEnable = TRUE), input uiID to specify the ID number (created by the SktTCPClient and SktTCPServer instructions); input DataBuffer to specify the application layer of data buffer, which supports one-dimensional arrays of BYTE type; input uiDataSize (in byte) to specifies the size of the data to be received. The value must not exceed the size of DataBuffer or 8192 bytes.

- xBusy is set to TRUE, and data reception continues during instruction execution (xEnable = TRUE maintained). When data is received, the reception completion flag xReady is set to TRUE, and the actual size of received data uiCount is output. This maintains for only one cycle.
- If an error occurs during instruction execution, xError is set to TRUE, and wErrorID outputs an error code to explain the cause of the error.



- **Precautions**

  In on-site applications, multiple tasks should not call the same instance of SktTCPRecv.

18.4.12.6 SktTCPGetStatus

Get TCP connection status.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SktTCPGetStatus	This instruction gets TCP connection status.	FB		SktTCPGetStatus_Instance_0(xEnable := , uiID := , xDone => , xBusy => , xError => , wErrorID => , eStatus => , stConnectInfo =>);

- **Related variables**

  Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Enable	BOOL	TRUE, FALSE	FALSE	Input TRUE to execute TCP connection acquisition.
	uiID	ID number	UINT	1 to 256	0	Each connection corresponds to an ID number.
Output	xDone	Reserved	BOOL	TRUE, FALSE	FALSE	Always FALSE.
	xBusy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing, and FALSE when the execution ends.

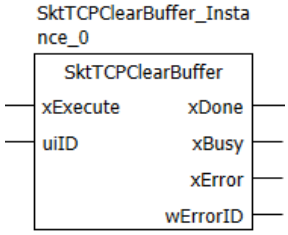
Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	xError	Execution error	BOOL	TRUE, FALSE	FALSE	Error flag that is set to TRUE when an instruction execution error occurs.
	wErrorID	Fault ID	WORD	-	0	Outputs an error ID greater than 0 when the instruction execution error occurs. For details, see 18.4.12.11 Fault Codes.
	eStatus	Connection status	TCP_STATUS	-	-	TCP connection status.
	stConnectInfo	Connection information	TCP_CONNECT_INFO	-	-	Connection information includes the addresses of both communication parties.

- **Function**
  - The data type of "eStatus" is the TCP_STATUS enumeration, with enumeration values defined as follows.

Enumeration Value	Definition
0: TCP_NOTCONNECT	No connection
1: TCP_ESTABLISHED	Connection established
2: TCP_SYN_SENT	Connection request sent
3: TCP_SYN_RECV	Connection request responded
4: TCP_FIN_WAIT1	Connection release request initiated
5: TCP_FIN_WAIT2	Connection release request received
6: TCP_FIN_WAIT	Waiting for connection release response
7: TCP_CLOSE	Protocol stack connection released
8: TCP_CLOSE_WAIT	Waiting for application layer to call close to release resources
9: TCP_LAST_ACK	Waiting for final release confirmation
10: TCP_LISTEN	Waiting for connection request
11: TCP_CLOSING	Closing

  - Before the instruction is executed (xEnable = TRUE), Input uiID to specify the ID number (created by the SktTsERVER instruction).
  - xBusy is set to TRUE during instruction execution (xEnable=TRUE maintained).
  - After the instruction execution, set xEnable to FALSE and xBusy to FALSE.

◦ If an error occurs during instruction execution, xError is set to TRUE, and wErrorID outputs an error code to explain the cause of the error.



- **Precautions**

  In on-site applications, multiple tasks should not call the same instance of SktTCPGetStatus.

18.4.12.7 SktTCPClearBuffer

This instruction clears TCP receive buffer.

- **Instruction format**

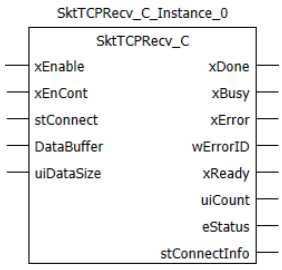
Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SktTCPClearBuffer	Clear TCP protocol stack buffer	FB		SktTCPClearBuffer_Instance_0(xExecute := , uiID := , xDone => , xBusy => , xError => , wErrorID =>);

- **Related variables**

  Variable

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Trigger execution	BOOL	TRUE, FALSE	FALSE	Buffer clearance is triggered on a rising edge.
	uiID	ID number	UINT	1 to 256	0	Each connection corresponds to an ID number.
Output	xDone	Done	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is done.
	xBusy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing.
	xError	Execution error	BOOL	TRUE, FALSE	FALSE	Error flag that is set to TRUE when an instruction execution error occurs.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	wErrorID	Fault ID	WORD	-	0	Outputs an error ID greater than 0 when the instruction execution error occurs. For details, see 18.4.12.11 Fault Codes.



- **Function**
  - Before instruction execution (xExecute=TRUE), input uiID to specify the ID number (created by SktTCPClient and SktTCPServer instructions).
  - During instruction execution, xExecute=TRUE is maintained.
  - After the instruction execution, set xDone to TRUE upon completion, at which point the TCP protocol stack buffer is cleared.
  - If an error occurs during instruction execution, xError is set to TRUE, and wErrorID outputs an error code to explain the cause of the error.
- **Precautions**

  In on-site applications, multiple tasks should not call the same instance of SktTCPClearBuffer.

18.4.12.8 SktTCPRecv_C

This instruction receives TCP data, and integrates the functions of connection creation, closure and status acquisition.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SktTCPRecv_C	Receive TCP data (integrating the functions of creation, closure, and status acquisition)	FB		SktTCPRecv_C_Instance_0 (xEnable := , xEnCont := , stConnect := , DataBuffer := , uiDataSize := , xDone => , xBusy => , xError => , wErrorID => , xReady => , uiCount => , eStatus => , stConnectInfo =>);

- **Related variables**

  Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Enable	BOOL	TRUE, FALSE	FALSE	Set to TRUE to execute reception and FALSE to exit reception.
	xEnCont	Enable connection	BOOL	TRUE, FALSE	FALSE	Input TRUE to establish and maintain the connection, input FALSE to close the connection.
	stConnect	Connection parameters	TCP_CONNECT_PARAM	-	-	Connection parameters include ID number, mode, and address.
	DataBuffer	Data reception buffer	ANY	-	-	It supports any data type, with array types limited to a maximum of three dimensions.
	uiDataSize	Size of received data	UINT	0 to 8192	0	Size of received data in byte. • Input > 0: Fixed-length reception mode. The maximum size must not exceed 8192 Bytes, nor exceed the actual size of received buffer. • Input = 0: Standard mode.
Output	xDone	Reserved	BOOL	TRUE, FALSE	FALSE	Always FALSE.
	xBusy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing, waiting for connection requests.

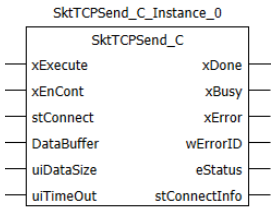
Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	xError	Execution error	BOOL	TRUE, FALSE	FALSE	Error flag that is set to TRUE when an instruction execution error occurs.
	wErrorID	Fault ID	WORD	-	0	Outputs an error ID greater than 0 when the instruction execution error occurs. For details, see 18.4.12.11 Fault Codes.
	xReady	Reception completion flag	BOOL	TRUE, FALSE	FALSE	Set to TRUE when data reception is done and maintain this state for one task cycle.
	uiCount	Actual size of received data	UINT	0 to 8192	0	Outputs the actual size of received data in byte when xReady=TRUE and maintains this state for one task cycle.
	eStatus	Connection status	TCP_STATUS	-	-	TCP connection status.
	stConnectInfo	Connection information	TCP_CONNECT_INFO	-	-	Connection information includes addresses of both parties in the connection.

- **Function**
  - The data type of "eStatus" is the TCP_STATUS enumeration, with enumeration values defined as follows.

Enumeration Value	Definition
0: TCP_NOTCONNECT	No connection
1: TCP_ESTABLISHED	Connection established
2: TCP_SYN_SENT	Connection request sent
3: TCP_SYN_RECV	Connection request responded
4: TCP_FIN_WAIT1	Connection release request initiated
5: TCP_FIN_WAIT2	Connection release request received

Enumeration Value	Definition
6: TCP_FIN_WAIT	Waiting for connection release response
7: TCP_CLOSE	Protocol stack connection released
8: TCP_CLOSE_WAIT	Waiting for application layer to call close to release resources
9: TCP_LAST_ACK	Waiting for final release confirmation
10: TCP_LISTEN	Waiting for connection request
11: TCP_CLOSING	Closing

  - Connection creation and connection status monitoring
    - SktTCPRecv_C calls SktTCPServer/SktTCPClient to create a connection.
    - When xEnCont=TRUE, the connection is created using the connection parameters stConnect, and the connection status is detected in real time and output via eStatus. If the connection is disconnected by the peer end while xEnCont=TRUE is maintained, a new connection will be re-established.
    - When xEnCont=FALSE, the connection is closed.
  - Receive data
    - SktTCPRecv_C calls SktTCPRecv to receive data.
    - When xEnable=TRUE, data reception is performed only if the connection has been successfully created (xEnCont=TRUE and eStatus=TCP_ESTABLISHED); otherwise, xEnable=TRUE is invalid.
    - When xEnable=FALSE, data reception stops.



- **Precautions**

  In on-site applications, multiple tasks should not call the same instance of SktTCPRecv_C.

18.4.12.9 SktTCPSend_C

This instruction sends TCP data, and integrates the functions of connection creation, closure and status acquisition.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SktTCPSend_C	Send TCP data (integrating the functions of creation, closure, and status acquisition)	FB		SktTCPSend_C_Instance_0(xExecute := , xEnCont := , stConnect := , DataBuffer := , uiDataSize := , uiTimeOut := , xDone => , xBusy => , xError => , wErrorID => , eStatus => , stConnectInfo =>);

- **Related variables**

  Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Trigger execution	BOOL	TRUE, FALSE	FALSE	Data sending is triggered on a rising edge.
	xEnCont	Enable connection	BOOL	TRUE, FALSE	FALSE	Input TRUE to establish and maintain the connection, input FALSE to close the connection.
	stConnect	Connection parameters	TCP_CONNECT_PARAM	-	-	Connection parameters include ID number, mode, and address.
	DataBuffer	Sending data buffer	ANY	-	-	It supports any data type, with array types limited to a maximum of three dimensions.
	uiDataSize	Size of sent data	UINT	1 to 8192	0	Size of sent data in byte.
	uiTimeOut	Sending timeout	UINT	1 to 1000	50	Sending timeout in ms.

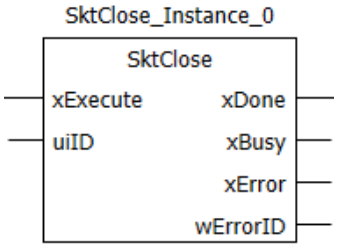
Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	xDone	Done	BOOL	TRUE, FALSE	FALSE	Set to TRUE when data sending is done.
	xBusy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing, waiting for connection requests.
	xError	Execution error	BOOL	TRUE, FALSE	FALSE	Error flag that is set to TRUE when an instruction execution error occurs.
	wErrorID	Fault ID	WORD	-	0	Outputs an error ID greater than 0 when the instruction execution error occurs. For details, see 18.4.12.11 Fault Codes.
	eStatus	Connection status	TCP_STATUS	-	-	TCP connection status.
	stConnectInfo	Connection information	TCP_CONNECT_INFO	-	-	Connection information includes addresses of both parties in the connection.

- **Function**
  - The data type of "eStatus" is the TCP_STATUS enumeration, with enumeration values defined as follows.

Enumeration Value	Definition
0: TCP_NOTCONNECT	No connection
1: TCP_ESTABLISHED	Connection established
2: TCP_SYN_SENT	Connection request sent
3: TCP_SYN_RECV	Connection request responded
4: TCP_FIN_WAIT1	Connection release request initiated
5: TCP_FIN_WAIT2	Connection release request received
6: TCP_FIN_WAIT	Waiting for connection release response
7: TCP_CLOSE	Protocol stack connection released

Enumeration Value	Definition
8: TCP_CLOSE_WAIT	Waiting for application layer to call close to release resources
9: TCP_LAST_ACK	Waiting for final release confirmation
10: TCP_LISTEN	Waiting for connection request
11: TCP_CLOSING	Closing

- Connection creation and connection status monitoring
  - SktTCPSend_C calls SktTCPServer/SktTCPClient to create a connection.
  - When xEnCont=TRUE, the connection is created using the connection parameters stConnect, and the connection status is detected in real time and output via eStatus. If the connection is disconnected by the peer end while xEnCont=TRUE is maintained, a new connection will be re-established.
  - When xEnCont=FALSE, the connection is closed.
- Send data
  - SktTCPSend_C calls SktTCPSend to send data.
  - When xExecute=TRUE, data will be sent, provided that the connection has been successfully established (xEnCont=TRUE, eStatus=TCP_ESTABLISHED). Otherwise, xExecute = TRUE will not take effect and the execution will not be carried out.



- **Precautions**

  In on-site applications, multiple tasks should not call the same instance of SktTCPSend_C.

18.4.12.10 SktClose

This instruction closes TCP communication.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SktClose	Close TCP communication service	FB		SktClose_Instance_0(xExecute := , uiID := , xDone => , xBusy => , xError => , wErrorID =>);

- **Related variables**

  Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Trigger execution	BOOL	TRUE, FALSE	FALSE	Communication shutdown is triggered on a rising edge.

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	uiID	ID number	UINT	1 to 256	0	Each connection corresponds to an ID number.
Output	xDone	Done	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is done.
	xBusy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing.
	xError	Execution error	BOOL	TRUE, FALSE	FALSE	Error flag that is set to TRUE when an instruction execution error occurs.
	wErrorID	Fault ID	WORD	-	0	Outputs an error ID greater than 0 when the instruction execution error occurs. For details, see 18.4.12.11 Fault Codes.

- **Function**
  - Before instruction execution (xExecute=TRUE), input uiID to specify the ID number (created by SktTCPClient and SktTCPServer instructions).
  - During instruction execution, xExecute=TRUE is maintained.
  - After the instruction execution, set xDone to TRUE, at which point the TCP communication closing is terminated and the ID number is released.
  - If an error occurs during instruction execution, xError is set to TRUE, and wErrorID outputs an error code to explain the cause of the error.
- **Precautions**

  In on-site applications, multiple tasks should not call the same instance of SktClose.

18.4.12.11 Fault Codes

Fault code	Value	Description
IEC_ERROR_OK	0	Normal
IEC_ERROR_FAILED	1	Internal error
IEC_ERROR SOCKET	2	Socket creation error
IEC_ERROR_BIND	3	Address binding error
IEC_ERROR_LISTEN	4	Listening error
IEC_ERROR_ACCEPT	5	Accept connection error
IEC_ERROR_CONNECT	6	Send connection error
IEC_ERROR_SEND	7	Send data error
IEC_ERROR_RECV	8	Receive data error
IEC_ERROR_TIMEOUT	9	Timeout error

Fault code	Value	Description
IEC_ERROR_ID_USED	10	ID already in use
IEC_ERROR_ID_DISENABLE	11	ID not enabled
IFC_ERROR_PROTO	12	Protocol error
IEC_ERROR_JOIN_GROUT	13	Failed to join multicast
IEC_ERROR_PARAM_ID	100	ID error
IEC_ERROR_PARAM_IP	101	IP address error
IEC_ERROR_PARAM_PORT	102	Port number error
IEC_ERROR_PARAM_BUFFER	103	Cache error
IEC_ERROR_PARAM_TIMEOUT	104	Timeout error
IEC_ERROR_PARAM_MODE	105	Mode error
ERROR_LOCAL_PORT	1001	Local port mismatch
ERROR_LOCAL_IP	1002	Local IP mismatch
ERROR_REMOTE_PORT	1003	Remote port mismatch
ERROR_REMOTE_IP	1004	Remote IP mismatch
ERROR_PATAM_MODE	1005	TCP communication mode mismatch
ERROR_PATAM_TYPE	1006	Communication type mismatch

18.4.12.12 Example of Free TCP Communication Instruction Usage

Example of TCP client usage

Create a TCP client to access the server address (IP Address: 192.168.1.10, Port: 8080). After a successful connection is established, enable data reception, then wait for and receive the data from the server. Finally, send the received data back to the server.

- **Implementation with basic instructions**

Variable declarations are as follows:

```
VAR
en_start: BOOL;
start_connect: BOOL;
exit_connect: BOOL;
SktTCPClient_Instance_0: SktTCPClient;
stServerAddress: ADDRESS;
uiID: UINT;
diTimeOut: DINT;
SktTCPRecv_Instance_0: SktTCPRecv;
DataBuffer: ARRAY[1..1024] OF byte;
SktTCPSend_Instance_0: SktTCPSend;
R_TRIG_Instance_0: R_TRIG;
F_TRIG_Instance_0: F_TRIG;
SktClose_Instance_0: SktClose;
SktTCPGetStatus_Instance_0: SktTCPGetStatus;
END_VAR
```

The logic implemented in the program editing area is as follows:

```
// Execute connection establishment on the rising edge of en_start
R_TRIG_Instance_0(
CLK := en_start,
Q => );
IF R_TRIG_Instance_0.Q THEN
start_connect := TRUE;
exit_connect := FALSE;
END_IF

// Execute connection closure on the falling edge of en_start
F_TRIG_Instance_0(
CLK := en_start,
Q => );
IF F_TRIG_Instance_0.Q THEN
start_connect := FALSE;
exit_connect := TRUE;
END_IF

// Create TCP client
stServerAddress.strIPAddr := '192.168.1.10'; // Server IP address to access
stServerAddress.uiPort := 8080; // Server port to access
diTimeOut := 1000; // Set a 1s timeout for waiting for the server to respond to the connection request.
uiID := 1; // Use ID number 1
SktTCPClient_Instance_0(
xExecute := start_connect,
uiID := uiID,
stServerAddress := stServerAddress,
diTimeOut := diTimeOut,
xDone => ,
xBusy => ,
xError => ,
wErrorID => ,
stConnectInfo => );

// Close TCP client
SktClose_Instance_0(
```

```
xExecute := exit_connect,
uiID := uiID,
xDone => ,
xBusy => ,
xError => ,
wErrorID => );

// Receive TCP data
SktTCPRecv_Instance_0(
xEnable := SktTCPClient_Instance_0.xDone,// Enable data reception after the TCP client is successfully created.
uiID := uiID,
DataBuffer := DataBuffer,
uiDataSize := 0, // Use standard receive mode
xDone => ,
xBusy => ,
xError => ,
wErrorID => ,
xReady => ,
uiCount => );

// Send TCP data
SktTCPSend_Instance_0(
xExecute := SktTCPRecv_Instance_0.xReady, // After the data is received, enable data sending and forward the received data.
uiID := uiID,
DataBuffer := DataBuffer,
uiDataSize := SktTCPRecv_Instance_0.uiCount,
uiTimeOut := ,
xDone => ,
xBusy => ,
xError => ,
wErrorID => );

// Obtain connection status
SktTCPGetStatus_Instance_0(
xEnable := SktTCPClient_Instance_0.xDone,
```

```
uiID := uiID,
xDone => ,
xBusy => ,
xError => ,
wErrorID => ,
eStatus => ,
stConnectInfo => );
IF SktTCPGetStatus_Instance_0.eStatus = TCP_STATUS.TCP_ESTABLISHED THEN
// The connection is normal, and corresponding actions can be performed.
   ;
END_IF
```

- **Implementation with integrated instructions**

Variable declarations are as follows:

```
VAR
SktTCPRecv_C_Instance_0: SktTCPRecv_C;
SktTCPSend_C_Instance_0: SktTCPSend_C;
stConnect: TCP_CONNECT_PARAM;
DataBuffer: ARRAY[1..1024] OF byte;
END_VAR
```

The logic implemented in the program editing area is as follows:

```
// Set connection parameters
stConnect.byMode := 1; // Client mode
stConnect.stRemote.strIPAddr := '192.168.1.10';// IP address of remote server
stConnect.stRemote.uiPort := 8080;// Port of remote server
stConnect.uiID := 1;// ID number

// Receive TCP data
SktTCPRecv_C_Instance_0(
xEnable := TRUE,
xEnCont := TRUE,
stConnect := stConnect,// Connection parameters
DataBuffer := DataBuffer,
uiDataSize := ,
xDone => ,
xBusy => ,
xError => ,
wErrorID => ,
xReady => ,
uiCount => ,
eStatus => ,
stConnectInfo => );

// Send TCP data
SktTCPSend_C_Instance_0(
xExecute := SktTCPRecv_C_Instance_0.xReady,
xEnCont := TRUE,
stConnect := stConnect,// Connection parameters
DataBuffer := DataBuffer,
uiDataSize := SktTCPRecv_C_Instance_0.uiCount,
uiTimeOut := ,
xDone => ,
xBusy => ,
xError => ,
wErrorID => ,
eStatus => ,
stConnectInfo => );
```

Example of TCP server usage

Create a TCP server to listen on port 8080 of all network cards. After a successful connection is established, enable data reception, then wait for and receive the data from the client. Finally, send the received data back to the client.

- **Implementation with basic instructions**

Variable declarations are as follows:

```
VAR
en_start: BOOL;
start_listen: BOOL;
exit_connect: BOOL;
SktTCPServer_Instance_0: SktTCPServer;
SktClose_Instance_0: SktClose;
SktTCPRecv_Instance_0: SktTCPRecv;
SktTCPSend_Instance_0: SktTCPSend;
SktTCPGetStatus_Instance_0: SktTCPGetStatus;
stLocalAddress: ADDRESS;
uiID: UINT;
R_TRIG_Instance_0: R_TRIG;
F_TRIG_Instance_0: F_TRIG;
DataBuffer: ARRAY[1..1024] OF byte;
END_VAR
```

The logic implemented in the program editing area is as follows:

```
// Execute connection closure on the falling edge of en_start
F_TRIG_Instance_0(
CLK := en_start,
Q => );
IF F_TRIG_Instance_0.Q THEN
start_listen := FALSE;
exit_connect := TRUE;
END_IF

// create a TCP server and wait for client connection request
stLocalAddress.strIPAddr := '0.0.0.0';// Multi-network adapter device: 0.0.0.0 = listen on all network adapters
stLocalAddress.uiPort := 8080;// Port number
uiID := 1; // Use ID number 1
SktTCPServer_Instance_0(
xExecute := start_listen,
uiID := uiID,
stLocalAddress := stLocalAddress,
xDone => ,
xBusy => ,
xError => ,
wErrorID => ,
stConnectInfo => );

//Close connection
SktClose_Instance_0(
xExecute := exit_connect,
uiID := uiID,
xDone => ,
xBusy => ,
xError => ,
wErrorID => );

// Receive TCP data
SktTCPRecv_Instance_0(
xEnable := SktTCPServer_Instance_0.xDone,
```

```
uiID := uiID,
DataBuffer := DataBuffer,
uiDataSize := 0,
xDone => ,
xBusy => ,
xError => ,
wErrorID => ,
xReady => ,
uiCount => );

// Send TCP data
SktTCPSend_Instance_0(
xExecute := SktTCPRecv_Instance_0.xReady,
uiID := uiID,
DataBuffer := DataBuffer,
uiDataSize := SktTCPRecv_Instance_0.uiCount,
uiTimeOut := ,
xDone => ,
xBusy => ,
xError => ,
wErrorID => );

// Obtain connection status
SktTCPGetStatus_Instance_0(
xEnable := SktTCPServer_Instance_0.xDone,
uiID := uiID,
xDone => ,
xBusy => ,
xError => ,
wErrorID => ,
eStatus => ,
stConnectInfo => );
IF SktTCPGetStatus_Instance_0.eStatus = TCP_STATUS.TCP_ESTABLISHED THEN
// The connection is normal, and corresponding actions can be performed.
   ;
END_IF
```

- **Implementation with integrated instructions**

Variable declarations are as follows:

```
VAR
SktTCPRecv_C_Instance_0: SktTCPRecv_C;
SktTCPSend_C_Instance_0: SktTCPSend_C;
stConnect: TCP_CONNECT_PARAM;
DataBuffer: ARRAY[1..1024] OF byte;
END_VAR
```

The logic implemented in the program editing area is as follows:

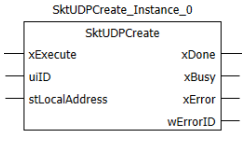
```
// Set connection parameters
stConnect.byMode := 0; // Server mode
stConnect.stLocal.strIPAddr := '0.0.0.0'; // Local server IP address: '0.0.0.0' allows access from all network interfaces on multi-NIC devices
stConnect.stLocal.uiPort := 8080; // Local server port
stConnect.uiID := 1;// ID number

// Receive TCP data
SktTCPRecv_C_Instance_0(
xEnable := TRUE,
xEnCont := TRUE,
stConnect := stConnect,// Connection parameters
DataBuffer := DataBuffer,
uiDataSize := ,
xDone => ,
xBusy => ,
xError => ,
wErrorID => ,
xReady => ,
uiCount => ,
eStatus => ,
stConnectInfo => );

// Send TCP data
SktTCPSend_C_Instance_0(
xExecute := SktTCPRecv_C_Instance_0.xReady,
xEnCont := TRUE,
stConnect := stConnect,// Connection parameters
DataBuffer := DataBuffer,
uiDataSize := SktTCPRecv_C_Instance_0.uiCount,
uiTimeOut := ,
xDone => ,
xBusy => ,
xError => ,
wErrorID => ,
eStatus => ,
```

```
stConnectInfo => );
```

18.4.13 Free UDP



18.4.13.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.13.2 SktUDPCreate	FB	Create UDP communication service	TcpUdpFreeProtocol	Library version 1.0.0.0 and later
18.4.13.3 SktUDPRecv	FB	Receive UDP data		Library version 1.0.0.0 and later
18.4.13.4 SktUDPSend	FB	Send UDP data		Library version 1.0.0.0 and later
18.4.13.5 SktUDPJoinGroup	FB	Join UDP multicast		Library version 1.0.0.0 and later
18.4.13.6 SktUDPClearBuffer	FB	Clear UDP protocol stack buffer		Library version 1.1.0.0 and later
18.4.13.7 SktClose	FB	Close UDP communication service		Library version 1.0.0.0 and later

18.4.13.2 SktUDPCreate

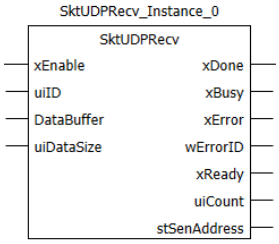
This instruction creates UDP communication.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SktUDPCreate	Create UDP communication service	FB		SktUDPCreate_Instance_0 (xExecute := , uiID := , stLocalAddress := , xDone => , xBusy => , xError => , wErrorID =>);

- **Related variables**

  Variable



Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Trigger execution	BOOL	TRUE, FALSE	FALSE	Execution starts on rising edge.
	uiID	ID number	UINT	1 to 256	0	Each connection corresponds to an ID number.
	stLocalAddress	Local IP address	ADDRESS	-	-	Local IP address and port number (port range: 2000 to 65535)
Output	xDone	Done	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is done.
	xBusy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing.
	xError	Execution error	BOOL	TRUE, FALSE	FALSE	Error flag that is set to TRUE when an instruction execution error occurs.
	wErrorID	Fault ID	WORD	-	0	Outputs an error ID greater than 0 when the instruction execution error occurs. For details, see 18.4.1 2.11 Fault Codes.

- **Function**
  - Before the instruction execution, input uiID to specify the ID number to be created for subsequent calls to SktUDPSend, SktUDPRecv, and SktClose. Input StLocalAddress to set the local IP and port number for UDP communication. When the IP is set to 0.0.0.0, data can be received on all network adapters. The port number should be greater than 2000.
  - During instruction execution, xExecute=TRUE is maintained.
  - Set xDone to TRUE when the instruction is done and the communication is successfully established.
  - If an error occurs during instruction execution, xError is set to TRUE, and wErrorID outputs an error code to explain the cause of the error.
- **Precautions**
  - After a successful connection, uiID will no longer be bound to the instruction. To close the UDP communication and release the ID, the SktClose instruction must be called.
  - In on-site applications, multiple tasks should not call the same instance of SktUDPCreate.

18.4.13.3 SktUDPRecv

This instruction receives UDP data.

- **Instruction format**

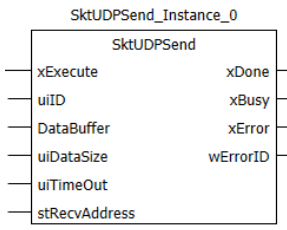
Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SktUDPRecv	Receive UDP data	FB		SktUDPRecv_Instance_0(xEnable := , uiID := , DataBuffer := , uiDataSize := , xDone => , xBusy => , xError => , wErrorID => , xReady => , uiCount => , stSenAddress =>);

- **Related variables**

  Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Enable	BOOL	TRUE, FALSE	FALSE	Input TRUE to execute reception and FALSE to exit reception.
	uiID	ID number	UINT	1 to 256	0	Each connection corresponds to an ID number.
	DataBuffer	Data reception buffer	ANY	-	-	It supports any data type, with array types limited to a maximum of three dimensions.
	uiDataSize	Size of received data	UINT	0 to 2048	0	Size of received data in byte. uiDataSize=0 indicates the maximum value of the custom cache array.
Output	xDone	Reserved	BOOL	TRUE, FALSE	FALSE	Always FALSE.
	xBusy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing, waiting for connection requests.

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	xError	Execution error	BOOL	TRUE, FALSE	FALSE	Error flag that is set to TRUE when an instruction execution error occurs.
	wErrorID	Fault ID	WORD	-	0	Outputs an error ID greater than 0 when the instruction execution error occurs. For details, see 18.4.12.11 Fault Codes.
	xReady	Reception completion flag	BOOL	TRUE, FALSE	FALSE	Set to TRUE when data reception is done and maintain this state for one task cycle.
	uiCount	Actual size of received data	UINT	0 to 2048	0	Outputs the actual size of received data in byte when xReady=TRUE and maintains this state for one task cycle.
	stSenAddress	Sender Address	ADDRESS	-	-	Sender IP address and port number (port range: 2000 to 65535)



- **Function**
  - Before instruction execution (xEnable=TRUE), input uiID to specify the ID number (created by the SktUDPCreate); input DataBuffer to specify the application layer of data buffer, which supports one-dimensional arrays of BYTE type; input uiDataSize (in byte) to specifies the size of the data to be received, which must not exceed the size of DataBuffer or a maximum of 2048 bytes. If uiDataSize is set to 0, the system will default to using the buffer size of DataBuffer as the length of the received data.
  - xBusy is set to TRUE, and data reception continues during instruction execution (xEnable=TRUE maintained). When data is received, output the reception completion flag xReady=TRUE, the actual size of received data size uiCount, and the sender IP address and port stSenAddress**.** This state is maintained for only one cycle.
  - If an error occurs during instruction execution, xError is set to TRUE, and wErrorID outputs a fault code to explain the cause of the error.
- **Precautions**

  In on-site applications, multiple tasks should not call the same instance of SktTCPRecv.

18.4.13.4 SktUDPSend

This instruction sends UDP data.

- **Instruction format**

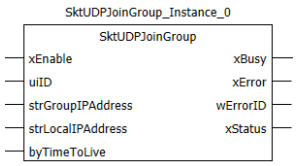
Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SktUDPSend	Send UDP data	FB		SktUDPSend_Instance_0(xExecute := , uiID := , DataBuffer := , uiDataSize := , uiTimeOut := , stRecvAddress := , xDone => , xBusy => , xError => , wErrorID =>);

- **Related variables**

Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Trigger execution	BOOL	TRUE, FALSE	FALSE	Data sending is triggered on a rising edge.
	uiID	ID number	UINT	1 to 256	0	Each connection corresponds to an ID number.
	DataBuffer	Sending data buffer	ANY	-	-	It supports any data type, with array types limited to a maximum of three dimensions.
	uiDataSize	Size of sent data	UINT	1 to 2048	0	Size of sent data in byte.
	uiTimeOut	Sending timeout	UINT	1 to 1000	50	Sending timeout in ms.
	stRecvAddress	Receiver address	ADDRESS	-	-	Receiver IP address and port number (port range: 2000 to 65535).
Output	xDone	Done	BOOL	TRUE, FALSE	FALSE	Set to TRUE when data sending is done.

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	xBusy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing, waiting for connection requests.
	xError	Execution error	BOOL	TRUE, FALSE	FALSE	Error flag that is set to TRUE when an instruction execution error occurs.
	wErrorID	Fault ID	WORD	-	0	Outputs an error ID greater than 0 when the instruction execution error occurs. For details, see 18.4.1 2.11 Fault Codes.



- **Function**
  - Before the instruction execution (xExecute=TRUE), input uiID to specify the ID number (created by SktUDPCreate instruction); input uiDataSize in byte as the data size to be sent, which must not exceed the size of DataBuffer or a maximum of 2048 bytes; input sending timeout uiTimeOut (in ms, default: 50); the default value is sufficient for most cases, and it can be appropriately increased when network congestion occurs.
  - During instruction execution, xExecute=TRUE is maintained.
  - After instruction execution, set xDone to TRUE.
  - If an error occurs during instruction execution, xError is set to TRUE, and wErrorID outputs an error code to explain the cause of the error.
- **Precautions**

  In on-site applications, multiple tasks should not call the same instance of SktUDPSend.

18.4.13.5 SktUDPJoinGroup

The instruction joins UDP multicast group.

- **Instruction format**

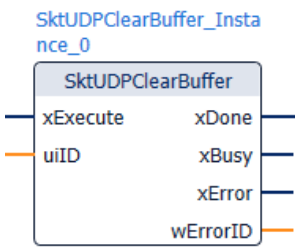
Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SktUDPJoinGroup	Join UDP multicast	FB		SktUDPJoinGroup_Instance_0(xEnable := , uiID := , strGroupIPAddress := , strLocalIPAddress := , byTimeToLive := , xBusy => , xError => , wErrorID => , xStatus =>);

- **Related variables**

  Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Enable	BOOL	TRUE, FALSE	FALSE	Enable joining multicast.
	uiID	ID number	UINT	1 to 256	0	Each UDP port corresponds to an ID number.
	strGroupIPAddress	Multicast address	STRING	-	-	Multicast IP address.
	strLocalIPAddress	Local IP address	STRING	-	-	Local IP address.
	byTimeToLive	Time to live	BYTE	0 to 255	0	Time to live (number of routings.)
Output	xBusy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing, and FALSE when the execution ends.
	xError	Execution error	BOOL	TRUE, FALSE	FALSE	Error flag that is set to TRUE when an instruction execution error occurs.
	wErrorID	Fault ID	WORD	-	0	Outputs an error ID greater than 0 when the instruction execution error occurs. For details, see 18.4.12.11 Fault Codes.

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	xStatus	Status	BOOL	TRUE, FALSE	FALSE	Set to TRUE when successfully joined the multicast group.



- **Function**
  - Before the instruction is executed (xEnable set to TRUE), Input uiID to specify the ID number (created by the SktUDPCreate instruction). strGroupIPAddress: Multicast IP address (D-class IPv4 range: 224.0.0.0 to 239.255.255.255, allocated by standard organizations for multicast use). strLocalIPAddress: IP address of the local network adapter. For devices with multiple network adapters, input the IP address of the corresponding adapter to join the multicast group. byTimeToLive (TTL): Time-to-live, determining the number of routings the multicast packet can traverse.
  - xBusy is set to TRUE during instruction execution (xEnable=TRUE maintained). xStatus is set to TRUE when the multicast group is joined successfully.
  - xBusy is set to FALSE, and the multicast group is exited upon completion of execution (xEnable=FALSE).
  - If an error occurs during instruction execution, xError is set to TRUE, and wErrorID outputs a fault code to explain the cause of the error.
- **Precautions**

  In on-site applications, multiple tasks should not call the same instance of SktUDPJoinGroup.

18.4.13.6 SktUDPClearBuffer

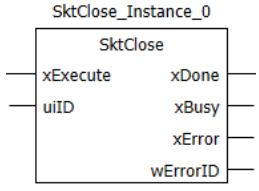
This instruction clears the UDP protocol stack buffer.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SktUDPClearBuffer	Clear UDP protocol stack buffer	FB		SktUDPClearBuffer_Instance_0(xExecute := , uiID := , xDone => , xBusy => , xError => , wErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Trigger execution	BOOL	TRUE, FALSE	FALSE	Buffer clearance is triggered on a rising edge.
	uiID	ID number	UINT	1 to 256	0	Each UDP port corresponds to an ID number.



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	xDone	Done	BOOL	Follows data type	-	Set to TRUE when the instruction is done.
	xBusy	Executing	BOOL	Follows data type	-	Set to TRUE when the instruction is executing.
	xError	Execution error	BOOL	Follows data type	-	Error flag that is set to TRUE when an instruction execution error occurs.
	wErrorID	Fault code	WORD	Follow data type	0	Outputs an error ID greater than 0 when the instruction execution error occurs. For details, see 18.4.12.11 Fault Codes.

- **Function**
  SktUDPClearBuffer is the instruction used to clear the UDP protocol stack data buffer.
  - Before the instruction execution (xEnable set to TRUE), Input uiID to specify the ID number (created by the SktUDPCreate instruction).
  - After the execution is completed, xDone is set to TRUE, indicating that the UDP protocol stack buffer has been cleared. If the UDP protocol stack receives new data immediately after the execution is completed, its buffer cannot be guaranteed to be cleared.
  - When an execution error occurs, xError is set to TRUE. You can analyze the cause of the error based on the output wErrorID.
- **Precaution**
  In on-site applications, multiple tasks should not call the same instance of SktUDPClearBuffer.

18.4.13.7 SktClose

Close UDP communication.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	ST Representation
SktClose	Close UDP communication service	FB		SktClose_Instance_0(xExecute := , uiID := , xDone => , xBusy => , xError => , wErrorID =>);

- **Related variables**

  Variable

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Trigger execution	BOOL	TRUE, FALSE	FALSE	Communication shutdown is triggered on a rising edge.
	uiID	ID number	UINT	1 to 256	0	Each connection corresponds to an ID number.
Output	xDone	Done	BOOL	TRUE, FALSE	FALSE	Instruction completion flag set to TRUE.
	xBusy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the instruction is executing.
	xError	Execution error	BOOL	TRUE, FALSE	FALSE	Error flag that is set to TRUE when an instruction execution error occurs.
	wErrorID	Fault ID	WORD	-	0	Outputs an error ID greater than 0 when the instruction execution error occurs. For details, see 18.4.12.11 Fault Codes.

- **Function**
  - Before the instruction execution(xExecute=TRUE), Input uiID to specify the ID number (created by the SktUDPCreate instruction).
  - During instruction execution, xExecute=TRUE is maintained.
  - After the instruction execution, set xDone to TRUE, at which point the UDP communication closing is terminated and the ID number is released.
  - If an error occurs during instruction execution, xError is set to TRUE, and wErrorID outputs a fault code to explain the cause of the error.
- **Precautions**

  In on-site applications, multiple tasks should not call the same instance of SktClose.

18.4.13.8 Example of Free UDP Communication Instruction Usage

The section involves creating UDP communication, receiving data from port 8080 of all local network adapters, and returning the received data to the sender via the original path.

Variable declarations are as follows:

```
VAR
en_start: BOOL;
start_udp: BOOL;
exit_udp: BOOL;
SktUDPCreate_Instance_0: SktUDPCreate;
SktUDPRecv_Instance_0: SktUDPRecv;
SktUDPSend_Instance_0: SktUDPSend;
SktClose_Instance_0: SktClose;
R_TRIG_Instance_0: R_TRIG;
F_TRIG_Instance_0: F_TRIG;
stLocalAddress: ADDRESS;
uiID: UINT;
DataBuffer: ARRAY[1..1024] OF byte;
END_VAR
```

The logic implemented in the program editing area is as follows:

```
// Create UDP on the rising edge of en_start
R_TRIG_Instance_0(
CLK := en_start,
Q => );
IF R_TRIG_Instance_0.Q THEN
start_udp := TRUE;
exit_udp := FALSE;
END_IF

//Close UDP on the falling edge of en_start
F_TRIG_Instance_0(
CLK := en_start,
Q => );
IF F_TRIG_Instance_0.Q THEN
start_udp := FALSE;
exit_udp := TRUE;
END_IF

//Create UDP
stLocalAddress.strIPAddr := '0.0.0.0';
stLocalAddress.uiPort := 8080;
uiID := 1;
SktUDPCreate_Instance_0(
xExecute := start_udp,
uiID := uiID,
stLocalAddress := stLocalAddress,
xDone => ,
xBusy => ,
xError => ,
wErrorID => );

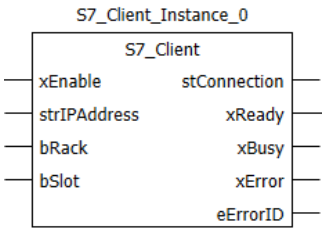
//close UDP
SktClose_Instance_0(
xExecute := exit_udp,
uiID := uiID,
xDone => ,
```

```
xBusy => ,
xError => ,
wErrorID => );

// Receive UDP data
SktUDPRecv_Instance_0(
xEnable := SktUDPCreate_Instance_0.xDone,
uiID := uiID,
DataBuffer := DataBuffer,
uiDataSize := ,
xDone => ,
xBusy => ,
xError => ,
wErrorID => ,
xReady => ,
uiCount => ,
stSenAddress => );

//Send UDP data
SktUDPSend_Instance_0(
xExecute := SktUDPRecv_Instance_0.xReady,
uiID := uiID,
DataBuffer := DataBuffer,
uiDataSize := SktUDPRecv_Instance_0.uiCount,
uiTimeOut := ,
stRecvAddress := SktUDPRecv_Instance_0.stSenAddress,
xDone => ,
xBusy => ,
xError => ,
wErrorID => );
```

18.4.14 S7 Communication



18.4.14.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable Library Version
18.4.14.2 S7_Client	FB	Create a S7 client	S7Comm	Library version 1.0.0.0 and later
18.4.14.3 S7_Server	FB	Create a S7 server		Library version 1.0.0.0 and later
18.4.14.4 S7_Get	FB	Read data as an S7 client		Library version 1.0.0.0 and later
18.4.14.5 S7_Put	FB	Write data as an S7 client		Library version 1.0.0.0 and later
18.4.14.6 S7_Data_Area_Create	FB	Create memory areas on S7 server		Library version 1.0.0.0 and later

18.4.14.2 S7_Client

This instruction create a S7 client.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
S7_Client	Create a S7 client	FB		S7_Client_Instance_0(xEnable := , strIPAddress := , bRack := , bSlot := , stConnection => , xReady => , xBusy => , xError => , eErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Function block enable	BOOL	TRUE, FALSE	FALSE	Level triggered
	strIPAddress	Remote IP address	STRING	Follows data type	''	Remote IP Address

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	bRack	Rack ID	BYTE	Follows data type	0	Unused and reserved
	bSlot	Slot ID	BYTE	Follows data type	0	Unused and reserved
Output	stConnection	Connection handle	S7_Connection	Follows data type	-	Connection handle.
	xReady	Ready function block	BOOL	TRUE, FALSE	-	Indicates the function block is ready for execution
	xBusy	Function block execution flag	BOOL	TRUE, FALSE	-	Function block execution flag
	xError	Function block fault flag	BOOL	TRUE, FALSE	-	Function block fault flag
	eErrorID	Function block fault ID	S7_ERROR	Follows data type	-	Function block fault ID. For details, see 18.4.14.7 Fault Codes.

- **Function**
  This instruction connects to the server at specified IP when xEnable is set to TRUE and disconnects when xEnable is set to FALSE.
- **Program example**

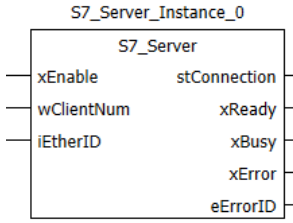
  ST:

Name	Type	Address	Value
S7_Client_Instance_0	S7_Client		
client_enable	BOOL		TRUE
ip	STRING		'192.168.1.17'
client_stconn	S7_Connection		
client_ready	BOOL		TRUE
client_busy	BOOL		FALSE
client_error	BOOL		FALSE
client_errorid	S7_ERROR		NO_ERROR
S7_Get_Instance_0	S7_Get		
get_execute	BOOL		FALSE

```
S7_Client_Instance_0(xEnable TRUE := client_enable TRUE ,
                     strIPAddress '192.168.1.17' := ip '192.168.1.17' ,
                     bRack := ,
                     bSlot := ,
                     stConnection => client_stconn,
                     xReady TRUE => client_ready TRUE ,
                     xBusy FALSE => client_busy FALSE ,
                     xError FALSE => client_error FALSE ,
                     eErrorID NO_ERROR => client_errorid NO_ERROR );
```

LD:

Name	Type	Address	Value
S7_Client_Instance_0	S7_Client		
xEnable	BOOL		TRUE
strIPAddress	STRING		'192.168.1.17'
bRack	BYTE		0
bSlot	BYTE		0
stConnection	S7_Connection		
xReady	BOOL		TRUE
xBusy	BOOL		FALSE
xError	BOOL		FALSE



- **Precautions**
  - bRack and bSlot are reserved variables, which do not need to be configured and can be left at default values.
  - xBusy is set during reconnection upon server disconnection, After successful reconnection, it will be set again. Reconnect time is 10s.

◦ A maximum of eight client instructions can be executed at the same time, an error will be reported if this number is exceeded.

18.4.14.3 S7_Server

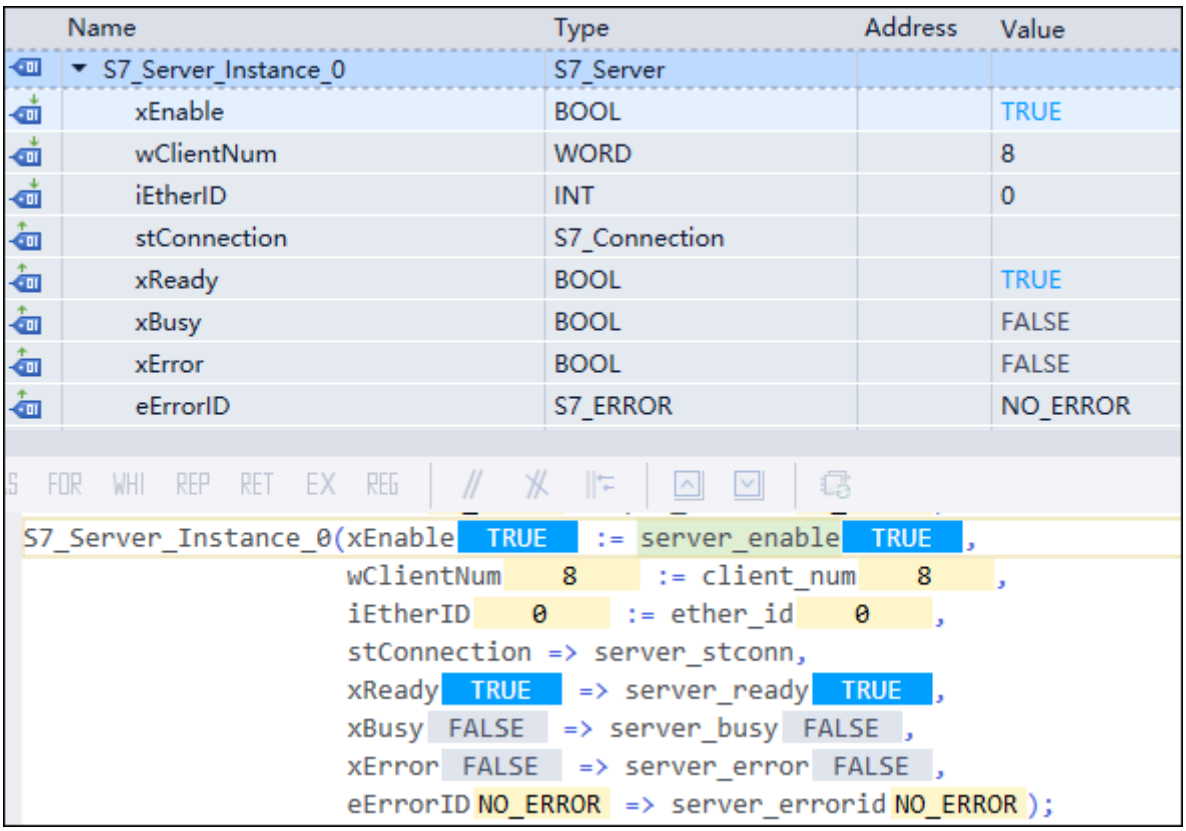
This instruction create a S7 server.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
S7_Server	Create a S7 server	FB		S7_Server_Instance_0(xEnable := , wClientNum := , iEtherID := , stConnection => , xReady => , xBusy => , xError => , eErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Function block enable	BOOL	TRUE, FALSE	FALSE	Level triggered
	wClientNum	Number of connected clients	WORD	1 to 8	0	Maximum number of connected clients
	iEtherID	Network adapter ID	INT	Follows data type	0	Network port ID bound to the server 0: Port A 1: Port B It changes in incremental mode.
Output	stConnection	Connection handle	S7_Connection	Follows data type	-	Connection handle.
	xReady	Ready function block	BOOL	TRUE, FALSE	-	Indicates the function block is ready for execution
	xBusy	Function block execution flag	BOOL	TRUE, FALSE	-	Function block execution flag
	xError	Function block fault flag	BOOL	TRUE, FALSE	-	Function block fault flag



Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	eErrorID	Function block fault ID	S7_ERROR	Follows data type	-	Function block fault ID. For details, see 18.4.14.7 Fault Codes.

- **Function**

  This instruction enables server startup and port binding via iEtherID with maximum numbers of clients set by wClientNum when xEnable is set to TRUE. It shuts down the server when xEnable is set to false.

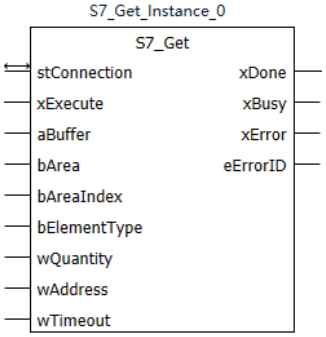
- **Program example**

  ST:

Name	Type	Address	Value
S7_Server_Instance_0	S7_Server		
xEnable	BOOL		TRUE
wClientNum	WORD		8
iEtherID	INT		0
stConnection	S7_Connection		
xReady	BOOL		TRUE
xBusy	BOOL		FALSE
xError	BOOL		FALSE
eErrorID	S7_ERROR		NO_ERROR

```
S7_Server_Instance_0(xEnable TRUE := server_enable TRUE,
                     wClientNum 8 := client_num 8,
                     iEtherID 0 := ether_id 0,
                     stConnection => server_stconn,
                     xReady TRUE => server_ready TRUE,
                     xBusy FALSE => server_busy FALSE,
                     xError FALSE => server_error FALSE,
                     eErrorID NO_ERROR => server_errorid NO_ERROR);
```

  LD:



- **Precautions**
  - One port matches one S7_Server. Each S7_Server supports up to eight client connections. 0 maps to Port A and 1 maps to Port B in order.
  - The network adapter can only be called when it is in the available state. If it is in the EtherCAT state, an error will be reported.

18.4.14.4 S7_Get

This instruction reads data via the S7 protocol as an S7 client.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
S7_Get	Read data as an S7 client	FB		S7_Get_Instance_0(stConnection := , xExecute := , aBuffer := , bArea := , bAreaIndex := , bElementType := , wQuantity := , wAddress := , wTimeout := , xDone => , xBusy => , xError => , eErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input/ Output	stConnection	Handle of S7_Client	S7_Connection	Follows data type	-	Handle of S7_Client
Input	xExecute	Function block enable	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered
	aBuffer	Data buffer	ANY	Follows data type	-	Data Buffer
	bArea	Data area type	S7_AREA_TYPE	Follows data type	S7_AREA_DB	Data area type 0: S7_AREA_INPUTS (I area) 1: S7_AREA_OUTPUTS (Q area) 2: S7_AREA_MERKERS (M area) 5: S7_AREA_DB (DB area)
	bAreaIndex	Data area index	BYTE	Follows data type	0	It is valid only for DB data area.
	bElementType	Data element type to access	S7_ELEMENT_TYPE	Follows data type	S7_BYTE	Element type 1: S7_BIT (Bit access) 2: S7_BYTE (Byte access) 3: S7_CHAR (Character access) 4: S7_WORD (Word access) 5: S7_INT (Integer access) 6: S7_DWORD (Double word access) 7: S7_DINT (Double integer access) 8: S7_REAL (Real number access)
	wQuantity	Number of elements to access	WORD	Follow data type	0	Number of elements to access
	wAddress	Remote data base address	WORD	Follow data type	0	Start address for accessing the remote data area

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	wTimeout	Timeout interval (ms)	WORD	Follow data type	1000	Maximum time for remote response
Output	xDone	Function block execution completion	BOOL	TRUE, FALSE	-	Function block execution completion flag
	xBusy	Function block execution flag	BOOL	TRUE, FALSE	-	Function block execution flag
	xError	Function block fault flag	BOOL	TRUE, FALSE	-	Function block fault flag
	eErrorID	Function block fault ID	S7_ERROR	Follows data type	-	Function block fault ID. For details, see 18.4.14.7 Fault Codes.

- **Function**
  This instruction reads the server data into buffer when xExecute is set to TRUE.
- **Program example**

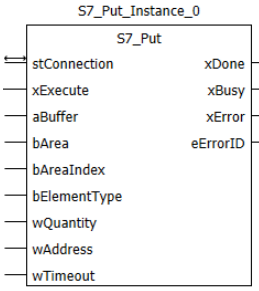
  ST:

Name	Type	Address	Value
S7_Get_Instance_0	S7_Get		
stConnection	S7_Connection		
xExecute	BOOL		TRUE
aBuffer	ANY		
bArea	S7_AREA_TYPE		S7_AREA_DB
bAreaIndex	BYTE		1
bElementType	S7_ELEMENT_TYPE		S7_BIT
wQuantity	WORD		1
wAddress	WORD		0
wTimeout	WORD		1000
xDone	BOOL		TRUE
xBusy	BOOL		FALSE
xError	BOOL		FALSE
eErrorID	S7_ERROR		NO_ERROR

```
S7_Get_Instance_0(stConnection := client_stconn,
                  xExecute TRUE  := get_execute TRUE ,
                  aBuffer := get_buf   0    ,
                  bAreaS7_AREA... := get_areaS7_AREA...,
                  bAreaIndex   1    := get_index   1    ,
                  bElementType S7_BIT  := get_type S7_BIT ,
                  wQuantity    1      := get_num    1      ,
                  wAddress     0      := get_address     0      ,
                  wTimeout   1000   := get_timeout   1000   ,
                  xDone TRUE  => get_done TRUE ,
                  xBusy FALSE  => get_busy FALSE ,
                  xError FALSE  => get_error FALSE ,
                  eErrorID NO_ERROR  => get_errorid NO_ERROR );
```

LD:

Name	Type	Address	Value
S7_Get_Instance_0	S7_Get		
stConnection	S7_Connection		
xExecute	BOOL		TRUE
aBuffer	ANY		
bArea	S7_AREA_TYPE		S7_AREA_DB
bAreaIndex	BYTE		1
bElementType	S7_ELEMENT_TYPE		S7_BIT
wQuantity	WORD		1
wAddress	WORD		0
wTimeout	WORD		1000
xDone	BOOL		TRUE
xBusy	BOOL		FALSE
xError	BOOL		FALSE
eErrorID	S7_ERROR		NO_ERROR



- **Precautions**
  - Multiple S7_Get instructions cannot be called at the same time and must be executed in sequence. Start the next call only after the Done flag of the current instruction is set. Otherwise, an error will be reported. In practical applications, the Done flag of previous instruction can trigger the next instruction.
  - When bElementType is set to S7_BIT, the value of wQuantity is 1, indicating single-bit access.
  - When bElementType is set to S7_BIT, wAddress adopts bitwise addressing. When bElementType is set to other data types,
    wAddress adopts bytewise addressing.

18.4.14.5 S7_Put

This instruction writes data via the S7 protocol as an S7 client.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
S7_Put	Write data as an S7 client	FB		S7_Put_Instance_0(stConnection := , xExecute := , aBuffer := , bArea := , bAreaIndex := , bElementType := , wQuantity := , wAddress := , wTimeout := , xDone => , xBusy => , xError => , eErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input/ Output	stConnection	Handle of S7_Client	S7_Connection	Follow data type	-	Handle of S7_Client
Input	xExecute	Function block enable	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered
	aBuffer	Data buffer	ANY	Follows data type	-	Data Buffer
	bArea	Data area type	S7_AREA_TYPE	Follows data type	S7_AREA_DB	Data area type 0: S7_AREA_INPUTS (I area) 1: S7_AREA_OUTPUTS (Q area) 2: S7_AREA_MERKERS (M area) 5: S7_AREA_DB (DB area)
	bAreaIndex	Data area index	BYTE	Follows data type	0	It is valid only for DB data area.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	bElementType	Data element type to access	S7_ELEMENT_TYPE	Follows data type	S7_BYTE	Element type 1: S7_BIT 2: S7_BYTE 3: S7_CHAR 4: S7_WORD 5: S7_INT 6: S7_DWORD 7: S7_DINT 8: S7_REAL
	wQuantity	Number of elements to access	WORD	Follow data type	0	Number of elements to access
	wAddress	Remote data base address	WORD	Follow data type	0	Start address for accessing the remote data area
	wTimeout	Timeout interval (ms)	WORD	Follow data type	1000	Maximum time for remote response
Output	xDone	Ready function block	BOOL	TRUE, FALSE	-	Function block execution completion flag
	xBusy	Function block execution flag	BOOL	TRUE, FALSE	-	Function block execution flag
	xError	Function block fault flag	BOOL	TRUE, FALSE	-	Function block fault flag
	eErrorID	Function block fault ID	S7_ERROR	Follows data type	-	Function block fault ID. For details, see 18.4.14.7 Fault Codes.

- **Function**
  This instruction writes the buffer data into server when xExecute is set to TRUE.
- **Program example**

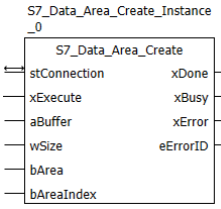
  ST:

Name	Type	Address	Value
S7_Put_Instance_0	S7_Put		
stConnection	S7_Connection		
xExecute	BOOL		TRUE
aBuffer	ANY		
bArea	S7_AREA_TYPE		S7_AREA_DB
bAreaIndex	BYTE		1
bElementType	S7_ELEMENT_TYPE		S7_BIT
wQuantity	WORD		1
wAddress	WORD		0
wTimeout	WORD		1000
xDone	BOOL		TRUE
xBusy	BOOL		FALSE
xError	BOOL		FALSE
eErrorID	S7_ERROR		NO_ERROR
s7_err	DINT		0

```
S7_Put_Instance_0(stConnection := client_stconn,
                  xExecute TRUE  := put_execute TRUE ,
                  aBuffer := put_buf    0     ,
                  bAreaS7_AREA... := put_areaS7_AREA...,
                  bAreaIndex   1    := put_index   1    ,
                  bElementType S7_BIT  := put_type S7_BIT ,
                  wQuantity    1    := put_num    1    ,
                  wAddress     0    := put_address    0    ,
                  wTimeout   1000   := put_timeout  1000   ,
                  xDone  TRUE  => put_done  TRUE ,
                  xBusy  FALSE => put_busy  FALSE ,
                  xError FALSE => put_error FALSE ,
                  eErrorID NO_ERROR => put_errorid NO_ERROR );
```

LD:

Name	Type	Address	Value
S7_Put_Instance_0	S7_Put		
stConnection	S7_Connection		
xExecute	BOOL		TRUE
aBuffer	ANY		
bArea	S7_AREA_TYPE		S7_AREA_DB
bAreaIndex	BYTE		1
bElementType	S7_ELEMENT_TYPE		S7_BIT
wQuantity	WORD		1
wAddress	WORD		0
wTimeout	WORD		1000
xDone	BOOL		TRUE
xBusy	BOOL		FALSE
xError	BOOL		FALSE
eErrorID	S7_ERROR		NO_ERROR



- **Precautions**
  - Multiple S7_Put instructions cannot be called at the same time and must be executed in sequence. Start the next call only after the Done flag of the current instruction is set. Otherwise, an error will be reported. In practical applications, the Done flag of previous instruction can trigger the next instruction.
  - When bElementType is set to S7_BIT, the value of wQuantity is 1, indicating single-bit access.
  - When bElementType is set to S7_BIT, wAddress adopts bitwise addressing. When bElementType is set to other data types,
    wAddress adopts bytewise addressing.

18.4.14.6 S7_Data_Area_Create

This instruction creates data memory areas on the S7 protocol communication server.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
S7_Data_Area_Create	Create memory areas on S7 server	FB		S7_Data_Area_Create_Instance_0(stConnection := , xExecute := , aBuffer := , wSize := , bArea := , bAreaIndex := , xDone => , xBusy => , xError => , eErrorID =>);

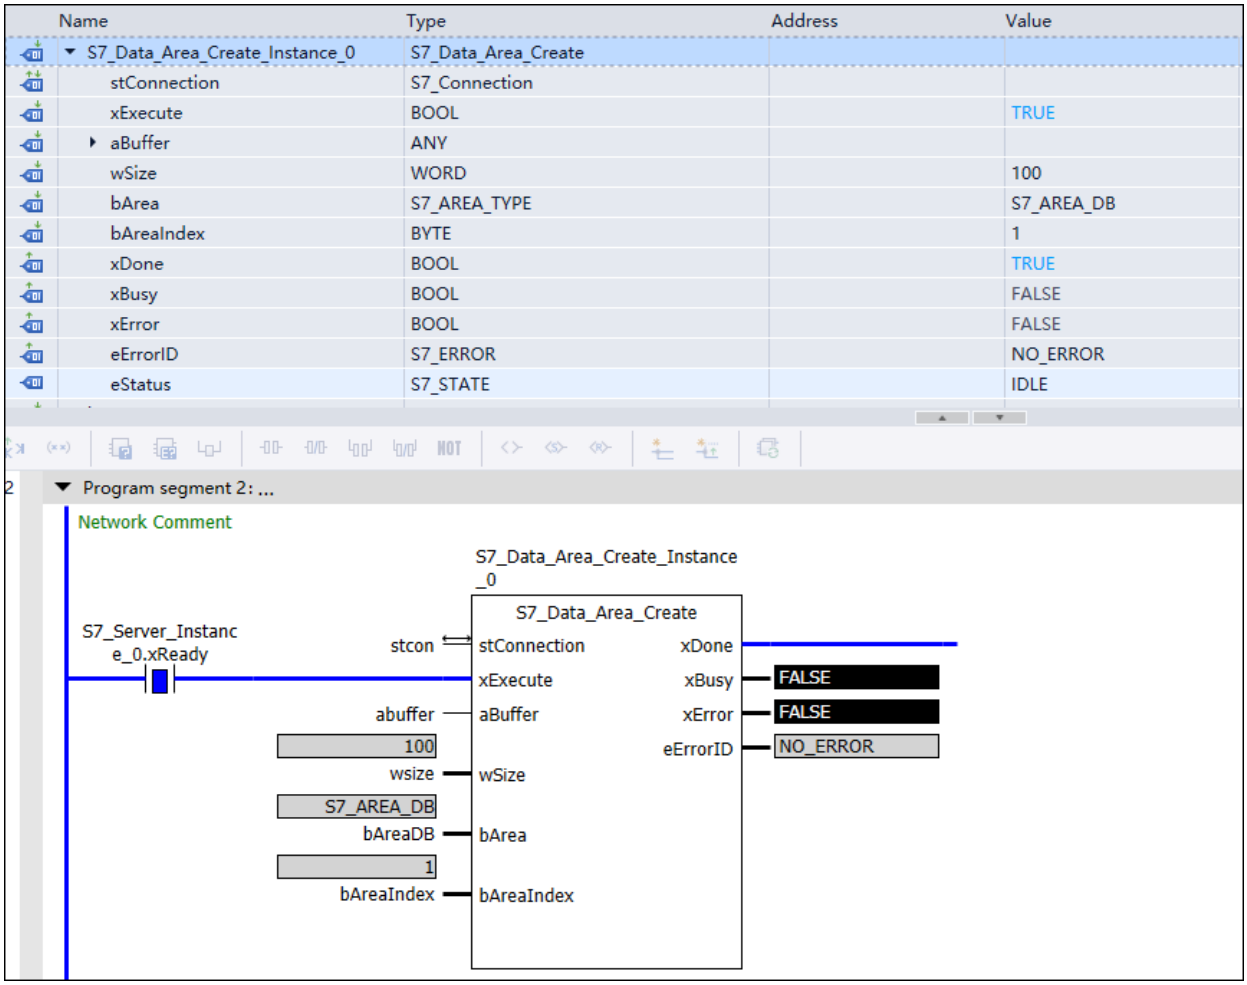
- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input/ Output	stConnection	Handle of S7_Client	S7_Connection	Follow data type	-	Handle of S7_Client
Input	xExecute	Function block enable	BOOL	TRUE, FALSE	FALSE	Rising edge-triggered
	aBuffer	Data buffer	ANY	Follows data type	-	Data Buffer
	wSize	Size of data area	WORD	Follow data type	0	Size of data area (bytes)
	bArea	Data area type	S7_AREA_TYPE	Follows data type	S7_AREA_DB	Data area type 0: S7_AREA_INPUTS (I area) 1: S7_AREA_OUTPUTS (Q area) 2: S7_AREA_MERKERS (M area) 5: S7_AREA_DB (DB area)
	bAreaIndex	Data area index	BYTE	Follows data type	0	It is valid only for DB data area.
Output	xDone	Function block execution completion	BOOL	TRUE, FALSE	-	Function block execution completion flag

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	xBusy	Function block execution flag	BOOL	TRUE, FALSE	-	Function block execution flag
	xError	Function block fault flag	BOOL	TRUE, FALSE	-	Function block fault flag
	eErrorID	Function block fault ID	S7_ERROR	Follows data type	-	Function block fault ID. For details, see 18.4.14.7 Fault Codes.

- **Function**

  When xExecute is set to TRUE, this instruction creates data memory areas (I/Q/M/DB) based on the value of bArea for client access. When xExecute is set to FALSE, it destroys the data areas.



- **Program example**

  ST:

Name	Type	Address	Value
S7_Data_Area_Create_Instance_0	S7_Data_Area_Create		
stConnection	S7_Connection		
xExecute	BOOL		TRUE
aBuffer	ANY		
wSize	WORD		1
bArea	S7_AREA_TYPE		S7_AREA_DB
bAreaIndex	BYTE		0
xDone	BOOL		TRUE
xBusy	BOOL		FALSE
xError	BOOL		FALSE
eErrorID	S7_ERROR		NO_ERROR

```
S7_Data_Area_Create_Instance_0(stConnection := server_stconn,
                               xExecute TRUE  := server_execute TRUE ,
                               aBuffer := server_buf  0 ,
                               wSize  1  := server_size  1 ,
                               bAreaS7_AREA... := server_areaS7_AREA...,
                               bAreaIndex  0  := server_index  0 ,
                               xDone TRUE  => server_done TRUE ,
                               xBusy FALSE  => area_busy FALSE ,
                               xError FALSE  => area_error FALSE ,
                               eErrorID NO_ERROR => area_errorid NO_ERROR );
```

  LD:

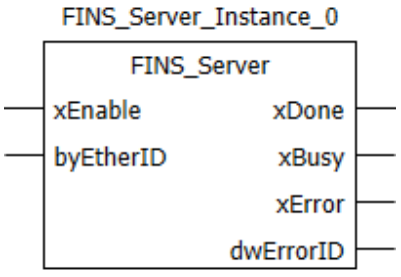
- **Precautions**
  - The data areas (I/Q/M/DB) created by this instruction serve only as area identifiers and are used only for remote read/write access. For the interaction with medium-sized PLCs, map the array to the I/Q/M areas.
  - The data areas (I/Q/M) created by this instruction are unique. Multiple DB data areas can be created, but their data area index (bAreaIndex) must be unique.

18.4.14.7 Fault Codes

Name	Fault Code	Description
NO_ERROR	0	No error.
CONNECT_FAILED	1	Failed to create connection
CONNECT_MODE_INVALID	2	Connection mode invalid
CONNECTION_INVALID	3	Connection handle invalid
CONNECTION_OCCUPY	4	Connection handle occupied
CONNECTION_MODIFY	5	Connection handle modification error
MEMORY_ADDR_INVALID	6	Memory address invalid
MEMORY_OUT_OF_BOUNDS	7	Memory access out of bounds
DATA_DIM_INVALID	8	Data dimension invalid (only one-dimensional supported)
DATA_ADDR_INVALID	9	Invalid data address.

Name	Fault Code	Description
DATA_TYPE_INVALID	10	Data type invalid
DATA_VALUE_INVALID	11	Data value invalid
GET_DATA_FAILED	12	Failed to read data
PUT_DATA_FAILED	13	Failed to write data
GET_DATA_TIMEOUT	14	Data read timeout
PUT_DATA_TIMEOUT	15	Data write timeout
CLIENT_COUNT_MAX	16	Maximum number of clients reached
AREA_NO_EXIST	17	No data area
AREA_ALREADY_EXIST	18	Already existing data area
SERVER_START_FAILED	19	Failed to start the server
UNKNOWN	65535	Unknown error

18.4.15 FINS Communication



18.4.15.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable
18.4.15.2 FINS_Server	FB	Start the FINS server	HC_FINS	Library version 1.0.0.0 and later
18.4.15.3 FINS_ServerDiag	FB	Get the diagnostic information of FINS server		

18.4.15.2 FINS_Server

This instruction starts the FINS server.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
FINS_Server	Start the FINS server	FB		FINS_Server_Instance_0(xEnable := , byEtherID := , xDone => , xBusy => , xError => , dwErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Function block enable	BOOL	TRUE, FALSE	FALSE	Function block enable flag • When xEnable is set to TRUE, it indicates that the FINS server is enabled, and clients can read and write PLC data over TCP/UDP connections. • When xEnable is set to FALSE, it indicates that the FINS server is disabled, and data exchanges with clients over TCP/UDP connections are terminated.
	byEtherID	Ethernet network ID	BYTE	Follows data type	0	The valid values of Ethernet network ID start from 0, and the valid range is determined by the number of Ethernet ports on the device. For example, EVO760 supports two Ethernet ports with valid values ranging from 0 to 1: 0 for LANA and 1 for LANB.
Output	xDone	Execution completion flag	BOOL	TRUE, FALSE	FALSE	Function block completion flag.
	xBusy	Execution flag	BOOL	TRUE, FALSE	FALSE	Function block execution flag
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Function block fault flag
	dwErrorID	Fault code	DWORD	Depends on data type	0	0: No fault 1: Input parameter fault (network ID configuration error) 2: Network conflict fault 3: Execution fault (execution error)

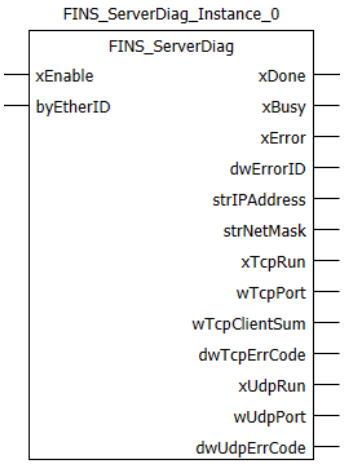
- **Function**

  This instruction starts the FINS server. The detailed execution is as follows.

  ◦ Before execution, set byEtherID to start the FINS service on the corresponding Ethernet port (0-LAN1/1-LAN2), and determine the range by the maximum number of Ethernet ports supported by the device.

  ◦ Start/stop the FINS service. Set xEnable to TRUE to start, and set xEnable to FALSE to stop.

  ◦ When xBusy is set to TRUE, the FINS server is starting.



- When xDone is set to TRUE, the FINS server starts successfully.
- When xError is set toTRUE, the FINS server fails to start, and the cause can be identified by dwErrorID.

- **Precautions**
  - This instruction does not support simulation.
  - The FINS server stops upon cold or warm reset, and needs to be enabled again for restart.

18.4.15.3 FINS_ServerDiag

This instruction get the diagnostic information of FINS server.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
FINS_ServerDiag	Get the diagnostic information of FINS server	FB		FINS_ServerDiag_Instance_0(xEnable := , byEtherID := , xDone => , xBusy => , xError => , dwErrorID => , strIPAddress => , strNetMask => , xTcpRun => , wTcpPort => , wTcpClientSum => , dwTcpErrCode => , xUdpRun => , wUdpPort => , dwUdpErrCode =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Function block enable	BOOL	TRUE, FALSE	FALSE	Function block enable flag • When xEnable is set to TRUE, refresh the diagnostic information of FINS server. • When xEnable is set to FALSE, stop reading the diagnostic information of FINS server.

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	byEtherID	Ethernet network ID	BYTE	Follows data type	0	The valid values of Ethernet network ID start from 0, and the valid range is determined by the number of Ethernet ports on the device. For example, EVO760 supports two Ethernet ports with valid values ranging from 0 to 1: 0 for LANA and 1 for LANB.
Output	xDone	Execution completion flag	BOOL	TRUE, FALSE	FALSE	Function block completion flag.
	xBusy	Execution flag	BOOL	TRUE, FALSE	FALSE	Function block execution flag
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Function block fault flag
	dwErrorID	Fault code	DWORD	Depends on data type	0	0: No fault 1: Input parameter fault (network ID configuration error) 2: Network conflict fault 3: Execution fault (execution error)
	strIPAddress	IP address	STRING(17)	Follow data type	'192.168.1.88'	IP address (FinsServer diagnostic information)
	strNetMask	Subnet mask	STRING(17)	Follow data type	'255.255.255.0'	Subnet mask (FinsServer diagnostic information)
	xTcpRun	TCP operation state	BOOL	TRUE, FALSE	FALSE	TCP operation state (FinsServer diagnostic information)
	wTcpPort	TCP port number	WORD	Follow data type	9600	TCP port number (FinsServer diagnostic information)
	wTcpClientSum	Number of TCP clients	WORD	Follow data type	0	Number of TCP clients (FinsServer diagnostic information)

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	dwTcpErrCode	TCP fault codes	DWORD	Depends on data type	0	TCP fault codes (FinsServer diagnostic information). For details, see TCP/UDP Fault Codes.
	xUdpRun	UDP operation state	BOOL	TRUE, FALSE	FALSE	UDP operation state (FinsServer diagnostic information)
	wUdpPort	UDP port number	WORD	Follow data type	9600	UDP port number (FinsServer diagnostic information)
	dwUdpErrCode	UDP fault codes	DWORD	Depends on data type	0	UDP fault codes (FinsServer diagnostic information). For details, see TCP/UDP Fault Codes.

- **Function**
  - This instruction enables the FINS server diagnostic function. The detailed execution is as follows.
    - Before execution, set byEtherID to start the FINS service diagnosis for the corresponding port.
    - Start/stop the FINS service diagnosis. Set xEnable to TRUE to start, and set xEnable to FALSE to stop.
    - When xBusy is set TRUE, the FINS server diagnosis have been started and continue to run. Thediagnostic code dwTcpErrCode indicates whether the protocol stack execution is abnormal, and the number of connections wTcpClientSum indicates how many clients are accessing.
    - When xError is set toTRUE, the FINS server diagnosis fails to start, and the cause can be identified by dwErrorID.
  - The UDP/TCP fault codes of the FINS_ServerDiag diagnostic function block are shown in the table below.

Fault Code	Description	Remarks
0	No fault	-
1	Incorrect FINS frame header	The FINS TCP data frame header should be 0x46494E53.
2	Incorrect FINS fault code	The fault code of FINS TCP handshake command frame should be 0x00000000.
3	FINS client nodes overlimt	The FINS client nodes cannot exceed 254.
4	FINS handshake failure	The FINS TCP client handshake failed.
5	Incorrect FINS fixed value	The FINS fixed value is filled incorrectly and does not match the FINS command frame.
6	Incorrect type of FINS memory area	The memory area type for FINS read/write command frame is not supported.
7	Incorrect FINS command frame format	The length of FINS command frame is incorrect.

Fault Code	Description	Remarks
8	Number of FINS read/write operations overlimit	The read/write length of FINS command frame exceeds 2000 or is 0.
9	Incorrect FINS access address range	The FINS access address range is incorrect.
10	Incorrect FINS function request code	The FINS function code is not supported.
11	Incorrect FINS frame length	The frame length is incorrect and does not conform to a FINS frame.

- **Precautions**
  - This instruction does not support simulation.
  - The FINS server diagnosis stops upon cold or warm reset, and needs to be enabled again for restart.

18.4.15.4 Example of FINS Communication Instruction Usage

The following is an example of starting the FINS server function.

Variable declarations are as follows:

```
VAR
FINS_Server_Instance_0: FINS_Server;
FINS_ServerDiag_Instance_0: FINS_ServerDiag;
en_fins: BOOL;
en_fins_diag: BOOL;
ether_id: BYTE;
END_VAR
```

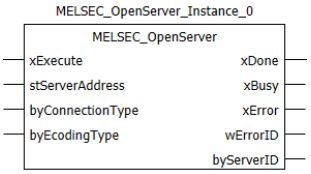
The logic implemented in the program editing area is as follows:

```
// Set network port ID
ether_id := 0; // 0 - Start LAN1 port
// Enable the FINS server
en_fins := TRUE;
// Enable the FINS diagnosis
en_fins_diag := TRUE;

FINS_Server_Instance_0(
xEnable := en_fins,
byEtherID := ether_id,
xDone => ,
xBusy => ,
xError => ,
dwErrorID => );

FINS_ServerDiag_Instance_0(
xEnable := en_fins_diag,
byEtherID := ether_id,
xDone => ,
xBusy => ,
xError => ,
dwErrorID => ,
strIPAddress => ,
strNetMask => ,
xTcpRun => ,
wTcpPort => ,
wTcpClientSum => ,
dwTcpErrCode => ,
xUdpRun => ,
wUdpPort => ,
dwUdpErrCode => );
```

18.4.16 Melsec Communication



18.4.16.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable
18.4.16.2 MELSEC_OpenServer	FB	Create a Melsec server	MelsecServer	Library version 1.0.0.0 and later
18.4.16.3 MELSEC_CloseServer	FB	Close the Melsec server		
18.4.16.4 MELSEC_ServerDiag	FB	Get the diagnostic information of Melsec server		
18.4.16.5 MELSEC_SetServerSoftAddr	FB	Set the device address		

18.4.16.2 MELSEC_OpenServer

This instruction enables the MC (MELSEC) slave.

- **Instruction format**

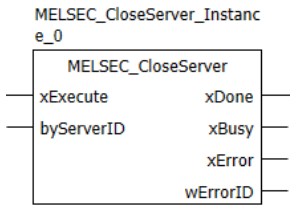
Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
MELSEC_OpenServer	Create a Melsec server	FB		MELSEC_OpenServer_Instance_0(xExecute := , stServerAddress := , byConnectionType := , byEcodingType := , xDone => , xBusy => , xError => , wErrorID => , byServerID =>);

- **Related variables**

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Instruction Enable	BOOL	TRUE, FALSE	FALSE	Triggered execution.
	stServerAddress	Server address	ADDRESS	Follows data type	-	Server address, including IP and port number

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	byConnectionType	Connection type	BYTE	0 and 1	0	Connection type 0: TCP 1: UDP
	byEcodingType	Encoding type	BYTE	0 and 1	0	Encoding type 0: binary 1: ASCII
Output	xDone	Execution completion flag	BOOL	TRUE, FALSE	FALSE	Execution completed
	xBusy	Execution flag	BOOL	TRUE, FALSE	FALSE	Executing
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Execution error
	wErrorID	Fault code	WORD	Follow data type	0	See 18.4.16.6 Fault Codes.
	byServerID	Server ID	BYTE	Follows data type	0	Server ID

- **Function**
  - This instruction starts the MC slave when xExecute is set to TRUE. The detailed execution is as follows.
    - Before execution, set the local server address via stServerAddress, and specify the connection type and encoder type via byConnectionType and byEcodingType. When xExecute is set toTRUE, the instruction starts execution.
    - When xDone is set to TRUE, the instruction is successfully executed, and the generated byServerID can be used with MELSEC_CloseServer and MELSEC_ServerDiag.
    - When xBusy is set to TRUE, it indicates that the instruction is executing during current scan cycle.
    - If xError is set to TRUE, it indicates that an error occurred during instruction execution. The cause can be identified by wErrorID.
  - The data type of stServerAddress is ADDRESS. The descriptions of structure members are in the table below.



Name	Data Type	Description
strIPAddr	STRING	IP address
uiPort	UINT	Port number with rangeof 1025 to 65535

- **Precautions**
  - If the input port number is within the specified range of 1025 to 65535 yet an error still occurs, the port may already be used by another function.
  - The MC slave automatically shuts down upon cold/hot reset or RUN/STOP mode switching and needs to be re-enabled.
  - This instruction does not support simulation.

18.4.16.3 MELSEC_CloseServer

This instruction closes the Melsec server.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
MELSEC_CloseServer	Close the Melsec server	FB		MELSEC_CloseServer_Instance_0(xExecute := , byServerID := , xDone => , xBusy => , xError => , wErrorID =>);

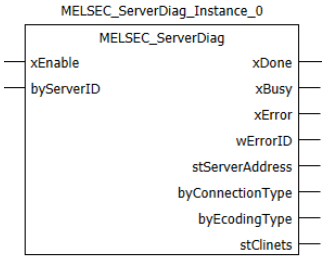
- **Related variables**

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Instruction enable	BOOL	TRUE, FALSE	FALSE	Triggered execution.
	byServerID	Server ID	BYTE	-	-	Server ID
Output	xDone	Execution completion flag	BOOL	TRUE, FALSE	FALSE	Execution completed
	xBusy	Execution flag	BOOL	TRUE, FALSE	FALSE	Executing
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Execution error
	wErrorID	Fault code	WORD	Follow data type	0	See 18.4.16.6 Fault Codes

- **Function**

  This instruction closes the MC slave when xExecute is set to TRUE. The detailed execution is as follows.

  - Before execution, input the byServerID (generated by MELSEC_OpenServer). When xExecute is set to TRUE, the instruction starts execution.
  - When xDone is set to TRUE, the instruction is successfully executed.
  - When xBusy is set to TRUE, the instruction is being executed in the current scan cycle.
  - If xError is set to TRUE, it indicates that an error occurred during instruction execution. The cause can be identified by wErrorID.



- **Precautions**

  This instruction does not support simulation.

18.4.16.4 MELSEC_ServerDiag

This instruction gets the diagnostic information of Melsec server.

- **Instruction format**

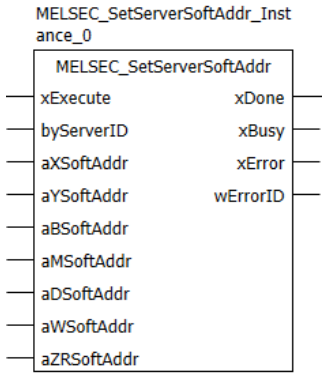
Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
MELSEC_ServerDiag	Get the diagnostic information of Melsec server	FB		MELSEC_ServerDiag_Instance_0(xEnable := , byServerID := , xDone => , xBusy => , xError => , wErrorID => , stServerAddress => , byConnectionType => , byEcodingType => , stClinets =>);

- **Related variables**

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xEnable	Instruction enable	BOOL	TRUE, FALSE	FALSE	Triggered execution.
	byServerID	Server ID	BYTE	-	-	Server ID
Output	xDone	Execution completion flag	BOOL	TRUE, FALSE	FALSE	Execution completed
	xBusy	Execution flag	BOOL	TRUE, FALSE	FALSE	Executing
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Execution error
	wErrorID	Fault code	WORD	Follow data type	0	See 18.4.16.6 Fault Codes.
	stServerAddress	Server IP address	ADDRESS	Follows data type	-	Server address
	byConnectionType	Connection type	BYTE	0 and 1	0	Connection type 0: TCP 1: UDP
	byEcodingType	Encoding type	BYTE	0 and 1	0	Encoding type 0: binary 1: ASCII

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	stClinets	Client information	CLIENT_INFO	Follows data type	-	Client information It takes effect only under TCP connection type (byConnectionType set to 0).

- **Function**
  - This instruction gets the diagnostic information of MC slave when xEnable is set to TRUE. The detailed execution is as follows.
    - Before execution, input the byServerID (generated by MELSEC_OpenServer). When xEnable is set to TRUE, the instruction starts execution.
    - When xDone is set to TRUE, the instruction is successfully executed.
    - When xBusy is set to TRUE, the instruction is being executed in the current scan cycle, and the real-time information of clients connected to the server is output.
    - If xError is set to TRUE, it indicates that an error occurred during instruction execution. The cause can be identified by wErrorID.
  - The data type of stServerAddress is ADDRESS. For details, see ADDRESS.
  - The data type of stClinets is CLIENT_INFO. The descriptions of structure members are in the table below.



Name	Data Type	Description
byConnectedCount	BYTE	Number of connections
ConnectAddress	ARRAY [1..32] OF ADDRESS	Connection address

- **Precautions**
  This instruction does not support simulation.

18.4.16.5 MELSEC_SetServerSoftAddr

This instruction sets the device address of MC slave.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
MELSEC_SetServerSoftAddr	Set the device address	FB		MELSEC_SetServerSoftAddr_Instance_0(xExecute := , byServerID := , aXSoftAddr := , aYSoftAddr := , aBSoftAddr := , aMSoftAddr := , aDSoftAddr := , aWSoftAddr := , aZRSoftAddr := , xDone => , xBusy => , xError => , wErrorID =>);

- **Related variables**

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Instruction enable	BOOL	TRUE, FALSE	FALSE	Triggered execution.
	byServerID	Server ID	BYTE	Follows data type	0	Server ID
	aXSoftAddr	Address of X device	ANY	Follows data type	-	Address of X device
	aYSoftAddr	Address of Y device	ANY	Follows data type	-	Address of Y device
	aBSoftAddr	Address of B device	ANY	Follows data type	-	Address of B device
	aMSoftAddr	Address of M device	ANY	Follows data type	-	Address of M device
	aDSoftAddr	Address of D device	ANY	Follows data type	-	Address of D device
	aWSoftAddr	Address of W device	ANY	Follows data type	-	Address of W device
	aZRSoftAddr	Address of Z device	ANY	Follows data type	-	Address of Z device
Output	xDone	Execution completion flag	BOOL	TRUE, FALSE	FALSE	Execution completed
	xBusy	Execution flag	BOOL	TRUE, FALSE	FALSE	Executing
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Execution error

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	wErrorID	Fault code	WORD	Follow data type	0	See 18.4.16.6 Fault Codes.

- **Function**
  - This instruction sets the device addresses of the MC slave, including X/Y/B/M/D/W/ZR devices. The device types are listed in the table below.

Device	Type
X/Y/B/M	Bit device
D/W/ZR	Word device

  - Default access range of devices
    For medium-sized PLCs, the M, Q, and I areas support bit, half-word, and word addressing, with Q and I areas allocated uniformly by iFA. Since the MC slave is configured via this instruction, a mapping relationship must be established between the M area and Mitsubishi devices, as shown in the table below (direct access to Q/I areas is unavailable).

Inovance Device	Type	Range	Number of Points	Mitsubishi Deivice
% MX	Bit	%MX0.0 to %MX127.7	1024	X
% MX	Bit	%MX200.0 to %MX327.7	1024	Y
% MX	Bit	%MX400.0 to %MX1399.7	8000	M
% MX	Bit	%MX1500.0 to %MX5595.7	32768	B
% MW	Word	%MW3000 to %MW10999	8000	D
% MW	Word	%MW12000 to %MW44767	32768	W
% MW	Word	%MW45000 to %MW94999	50000 points	ZR

  - Custom device address
    The mapping rules between custom arrays and devices are shown in the table below.

Device	Memory Size in Byte	Custom BOOL Array	Custom BYTE Array	Custom WORD Array	Device Address
X/Y/B/M	1	0	0	0	0
	1	1	1		1
	1	2	2	1	2
	1	3	3		3
D/W/ZR	1	0	0	0	0
	1	1	1		
	1	2	2	1	1
	1	3	3		
	1	4	4	2	2
	1	5	5		
	1	6	6	3	3

Device	Memory Size in Byte	Custom BOOL Array	Custom BYTE Array	Custom WORD Array	Device Address
	1	7	7		

◦ Before execution, ensure the input parameters are correct, as shown in the table below.

Input Variable	Description
byServerID	The server ID is generated when the MC protocol is started by MELSEC_OpenServer. Input the server ID corresponding to the server you wish to use.
aXSoftAddr	X device address supports only one-dimensional arrays. You can input either the array name or the array name with an index (subscript). Since the X device is a bit device, it is recommended to input a one-dimensional BOOL array.
Other device addresses	For details, see aXSoftAddr. It is recommended to input a one-dimensional array matching the device type. For example, input a one-dimensional BOOL array for bit devices and a one-dimensional WORD array for word devices.

◦ During execution, xBusy is to TRUE and remains at high level.

◦ When the execution is completed and the configuration is successful, xDone is set to TRUE.

◦ If the execution and configuration fail, xError is set to TRUE. The cause can be identified by wErrorID.

- **Precautions**
  ◦ A cold/warm reset or RUN/STOP mode switch will restore the default device address.
  ◦ When the device address changes, the instruction must be executed again to update the address.
  ◦ This instruction does not support simulation.

18.4.16.6 Fault Codes

Fault code	Value	Description
MELSEC_ERR_OK	0	No fault
MELSEC_ERR_FAILED	1	Internal error
MELSEC_ERR_SERVER_ENALBED	2	MC service is enabled.
MELSEC_ERR_SERVER DISALBED	3	MC service is disabled.
MELSEC_ERR_SOFT_MAP_ADDR	4	Incorrect device mapping address
MELSEC_ERR_IPADDR	5	Incorrect IP address
MELSEC_ERR_CONNECT_TYPE	6	Incorrect connection type
MELSEC_ERR_PORT	7	Incorrect port number
MELSEC_ERR_ECODING_TYPE	8	Incorrect encoding type
MELSEC_ERR_SERVER_ID	9	Incorrect server ID
MELSEC_ERR_SERVER_START	10	Failed to start the service
MELSEC_ERR_SEVER_SOCKET	11	Service socket error
MELSEC_ERR_SEVER_BIND	12	Failed to bind the server

Fault code	Value	Description
MELSEC_ERR_SEVER_LISTEN	13	Failed to listen the server
MELSEC_ERR_SEVER_STATE	14	Abnormal service status
MELSEC_ERR_SEVER_EXECUTING	15	Operation in progress
MELSEC_ERR_MAP_SOFT_X	32	Failed to map X device
MELSEC_ERR_MAP_SOFT_Y	33	Failed to map Y device
MELSEC_ERR_MAP_SOFT_B	34	Failed to map B device
MELSEC_ERR_MAP_SOFT_M	35	Failed to map M device
MELSEC_ERR_MAP_SOFT_D	36	Failed to map D device
MELSEC_ERR_MAP_SOFT_W	37	Failed to map W device
MELSEC_ERR_MAP_SOFT_ZR	38	Failed to map ZR device

18.4.16.7 Example of Melsec Communication Instruction Usage

This is an example of starting the MC slave, getting diagnostic information, and then shutting down the MC slave.

Variable declarations are as follows:

```
VAR
MELSEC_OpenServer_0: MELSEC_OpenServer;
MELSEC_ServerDiag_0: MELSEC_ServerDiag;
MELSEC_CloseServer_0: MELSEC_CloseServer;
stServerAddress: MelsecServer.ADDRESS;
byConnectionType: BYTE;
byEcodingType: BYTE;
byServerID: BYTE;
xEnOpenServer: BOOL;
xEnServerDiag: BOOL;
xEnCloseServer: BOOL;
END_VAR
```

The logic implemented in the program editing area is as follows:

```
// Set the listening address of the local server

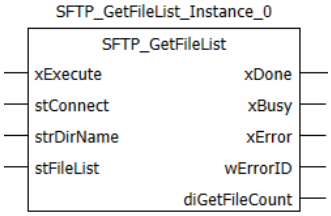
18.4.17 SFTP Communication



18.4.17.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable
18.4.17.2 SFTP_GetFileList	FB	Get file list from SFTP server	SftpClient	Library version 1.0.0.0 and later
18.4.17.3 SFTP_GetFile	FB	Get file from SFTP server		
18.4.17.4 SFTP_PutFile	FB	Upload local file to SFTP server		
18.4.17.5 SFTP_DeleteFile	FB	Delete file on SFTP server		
18.4.17.6 SFTP_MoveFile	FB	Move file on SFTP server		
18.4.17.7 SFTP_RenameFile	FB	Rename file on SFTP server		
18.4.17.8 SFTP_CreateDir	FB	Create directory on SFTP server		

18.4.17.2 SFTP_GetFileList

This instruction gets all files or directories from the specified server path.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SFTP_GetFileList	Get file list from SFTP server	FB		SFTP_GetFileList_Instance_0(xExecute := , stConnect := , strDirName := , stFileList := , xDone => , xBusy => , xError => , wErrorID => , diGetFileCount =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Instruction enable	BOOL	TRUE, FALSE	FALSE	Triggered execution.
	stConnect	Connection information	SFTP_CONNECT_INFO	Follows data type	-	Connection information, including the server address and port.
	strDirName	Server directory name (including the absolute path)	STRING	Follows data type	-	Server directory name (including the absolute path)
	stFileList	File list	ANY	Follows data type	-	File list: one-dimensional array of SFTP_FILE_INFO
Output	xDone	Execution completion flag	BOOL	TRUE, FALSE	FALSE	Execution completed
	xBusy	Execution flag	BOOL	TRUE, FALSE	FALSE	Executing
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Execution error
	wErrorID	Fault code	WORD	Follow data type	0	See 18.4.17.9 Fault Codes.
	diGetFileCount	Number of files obtained	DINT	Follows data type	0	Number of files obtained

- **Function**
  - The SFTP_GetFileList instruction is used to download all the files or directories from the specified SFTP server path. It is triggered for one-time execution by xExecute. It establishes a connection with the serverbased on the information specified by stConnect, obtains all files from the server directory specified by strDirName, and stores the data into stFileList. If the execution is successful, xDone is set

to TRUE and the actual number of files obtained specified by diGetFileCount is output. If the execution fails, xError is set to TRUE and wErrorID is output.

◦ The data type of stConnect is SFTP_CONNECT_INFO. The descriptions of structure members are in the table below.

Name	Data Type	Description
strServerIPAddr	STRING	Server address
uiServerPort	UINT	Server port
strUsername	STRING	Login account
strPassword	STRING	Login password

◦ The data type of stFileList SFTP_FILE_INFO. The descriptions of structure members are in the table below.

Name	Data Type	Description
strName	STRING	File name
diaDate	ARRAY [0..5] OF DINT	File update time: year\month\day\hour\minute\second
uliSize	ULINT	File size
xReadOnly	BOOL	File Read-only flag
xFileType	BOOL	File type flag

- **Program example**

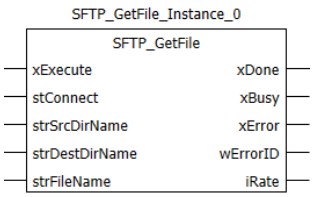
The variable declarations are as follows.

```
VAR
SFTP_GetFileList_0: SFTP_GetFileList;
stConnect: SftpClient.SFTP_CONNECT_INFO;
strDirName: STRING;
stFileList:ARRAY[0..10] OF SFTP_FILE_INFO;
en_get_file_list:BOOL;
END_VAR
```

The program editing area implements the logic as follows:

```
// SFTP server connection settings
stConnect.strServerIPAddr := '192.168.1.88';// SFTP server IP address
stConnect.uiServerPort := 22;// SFTP server port number
stConnect.strUsername := 'username';// Username
stConnect.strPassword := 'password';// Password

strDirName:='/DirName';// Server directory, including the path.



SFTP_GetFileList_0(
xExecute:= en_get_file_list,
stConnect:= stConnect,
strDirName:= strDirName,
stFileList:= stFileList,
xDone=> ,
xBusy=> ,
xError=> ,
wErrorID=> ,
diGetFileCount=> );
IF SFTP_GetFileList_0.xDone THEN
;// Execution completed
ELSIF SFTP_GetFileList_0.xError THEN
;// Error handling
ELSIF SFTP_GetFileList_0.xBusy THEN
;// Executing
ELSE
;// Not executed
END_IF
```

- **Precautions**
  This instruction does not support simulation.

18.4.17.3 SFTP_GetFile

This instruction get server files to the local device.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SFTP_GetFile	Get file from SFTP server	FB		SFTP_GetFile_Instance_0(xExecute := , stConnect := , strSrcDirName := , strDestDirName := , strFileName := , xDone => , xBusy => , xError => , wErrorID => , iRate =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Instruction enable	BOOL	TRUE, FALSE	FALSE	Triggered execution.
	stConnect	Connection information	SFTP_CONNECT_INFO	Follows data type	-	Connection information, including the server address and port.
	strSrcDirName	Server directory name (including the absolute path)	STRING	Follows data type	-	Server directory name (including the absolute path)
	strDestDirName	Local directory name	STRING	Follows data type	-	Local directory name. For details, see the description of the local directory in the 18.2.11.2 File Operations > Overview section.
	strFileName	Name of the file to be obtained	STRING	Follows data type	-	Name of the file to be obatained
Output	xDone	Execution completion flag	BOOL	TRUE, FALSE	FALSE	Execution completed
	xBusy	Execution flag	BOOL	TRUE, FALSE	FALSE	Executing

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Execution error
	wErrorID	Fault code	WORD	Follow data type	0	See 18.4.17.9 Fault Codes.
	iRate	Download progress %	INT	Follows data type	-	Download progress %

- **Function**
  - The SFTP_GetFile instruction is used to obtain files from the SFTP server. This instruction is executed once when the xExecute signal is triggered. It establishes a connection with the server based on the information specified by strSrcDirName. After that, it downloads a file strFileName from the server directory strServerDirName to the local directory strDestDirName. If the execution is successful, xDone is set to TRUE. If the execution fails, xError is set to TRUE, and wErrorID is output.
  - The data type of stConnect is SFTP_CONNECT_INFO. For details, see SFTP_CONNECT_INFO.
- **Program example**

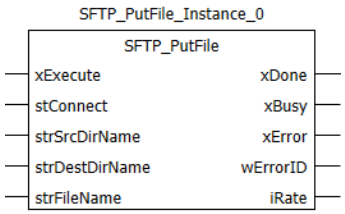
  The variable declarations are as follows.

```
VAR
SFTP_GetFile_0: SFTP_GetFile;
stConnect: SftpClient.SFTP_CONNECT_INFO;
strSrcDirName: STRING;
strDestDirName: STRING;
strFileName: STRING;
en_get_file: BOOL;
END_VAR
```

  The program editing area implements the logic as follows:

```
// SFTP server connection settings
stConnect.strServerIPAddr := '192.168.1.88';// SFTP server IP address
stConnect.uiServerPort := 22;// SFTP server port number
stConnect.strUsername := 'username';// Username
stConnect.strPassword := 'password';// Password

strSrcDirName:='/SrcDirName';// Source directory name for download (server directory), including the path. The leading '/' indicates the top-level directory of the server, also known as the root directory. To access a subdirectory, use '/subdirectory_name/'.
strDestDirName:='/DestDirName';// Target directory name for download (local directory), including the path.
strFileName:='filename'; // Name of the file to be downloaded



SFTP_GetFile_0(
xExecute:= en_get_file,
stConnect:= stConnect,
strSrcDirName:= strSrcDirName,
strDestDirName:= strDestDirName,
strFileName:= strFileName,
xDone=> ,
xBusy=> ,
xError=> ,
wErrorID=> ,
iRate=> );
IF SFTP_GetFile_0.xDone THEN
;// Execution completed
ELSIF SFTP_GetFile_0.xError THEN
;// Error handling
ELSIF SFTP_GetFile_0.xBusy THEN
;// Executing
ELSE
;// Not executed
END_IF
```

- **Precautions**
  This instruction does not support simulation.

18.4.17.4 SFTP_PutFile

This instruction upload local files to the server.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SFTP_PutFile	Upload local file to SFTP server	FB		SFTP_PutFile_Instance_0(xExecute := , stConnect := , strSrcDirName := , strDestDirName := , strFileName := , xDone => , xBusy => , xError => , wErrorID => , iRate =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Instruction enable	BOOL	TRUE, FALSE	FALSE	Triggered execution.
	stConnect	Connection information	SFTP_CONNECT_INFO	Follows data type	-	Connection information, including the server address and port.
	strSrcDirName	Local directory name	STRING	Follows data type	-	Local directory name. For details, see the description of the local directory in the 18.2.11.2 File Operations > Overview section.
	strDestDirName	Server directory name (including the absolute path)	STRING	Follows data type	-	Server directory name (including the absolute path)
	strFileName	Name of the file to be uploaded	STRING	Follows data type	-	Name of the file to be uploaded

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	xDone	Execution completion flag	BOOL	TRUE, FALSE	FALSE	Execution completed
	xBusy	Execution flag	BOOL	TRUE, FALSE	FALSE	Executing
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Execution error
	wErrorID	Fault code	WORD	Follow data type	0	See 18.4.17.9 Fault Codes.
	iRate	Upload progress %	INT	Follows data type	-	Download progress %

- **Function**
  - The SFTP_PutFile instruction is used to upload a local file to the SFTP server. This instruction is executed once when the xExecute signal is triggered. It establishes a connection with the server based on the information specified by strSrcDirName. After that, it uploads a file strFileName from the local directory strSrcDirName to the server directory strDestDirName. If the execution is successful, xDone is set to TRUE. If the execution fails, xError is set to TRUE, and wErrorID is output.
  - The data type of stConnect is SFTP_CONNECT_INFO. For details, see SFTP_CONNECT_INFO.
- **Program example**

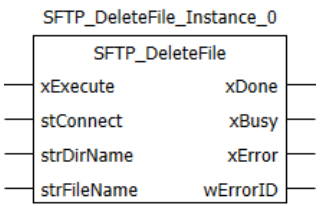
  The variable declarations are as follows.

```
VAR
SFTP_PutFile_0: SFTP_PutFile;
stConnect: SftpClient.SFTP_CONNECT_INFO;
strSrcDirName: STRING;
strDestDirName: STRING;
strFileName: STRING;
en_put_file: BOOL;
END_VAR
```

  The program editing area implements the logic as follows:

```
// SFTP server connection settings
stConnect.strServerIPAddr := '192.168.1.88';// SFTP server IP address
stConnect.uiServerPort := 22;// SFTP server port number
stConnect.strUsername := 'username';// Username
stConnect.strPassword := 'password';// Password

strSrcDirName:='/SrcDirName';// Source directory name for upload (local directory), including the path.
strDestDirName:='/DestDirName';// Target directory name for download (server directory), including the path.
strFileName:='file';// Name of the file to be uploaded



SFTP_PutFile_0(
xExecute:= en_put_file,
stConnect:= stConnect,
strSrcDirName:= strSrcDirName,
strDestDirName:= strDestDirName,
strFileName:= strFileName,
xDone=> ,
xBusy=> ,
xError=> ,
wErrorID=> ,
iRate=> );
IF SFTP_PutFile_0.xDone THEN
;// Execution completed
ELSIF SFTP_PutFile_0.xError THEN
;// Error handling
ELSIF SFTP_PutFile_0.xBusy THEN
;// Executing
ELSE
;// Not executed
END_IF
```

- **Precautions**
  This instruction does not support simulation.

18.4.17.5 SFTP_DeleteFile

This instruction deletes the file or directory at the specified path on the server.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SFTP_DeleteFile	Delete file on SFTP server	FB		SFTP_DeleteFile_Instance_0(xExecute := , stConnect := , strDirName := , strFileName := , xDone => , xBusy => , xError => , wErrorID =>);

- **Related variables**

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Instruction enable	BOOL	TRUE, FALSE	FALSE	Triggered execution.
	stConnect	Connection information	SFTP_CONNECT_INFO	Follows data type	-	Connection information, including the server address and port.
	strDirName	Server directory name (including the absolute path)	STRING	Follows data type	-	Server directory name (including the absolute path)
	strFileName	Name of the file or directory to be deleted	STRING	Follows data type	-	Name of the file or directory to be deleted
Output	xDone	Execution completion flag	BOOL	TRUE, FALSE	FALSE	Execution completed
	xBusy	Execution flag	BOOL	TRUE, FALSE	FALSE	Executing
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Execution error

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	wErrorID	Fault code	WORD	Follow data type	0	See 18.4.17.9 Fault Codes.

- **Function**
  - The SFTP_DeleteFile instruction is used to delete files or directories at the specified path on the server. This instruction is executed once when the xExecute signal is triggered. It establishes a connection with the server based on the information specified by stConnect. After that, it deletes a file or directory strFileName on the server directory strDirName. If the execution is successful, xDone is set to TRUE. If the execution fails, xError is set to TRUE, and wErrorID is output.
  - The data type of stConnect is SFTP_CONNECT_INFO. For details, see SFTP_CONNECT_INFO.
- **Program example**

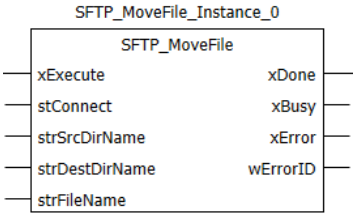
  The variable declarations are as follows.

```
VAR
SFTP_DeleteFile_0: SFTP_DeleteFile;
stConnect: SftpClient.SFTP_CONNECT_INFO;
strDirName: STRING;
strFileName: STRING;
en_delete_file: BOOL;
END_VAR
```

  The program editing area implements the logic as follows:

```
// SFTP server connection settings
stConnect.strServerIPAddr := '192.168.1.88';// SFTP server IP address
stConnect.uiServerPort := 22;// SFTP server port number
stConnect.strUsername := 'username';// Username
stConnect.strPassword := 'password';// Password

strDirName:='/DirName';// Directory name (including path)
strFileName:='filename';// Name of the file to be deleted



SFTP_DeleteFile_0(
xExecute:= en_delete_file,
stConnect:= stConnect,
strDirName:= strDirName,
strFileName:= strFileName,
xDone=> ,
xBusy=> ,
xError=> ,
wErrorID=> );
IF SFTP_DeleteFile_0.xDone THEN
;// Execution completed
ELSIF SFTP_DeleteFile_0.xError THEN
;// Error handling
ELSIF SFTP_DeleteFile_0.xBusy THEN
;// Executing
1. ELSE
;// Not executed
END_IF
```

- **Precautions**
  This instruction does not support simulation.

18.4.17.6 SFTP_MoveFile

This instruction moves files or directories on the server to the specified directory.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SFTP_MoveFile	Move file on SFTP server	FB		SFTP_MoveFile_Instance_0(xExecute := , stConnect := , strSrcDirName := , strDestDirName := , strFileName := , xDone => , xBusy => , xError => , wErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Instruction enable	BOOL	TRUE, FALSE	FALSE	Triggered execution.
	stConnect	Connection information	SFTP_CONNECT_INFO	Follows data type	-	Connection information, including the server address and port .
	strSrcDirName	Source directory name (including absolute path)	STRING	Follows data type	-	Source directory name (including absolute path)
	strDestDirName	Destination directory name (including absolute path)	STRING	Follows data type	-	Destination directory name (including absolute path)
	strFileName	Name of the file or directory to be moved	STRING	Follows data type	-	Name of the file or directory to be moved
Output	xDone	Execution completion flag	BOOL	TRUE, FALSE	FALSE	Execution completed
	xBusy	Execution flag	BOOL	TRUE, FALSE	FALSE	Executing
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Execution error

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	wErrorID	Fault code	WORD	Follow data type	0	See 18.4.17.9 Fault Codes.

- **Function**
  - The SFTP_MoveFile instruction is used to move a file or directory on the SFTP server to the designated directory. This instruction is executed once when the xExecute signal is triggered. It establishes a connection with the server based on the information specified by stConnect. After that, it moves a file or directory strFileName from the source server directory strSrcDirName to the specified directory strDestDirName. If the execution is successful, xDone is set to TRUE. If the execution fails, xError is set to TRUE, and wErrorID is output.
  - The data type of stConnect is SFTP_CONNECT_INFO. For details, see SFTP_CONNECT_INFO.
- **Program example**

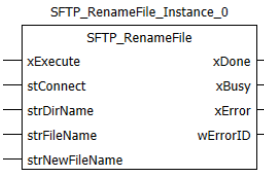
  The variable declarations are as follows.

```
VAR
SFTP_MoveFile_0: SFTP_MoveFile;
stConnect: SftpClient.SFTP_CONNECT_INFO;
strSrcDirName: STRING;
strDestDirName: STRING;
strFileName: STRING;
en_move_file: BOOL;
END_VAR
```

  The program editing area implements the logic as follows:

```
// SFTP server connection settings
stConnect.strServerIPAddr := '192.168.1.88';// SFTP server IP address
stConnect.uiServerPort := 22;// SFTP server port number
stConnect.strUsername := 'username';// Username
stConnect.strPassword := 'password';// Password

strSrcDirName:='/SrcDirName';// Source directory (server directory), including path
strDestDirName:='/DestDirName';// Target directory (server directory), including path
strFileName:='filename';// Name of the file to be moved



SFTP_MoveFile_0(
xExecute:= en_move_file,
stConnect:= stConnect,
strSrcDirName:= strSrcDirName,
strDestDirName:= strDestDirName,
strFileName:= strFileName,
xDone=> ,
xBusy=> ,
xError=> ,
wErrorID=> );
IF SFTP_MoveFile_0.xDone THEN
;// Execution completed
ELSIF SFTP_MoveFile_0.xError THEN
;// Error handling
ELSIF SFTP_MoveFile_0.xBusy THEN
;// Executing
ELSE
;// Not executed
END_IF
```

- **Precautions**
  This instruction does not support simulation.

18.4.17.7 SFTP_RenameFile

This instruction renames the file or directory at the specified path on the server.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SFTP_RenameFile	Rename file on SFTP server	FB		SFTP_RenameFile_Instance_0(xExecute := , stConnect := , strDirName := , strFileName := , strNewFileName := , xDone => , xBusy => , xError => , wErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Instruction enable	BOOL	TRUE, FALSE	FALSE	Triggered execution.
	stConnect	Connection information	SFTP_CONNECT_INFO	Follows data type	-	Connection information, including the server address and port.
	strDirName	Server directory name (including the absolute path)	STRING	Follows data type	-	Server directory name (including the absolute path)
	strFileName	Original name of the file or directory	STRING	Follows data type	-	Original name of the file or directory
	strNewFileName	New name of the file or directory	STRING	Follows data type	-	New name of the file or directory
Output	xDone	Execution completion flag	BOOL	TRUE, FALSE	FALSE	Execution completed
	xBusy	Execution flag	BOOL	TRUE, FALSE	FALSE	Executing
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Execution error
	wErrorID	Fault code	WORD	Follow data type	0	See 18.4.17.9 Fault Codes.

- **Function**
  - The SFTP_RenameFile instruction is used to rename files or directories at the specified path on the server. This instruction is executed onece when the xExecute signal is triggered. It establishes a connection with the server based on the information specified by stConnect. After that, it changes the name of a file or directory on the server directory strDirName from strFileName to strNewFileName. If

the execution is successful, xDone is set to TRUE. If the execution fails, xError is set to TRUE, and wErrorID is output.

- The data type of stConnect is SFTP_CONNECT_INFO. For details, see SFTP_CONNECT_INFO.

- **Program example**

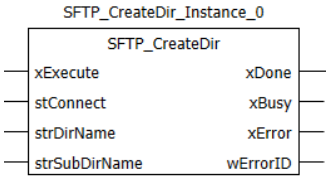
  The variable declarations are as follows.

```
VAR
SFTP_RenameFile_0: SFTP_RenameFile;
stConnect: SftpClient.SFTP_CONNECT_INFO;
strDirName: STRING;
strFileName: STRING;
strNewFileName: STRING;
en_rename_file: BOOL;
END_VAR
```

  The program editing area implements the logic as follows:

```
// SFTP server connection settings
stConnect.strServerIPAddr := '192.168.1.88';// SFTP server IP address
stConnect.uiServerPort := 22;// SFTP server port number
stConnect.strUsername := 'username';// Username
stConnect.strPassword := 'password';// Password

strDirName:='/DirName';// Directory name (server directory), including the path.
strFileName:='filename';// Original name of the file
strNewFileName:='newfilename';// New name of the file



SFTP_RenameFile_0(
xExecute:= en_rename_file,
stConnect:= stConnect,
strDirName:= strDirName,
strFileName:= strFileName,
strNewFileName:= strNewFileName,
xDone=> ,
xBusy=> ,
xError=> ,
wErrorID=> );
IF SFTP_RenameFile_0.xDone THEN
;// Execution completed
ELSIF SFTP_RenameFile_0.xError THEN
;// Error handling
ELSIF SFTP_RenameFile_0.xBusy THEN
;// Executing
ELSE
;// Not executed
END_IF
```

- **Precautions**
  This instruction does not support simulation.

18.4.17.8 SFTP_CreateDir

This instruction creates a new directory at the specified server path.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SFTP_CreateDir	Create directory on SFTP server	FB		SFTP_CreateDir_Instance_0(xExecute := , stConnect := , strDirName := , strSubDirName := , xDone => , xBusy => , xError => , wErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	xExecute	Instruction enable	BOOL	TRUE, FALSE	FALSE	Triggered execution.
	stConnect	Connection information	SFTP_CONNECT_INFO	Follows data type	-	Connection information, including the server address and port.
	strDirName	Server directory name (including the absolute path)	STRING	Follows data type	-	Server directory name (including the absolute path)
	strSubDirName	Name of the subdirectory to create	STRING	Follows data type	-	Name of the subdirectory to create
Output	xDone	Execution completion flag	BOOL	TRUE, FALSE	FALSE	Execution completed
	xBusy	Execution flag	BOOL	TRUE, FALSE	FALSE	Executing
	xError	Error flag	BOOL	TRUE, FALSE	FALSE	Execution error
	wErrorID	Fault code	WORD	Follow data type	0	See 18.4.17.9 Fault Codes.

- **Function**
  - The SFTP_CreateDir instruction is used to create a directory at the specified server path. This instruction is executed once when the xExecute signal is triggered. It establishes a connection with the server based on the information specified by stConnect. After that, it creates a new directory strSubDirName in the server directory strDirName. If the execution is successful, xDone is set to TRUE. If the execution fails, xError is set to TRUE, and wErrorID is output.

- The data type of stConnect is SFTP_CONNECT_INFO. For details, see SFTP_CONNECT_INFO.

- **Program example**

  The variable declarations are as follows.

```
VAR
SFTP_CreateDir_0: SFTP_CreateDir;
stConnect: SftpClient.SFTP_CONNECT_INFO;
strDirName: STRING;
strSubDirName: STRING;
en_create_dir: BOOL;
END_VAR
```

  The program editing area implements the logic as follows:

```
// SFTP server connection settings
stConnect.strServerIPAddr := '192.168.1.88';// SFTP server IP address
stConnect.uiServerPort := 22;// SFTP server port number
stConnect.strUsername := 'username';// Username
stConnect.strPassword := 'password';// Password

strDirName:='/DirName';// Directory name (server directory), including the path.
strSubDirName:='SubDirName';//Name of the subdirectory to create
SFTP_CreateDir_0(
xExecute:= en_create_dir,
stConnect:= stConnect,
strDirName:= strDirName,
strSubDirName:= strSubDirName,
xDone=> ,
xBusy=> ,
xError=> ,
wErrorID=> );
IF SFTP_CreateDir_0.xDone THEN
;// Execution completed
ELSIF SFTP_CreateDir_0.xError THEN
;// Error handling
ELSIF SFTP_CreateDir_0.xBusy THEN
;// Executing
ELSE
;// Not executed
END_IF
```

- **Precautions**
  This instruction does not support simulation.

18.4.17.9 Fault Codes

Fault code	Value	Description
SFTP_ERROR_OK	0	Normal
SFTP_ERROR_FAILED	1	Internal error
SFTP_ERROR_CLIENT_DISABLE	2	Client is not started
SFTP_ERROR_NO_SDCARD	3	SD card is not inserted (reserved, SD card detection not supported temporarily)

Fault code	Value	Description
SFTP_ERROR_SDCARD_SIZE	4	Insufficient available space on SD card (reserved, SD card detection not supported temporarily)
SFTP_ERROR_UNSUPPORTED_DIR	5	Unsupported directory
SFTP_ERROR_PARA_IP	20	Incorrect IP address
SFTP_ERROR_PARA_PORT	21	Incorrect port number
SFTP_ERROR_PARA_USERNAME	22	Invalid account
SFTP_ERROR_PARA_PASSWORD	23	Incorrect password
SFTP_ERROR_PARA_PARA_PATH	40	Invalid directory name
SFTP_ERROR_PARA_FILENAME	41	Invalid file name
SFTP_ERROR_PARA_MAX_LEN	42	Path length exceeds the upper limit
SFTP_ERROR_FILE_LIST_TYPE	60	Incorrect type of file information list
SFTP_ERROR_FILE_LIST_DIME	61	Incorrect dimension of file information list
SFTP_ERROR_SESSION	1002	Failed to create a session
SFTP_ERROR_TIMEOUT	1003	Connection timeout
SFTP_ERROR_SOCK	1004	Connection error
SFTP_ERROR_PROTOCOL_UNMATCH	1005	Protocol mismatch
SFTP_ERROR_PASSWORD_NONSUPPORT	1006	Password authentication is not supported.
SFTP_ERROR_AUTH	1007	Authentication failed

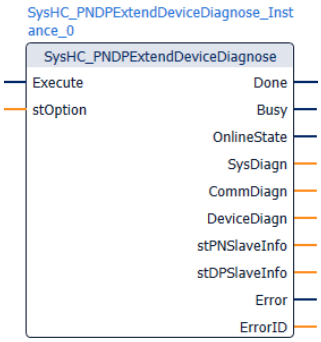
18.4.18 SysPub



18.4.18.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable
18.4.18.2 SysHC_PNDPExtend DeviceDiagnose	FB	Get the fault diagnosis status of the master and slave of the PN and DP modules	SysPub	Library version 1.0.0.0 and later

18.4.18.2 SysHC_PNDPExtendDeviceDiagnose

This instruction gets the fault diagnosis status of the master and slave of the PN and DP modules.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
SysHC_PNDPExtend DeviceDiagnose	Get the fault diagnosis status of the master and slave of the PN and DP modules	FB		SysHC_PNDPExtendDeviceDiagnose_Instance_0 (Execute := , stOption := , Done => , Busy => , OnlineState => , SysDiagn => , CommDiagn => , DeviceDiagn => , stPNSlaveInfo => , stDPSlaveInfo => , Error => , ErrorID =>);

- **Related variables**

Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Input	Execute	Enable	BOOL	TRUE, FALSE	FALSE	Enable, triggered by high-level
	stOption	Configure parameters	NETX_CFG_ OPTION	Follows data type	-	Obtain the diagnostic status of the corresponding PN/DP master and slave based on the input stOption.
Output	Done	Done	BOOL	Follows data type	FALSE	Set to TRUE when the function block execution is completed.
	Busy	Executing	BOOL	TRUE, FALSE	FALSE	Set to TRUE when the function block is executing.

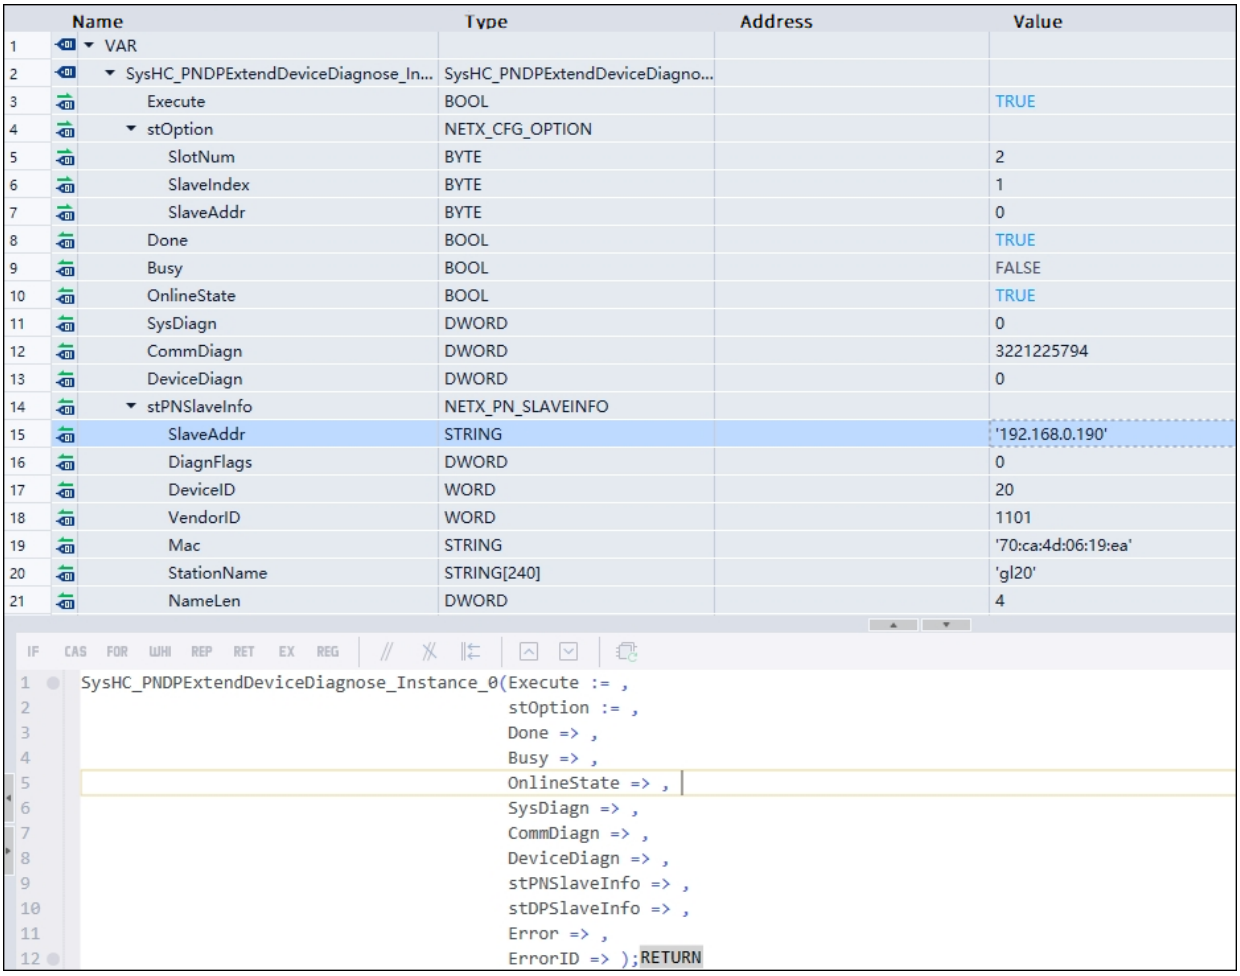
Input/ Output	Variable	Name	Data Type	Valid Range	Default Value	Description
	OnlineState	Online status	BOOL	TRUE, FALSE	FALSE	TRUE: The slave is online. FALSE: The slave is offline.
	SysDiagn	Master system diagnostic information	DWORD	Depends on data type	0	PN master system diagnostic code. For details, see PN system master diagnostic codes.
	CommDiagn	Master communication diagnostic information	DWORD	Depends on data type	0	PN master communication diagnostic code. For details, see PN master communication diagnostic codes.
	DeviceDiagn	Communication module diagnostic information	DWORD	Depends on data type	0	PN communication module diagnostic code. For details, see PN master diagnostic codes.
	stPNSlaveInfo	PN slave information	NETX_PN_SLAVEINFO	Follows data type	-	PN slave information
	stDPSlaveInfo	DP slave information	NETX_DP_SLAVEINFO	Follows data type	-	DP slave information
	Error	Faulty status	BOOL	Follows data type	FALSE	Indicates whether a fault occurred during instruction execution.
	ErrorID	Instruction fault ID	NETX_ERROR	Follows data type	0	1: MASTER_TYPE_ERROR (Master type error) 2: MASTER_SLOT_ERROR (Master slot number error) 3: SLAVE_INDEX_ERROR (PN slave index error) 4: SLAVE_ADDR_ERROR (DP slave address error)

- **Function**
  - When the input parameter "Execute" changes from FALSE to TRUE, the instruction is enabled and can be used to obtain diagnostic information after certain conditions are met.
  - Based on the input stOption information, the system outputs the corresponding diagnostic status of the PN/DP master and slaves. The data type of stOption is NETX_CFG_OPTION. The meanings of the structure members are shown in the following table.

Name	Data Type	Description
SlotNum	BYTE	PN/DP physical slot number Valid values are 1, 2, 3, 4; default: 0
SlaveIndex	BYTE	PN slave index number Valid range is 1 to 128; default: 0

Name	Data Type	Description
SlaveAddr	BYTE	DP slave address Valid range is 0 to 126; default:0

◦ The data type of stPNSlaveInfo is NETX_PN_SLAVEINFO. The meanings of the structure members are shown in the following table.



Name	Data Type	Description
SlaveAddr	STRING	PN slave IP address
DiagnFlags	DWORD	PN slave diagnostic code information. For details, see PN slave diagnostic codes.
DeviceID	WORD	Device ID
VendorID	WORD	Vendor ID
Mac	STRING	PN slave Mac
StationName	STRING	PN slave name
NameLen	DWORD	Name length of PN slave

◦ The data type of stDPSlaveInfo is NETX_DP_SLAVEINFO. The meanings of the structure members are shown in the table below.

Name	Data Type	Description
SlaveState	BOOL	DP slave status information. For details, see DP slave information.
SlaveDiag	BOOL	DP slave diagnostic information. For details, see DP slave information.

18.4.18.3 Diagnostic Codes

PN master diagnostic codes

Each bit mask corresponds to a specific diagnostic status or error type. When you obtain a diagnostic code, you can perform AND operation between the code and each bit mask.

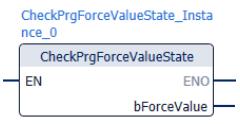
- If the result equals the bit mask, the corresponding diagnostic status exists and the bit is set to 1.
- If the result is 0, the corresponding diagnostic status does not exist.

  For example, if the obtained diagnostic code is 0x00011, it indicates errors of 0x00001 and 0x00010 occur simultaneously.

Bitmask	Description
0x00001	NetX module initialization failed
0x00002	NetX module status query error
0x00004	NetX module I/O data transmission error
0x00008	NetX module mailbox data transmission error
0x00010	Parallel port communication timeout
0x00020	Downlink mailbox data timeout

Bitmask	Description
0x00040	Downlink I/O data timeout
0x00080	Module not ready

18.4.19 VarForce



18.4.19.1 Instruction List

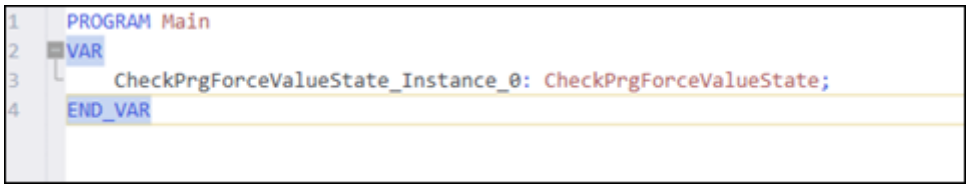
Instruction	FB/FC	Function	Library	Applicable
18.4.19.2 CheckPrgForceValueState	FB	Check whether there are forced variables during the execution of the user program	VarForce	Library version 1.0.0.0 and later

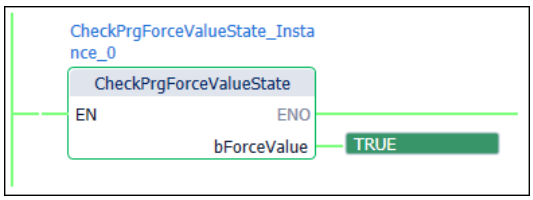
18.4.19.2 CheckPrgForceValueState

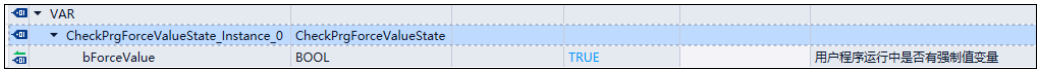
This instruction checks whether there are forced variables during the execution of the user program.

- **Instruction format**

Instruction	Name	FB/FC	Ladder Diagram Representation	Structured Text Representation
CheckPrgForceValueState	Check whether there are forced variables during the execution of the user program	FB		CheckPrgForceValueState_Instance_0(bForceValue =>);







- **Related variables**

Input/Output	Variable	Name	Data Type	Valid Range	Default Value	Description
Output	bForceValue	Checks whether there are forced value variables during the execution of the user program	BOOL	TRUE, FALSE	FALSE	Return value of the function.

- **Function**

  This function block is used to obtain status. After it is called, it checks whether there are forced variables in the user program during the execution of the dependent task.

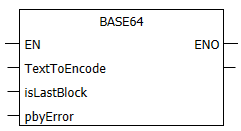
18.5 Special Instructions

18.5.1 Instruction Description

All instructions in this chapter involve pointers, you must use carefully. For string operations, you can use alternative instructions in 18.1.10 String.

18.5.2 Util



18.5.2.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable Library Version
18.5.2.2 BASE64	FC	BASE64 encoding	Util	Library version 1.0.0.0 and later

18.5.2.2 BASE64

BASE64 is one of the encoding methods for transmitting 8-bit byte code, which represents binary data based on 64 printable characters.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
BASE64	BASE64 encoding	FC		:= BASE64(TextToEncode := , isLastBlock := , pbyError :=);

- **Related variables**

  Variable

Input/Output	Variable	Name	Valid Range	Default Value	Description
Input	TextToEncode	Text to be encoded	Follows data type	-	Data type is PT_SIZE: pString: POINTER TO BYTE (text address). uiSize: UINT (text length). The maximum supported encoding length is 22800.
	isLastBlock	Whether the current text is complete	Follows data type	-	TRUE: The current text is complete. FALSE: The current text is only a part.
	pbyError	Error pointer	Follows data type	-	0: No error. 1: The text is too long. 2: The text character length is not an integer multiple of 3. 4: The text pointer is null or the length uiSize = 0.
Output	OUT	Output data	Follows data type	-	Output data.

Variable types

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String				
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
TextToEncode	PT_SIZE: pString: POINTER TO BYTE (text address) uiSize: UINT (text length)																			
isLastBlock	√	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
pbyError	POINTER TO BYTE																			
OUT	PT_SIZE																			

- **Function**

  Specific encoding method:

  Base64 requires converting every three 8-bit bytes into four 6-bit bytes (since 3 × 8 = 4 × 6 = 24). Then, two high-order zeros are padded to each 6-bit bytes to form four 8-bit bytes. Each byte corresponds to a number less than 64, which is the character index. The converted string will theoretically be one-third longer than the original.

  Three English characters can be exactly converted into four Base64 characters. If the condition is not to meet, the remaining bytes of the source text are individually converted according to the encoding rules (1 byte → 2 Base64 chars, 2 bytes → 3 Base64 chars, missing bits are padded with zeros). The result is then filled to 4 bytes using equal signs (=), with at most two equal signs. If the remainder is 0, the original byte count is exactly a multiple of 3 (ideal case). If the remainder is 1, it is converted into two Base64 characters. To make the Base64 output length a multiple of 4, two equal signs are appended; similarly, if the remainder is 2, one equal sign is appended. If the length of uiSize is greater than the length of the original string, append the difference with character "A" to the converted result.

  ◦ When isLastBlock is TRUE and TextToEncode.uiSize is 2, the encoding principle and results are shown in the table below:

Character	y								o								-							
ASCII code	121								111								-							
Binary bits	0	1	1	1	1	0	0	1	0	1	1	0	1	1	1	1	0	0	0	0	0	0	0	0
Encoding byte	00 011110								00 010110								00 111100							
Index number	30								22								60							
																	0							

Character	y	o	-
Base64 encoding	e	W	8	=

◦ When isLastBlock is TRUE and TextToEncode.uiSize is 1, the encoding principle and results are shown in the table below:

Character	y	-	-
ASCII code	121	-	-
Binary bits	0 1 1 1 1 0 0 1	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0 0
Encoding byte	00 011001	00 010000	00 000000	00 000000
Index number	25	16	0	0
Base64 encoding	Z	Q	=	=

◦ When isLastBlock is TRUE and TextToEncode.uiSize is 3, the encoding principle and results are shown in the table below:

Character	y	o	u
ASCII code	121	111	117
Binary bits	0 1 1 1 1 0 0 1	0 1 1 0 1 1 1 1	0 1 1 1 0 1 0 1
Encoding byte	00 011110	00 010110	00 111101	00 110101
Index number	30	22	61	53
Base64 encoding	e	W	9	1

- **Program example**

  Set TextToEncode to 'son', and the encoded output data is 'c29u'.

  ST:

	Name	Data type	Address	Value
1	struTextToEncode	PT_SIZE		
2	pString	POINTER TO BYTE		3015704984
3	uiSize	UINT		3
4	xisLastBlock	BOOL		FALSE
5	ppbyError	POINTER TO BYTE		3015704588
6	ppbyError^	BYTE		0
7	struOUT	PT_SIZE		
8	pString	POINTER TO BYTE		3008398168
9	uiSize	UINT		5
10	str1	STRING		'son'
11	str2	STRING		'c29u'
12	byError	BYTE		0
13	pstr2	POINTER TO STRING		3008398168
14	pstr2^	STRING		'c29u'

IF CAS FOR WHI REP RET EX

```
1  struTextToEncode.uiSize 3 := 3;
2  struTextToEncode.pString 3015704984 := ADR(str1 'son' );
3  ppbyError 3015704588 := ADR(byError 0 );
4
5  struOUT := BASE64(TextToEncode := struTextToEncode,
6  isLastBlock := xisLastBlock FALSE ,
7  pbyError := ppbyError 3015704588 );
8
9  pstr2 3008398168 := struOUT.pString 3008398168 ;
10 str2 'c29u' := pstr2^ 'c29u' ;RETURN
```

LD:

◦ Encoding example 1: Input 'Son', uiSize=3, isLastBlock=1 → Base64 encoded result: 'U29u'

ASCII character	S	o	n
Decimal	83	111	110
Binary	01010011	01101111	01101110

Each group consists of 6 bits	010100	110110	111101	101110
High-order padding with zeros	00010100	00110110	00111101	00101110

ASCII character	S	o	n
Corresponding Base64 index	20	54	61	46
Corresponding Base64 character	U	2	9	u

◦ Encoding example 2: Input 'Son', uiSize = 2, isLastBlock = 1 → Base64 encoded result: 'U28u'

ASCII character	S	o	-
Decimal	83	111	-
Binary	01010011	01101111	-

Each group consists of 6 bits	010100	110110	111100	-
High-order padding with zeros	00010100	00110110	00111100	-
Corresponding Base64 index	20	54	60	-
Corresponding Base64 character	U	2	8	=

◦ Encoding example 3: Input 'Son', uiSize = 1, isLastBlock = 1 → Base64 encoded result: 'Uw=='

ASCII character	S	-	-
Decimal	83	-	-
Binary	01010011	-	-

Each group consists of 6 bits	010100	110000	-	-
High-order padding with zeros	00010100	00110000	-	-
Corresponding Base64 index	20	48	-	-
Corresponding Base64 character	U	w	=	=

◦ Encoding example 4 (Chinese): For Base64 encoding of Chinese characters, use the String type under the UTF-8 format.
For example, input "你", uiSize = 3 → Base64 encoded result: '5L2g'

ASCII character	你		
Decimal	228	189	160
Binary	11100100	10111101	10100000

Each group consists of 6 bits	111001	001011	110110	000000
High-order padding with zeros	00111001	00001011	00110110	00100000
Corresponding Base64 index	57	11	54	32

ASCII character	你			
Corresponding Base64 character	5	L	2	g

◦ Fault description:
If any of the following errors occur, Base64.uiSize outputs 0 and the text result is incorrect. Normal usage should proceed when no ERROR is detected.

Condition	ERROR
TextToEncode.pString = 0 The input string pointer is null	4
TextToEncode.uiSize=0	4
TextToEncode.uiSize > 32767 The length of input string is greater than 32767	1
isLastBlock = FALSE (only part of the text) and the length is not a multiple of 3	2

- **Precautions**

  BASE64 supports a maximum encoding length of 22800

pByte2	POINTER TO BYTE																			
StrCaseCmpA	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–

- **Function**

  This instruction compares two strings in a case-sensitive manner. The comparison results are as follows.

Return Value	Definition
0	The two strings are equal.
1	pByte1 is greater than pByte2.
-1	pByte1 is less than pByte2.
-2	pByte1 or pByte2 is a null pointer.

- **Program example**

  STR1 is the string pointed to by the pByte1_var pointer, STR2 is the string pointed to by the pByte2_var pointer.

  ST:

	Name	Data type	Address	Value	Prepare value	Comment
1	STR1	STRING		'ABC'		
2	STR2	STRING		'abcd'		
3	pByte1_var	POINTER TO BYTE		2558301765760		
4	pByte2_var	POINTER TO BYTE		2558301765841		
5	out_1	INT		-1		

```
1  out_1  -1  := StrCaseCmpA(pByte1 := pByte1_var  2558301765760 , pByte2 := pByte2_var  2558301765841 );RETURN
```

LD:

	Name	Data type	Address	Value
1	STR1	STRING		'ABC'
2	STR2	STRING		'abcd'
3	pByte1_var	POINTER TO BYTE		2558301765946
4	pByte2_var	POINTER TO BYTE		2558301766027
5	out_1	INT		-1

18.5.3.1.3 StrCaseCmpEndA

This instruction compares the endings of two strings in a case-insensitive manner.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
StrCaseCmpEndA	String end comparison (case-insensitive)	FC		:= StrCaseCmpEndA(pString := , pSuffix :=);

- **Related variables**

Variable

Input/Output	Variable	Name	Valid Range	Default Value	Description
Input	pString	Pointer to the string to be checked	Follows data type	-	Pointer to the string to be checked.

Input/Output	Variable	Name	Valid Range	Default Value	Description
	pSuffix	Pointer to the suffix to be found	Follows data type	-	Pointer to the suffix to be found.
Output	StrCaseCmpEndA	Return value	Follows data type	-	Comparison result.

Variable types

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String				
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
pString	CharBufferPtr: POINTER TO BYTE																			
pSuffix	CharBufferPtr: POINTER TO BYTE																			
StrCaseCmpEndA	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–

- **Function**

  This instruction compares two strings in a case-sensitive manner. The comparison results are as follows.

Return Value	Definition
0	The ends and prefixes of both strings match.
-1	The ends and prefixes of both strings do not match.
-2	pString or pSuffix is a null pointer.

- **Precautions**

  When the suffix check result is empty, the return value will be 0.

- **Program example**

  STR1 is the string pointed to by the pString_var pointer, and STR2 is the string pointed to by the pSuffix_var pointer.

  ST:

	Name	Data type	Address	Value	Prepare value	Comment
1	STR1	STRING		'ABCdefgh'		
2	STR2	STRING		'FgH'		
3	pString_var	POINTER TO BYTE		2558301765946		
4	pSuffix_var	POINTER TO BYTE		2558301766027		
5	out_1	INT		0		

```
1  out_1 := StrCaseCmpEndA(pString := pString_var , pSuffix := pSuffix_var );RETURN
```

LD:

18.5.3.1.5 StrCaseFindA

This instruction performs a case-insensitive find operation on two strings.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
StrCaseFindA	String finding (case-insensitive)	FC		:= StrCaseFindA(pst1 := , pst2 := , uiSearchStart :=);

- **Related variables**

Variable

Input/ Output	Variable	Name	Valid Range	Default Value	Description
Input	pst1	Pointer to the string to be checked	Follows data type	-	Pointer to the string to be checked.
	pst2	Pointer to the string to be found	Follows data type	-	Pointer to the string to be found.
	uiSearchStart	Search start position	Follows data type	-	Search start position.
Output	StrCaseFindA	Return value	Follows data type	-	Result.

Variable types

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String				
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
pst1	POINTER TO STRING[255]																			
pst2	POINTER TO STRING[255]																			
uiSearchStart	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–	–	–	–	–
StrCaseFindA	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–

- **Function**

  This instruction performs a case-insensitive find operation on two strings, starting from the uiSearchStart position in STR1. If STR 2 appears in STR 1, return the position of the first character of STR 2 within STR 1. The result are as follows.

Return Value	Definition
0	The string to be found does not exist.
-1	Errors arise from invalid strings, i.e., there is a null pointer.
>=1	The position of the first character of STR 2 within STR 1, where the first character is counted as position 1.

- **Precautions**
  - When the search position uiSearchStart is 0 or 1, the search starts from the first character of STR1.
  - If the input is Chinese, use StrCaseFindW.
- **Program example**

  STR1 is the string pointed to by the pst1_var pointer, and STR2 is the string pointed to by the pst2_var pointer.

  ST:

	Name	Data type	Address	Value	Prepare value	Comment
1	STR1	STRING		'ABCdefgh'		
2	STR2	STRING		'FgH'

5	uiSearchStart_var	UINT		2		
6	out_1	INT		6		

```
1  out_1 := StrCaseFindA(pst1 := pst1_var, pst2 := pst2_var, uiSearchStart := uiSearchStart_var );RETURN
```

  LD:

18.5.3.1.6 StrCmpA

This instruction compares two strings in a case-sensitive manner.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
StrCmpA	String comparison (case-sensitive)	FC		:= StrCmpA(pby1 := , pby2 :=);

- **Related variables**

Variable

Input/Output	Variable	Name	Valid Range	Default Value	Description
Input	pBy1	Comparison STR 1	Follows data type	-	Pointer to the comparison STR 1.
	pBy2	Comparison STR 2	Follows data type	-	Pointer to the comparison STR 2.
Output	StrCmpA	Return value	Follows data type	-	Comparison result.

Variable types

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String				
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
pBy1	POINTER TO BYTE																			
pBy2	POINTER TO BYTE																			
StrCmpA	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–

- **Function**

  This instruction compares two strings in a case-sensitive manner. The comparison results are as follows.

Return Value	Definition
0	The two strings are equal.
1	pByte1 is greater than pByte2.
-1	pByte1 is less than pByte2.

- **Precautions**

  If the input is Chinese, it is recommended to use StrCmpW.

- **Program example**

  STR1 is the string pointed to by the pby1_var pointer, and STR2 is the string pointed to by the pby2_var pointer.

  ST:

	Name	Data type	Address	Value	Prepare value
1	STR1	STRING		'ABC'	
2	STR2	STRING		'aBc'	
3	pby1_var	POINTER TO BYTE		2529969832450

```

  LD:

18.5.3.1.9 StrConcatA

This instruction concatenates two strings.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
StrConcatA	String concatenation	FC	StrConcatA EN ENO pstFrom pstTo iBufferSize	:= StrConcatA(pstFrom := , pstTo := , iBufferSize :=);

- **Related variables**

Variable

Input/Output	Variable	Name	Valid Range	Default Value	Description
Input	pstFrom	Pointer to byte	Follows data type	-	Pointer to the bytes to be concatenated.
	pstTo	Pointer to byte	Follows data type	-	Pointer to the bytes to be appended.
	iBufferSize	Buffer size	Follows data type	-	Buffer size of "pstTo".
Output	StrConcatA	Return value	Follows data type	-	Operation result.

Variable types

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String				
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
pstFrom	CharBufferPtr: POINTER TO BYTE																			
pstTo	CharBufferPtr: POINTER TO BYTE																			
iBufferSize	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–
StrConcatA	√	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–

- **Function**

  This instruction concatenates the string pointed to by pstFrom to the end of pstTo. The possible scenarios are as follows.

Return Value	Definition
FALSE	The length of the concatenated string exceeds iBufferSize, the string pointed to by pstTo remains unchanged.
	Invalid string (i.e., there is a null pointer); the string pointed to by pstTo remains unchanged.
TRUE	If the result is normal, assign the concatenated string to the string pointed to by pstTo.

- **Precautions**

  If the input is in Chinese, it is recommended to use StrConcatW.

- **Program example**

  STR1 is the string pointed to by the pstFrom_var pointer, STR2 is the string pointed to by the pstTo_var pointer.

  ST:

  (1) Original state

	Name	Data type	Address	Value

(2) Enable

18.5.3.1.10 StrCpyA

This instruction copies string.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
StrCpyA	String copy	FC	StrCpyA EN ENO pBuffer iBufferSize pStr	:= StrCpyA(pBuffer := , iBufferSize := , pStr :=);

- **Related variables**

Variable

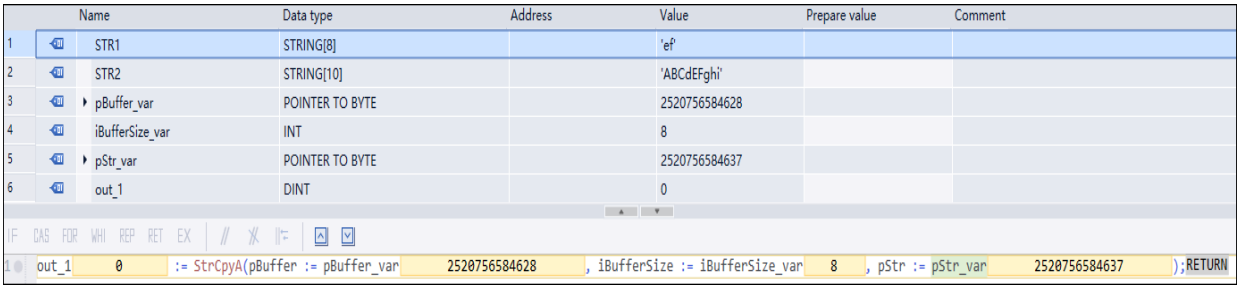
Input/Output	Variable	Name	Valid Range	Default Value	Description
Input	pBuffer	Pointer to the buffer	Follows data type	-	Pointer to the buffer.
	iBufferSize	Buffer size	Follows data type	-	Buffer size.
	pStr	Pointer to the source string	Follows data type	-	Pointer to the source string.
Output	StrCpyA	Return value	Follows data type	-	Return value.

Variable types

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String				
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
pBuffer	CharBufferPtr: POINTER TO BYTE																			
iBufferSize	–	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–
pStr	CharBufferPtr: POINTER TO BYTE																			
StrCpyA	–	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–

- **Function**

  This instruction copies the string pointed to by pStr to the string pointed to by pBuffer. Note: The number of copied characters is the smaller value of the pointed source string length and buffer size.



- **Precautions**
  - pBuffer must not be NULL.
  - Strings are typically null-terminated with “\0”, which should be considered when calculating the length.
  - If the copied length (the smaller value of pStr length and iBufferSize) exceeds the length of the string pointed to by pBuffer, unexpected results will occur.
  - If the input is Chinese, it is recommended to use StrCpyW.
  - The return value of the function is 0.

- **Program example**

  STR1 is the string pointed to by the pBuffer_var pointer, and STR2 is the string pointed to by the pStr_var pointer.

  ST:

  (1) Original state

18.5.3.1.12 StrFindA

This instruction performs a case-sensitive find operation on two strings.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
StrFindA	String find (case-sensitive)	FC		:= StrFindA(pst1 := , pst2 := , uiSearchStart :=);

- **Related variables**

Variable

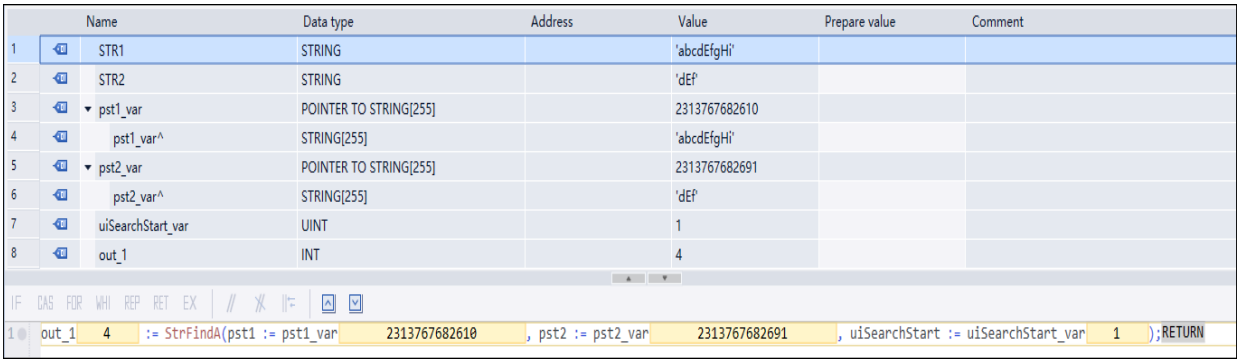
Input/Output	Variable	Name	Valid Range	Default Value	Description
Input	pst1	Pointer to the string to be checked	Max length: 255	-	Pointer to the string to be checked.
	pst2	Pointer to the string to be found	Max length: 255	-	Pointer to the string to be found.
	uiSearchStart	Search start position	Follows data type	-	Search start position.
Output	StrFindA	Return value	Follows data type	-	Result.

Variable types

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String				
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
pst1	POINTER TO STRING[255]																			
pst2	POINTER TO STRING[255]																			
uiSearchStart	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–	–	–	–	–
StrFindA	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–

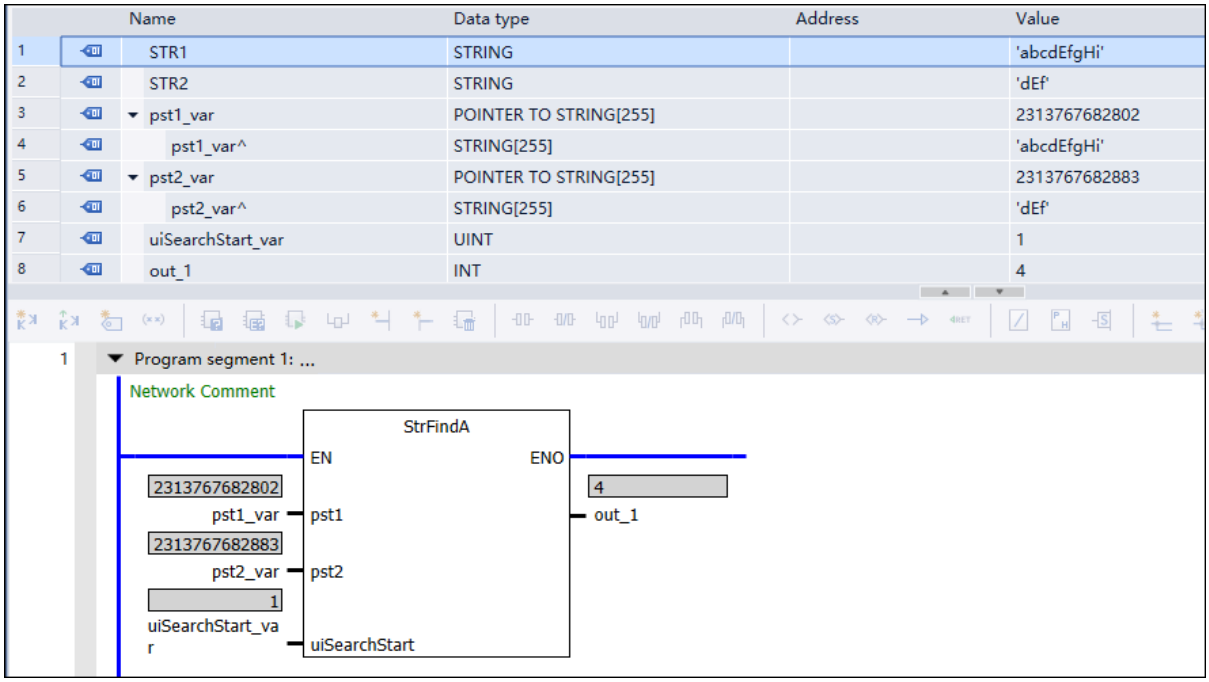
- **Function**

  This instruction performs a case-sensitive find operation on two strings starting from the uiSearchStart-th character of the STR 1. If the STR 2 appears in the STR 1, return the position of the first character of STR2 within STR 1. The results are as follows.



Return Value	Description
0	The string to be found does not exist.
-1	Errors arise from invalid strings, i.e., there is a null pointer.

Return Value	Description
>= 1	The position of the first character of STR 2 within STR 1, where the first character is counted as position 1.



- **Precautions**
  - When the search position uiSearchStart is 0 or 1, the search starts from the first character of STR1.
  - If the input is Chinese, it is recommended to use StrFindW.
- **Program example**

  STR1 is the string pointed to by the pst1_var pointer, and STR2 is the string pointed to by the pst2_var pointer.

  ST:

Instruction	Name	FB/FC	LD Representation	ST Representation
StrLenA	Calculation of string length	FC	StrLenA EN ENO pstData	:= StrLenA(pstData :=);

- **Related variables**

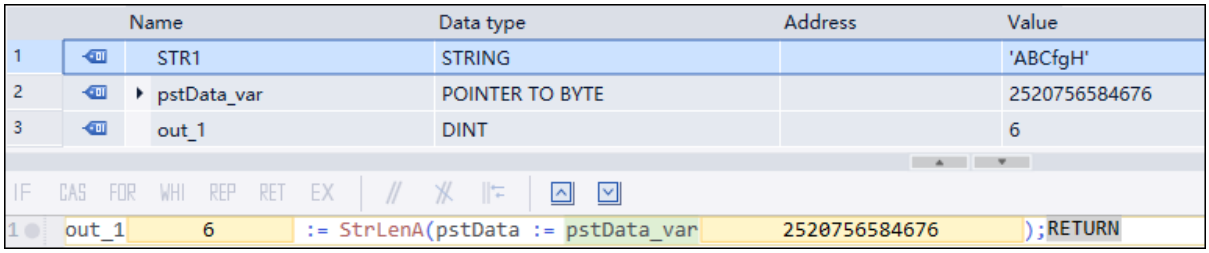
Variable

Input/Output	Variable	Name	Valid Range	Default Value	Description
Input	pstData	Pointer to byte	Follows data type	-	Pointer to byte.
Output	StrLenA	Return value	Follows data type	-	Return value.

Variable types

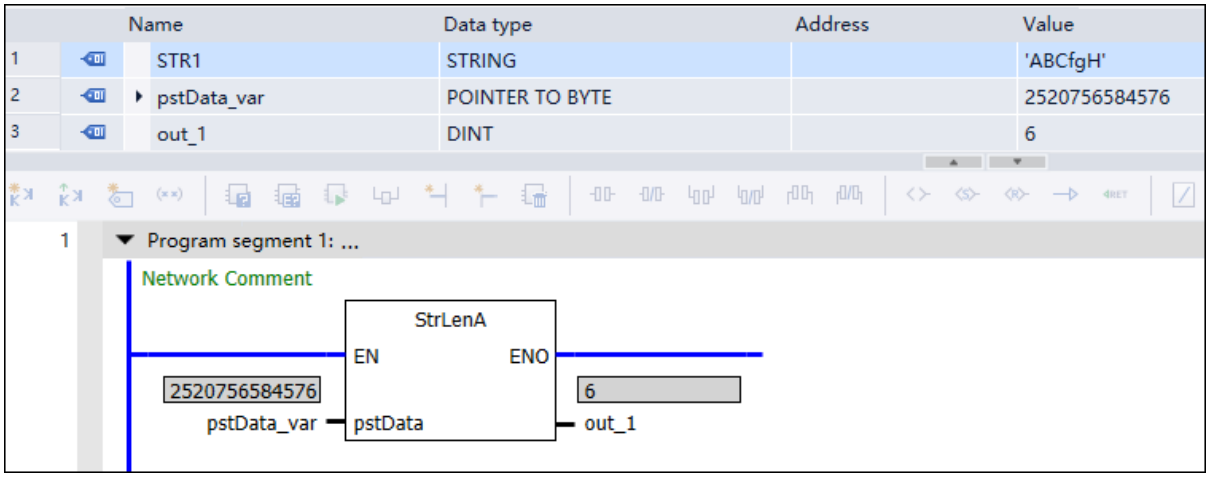
	Boolean	Bit String				Integer								Real Number		Time/Duration/Date/String				
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
pstData	CharBufferPtr: POINTER TO BYTE																			

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String				
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
StrLenA	–	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–



- **Function**
  - This instruction calculates the length of the string pointed to by pstData with null characters excluded, and output the result as a return value.
  - If the input is Chinese, it is recommended to use StrLenW.
  - Return value results are as follows.

Return Value	Definition
>=1	The length of a string.
-1	Pointer being null.



- **Program example**

  STR1 is the string pointed to by the pstData_var pointer.

  ST:

  LD:

18.5.3.1.15 StrMidA

This instruction extracts a string of specified length starting from a specified position in the source string.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
StrMidA	Substring acquisition	FC		:= StrMidA(pst := , uiInputBufferSize := , iLength := , iPosition := , pstResult := , uiResultBufferSize :=);

- **Related variables**

Variable

Input/Output	Variable	Name	Valid Range	Default Value	Description
Input	pst	Pointer to the string to be extracted	Follows data type	-	Pointer to the string to be extracted.
	uiInputBufferSize	Buffer size pointed to by pst	Follows data type	-	Buffer size pointed to by pst.
	iLength	Caracter length	Follows data type	-	Character length.
	iPosition	Target position	Follows data type	-	Target position.
	pstResult	Return result	Follows data type	-	Return result.
	uiResultBufferSize	Buffer size for the return result	Follows data type	-	Buffer size for the return result.
Output	StrMidA	Return value	Follows data type	-	Return value.

Variable types

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String				
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
pst	POINTER TO BYTE																			
uiInputBufferSize	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–	–	–	–	–
iLength	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–
iPosition	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–
pstResult	POINTER TO BYTE																			
uiResultBufferSize	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–	–	–	–	–
StrMidA	√	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–

- **Function**
  - This instruction extracts a string of specified length from a specified position in the source string, and return the string of the specified length.
  - If iPosition is less than or equal to 0 or iLength is less than 0, the output will remain unchanged.
  - If the set position iPosition exceeds the length of the string, there will be no output.
  - If the substring of the set length iLength starting from the set position iPosition exceeds the length of the input string, then all characters from the source data starting at iPosition will be extracted.
  - If the length of the source string to be extracted exceeds the size of the set buffer uiResultBufferSize, only the data of the buffer size length will be truncated.
  - If the input is Chinese, it is recommended to use StrMidW.
  - The return value is currently unused and always remains 0.
- **Program example**

  STR1 is the string pointed to by the pst_var pointer, and STR2 is the string pointed to by the pstResult_var pointer.

Input/Output	Variable	Name	Valid Range	Default Value	Description
	uiSearchStart	Search start position	Follows data type	-	Search start position.
Output	StrCaseFindW	Return value	Follows data type	-	Result.

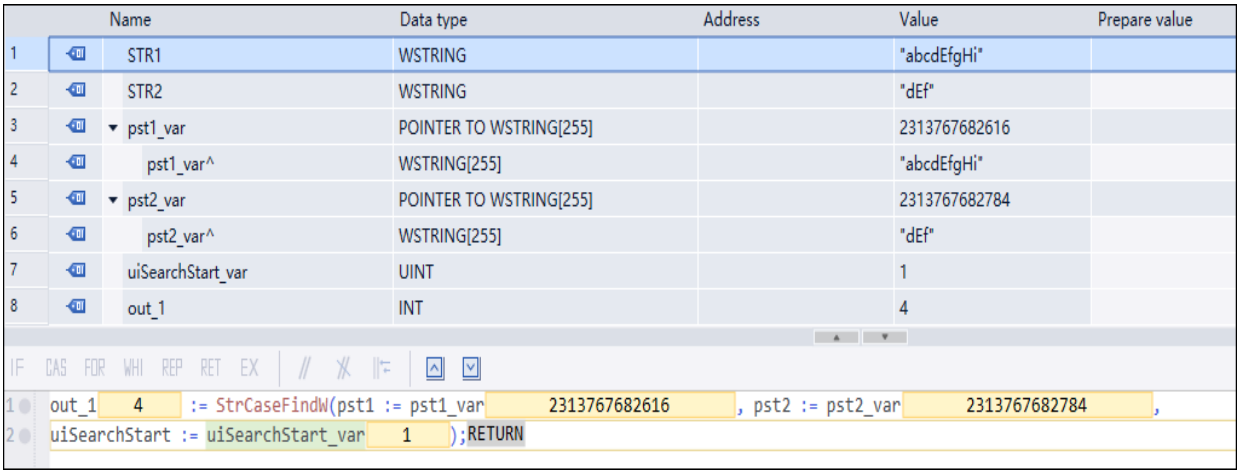
Variable types

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String				
	BOOL	BYTE	WORD	DWORD	Largeword	USINT	UINT	UDINT	Unsigned long integer	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
pst1	POINTER TO WSTRING[255]																			
pst2	POINTER TO WSTRING[255]																			
uiSearchStart	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–	–	–	–	–
StrCaseFindW	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–

- **Function**

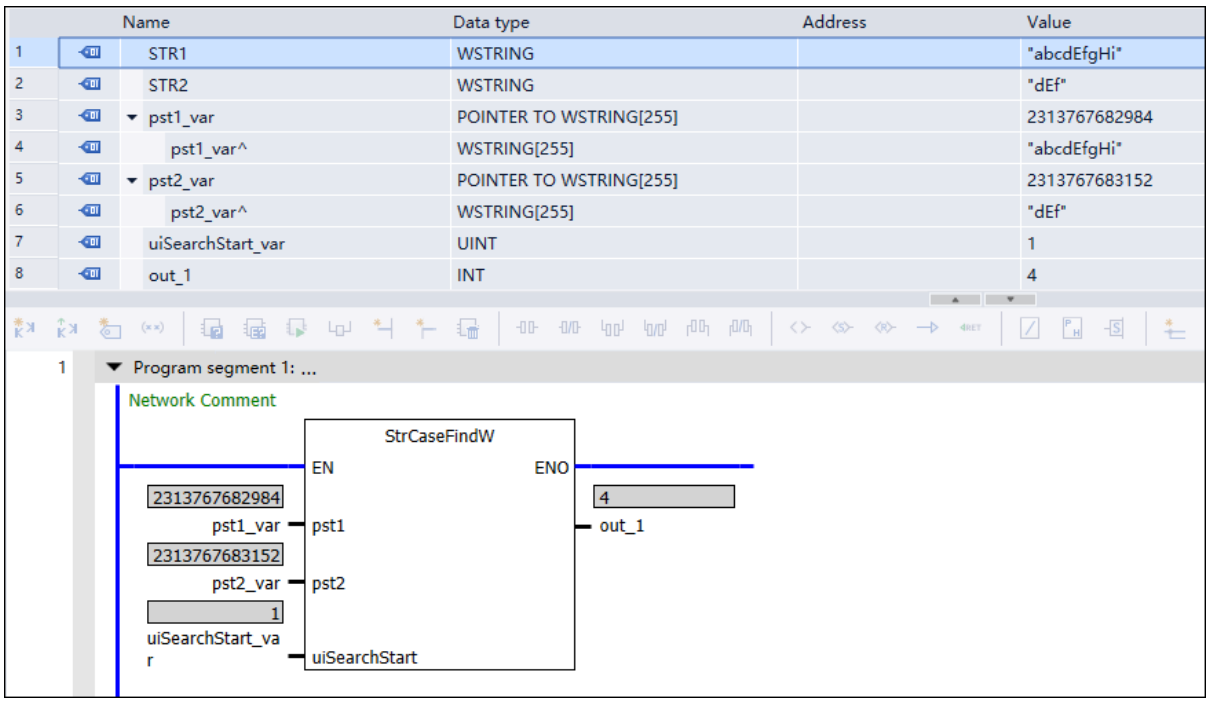
  This instruction performs a case-insensitive find operation on two strings starting from the uiSearchStart-th position of the STR 1. If the STR 2 appears in the STR 1, return the position of the first character of STR2 within STR 1. The results are as follows.

Return Value	Comparison Result
0	The string to be found does not exist.
-1	Errors arise from invalid strings, i.e., there is a null pointer.
>=1	The position of the first character of STR 2 within STR 1, where the first character is counted as position 1.



- **Precautions**

When the search position uiSearchStart is 0 or 1, the search starts from the first character of STR1.



- **Program example**

  STR1 is the string pointed to by the pst1_var pointer, and STR2 is the string pointed to by the pst2_var pointer.

  ST:

  LD:

18.5.3.2.3 StrCmpW

This instruction compares two wide strings in a case-sensitive manner.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
StrCmpW	Wide string comparison (case-sensitive)	FC		:= StrCmpW(pwd1 := , pwd2 :=);

- **Related variables**

  Variable

Input/Output	Variable	Name	Valid Range	Default Value	Description
Input	pwd1	Comparison STR 1	Follows data type	-	Pointer to the comparison STR 1.
	pwd2	Comparison STR 2	Follows data type	-	Pointer to the comparison STR 2.
Output	StrCmpW	Return value	Follows data type	-	Comparison result.

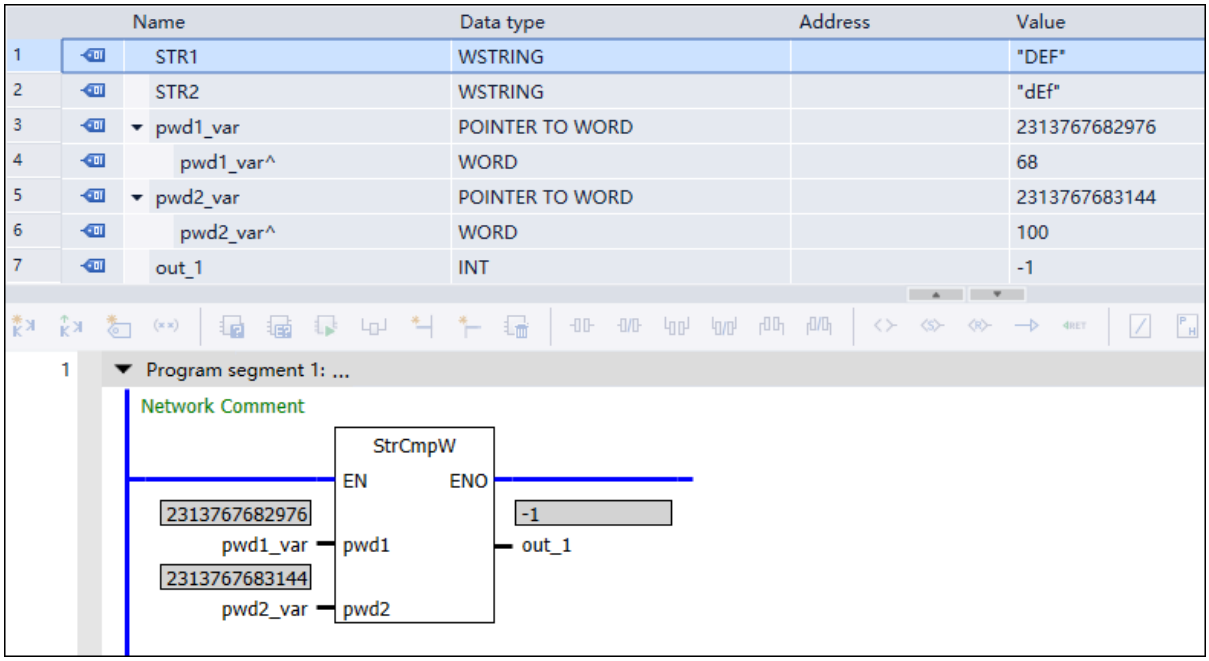
  Variable types

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String				
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
pwd1	POINTER TO WORD																			
pwd2	POINTER TO WORD																			
StrCmpW	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–

- **Function**

  This instruction compares two strings in a case-sensitive manner. The comparison results are as follows.

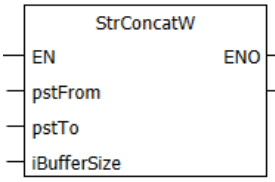
Return Value	Comparison Result
0	The two strings are equal.
1	pwd1 is greater than pwd2.
-1	pwd1 is less than pwd2.



- **Program example**

STR1 is the string pointed to by the pwd1_var pointer, and STR2 is the string pointed to by the pwd2_var pointer.

ST:



LD:

18.5.3.2.4 StrConcatW

This instruction concatenates two wide strings.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
StrConcatW	Wide string concatenation	FC		:= StrConcatW(pstFrom := , pstTo := , iBufferSize :=);

- **Related variables**

  Variable

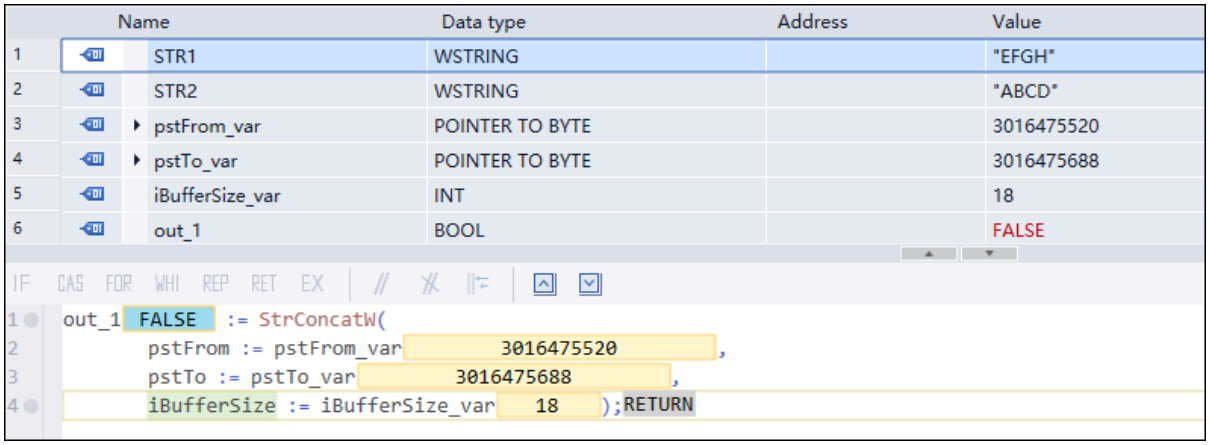
Input/Output	Variable	Name	Valid Range	Default Value	Description
Input	pstFrom	Pointer to byte	Follows data type	-	Pointer to the bytes to be concatenated.
	pstTo	Pointer to byte	Follows data type	-	Pointer to the bytes to be appended.
	iBufferSize	Buffer size	Follows data type	-	Buffer size of "pstTo".
Output	StrConcatW	Return value	Follows data type	-	Operation result.

Variable types

	Boolean	Bit String				Integer							Real Number		Time/Duration/ Date/String				
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
pstFrom	CharBufferPtr: POINTER TO BYTE																			
pstTo	CharBufferPtr: POINTER TO BYTE																			
iBufferSize	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–
StrConcatW	√	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–

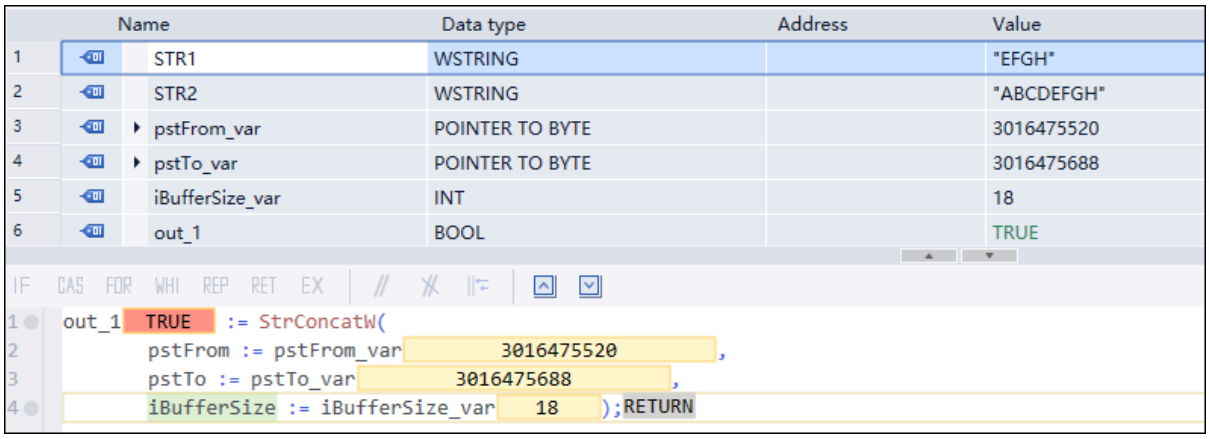
- **Function**

  This instruction concatenates the string pointed to by pstFrom to the end of pstTo. The possible scenarios are as follows.



Return Value	Comparison Result
FALSE	The length of the concatenated string exceeds iBufferSize, the string pointed to by pstTo remains unchanged.
	Invalid string (i.e., there is a null pointer); the string pointed to by pstTo remains unchanged.
TRUE	If the result is normal, assign the concatenated string to the string pointed to by pstTo.

- **Program example**



STR1 is the string pointed to by the pstFrom_var pointer, STR2 is the string pointed to by the pstTo_var pointer.

ST:

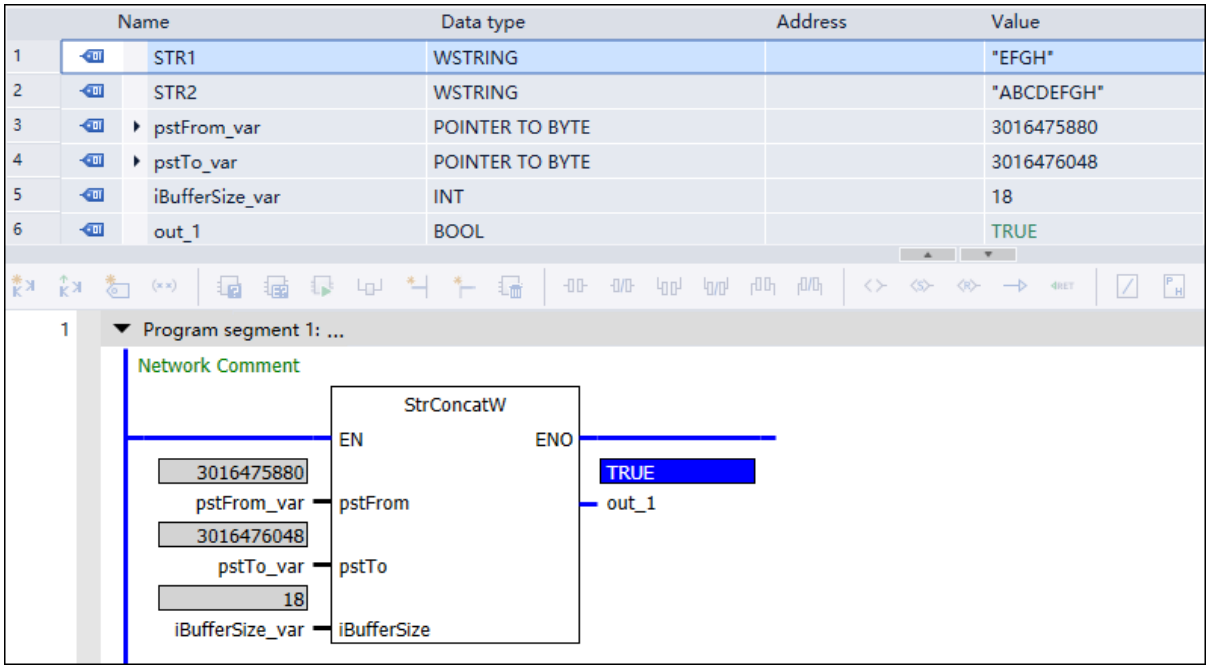
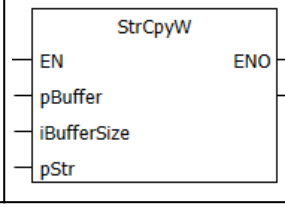
(2) Enable



LD:

(1) Original state



(2) Enable

18.5.3.2.5 StrCpyW

This instruction copies wide string.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
StrCpyW	Wide string copy	FC		:= StrCpyW(pBuffer := , iBufferSize := , pStr :=);

- **Related variables**

Variable

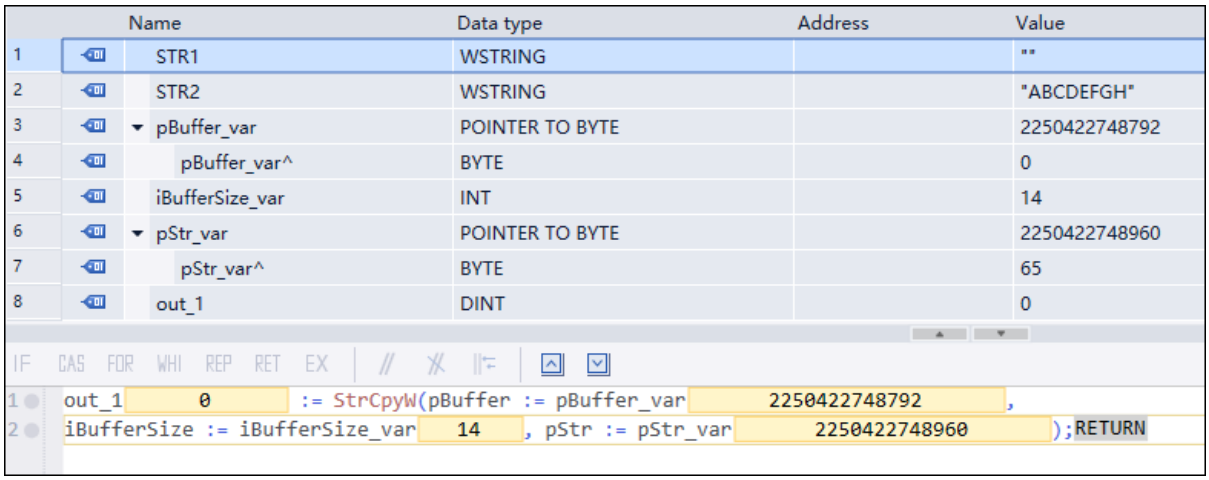
Input/Output	Variable	Name	Valid Range	Default Value	Description
Input	pBuffer	Pointer to the buffer	Follows data type	-	Pointer to the buffer.
	iBufferSize	Buffer size	Follows data type	-	Buffer size.
	pStr	Pointer to the source string	Follows data type	-	Pointer to the source string.
Output	StrCpyW	Return value	Follows data type	-	Return value.

Variable types

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String				
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
pBuffer	CharBufferPtr: POINTER TO BYTE																			
iBufferSize	–	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–
pStr	CharBufferPtr: POINTER TO BYTE																			
StrCpyW	–	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–

- **Function**

  This instruction copies the string pointed to by pStr to the string pointed to by pBuffer. It should be noted that the number of characters copied is the smaller value between the number of characters in the source string being pointed to and the buffer size.



- **Precautions**
  - pBuffer must not be NULL.
  - Strings are typically null-terminated with "\0", which should be considered when calculating the length.
  - The return value of the function is always 0.

- **Program example**

  STR1 is the string pointed to by the pBuffer_var pointer, and STR2 is the string pointed to by the pStr_var pointer.

iLengthToReplace	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–
iLengthToReplaceWith	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–
iPosition	–	–	–	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–
StrReplaceW	√	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–

- **Function**

  This instruction replaces a part of the original string with the target string.

- **Precautions**
  - If iPosition is less than or equal to 0 or iLength is less than 0, the output will remain unchanged.
  - If the set position iPosition exceeds the length of the string, there will be no output.
  - If the substring selected from the set position iPosition with the set length iLengthInput exceeds the remaining length of the input string, the function is equivalent to extracting characters to the right of the specified position in the source string.
  - The return value of the function is always 0.

- **Program example**

  pstStr is the string pointed to by the pointer pstInput_var, and pstDst is the string pointed to by the pointer pstReplaceWith_var.

  ST:

18.5.3.2.12 WCharToUpper

This instruction converts character to uppercase.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
WCharToUpper	Character uppercase conversion	FC	WCharToUpper EN ENO wdChar	:= WCharToUpper(wdChar :=);

- **Related variables**

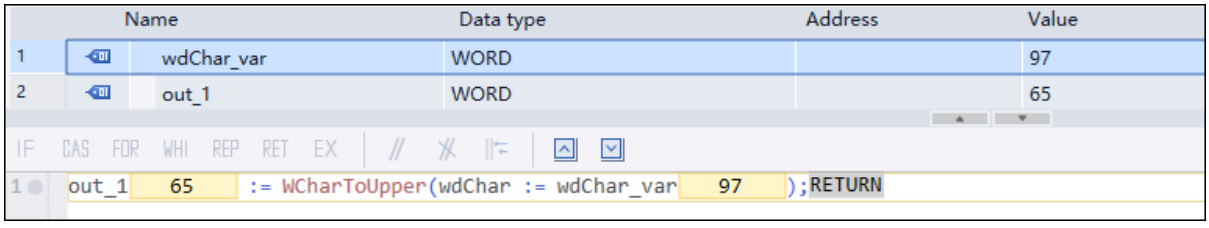
Variable

Input/Output	Variable	Name	Valid Range	Default Value	Description
Input	wdChar	Character to be converted	Follows data type	-	Character to be converted.

Input/Output	Variable	Name	Valid Range	Default Value	Description
Output	WCharToUpper	Return value	Follows data type	-	Converted character.

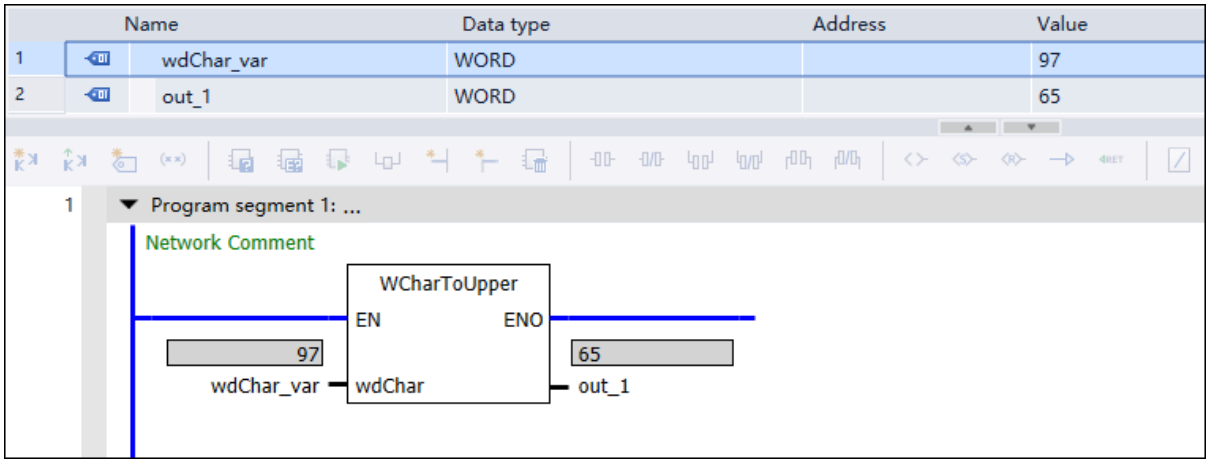
Variable types

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String				
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
wdChar	–	–	√	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
WCharToUpper	–	–	√	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–



- **Function**

  This instruction converts the character wdChar to uppercase and output it as a WORD type.



- **Precautions**
  - When the ASCII value of the character to be converted lies between 'a' and 'z', the algorithm performs the conversion; otherwise, the return value remains the ASCII code value of the original character.
  - The return value of the function is always 0.

- **Program example**

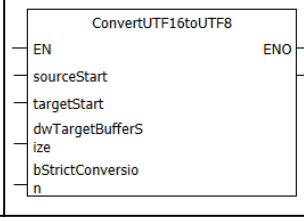
  LD:

18.5.3.3 UTF8



18.5.3.3.1 Instruction List

Instruction	FB/FC	Function	Library	Applicable Library Version
18.5.3.3.2 ConvertUTF16toUTF8	FC	String format conversion	StringUtils	Library version 1.0.0.0 and later
18.5.3.3.3 ConvertUTF8toUTF16	FC	String format conversion		Library version 1.0.0.0 and later
18.5.3.3.4 IsLegalUTF8	FC	UTF-8 format check		Library version 1.0.0.0 and later

18.5.3.3.2 ConvertUTF16toUTF8

This instruction converts a UTF-16 string to a UTF-8 string.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
ConvertUTF16toUTF8	String format conversion	FC		:= ConvertUTF16toUTF8(sourceStart := , targetStart := , dwTargetBufferSize := , bStrictConversion :=);

- **Related variables**

Variable

Input/Output	Variable	Name	Valid Range	Default Value	Description
Input	sourceStart	Pointer to the UTF-16 string to be converted	Follows data type	-	Pointer to the UTF-16 string to be converted.
	targetStart	Pointer to the UTF-8 string to be converted to	Follows data type	-	Pointer to the UTF-8 string to be converted to.
	dwTargetBufferSize	Buffer size	Follows data type	-	Buffer size.
	bStrictConversion	Conversion restriction	Follows data type	-	Conversion restriction.
Output	ConvertUTF16toUTF8	Return value	Follows data type	-	Return value.

Variable types

	Boolean	Bit String				Integer								Real Number		Time/Duration/ Date/String				
	BOOL	BYTE	WORD	DWORD	LWORD	USINT	UINT	UDINT	ULINT	SINT	INT	DINT	LINT	REAL	LREAL	TIME	DATE	TIME_OF_DAY	DATE_AND_TIME	STRING
sourceStart	POINTER TO WORD																			
targetStart	POINTER TO BYTE																			
dwTargetBufferSize	–	–	–	–	√	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
bStrictConversion	√	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–	–
ConvertUTF16toUTF8	–	–	–	–	–	–	–	√	–	–	–	–	–	–	–	–	–	–	–	–

- **Function**

  This instruction converts a UTF-16 string to a UTF-8 string.

  The bstrictConversion parameter controls conversion strictness, ensuring proper handling of invalid or non-convertible characters during UTF-16-to-UTF-8 conversion
  and preventing data corruption or erroneous output.

- **Program example**

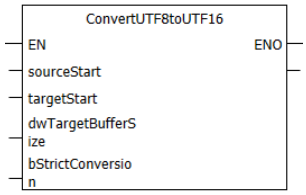
  STR1 is the UTF-16 string pointed to by the sourceStart_var pointer, and STR2 is the UTF-8 string pointed to by the targetStart_var pointer. Convert the UTF-16 input variable of WORD type to a UTF-8 string.

  Before conversion: the UTF-16 string STR1 := 16#6C49 (UTF16 represents character "汉")

  After conversion: the UTF-8 string is [16#E6, 16#B1, 16#89] (UTF8 represents character "汉")

  ST:

  LD:



- **Precautions**

  - If the data buffer size stored in "dwTargetBufferSize" is incorrect, the function return value is 16#40A1.
  - If the input is non-convertible data, the function return value is 16#40A2.

18.5.3.3.3 ConvertUTF8toUTF16

This instruction converts a UTF-8 string to a UTF-16 string.

- **Instruction format**

Instruction	Name	FB/FC	LD Representation	ST Representation
ConvertUTF8toUTF16	String format conversion	FC		:= ConvertUTF8toUTF16(sourceStart := , targetStart := , dwTargetBufferSize := , bStrictConversion :=);

- **Related variables**

19 HMI System Functions

19.1 Variables

- This function is used for getting a variable's class object by its name.
  - **Function format**
    smartTags('Tag_1')
  - **Related parameters**

Parameter	Description	Value/Interface
Variable name	Configured as a String variable, such as "Tag_1"	The default value is null.
Return value	Class variable, used to describe a class of variables in monitoring	getName()----Get the variable name valueOf()----Get the variable value

  - **Examples**

Application Type	Example

Get the variable value	function Script_1() {
	//The value of INT variable Tag_1 is 100
	//smartTags('Tag_1') -- object of variable Tag_1
	let a = getValue(smartTags('Tag_1')); //After the getValue is executed, a = 100
	
	let b = smartTags('Tag_1').valueOf(); // After the valueOf is executed, b = 100
	}

Set the variable value	function Script_1() {
	//The default value of INT variable Tag_1 is 0
	//smartTags('Tag_1') -- object of variable Tag_1
	setValue(smartTags('Tag_1'), 100); //After the setValue is executed, the value of variable Tag_1 is 100
	}

Use the variable object as input parameter	function Script_1() {
	//Set the screensaver time based on the value of INT variable Tag_1
	//smartTags('Tag_1') -- object of variable Tag_1
	setScreenSaverTime(smartTags('Tag_1'))
	
	}

Application Type	Example

Use the variable object as output parameter	function Script_1(){
	//Export the specified data records to the specified path, smartTags('Tag_1') -- object of variable Tag_1
	exportTagRecord("data record_1", 0, "/logRecord", smartTags('Tag_1')) //After the exportTagRecord is executed, the result is written to variable Tag_1
	}

Use the variable object as input and output parameters	function Script_1(){
	//smartTags('Tag_1') -- The default value of INT variable Tag_1 is 10
	//During the execution of increaseValue, the value of variable Tag_1 is obtained and then 1 is added and assigned back to the variable Tag_1
	increaseValue(smartTags('Tag_1'), 1, true); //After the increaseValue is executed, the value of variable Tag_1 is 11
	}

19.2 Bit Operations

Name	Function	Example

Invert a bit	invertBit	function Script_2(){ //The default value of BOOL variable Tag_1 is true
		invertBit(smartTags('Tag_1')); //After the invertBit is executed, the default value of Tag_1 is false
		}

Invert a bit in the given tag	invertBitInTag	function Script_2() { //The default value of INT variable Tag_1 is 0b0000000001. Invert the second bit
		invertBitInTag(smartTags('Tag_1'),2,false); //After the invertBitInTag is executed, the default value of Tag_1 is 000000000101
		}

Set a bit	setBit	function Script_2() { //The default value of BOOL variable Tag_1 is false
		setBit(smartTags('Tag_1')); //After the setBit is executed, the value of Tag_1 is true
		}

Set a bit in the given tag	setBitInTag	function Script_2(){ //The default value of INT variable Tag_1 is 0b0000000001. Set the second bit to 1
		resetBitInTag(smartTags('Tag_1'),2); //After the resetBitInTag is executed, the value of Tag_1 is 0000000000101
		}

Name	Function	Example

Reset a bit	resetBit	function Script_2(){ //The default value of BOOL variable Tag_1 is true
		resetBit(smartTags('Tag_1')); //After the resetBit is executed, the default value of Tag_1 is false
		}

Reset a bit in the given tag	resetBitInTag	function Script_2(){ //The default value of INT variable Tag_1 is 0b0000000101. Reset the second bit to 0
		resetBitInTag(smartTags('Tag_1'),2); //After the resetBitInTag is executed, the default value of Tag_1 is 0b00000000001
		}

19.3 Calculation

19.3.1 Increasing the Variable Value

This function is used for increasing a value to the variable.

- **Function format**

  increaseValue(/*variable(InOut)*/, /*variable/constant(In)*/, /*reset*/, /*whether to record the operation*/)

- **Related parameters**

Parameter	Description	Value
Variable	Integers and decimals are supported.	Configured as an integer or a decimal. The default value is null.
Value	Constants and variables are supported.	Configured as a constant or a variable. The default value is 1.
Reset	Reset the value.	Options: Yes/No. The default option is No. When Yes is selected, the variable value is reset to the lower limit when reaching the upper limit.
Whether to record the operation	Whether to record the operation event when this function is executed. The records can be found in the 13.3.5.4.8 Operation Logs view.	The default option is No.

- **Examples**

  Use in scripts:

```
function Script_1() {
//The default value of INT variable Tag_1 is 10, and the value range is [0,100]
//smartTags('Tag_1') -- object of variable Tag_1; true means reset after exceeding the limit
increaseValue(smartTags('Tag_1'), 1, true);
//After the increaseValue is executed, the value of variable Tag_1 is 11

//The default value of INT variable Tag_1 is 100, and the value range is [0,100]
```

```
//smartTags('Tag_1') -- object of variable Tag_1; true means reset after exceeding the limit
increaseValue(smartTags('Tag_1'), 1, true);
//After the increaseValue is executed, the value of variable Tag_1 is 0. The variable value increases by 1 each cycle until it exceeds the upper limit, at which point it is reset to the lower limit 0.
}
```

19.3.2 Decreasing the Variable Value

This function is used for decreasing a value of the variable.

- **Function format**

  ```
  decreaseValue(/*variable(InOut)*/, /*variable/constant(In)*/, /*reset*/, /*whether to record the operation*/)
  ```

- **Related parameters**

Parameter	Description	Value
Variable	Integers and decimals are supported.	Configured as an integer or a decimal. The default value is null.
Value	Constants and variables are supported.	Configured as a constant or a variable. The default value is constant 1.
Reset	Reset the value.	Options: Yes/No. The default option is No. When Yes is selected, the variable value is reset to the upper limit when reaching the lower limit.
Whether to record the operation	Whether to record the operation event when this function is executed. The records can be found in the 13.3.5.4.8 Operation Logs view.	The default option is No.

- **Examples**

  Use in scripts:

```
function Script_1() {

//The default value of INT variable Tag_1 is 10, and the value range is [0,100]
decreaseValue(smartTags(('Tag_1'),1,true); //smartTags(*Tag_1') - object of variable Tag_1, true means reset after exceeding the limit
//after the decreaseValue is executed, the value of variable Tag_1 is 9

//The default value of INT variable Tag_1 is 0, and the value range is [0,100]
decreaseValue(smartTags('Tag_1'),1,true); //smartTags('Tag_1)--object of variable Tag_1 , true means reset after exceeding the limit
//after the decreaseValue is executed, the value of variable Tag_1 is 100. The variable value decreases by 1 on each call, until it is below the lower limit, at which point it is reset to the upper limit 100.

}
```

19.3.3 Setting the Variable Value

This function is used for setting a value for the variable.

It is applicable to set values for variables of integer, word, decimal, boolean, and text types.

- **Function format**

  setValue(/*variable(Inout)*/, /*variable/constant(In)*/, /*whether to record the operation*/)

- **Related parameters**

Parameter	Description	Value
Variable	In-out	The default value is null.
Variable/ Constant	Constants and variables are supported.	The default value is constant 0.
Whether to record the operation	Whether to record the operation event when this function is executed. The records can be found in the 13.3.5.4.8 Operation Logs view.	The default option is No.

- **Examples**

  Use in scripts:

```
//Example 1. Set a fixed constant value of 100 for variable Tag1.
setValue(smartTags('Tag1'), 100);

//Example 2. Set a dynamically calculated value for variable Tag1.
//This value is obtained by adding 100 to the current value of Tag2.
setValue(smartTags('Tag1'), getValue(smartTags('Tag2')) + 100);
```

19.3.4 Getting the Variable Value

This function allows users to read the values of configured variables in the monitoring system and performs proper logical processing.

1. This function can be called in user-defined scripts.
2. This function cannot be called through configuration in variable events and screen events.

- **Function format**

  let tagValue=getValue(/*variable(Inout)*/)

- **Examples**

  Use in scripts:

```
function Script_1() {
//The value of INT variable Tag_1 is 100
//smartTags('Tag_1') -- object of variable Tag_1
let a = getValue(smartTags('Tag_1'));
//After the getValue is executed, a = 100
}
```

19.3.5 Linear Scaling

This function is used for linear scaling. Assign variable Y a value, which is calculated from the given value of variable X using the linear function Y = (a * X) + b.

Linear scaling can be performed on variables of integer, word, and decimal types.

- **Function format**

  linearScaling(/*variable(InOut)*/,/*variable(In)*/,/*constant(In)*/,/*constant(In)*/)

- **Related parameters**

Parameter	Description	Value
Y	Output	Configured as a variable only.
a	Parameter	Configured as a constant or a variable. The default value is constant 1.
X	Input	Configured as a variable only.
b	Parameter	Configured as a constant or a variable. The default value is constant 0.

- **Examples**

  Use in scripts:

```
function Script_1() {
//The default value of INT variable Tag_1 is 0, and the default value of INT variable Tag_2 is 100
//smartTags('Tag_1')--object of variable Tag_1; smartTags('Tag_2')--object of variable Tag_2
//Execute linearscaling to calculate the value of (2 * value of variable Tag_2) + 100, and write the value to variable Tag_1
linearScaling(smartTags('Tag_1'),2,smartTags('Tag2'),100);
//After the linearScaling is executed, the value of variable Tag_1 is 300
}
```

19.3.6 Inverse Linear Scaling

This function is used for inverse linear scaling. Assign variable X a value, which is calculated from the given value of variable Y using the linear function X = (Y - b) / a.

Inverse linear scaling can be performed on variables of integer, word, and decimal types.

- **Function format**

  inverseLinearScaling(/*variable(In)*/,/*variable(InOut)*/,/*constant(In)*/,/*constant(In)*/)

- **Related parameters**

Parameter	Description	Value
Y	Input	Configured as a variable only.
X	Output	Configured as a variable only.

Parameter	Description	Value
a	Parameter	Configured as a constant or a variable. The default value is constant 1.
b	Parameter	Configured as a constant or a variable. The default value is constant 0.

- **Examples**
  Use in scripts:

```
function Script_1() {
//The default value of INT variable Tag_1 is 0, and the default value of INT variable Tag_2 is 200
//smartTags('Tag_1'): object of variable Tag_1; smartTags('Tag_2'): object of variable Tag_2
//Execute inverseLinearScaling to calculate the value of (value of Tag_2 - 100) / 2, and write the result to variable Tag_1
inverseLinearScaling(smartTags('Tag_1'), smartTags('Tag_2'), 100, 2);
//After the inverseLinearScaling is executed, the value of variable Tag_1 is 50
}
```

19.3.7 Generating a Random Value

This function is used for generating a random value based on the preset conditions for the variable.

- **Random value range reference**
  - If the variable has upper and lower limits: A value will be randomly selected from this range.
  - If the variable has no upper or lower limits: The default range matching the variable's data type will be automatically used. For example: An integer will be randomly selected from [-32768, 32767] for INT variables.

    The configured range has higher priority than the default range.
- **Function format**

```
random(/*variable (In)*/)
```

- **Example**
  Use in scripts:

```
function Script_1() {
//Generate a random value for variableTag1, of which the configured range is [10, 100]
let a = random(smartTags('Tag1'));
//After successful execution, the value of variable Tag1 is randomly set to 55, a = 55
}
```

19.4 Screen

19.4.1 Activating a Screen

This function is used for activating a screen.

- **Function format**

```
activateScreen(/*screen name*/)
```

- **Related parameters**

Parameter	Description	Value
Screen name	Configured as "screen" or "variable": ◦ Screen: associated with overlay screens. ◦ Variable: associated with strings.	The default option is screen. The default value is null.

- **Example**

Use in scripts:

```
function Script_1() {
activateScreen("screen_1");
//Activate the specified screen based on the screen name "screen_1"
}
```

19.4.2 Activating a Screen by Number

This function is used for activating a screen by number.

- **Function format**

```
activateScreenByNumber(/*screen ID*/)
```

- **Related parameters**

Parameter	Description	Value
Screen ID	Configured as a variable of integer type.	The default value is null.

- **Example**

Use in scripts:

```
function Script_1() {
activateScreenByNumber(smartTags('ScreenID'));
//Open the specified screen based on the value of the variable ScreenID.
}
```

19.4.3 Activating the Previous Screen

This function is used for activating the previous screen.

- **Function format**

```
activatePreviousScreen()
```

- **Example**

Use in scripts:

```
function Script_1() {
activatePreviousScreen();
//Activate the previous screen
}
```

19.4.4 Showing the Popup Screen

This function is used to determine the display position of a popup screen. It determines the start position of the top-left corner of the popup screen based on the specified coordinate reference and automatically adjusts the position if the screen space is insufficient, ensuring the popup is fully displayed within the visible area.

- **Function format**

  showPopup(/*screen name*/,/*horizontal position*/,/*vertical position*/,/*bound variable mapping*/)

- **Related parameters**

Parameter	Description	Value
Popup screen name	Associated popup screen name.	The default value is null.
Position X	Center: horizontal center of the screen Left side of current graphic object: Leftmost border of the current graphic object Right side of current graphic object: Rightmost border of the current graphic object Custom: Specify an X-axis coordinate value	Center: -1 Left side of current graphic object: -2 Right side of current graphic object: -3 Custom: Within the screen boundaries and greater than zero.
Position Y	Center: Vertical center of the screen Current graphic object top: Topmost border of the current graphic object Current graphic object bottom: Bottommost border of the current graphic object Custom: Specify a Y-axis coordinate value	Center: -1 Current graphic object top: -2 Current graphic object bottom: -3 Custom: Within the screen boundaries and greater than zero.
Page parameter	Optional configuration, used to pass dynamic data or control commands to the popup screen.	When configuring the page parameters, associate a variable with each parameter.

- **Examples**

  Use in scripts:

  ◦ Define X-axis and Y-axis positions

```
function Script_1() {
//Show the popup screen
//"Popup screen 1", popup screen name
//100: X-axis position of the popup window
//200: Y-axis position of the popup window
//{"P_1":"Tag_1","P_2":"Tag_2","P_3":"Tag_3"} association of page parameters (P_1/2/3) and variables (Tag_1/2/3)
showPopup("popup screen 1",100,200,{"P_1":"Tag_1","P_2":"Tag_2","P_3":"Tag_3"});
}
```

◦ Determine X-axis and Y-axis positions based on current graphic object position

```
function Script_1() {
//Show the popup screen
//"Popup screen 1", popup screen name
//-2: X-axis position of the popup window is based on the leftmost border of the current graphic object
//-3: Y-axis position of the popup window is based on the bottommost border of the current graphic object
showPopup("Popup screen 1",-2,-3);
}
```

19.4.5 Hiding a Popup Screen

This function is used for hiding the specified popup screen.

- **Function format**

  hidePopup(/*screen name*/)

- **Related parameters**

Parameter	Description	Value
Screen name	Configured as "screen", which is associated with popup screens.	The default value is null.

- **Example**

  Use in scripts:

```
function Script_1() {
hidePopup("popup screen_1");
//Hide the popup screen based on the screen name "popup screen_1"
}
```

19.4.6 Hiding All Popup Screens

This function is used for hiding all popup screens.

- **Function format**

  hideAllPopups()

- **Related parameters**

  No input parameters.

- **Example**

  Use in scripts:

```
function Script_1() {
//Hide all popup screens
hideAllPopups();
}
```

19.4.7 Showing the Message Box

This function is used for showing the message box.

- **Function format**

```
showMessageBox(/*message content*/)
```

- **Related parameters**

Parameter	Description	Value
Message content	Configured as "constant" or "variable": Variable: associated with strings.	The default option is constant. The default value is null.

- **Example**

Use in scripts:

```
function Script_1() {
showMessageBox("Hello iFA");
//Show the message. The content in parentheses is "Hello iFA"
}
```

19.4.8 Getting Parameters from a Popup Screen

This function is used for getting page parameters from a popup screen.

- **Function format**

```
getParametersFromScreen(/*screen name*/)
```

- **Related parameters**

Parameter	Description	Value
Screen name	Configured as "screen", which is associated with popup screens.	The default value is null.

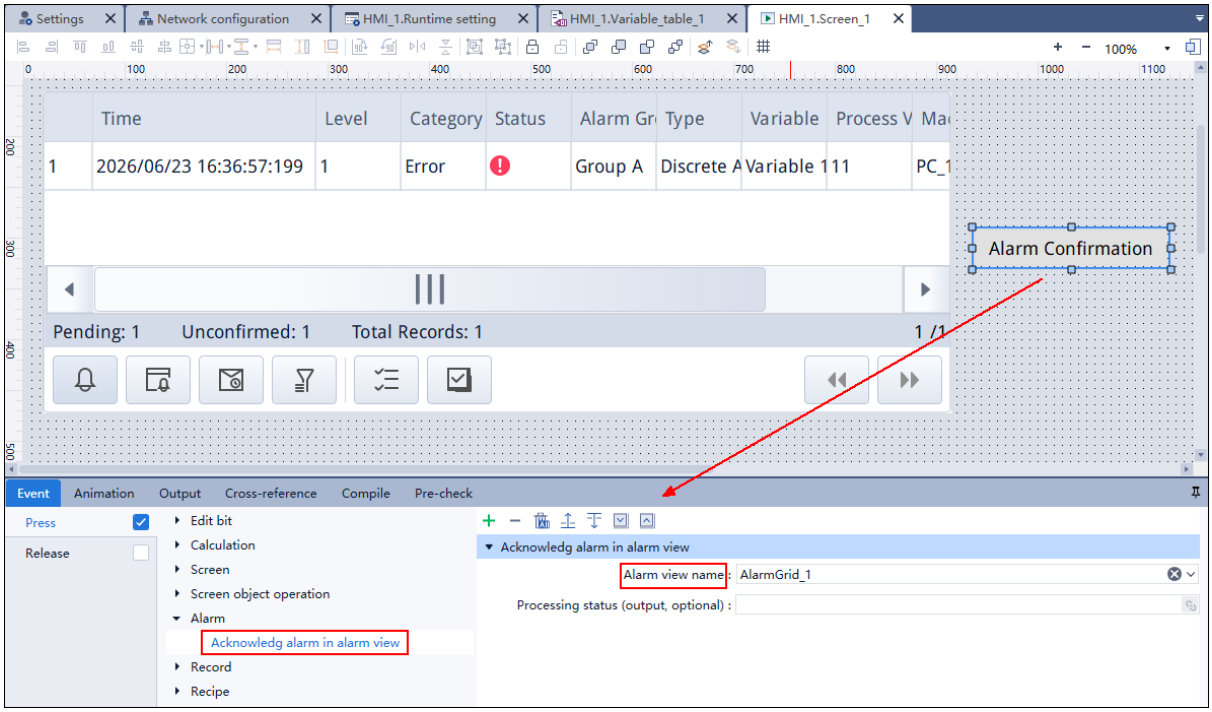
- **Example**

Use in scripts:

```
function Script_1() {
//Get page parameters from a popup screen, and return the result in the following data format:
{"P_1":"Tag_1","P_2":"Tag_2","P_3":"Tag_3"}
var lst = getParametersFromScreen("screen_2");
//Show each item in the returned list using message box
for (var item of lst)
{
showMessageBox(item);
}
}
```

19.5 Alarm

19.5.1 Acknowledging an Alarm in the Alarm View



This system function is used to perform a "confirmation" operation on a selected alarm in the specified alarm view.

- **Restrictions**
  - This function can only be configured on the configuration screen. For example, associate the "press" event of a button with this function.
  - The graphic object (such as a button) for performing the confirmation operation must be located on the same screen as the target alarm view.
- **Related parameters**

Parameter	Description	Value
Alarm view name	Control name.	Configured as alarm view. The default value is null.
Status	Return a value.	2: Executing 4: Execution success 12: Execution failure This parameter is optional.

- **Example**

  Add an alarm view control and a button to the screen, and configure the trigger event as the "Alarm" function (as shown in the following figure). When the operator presses the button, the system acknowledges the currently selected alarm in the "Alarm view_1".

19.6 Record

19.6.1 Clearing a Record

This function is used for deleting all data in the specified record.

- **Function format**

  clearRecord(/*record type*/,/*record*/)

- **Related parameters**

Parameter	Description	Value
Record type	Data type of the record.	Configured as data record, alarm record, or operation record. The default option is data record.
Record	The created data record or alarm record.	The default value is null.

- **Examples**

  Use in scripts:

```
function Script_1() {
//Clear the data file generated by the record named "Data record_1" of data record type
clearRecord(1,"Data record_1")
//Clear the data file generated by the record named "Alarm record_1" of data record type
clearRecord(2,"Alarm record_1")
}
```

19.6.2 Starting Recording

This function is used for starting recording process values, operation logs, or alarms to the specified log file.

- **Function format**

  startRecord(/*record type*/,/*record*/)

- **Related parameters**

Parameter	Description	Value
Record type	Data type of the record.	Configured as data record, alarm record, or operation record. The default option is data record.
Record	Recorded data.	The default value is null.

- **Examples**

  Use in scripts:

```
function Script_1() {
//Start the record named "Data record_1" of data record type
startRecord(1, "Data record_1")
```

```
//Start the record named "Alarm record_1" of alarm record type
startRecord(2,"Alarm record_1")
}
```

19.6.3 Stopping Recording

This function is used for stopping recording process values or alarms to the specified log file.

- **Function format**

  stopRecord(/*record type*/,/*record*/)

- **Related parameters**

Parameter	Description	Value
Record type	Data type of the record.	Configured as data record, alarm record, or operation record. The default option is data record.
Record	Recorded data.	The default value is null.

- **Examples**

  Use in scripts:

```
function Script_1() {
//Stop the record named "Data record_1" of data record type
stopRecord(1, "Data record_1")
//Stop the record named "Alarm record_1" of alarm record type
stopRecord(2,"Alarm record_1")
}
```

19.6.4 Starting All Records

This function is used for re-establishing the connection between the monitoring system and the records to resume recording.

- **Function format**

  startAllRecords()

- **Example**

  Use in scripts:

```
function Script_1() {
//Start all configured records
startAllRecords();
}
```

19.6.5 Stopping All Records

This function is used for disconnecting the monitoring system from the records to stop recording.

- **Function format**

  stopAllRecords()

- **Example**

  Use in scripts:

```
function Script_1() {
//Stop all configured records
stopAllRecords();
}
```

19.6.6 Exporting a Data Record

This function is used for exporting the data of the specified record to the target path.

- **Function format**
  exportTagRecord(/*variable record name*/, /*storage location (SD card/USB1/USB2/local disk)*/, /*storage path*/, /*result variable object*/)
- **Related parameters**

Parameter	Description	Value
Data record	Enter the data record name	Match the name on the "record" node.
Storage location	Specify the location where the file is stored.	◦ 1: SD card of the HMI device ◦ 2: Device connected to USB1 port of the HMI device ◦ 3: Device connected to USB2 port of the HMI device ◦ 4: Local disk of the PC
Storage path	Specify the file storage path.	◦ The default storage path on the HMI device is "/TagRecord". ◦ The default storage path on the PC is "D:/TagRecord".
Result variable object	Return a value	◦ 2: Executing ◦ 4: Execution success ◦ 12: Execution failure This parameter is optional.

- **Example**
  Use in scripts:

```
function Script_1() {
//Export the specified data record to the specified path. "Data record 1": specified data record name; 1: storage in SD card; "/TagRecord": relative storage path. Write the execution result to variable Tag_1.
exportTagRecord(Data record_1",1,"/TagRecord",smartTags('Tag_1'))
}
```

19.6.7 Exporting an Alarm Record

This function is used for exporting the data of an alarm record to the target path.

- **Function format**
  exportAlarmRecord(/*alarm record name*/, /*storage location (SD card/USB1/USB2/local disk)*/, /*storage path*/, /*result variable object*/)
- **Related parameters**

Parameter	Description	Value
Data record	Enter the alarm record name	Match the name on the "record" node.
Storage location	Specify the location where the file is stored.	◦ 1: SD card of the HMI device ◦ 2: Device connected to USB1 port of the HMI device ◦ 3: Device connected to USB2 port of the HMI device ◦ 4: Local disk of the PC
Storage path	Specify the file storage path.	◦ The default storage path on the HMI device is "/AlarmRecord". ◦ The default path on the PC is "D:/AlarmRecord".
Result variable object	Return a value	◦ 2: Executing ◦ 4: Execution success ◦ 12: Execution failure This parameter is optional.

- **Example**
  Use in scripts:

```
function Script_1(){
//Export the specified alarm record to the specified path. "Alarm record_1": specified alarm record name; 1: storage in SD card; "/AlarmRecord": relative storage path. Write the execution result to variable Tag_1.
exportAlarmRecord("Alarm record_1",1,"/AlarmRecord",smartTags('Tag_1'))
}
```

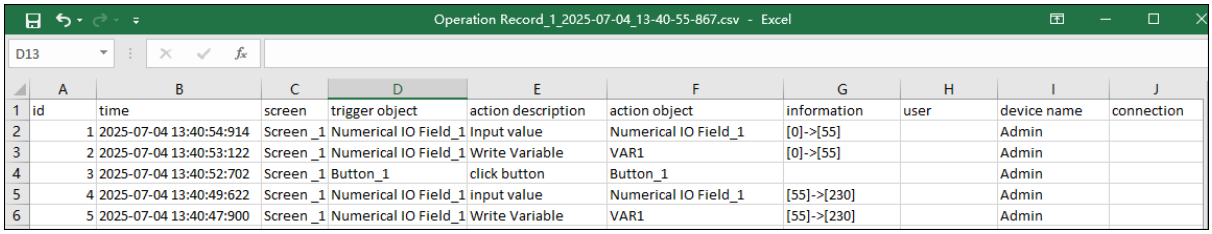
19.6.8 Exporting an Operation Record

This function is used for exporting an operation record to the target path.

- **Function format**
  exportOperationRecord(/*operation record name*/, /*storage location (SD card/USB1/USB2/local disk)*/, /*storage path*/, /*result variable object*/)
- **Related parameters**

Table19-6-8-1

Parameter	Description	Value
Operation record name	Enter the operation record name	Match the name on the "record" node.



Parameter	Description	Value
Storage location	Specify the location where the file is stored.	◦ 1: SD card of the HMI device ◦ 2: Device connected to USB1 port of the HMI device ◦ 3: Device connected to USB2 port of the HMI device ◦ 4: Local disk of the PC
Storage path	Specify the file storage path.	◦ The default storage path on the HMI device is "/OperationRecord". ◦ The default storage path on the PC is "D:/OperationRecord".
Result variable object	Return a value	◦ 2: Executing ◦ 4: Execution success ◦ 12: Execution failure This parameter is optional.

- **Example**

  Use in scripts:

```
function Script_1() {
//Export an operation record to the specified path. "Operation record_1": specified operation record name; 1: storage in SD card; "/operationRecord": relative storage path. Write the execution result to variable Tag_1.
exportOperationRecord("operation record_1",1,"/OperationRecord",smartTags('Tag_1'))
}
```

  The exported data records are stored in table form at the specified path. The table is provided as follows.

Operation Record_1_2025-07-04_13-40-55-867.csv - Excel

D13

	A	B	C	D	E	F	G	H	I	J
1	id	time	screen	trigger object	action description	action object	information	user	device name	connection
2	1	2025-07-04 13:40:54:914	Screen _1	Numerical IO Field_1	Input value	Numerical IO Field_1	[0]->[55]		Admin	
3	2	2025-07-04 13:40:53:122	Screen _1	Numerical IO Field_1	Write Variable	VAR1	[0]->[55]		Admin	
4	3	2025-07-04 13:40:52:702	Screen _1	Button_1	click button	Button_1			Admin	
5	4	2025-07-04 13:40:49:622	Screen _1	Numerical IO Field_1	input value	Numerical IO Field_1	[55]->[230]		Admin	
6	5	2025-07-04 13:40:47:900	Screen _1	Numerical IO Field_1	Write Variable	VAR1	[55]->[230]		Admin	

19.6.9 Exporting Data Records by Time

This function is used for exporting and storing data records within a specific time period to the target path.

- **Function format**

  exportTagRecordByTime(/*variable record name*/,/*storage location(SD card/USB1/USB2/local disk)*/,/*storage path*/,/*start time*/,/*end time*/,/*result variable object*/)

- **Related parameters**

Parameter	Description	Value
Variable record name	Specify the data record	Match the name on the "record" node.

Parameter	Description	Value
Storage location	Specify the location where the file is stored.	◦ 1: SD card of the HMI device ◦ 2: Device connected to USB1 port of the HMI device ◦ 3: Device connected to USB2 port of the HMI device ◦ 4: Local disk of the PC
Storage path	Specify the file storage path.	◦ The default storage path on the HMI device is "/TagRecord". ◦ The default storage path on the PC is "D:/TagRecord".
Start time	Specify the time range for exporting data. Configured as DATETIME variable or fixed time.	The end time must be equal to or later than the start time. When the start time and end time are exactly the same [i.e., date and time (hour, minute, second) are identical], the exported file is empty.
End time		
Result variable object	Return a value	◦ 2: Executing ◦ 4: Execution success ◦ 12: Execution failure This parameter is optional.

- **Exported file**
  The exported file is in CSV format. The file naming format is: Data record name_export time (YYYY-MM-DD_HH-MM-SS-MS).
- **Example**
  Use in scripts:

```
function Script_1() {
//Export the data between TIME1 and TIME2 from Data record_1 to the path /TagRecord of the SD card of the IT9000 touchscreen, and write the result status to variable T1.
exportTagRecordByTime("Data record_1", 1, "/TagRecord", smartTags('TIME1'), smartTags('TIME2'), smartTags('T1'))
}
```

  The exported file  Record _1_2025-05-07_11-20-13-123.csv is stored in the path /TagRecord of the SD card.

19.7 Recipe

19.7.1 Creating a Recipe Data Record

This function is used for creating a recipe data record.

- **Function format**

  newDataRecord(/*recipe number*/, /*whether to pass the data record name through variable*/, /*data record name input variable number*/, /*data record name output variable number*/,/*data record number output variable number*/, /*whether to use the default value for the ingredient variable (true-initial value of the recipe ingredient/false-collected value of the ingredient variable)*/,/*result variable object*/)

- **Related parameters**

Parameter	Description	Value
Recipe number	Number of the recipe for which a data record is to be created.	Recipe or variable can be selected. The default option is recipe. INT variables are supported: SINT, USINT, INT, UINT, DINT, UDINT, LINT, ULINT.
Variable input data record name	Whether to write new data record name through variable.	true: through variable false: through popup window
Data record name (input)		Supported variable types: String and Wstring. Data record name rules: any combination of Chinese characters, English letters, numbers, underlines (_), and middle hyphens (-), with a length of up to 64 characters.
Data record name (output)	Read data record name through variable.	Supported variable types: String and Wstring.
Data record number (output)	Read data record number through variable.	INT variables are supported: SINT, USINT, INT, UINT, DINT, UDINT, LINT, ULINT.
Value source	Specify the value source for each ingredient in the new data record.	true: Initial value of the recipe ingredient. false: Collected value of the ingredient variable.
Status	Return a value (optional).	2: Executing 4: Execution success 12: Execution failure

- **Example**

  Use in scripts:

```
function Script_1() {
//Create a data record for recipe 1.
```

```
//The data record name is input through popup window, and current values are used for each ingredient in the data record.
//The variable (Recipe1DataRecord3rdName_in) means inputting the name of the new data record.
//The variable (Recipe1DataRecord3rdName_out) means reading the name of the new data record.
//The variable (Recipe1DataRecord3rdID_out) means reading the number of the new data record.
newDataRecord(1,false,smartTags('Recipe1DataRecord3rdName_in'),smartTags('Recipe1DataRecord3rdName_out'),smartTags('Recipe1DataRecord3rdID_out'),false);
}
```

19.7.2 Deleting a Recipe Data Record

This function is used for deleting a recipe data record.

- **Function format**

  ```
  deleteDataRecord(/*recipe number*/,/*data record number*/,/*confirm*/,/*status*/)
  ```

- **Related parameters**

Parameter	Description	Value
Recipe number/name	The recipe name or corresponding number to be deleted.	Configured as recipe name or variable. The default option is recipe name. The default value is null.
Data record number	Data record number of the recipe to be deleted.	Configured as a constant or a variable. The default value is constant 1.
Confirm	Select On or Off.	On: When the operating system executes the deletion, a confirmation dialog appears. Off: When the operating system executes the deletion, the data is deleted directly. The default option is On.
Status	Return a value	2: Executing 4: Execution success 12: Execution failure This parameter is optional.

- **Example**

  Use in scripts:

  ```
  function Script_1() {
  //Delete the data record (with the recipe number 1 and data record number 2)
  //Confirm: "On". In this case, selecting "Confirm" means deleting the record when the popup window "Confirm to delete the data record" appears; selecting "Cancel" means not deleting the record
  //Confirm: "Off". In this case, the data record will be deleted directly without any popup window
  // Status: smartTags('Tag_1'), associated with variable Tag_1. When the data record is deleted successfully, Tag_1 returns 4; otherwise, Tag_1 returns 12
  ```

```
deleteDataRecord(1, 2, "On", smartTags('Tag_1'));
}
```

19.7.3 Setting a Recipe Data Record to PLC

This function is used for downloading the component values of a saved data record in the recipe view to the PLC.

- **Function format**

  ```
  setDataRecordToPLC(/*recipe number*/, /*data record number*/, /*variable indicating the status*/)
  ```

- **Related parameters**

Parameter	Description	Value
Recipe number/name	The recipe name or corresponding number from which the data record is to be set.	Configured as recipe name or variable. The default option is recipe name. The default value is null.
Data record number	The number of the data record to be set.	Configured as a constant or a variable. The default value is constant 1.
Status	Return a value.	2: Executing 4: Execution success 12: Execution failure This parameter is optional.

- **Example**

  Use in scripts:

  ```
  function Script_1() {
  //Set the specified data record of the specified recipe to the PLC
  //Status: smartTags('Tag_1'): associated with variable Tag_1. When the setting is successful, Tag_1 returns 4; otherwise, Tag_1 returns 12
  //Set the data record with recipe number 1 and data record number 2 in the recipe view to the PLC
  setDataRecordToPLC(1, 2, smartTags('Tag_1'))
  }
  ```

19.7.4 Getting a Recipe Data Record from PLC

This function is used for getting a recipe data record from the PLC and uploading it to the recipe view on the screen.

- **Function format**

  ```
  getDataRecordFromPLC(/*recipe number*/, /*data record number*/, /*override*/, /*status*/)
  ```

- **Related parameters**

Parameter	Description	Value
Recipe number/ name	The recipe name or corresponding number from which the data record is to be obtained.	Configured as recipe name or variable. The default option is recipe name. The default value is null.
Data record number	The number of the data record to be obtained.	Configured as a constant or a variable. The default value is constant 1.
Override	Whether to overwrite the current data record with the PLC value	◦ true: Overwrite directly ◦ false: Pop up a dialog box for re-confirmation. The default option is false.
Status	Return a value.	2: Executing 4: Execution success 12: Execution failure This parameter is optional.

- **Example**

  Use in scripts:

```
function Script_1() {
//Get the data record from the PLC to recipe view
// Overwrite: Perform re-confirmation before overwriting the data record.
//Status: smartTags('Tag_1'), associated with variable Tag_1. When the operation is successful, Tag_1 returns 4; otherwise, Tag_1 returns 12
//Get the data record from the PLC to recipe view and override the data record with recipe number 1 and data record number 2
getDataRecordFromPLC(1,2,"false",smartTags('Tag_1'))
}
```

19.7.5 Getting the Recipe Data Record Name

This function is used for getting the data record name (writing the given recipe and recipe data record name to the given variable).

- **Function format**

  getDataRecordName(/*recipe number*/,/*data record number*/,/*recipe name variable ID*/,/*data record name variable ID*/,/*status*/)

- **Related parameters**

Parameter	Description	Value
Recipe number/name	The recipe name or corresponding number from which the data record is to be obtained.	Configured as recipe name or variable. The default option is recipe name. The default value is null.

Parameter	Description	Value
Data record number	The number of the data record to be obtained.	Configured as a constant or a variable. The default value is constant 1.
Recipe name variable	The returned recipe name.	Displayed through variable value. The default value is null.
Data record name variable	The returned data record name.	Displayed through variable value. The default value is null.
Status	Return a value.	2: Executing 4: Execution success 12: Execution failure This parameter is optional.

- **Example**
  Use in scripts:
  ```
  function Script_1() {
  //Get the data record name of the specified data record in the specified recipe
  //Status: smartTags('Tag_3'), associated with variable Tag_3. When the operation is successful, Tag_2 returns 4; otherwise, Tag_2 returns 12
  //Get the data record name of the data record with recipe number 1 and data record number 2; Tag_1 returns the recipe name, and Tag_2 returns the recipe data record name
  getDataRecordName(1, 2, smartTags('Tag_1'), smartTags('Tag_2'), smartTags('Tag_3'))
  }
  ```

19.7.6 Exporting Recipe Data Records

This function exports the data records of a specified recipe to a designated location.

- **Function format**
  exportDataRecords(/*recipe number*/,/*storage location (SD card/USB1/USB2/local disk)*/,/*storage path*/,/*file name*/,/*encoding style*/, /*result variable object*/)
- **Related parameters**

Parameter	Description	Value
Recipe number	Specify the number of the recipe to be exported.	Configured as a constant or a variable.
Storage location	Specify the location where the file is stored.	◦ 1: SD card of the HMI device ◦ 2: Device connected to USB1 port of the HMI device ◦ 3: Device connected to USB2 port of the HMI device ◦ 4: Local disk of the PC

Parameter	Description	Value
Storage path	Specify the file storage path.	◦ The default storage path on the HMI device is "/DataRecord". ◦ The default path on the PC is "D:/DataRecord".
Exported file name	Specify the name of the exported file.	Configured as a constant or a variable. The default option is constant "DataRecord".
Encoding style	Specify the encoding style for the exported file.	Configured as GBK or UTF-8. The default option is GBK.
Result variable object	Return a value	◦ 2: Executing ◦ 4: Execution success ◦ 12: Execution failure This parameter is optional.

In addition to this function, the recipe data records can be exported through interface operations. For specific operations, see 13.6.6 Importing and Exporting a Recipe.

- **Example**

  Use in scripts:

```
function Script_1() {
//Export the data record with recipe number 1 to the path /DataRecord of the SD card and save it as the file DataRecord.csv in GBK encoding style. Tag_2 indicates the export operation status.
exportDataRecords(1, 1,"/DataRecord","DataRecord","GBK", smartTags('Tag_2') ) ;
}
```

19.7.7 Importing Recipe Data Records

This function is used for importing the data record file at the specified location into the device and displaying it in the recipe view.

- **Function format**

```
importDataRecords(/*storage location (SD card/USB1/USB2/local disk)*/,/*storage path*/,/*file name*/,/*result variable object*/)
```

- **Related parameters**

Parameter	Description	Value
Storage location	Specify the location where the file is stored.	◦ 1: SD card of the HMI device ◦ 2: Device connected to USB1 port of the HMI device ◦ 3: Device connected to USB2 port of the HMI device ◦ 4: Local disk of the PC

Parameter	Description	Value
Storage path	Specify the location where the file is stored.	◦ The default storage path on the HMI device is "/DataRecord". ◦ The default path on the PC is "D:/DataRecord".
File name	Specify the name of the file to be imported.	Configured as a constant or a variable. The default option is constant "DataRecord".
Result variable object	Return a value	◦ 2: Executing ◦ 4: Execution success ◦ 12: Execution failure This parameter is optional.

In addition to this function, the recipe data records can be imported through interface operations. For specific operations, see 13.6.6 Importing and Exporting a Recipe.

- **Example**

  Use in scripts:

```
function Script_1() {
//Import the file Recipe1.csv from the USB flash disk connected to USB1 port into the device. The operation status is reflected by the Tag_2 variable.
importDataRecords(2,"/DataRecord","Recipe1", "Datarecord", smartTags('Tag_2'));
}
```

19.8 User Management

19.8.1 Displaying the Login Dialog

This function is used for popping up the login dialog.

- **Function format**

```
loginDialog(/*result variable object (InOut) */)
```

- **Related parameters**

Parameter	Description	Value
Status	Return a value.	2: Executing 4: Execution success 12: Execution failure This parameter is optional.

- **Example**

  Use in scripts:

```
function Script_1() {
//Pop up the login dialog
```

```
//Status: smartTags('Tag_1'): associated with variable Tag_1. When the login dialog pops up successfully, Tag_1 returns 4; otherwise, Tag_1 returns 12
//Pop up the login dialog
loginDialog(smartTags('Tag_1'))
}
```

19.8.2 Login

This function is used for user login.

- **Function format**

  ```
  login(/*username(In)*/,/*password(In)*/,/*result variable object(InOut)*/)
  ```

- **Related parameters**

Parameter	Description	Value
Username	The username to log in.	Configured as a constant or a variable. The default option is constant. The default value is null.
Password	Password for the user.	Configured as a constant or a variable. The default option is constant. The default value is null.
Status	Return a value.	2: Executing 4: Execution success 12: Execution failure This parameter is optional.

- **Example**

  Use in scripts:

  ```
  function Script_1() {
  //User logs in
  //Status: smartTags('Tag_1'): associated with variable Tag_1. When the user logs in successfully, Tag_1 returns 4; otherwise, Tag_1 returns 12
  //Username and password can be set using variables or constants
  //User name: zhangsan, password: Aa123456
  login("zhangsan","Aa123456",smartTags('Tag_1'))
  //username = Tag_2, password = Tag_3
  login(smartTags('Tag_2'),smartTags('Tag_3'),smartTags('Tag_1'))
  }
  ```

19.8.3 Logout

This function is used for user logout.

- **Function format**

```
logout(/*result variable object(Inout)*/)
```

- **Related parameters**

Parameter	Description	Value
Status	Return a value.	2: Executing 4: Execution success 12: Execution failure This parameter is optional.

- **Example**

Use in scripts:

```
function Script_1() {
//The user logs out
//Status: smartTags('Tag_1'): associated with variable Tag_1. When the user logs out successfully, Tag_1 returns 4; otherwise, Tag_1 returns 12
//Current user logs out
logout(smartTags('Tag_1'))
}
```

19.8.4 Getting the Username

This function is used for getting information about the currently logged-in user.

- **Function format**

```
getUserName(/*username*/,/*status*/,/*result variable object*/)
```

- **Related parameters**

Parameter	Description	Value
Username	Return the currently logged-in username.	The default value is null.
Status	Return a value.	2: Executing 4: Execution success 12: Execution failure This parameter is optional.
Additional information	Return a value.	2: Only when the function is executed successfully with valid user information being returned. 4: Only when the function is executed successfully with no username being returned. This parameter is optional.

- **Example**

Use in scripts:

```
function Script_1() {
```

```
//Get the username of the logged-in user
//Status: smartTags('Tag_1')
//Additional information: smartTags('Tag_3')
//If a user logs in and the desired information is obtained successfully, Tag_1 returns 4 and Tag_3 returns 2
//If no user logs in, Tag_1 returns 4 and Tag_3 returns 4
//If the desired information is not obtained, Tag_1 returns 12 and Tag_3 returns 0
//Get the username of the currently logged-in user. If successful, return the username to variable Tag_2
getUserName(smartTags('Tag_2'), smartTags('Tag_1'), smartTags('Tag_3'))
}
```

19.8.5 Switching the User

This function is used for switching the logged-in user.

- **Function format**

  ```
  switchUser(/*username(In)*/, /*password(In)*/, /*result variable object(Inout)*/)
  ```

- **Related parameters**

Parameter	Description	Value
Username	The username to switch.	Configured as a constant or a variable. The default option is constant. The default value is null.
Password	Password for the user.	Configured as a constant or a variable. The default option is constant. The default value is null.
Status	Return a value.	2: Executing 4: Execution success 12: Execution failure This parameter is optional.

- **Example**

  Use in scripts:

```
function Script_1() {
//Switch the logged-in user
//Status: smartTags('Tag_1'): associated with variable Tag_1. When the user is switched successfully, Tag_1 returns 4; otherwise, Tag_1 returns 12
//Username and password can be set using variables or constants
//Switch the logged-in user to lisi with password Bb123456
switchUser("lisi", "Bb123456", smartTags('Tag_1'))
//Switch the logged-in user to Tag_2 with password Tag_3
switchUser(smartTags('Tag_2'), smartTags('Tag_3'), smartTags('Tag_1'))
}
```

19.8.6 Changing the Password

This function is used for changing the password.

- **Function format**

  changePassword(/*username(In)*/, /*old password(In)*/, /*new password(In)*/, /*result variable object(Inout)*/)

- **Related parameters**

Parameter	Description	Value
Username	Username of the user whose password is to be changed.	Configured as a constant or a variable. The default option is constant. The default value is null.
Old password	Old password for the user.	Configured as a constant or a variable. The default option is constant. The default value is null.
New password	New password for the user.	Configured as a constant or a variable. The default option is constant. The default value is null. The password must meet the complexity rules defined in "Safety settings -> Settings". For details, see 9.5 Setting Password Policies.
Status	Return a value.	2: Executing 4: Execution success 12: Execution failure This parameter is optional.

- **Example**

  Use in scripts:

```
function Script_1() {
//Change the user password
//Status: smartTags('Tag_1'): associated with variable Tag_1. When the change is successful, Tag_1 returns 4; otherwise, Tag_1 returns 12
//Username, old password, and new password can be configured using constants or variables
//Change the password of the username "zhangsan" from old password Aa123456 to new password Bb123456
changePassword("zhangsan", "Aa123456", "Ba123456", smartTags('Tag_1'))
//Change the password of the username Tag_2 from old password Tag_3 to new password Tag_4
//smartTags('Tag_2'), smartTags('Tag_3'), smartTags('Tag_4') are variables corresponding to username, old password, and new password respectively. Use these variables to change the user password
```

```
changePassword(smartTags('Tag_2'), smartTags('Tag_3'), smartTags('Tag_4'), smartTags('Tag_1'))
}
```

19.8.7 Exporting User Data

This function is used for exporting user data to the specified path.

The exported data includes information that can be configured in the user view, such as user IDs, passwords, and deactivation time.

- **Function format**

  exportUserData(/*storage location (SD card /USB1/USB2/local disk)*/,/*storage path*/,/*file name*/,/*result variable object*/)

- **Related parameters**

Parameter	Description	Value
Storage location	Specify the location where the file is stored.	◦ 1: SD card of the HMI device ◦ 2: Device connected to USB1 port of the HMI device ◦ 3: Device connected to USB2 port of the HMI device ◦ 4: Local disk of the PC
Storage path	Specify the file storage path.	◦ The default storage path on the HMI device is "/UserData". ◦ The default storage path on the PC is "D:/UserData".
File name	Specify the name of the exported file.	Configured as a constant or a variable. The default option is constant "UserData".
Result variable object	Return a value	◦ 2: Executing ◦ 4: Execution success ◦ 12: Execution failure This parameter is optional.

- **Example**

  Use in scripts:

```
function Script_1() {
//Export user data to UserData.csv, save it to the /UserData directory on the USB flash disk connected to USB2 port. The operation status is reflected by the Tag_1 variable.
exportUserData(3,"/UserData ","UserData",SmartTags('Tag_1'));
}
```

19.8.8 Importing User Data

This function is used for importing the specified user data file into the device.

- **Function format**

  importUserData(/*storage location (SD card /USB1/USB2/local disk)*/,/*storage path*/,/*file name*/,/*result variable object*/)

- **Related parameters**

Parameter	Description	Value
Storage location	Specify the location where the file is stored.	◦ 1: SD card of the HMI device ◦ 2: Device connected to USB1 port of the HMI device ◦ 3: Device connected to USB2 port of the HMI device ◦ 4: Local disk of the PC
Storage path	Specify the file storage path.	◦ The default storage path on the HMI device is "/UserData". ◦ The default storage path on the PC is "D:/UserData".
File name	Specify the name of the exported file.	Configured as a constant or a variable. The default option is constant "UserData".
Result variable object	Return a value	◦ 2: Executing ◦ 4: Execution success ◦ 12: Execution failure This parameter is optional.

- **Precautions**

  After 19.8.7 exporting user data from a device, ensure all of the following conditions are met to import the data successfully:

  ◦ The number and names of all roles on the source and target devices, including system roles and user-defined roles, are exactly the same.

  ◦ Each user role also exists on the target device with the same name.

  ◦ Permission differences between roles with the same name do not prevent import; the imported role will inherit the original permissions on the target device.

- **Examples**

  Use in scripts:

```
function Script_1() {
//Import the UserData.csv from the /UserData directory of the USB flash disk connected to USB2 port to the device. The operation status is reflected by the Tag_1 variable.
importUserData(3,"/UserData","UserData",SmartTags('Tag_1'));
}
```

19.9 Configuration

19.9.1 Opening the Control Panel

This function is used for opening the touchscreen control panel.

- **Conditions**

  This function is available only on touchscreens, not on PCs. The control panel cannot be opened on a simulated touchscreen of a PC; it can only be opened on an actual touchscreen.

- **Function format**

  openControlPanel()

- **Example**

  Use in scripts:

```
function Script_1() {
//Open the control panel
openControlPanel()
}
```

19.9.2 Setting the IP Address

This function is used for setting the IP address for the HMI.

- **Conditions**

  This function is available only on touchscreens, not on PCs. It can be executed only on an actual touchscreen, not on a simulated touchscreen of a PC.

- **Function format**

  setIPAddress(/*whether to automatically get the IP (true/false)*/, /*network port selection (0--Port 1/1--Port 2)*/, /*IP address (string): "0.0.0.0"*/, /*subnet mask (string): "0.0.0.0"*/, /*gateway (string): "0.0.0.0"*/, /*result variable object (InOut)*/)

- **Related parameters**

Parameter	Description	Value
Whether to automatically get the IP	Whether to automatically get the IP address.	Configured as a constant. Select {Yes} or {No} from the drop-down list. The default option is {Yes}. ◦ {Yes}: The IP address, subnet mask, and gateway parameters are set to unavailable; ◦ {No}: All parameters are set to available.
Network port selection	Match the physical network port supported by the device.	For IT9000, both Port 1 and Port 2 are supported. The default option is Port 1.

Parameter	Description	Value
IP address	Target IP address to be set by the user.	Configured as a variable or constant. The data type is String. The default option is constant. The default value is null.
Subnet mask	Target subnet mask to be set by the user.	Configured as a variable or constant. The data type is String. The default option is constant. The default value is null.
Gateway	Target gateway to be set by the user.	Configured as a variable or constant. The data type is String. The default option is constant. The default value is null.
Status	Return a value.	Configured as a variable. The data types are Int and UInt. Description of return results: 4: Execution success 12: Execution failure This parameter is optional.

- **Example**

  Use in scripts:

```
function Script_1() {
//Set a static IP. false: not automatically get the IP; 0: Port 1; "0.0.0.127": IP address; "255.255.255.0": Subnet mask; "0.0.0.1": Gateway; smartTags('Tag_1"): object of variable Tag_1
setIPAddress(false,0, "0.0.0.127", "255.255.255.0", "0.0.0.1", smartTags('Tag_1'))
//After the setIPAddress is executed, the result is written to variable Tag_1
//Set a dynamic IP. true: Automatically get the IP; 0: Port 1; smartTags('Tag_1'): object of variable Tag_1
setIPAddress(false, 0, "", "", "", smartTags('Tag_1'))
//After the setIPAddress is executed, the result is written to variable Tag_1
}
```

19.9.3 Setting the Screensaver Time

This function is used for setting the screensaver time.

- **Conditions**

  This function is available only on touchscreens, not on PCs. It can be executed only on an actual touchscreen, not on a simulated touchscreen of a PC.

- **Function format**

  setScreenSaverTime(/*screensaver time (min)*/)

- **Related parameters**

Parameter	Description	Value
Screensaver time	The time interval before the touchscreen switches to the screensaver mode.	Configured as a constant or variable. Only integers can be entered. The constant range is 0-255. The default value is 3, and the unit is minutes.

- **Example**

  Use in scripts:

```
function Script_1() {
//Set the screensaver time to 5 min
setScreenSaverTime(5)
//Set the screensaver time to change based on the value of INT variable Tag_1, smartTags('Tag_1'): object of variable Tag_1
setScreenSaverTime(smartTags('Tag_1'))
}
```

19.9.4 Setting the Backlight Brightness

This function is used for setting the backlight brightness.

- **Conditions**

  This function is available only on touchscreens, not on PCs. It can be executed only on an actual touchscreen, not on a simulated touchscreen of a PC.

- **Function format**

```
setBrightness(/*backlight brightness value (0-100)*/)
```

- **Related parameters**

Parameter	Description	Value
Backlight brightness value	Backlight brightness value of the touchscreen.	Configured as a constant or variable. Only integers can be entered. The constant range is 0-100. The default value is 90.

- **Example**

  Use in scripts:

```
function Script_1() {
//Set the backlight brightness to 80
setBrightness(80)
//Set the backlight brightness to change based on the value of INT variable Tag_1, smartTags('Tag_1') -- object of variable Tag_1
setBrightness(smartTags('Tag_1'))
}
```

19.9.5 Setting the Backlight Mode

This function is used for setting the backlight mode.

- **Conditions**

  This function is available only on touchscreens, not on PCs. It can be executed only on an actual touchscreen, not on a simulated touchscreen of a PC.

- **Function format**

  setBacklightMode(/*Set backlight mode*/)

- **Related parameters**

Parameter	Description	Value
Setting the Backlight Mode	Set whether to enable the backlight mode.	Configured as Enable or Disable. The default option is Enable.

- **Example**

Use in scripts:

```
function Script_1() {
//Enable the backlight mode
setBacklightMode(true)
//Disable the backlight mode
setBacklightMode(false)
}
```

19.9.6 Setting the Backlight Time

This function is used for setting the backlight time.

- **Conditions**

  This function is available only on touchscreens, not on PCs. It can be executed only on an actual touchscreen, not on a simulated touchscreen of a PC.

- **Function format**

  setBacklightTime(/*Backlight off time (min)*/)

- **Related parameters**

Parameter	Description	Value
Backlight off time	Backlight off time of the touchscreen.	Configured as a constant or variable. Only integers can be entered. The constant range is 0–255. The default value is 5, and the unit is minutes.

- **Example**

Use in scripts:

```
function Script_1() {
//Set the backlight time to 5 min
```

```
setBacklightTime(5)
//Set the backlight time to change based on the value of INT variable Tag_1, smartTags('Tag_1'): object of variable Tag_1
setBacklightTime(smartTags('Tag_1'))
}
```

19.9.7 Setting the LED Mode

This function is used for setting the LED mode.

- **Conditions**

  This function is available only on touchscreens, not on PCs. It can be executed only on an actual touchscreen, not on a simulated touchscreen of a PC.

- **Function format**

  setLEDMode(/*LED switch (0--Off/1--On)*/)

- **Related parameters**

Parameter	Description	Value
LED	Set the LED color of the touchscreen.	1--On (yellow), 0--Off (green). The default value is 1.

- **Examples**

  Use in scripts:

```
function Script_1() {
//Set the LED to yellow
setLEDMode(1)
//Set the LED to green
setLEDMode(0)
}
```

19.9.8 Playing a Beep

This function is used for playing a single beep.

- **Conditions**

  This function is available only on touchscreens, not on PCs. It can be executed only on an actual touchscreen, not on a simulated touchscreen of a PC.

- **Function format**

  beep()

- **Example**

  Use in scripts:

```
function Script_1() {
//Calling the beep function triggers the beeper on the device
beep()
}
```

19.9.9 Setting the Sound Mode

This function is used for setting the sound mode. After the setting, both click sound and continuous unacknowledged alarm sounds will follow the defined mode.

- **Conditions**

  This function is available only on touchscreens, not on PCs. It can be executed only on an actual touchscreen, not on a simulated touchscreen of a PC.

- **Function format**

  setSoundMode(/*sound mode (0--Toggle/1--On/2--Off)*/)

- **Related parameters**

Parameter	Description	Value
Sound mode	The On/Off state of the sound.	Configured as Toggle, On, or Off. The default option is Toggle. ◦ Off: Neither the click sound nor the unacknowledged alarm sound can be played. ◦ On: Both click sound and unacknowledged alarm sound can be played. ◦ Toggle: Each execution of this function toggles the sound On/Off state once.

- **Examples**

  Use in scripts:

```
function Script_1() {
//Set the sound mode to be Toggle
setSoundMode(0)
//Set the sound mode to be On
setSoundMode(1)
//Set the sound mode to be Off
setSoundMode(2)
}
```

19.9.10 Restart

This function is used for restarting the operating system of the touchscreen.

- **Conditions**

  This function is available only on touchscreens, not on PCs. It can be executed only on an actual touchscreen, not on a simulated touchscreen of a PC.

- **Function format**

restart()

- **Example**
  Use in scripts:
  ```
  function Script_1() {
  //Restart the device
  restart()
  }
  ```

19.9.11 Safely Removing the Hardware

This function is used for safely removing the hardware.

- **Conditions**

  This function is available only on touchscreens, not on PCs. It can be executed only on an actual touchscreen, not on a simulated touchscreen of a PC.

- **Function format**

  safelyRemoveHardware(/*hardware selection (0--SD card/1--USB flash disk)*/, /*result variable object (InOut)*/)

- **Related parameters**

Parameter	Description	Value
Hardware selection	Select the hardware storage device.	Configured as SD card or USB flash disk. The default option is SD card. For IT9000, SD card, USB1, and USB2 are supported.
Result variable object	Return a value.	4: Execution success 12: Execution failure This parameter is optional.

- **Example**
  Use in scripts:
  ```
  function Script_1() {
  //Safely remove the hardware device
  //smartTags('Tag_1'): object of variable Tag_1;
  safelyRemoveHardware(0, smartTags('Tag_1'))
  //After the safelyRemoveHardware is executed, the result is written to variable Tag_1
  }
  ```

19.9.12 Setting the Language

This function is used for dynamically switching the text language displayed on the screen while the touchscreen device is running. This feature applies only to the text on user screens and does not affect the text displayed on the touchscreen control panel.

- **Function format**
  setLanguage(1)

- **Related parameters**

Parameter	Description	Value
Language	Specify the target language	Check 13.17.2 Runtime Configuration to confirm available languages and their numbers. ◦ Language number: Enter the target language number. Each language corresponds to a unique number. ◦ "-1": Switch languages in a loop according to the order specified in the Runtime Configuration. If the entered number is outside the range of available languages in the 13.17.2 Runtime Configuration, it is an invalid value and the system will not respond. You can also dynamically switch the language number using the SINT, INT, DINT, or LINT variable.
Status	Return a value.	4: Execution success 12: Execution failure This parameter is optional.

- **Examples**

  Use in scripts:

```
setLanguage(2057) //Set "English (UK)" as the fixed target language.
setLanguage(smartTags('Language'), smartTags('Status')) // Switch the language according to the value of variable Language and return the execution result to variable Status.
setLanguage(-1) //The target language is not fixed; the language scope and order are specified in the Runtime Configuration.
```

19.9.13 Unlocking Installments

This function is used to manage the unlock installment range and validate the installment password under the device's installment payment strategy during operation.

- **Function format**

```
unlockTerm(/*installment selection (1--Current installment / 2--All installments)*/,/*installment password variable object (InOut) **/)
```

- **Related parameters**

Parameter	Description	Value
Mode	Installment unlocking option	Current installment: the installment about to be unlocked. All installments: all installments to be unlocked under the installment payment strategy.
Password	Installment unlocking password	Supported variable types: String and Wstring.

- **Examples**

  Use in scripts:

```
function Script_1() {
```

```
//Dynamically unlock the next installment and verify the accuracy of the password entered for the variable "password".
unlockTerm(1,smartTags('password'));
}
```

19.9.14 Triggering Installments in Advance

This function allows early unlocking of the installment that is about to be unlocked or all subsequent installments not yet unlocked in the active installment payment strategy of a device.

- **Conditions**
  The installment payment strategy contains installments to be unlocked.
- **Function format**
  advanceTriggerTerm()
- **Examples**
  Use in scripts:

```
function Script_1() {
//Trigger the installment unlocking
advanceTriggerTerm();
}
```

19.9.15 Minimizing the Software

This function is used to minimize the software.

- **Conditions**

This function is available only on PCs.

- **Function format**

minimizeWindow()

- **Example**
  Use in scripts:

```
function Script_1 () {
//Minimize the software
minimizeWindow()
}
```

19.9.16 Exiting the Software

This function is used to exit the software.

- **Conditions**

This function is available only on PCs.

- **Function format**

exitServiceManager()

- **Example**
  Use in scripts:

```
function Script_1() {
//Exit the software
exitServiceManager()
}
```

19.10 Date and Time

19.10.1 Setting the Date and Time

This function is used for setting the HMI date and time, including year, month, day, hour, minute, and second.

- **Conditions**

  This function is available only on touchscreens, not on PCs. It can be executed only on an actual touchscreen, not on a simulated touchscreen of a PC.

- **Function format**

  setDateTime(/*year*/,/*month*/,/*day*/,/*hour*/,/*minute*/,/*second*/)

- **Related parameters**

Parameter	Description	Value
Year	Configured as Int or UInt variable.	The default value is null.
Month	Configured as Int or UInt variable.	The default value is null.
Day	Configured as Int or UInt variable.	The default value is null.
Hour	Configured as Int or UInt variable.	The default value is null.
Minute	Configured as Int or UInt variable.	The default value is null.
Second	Configured as Int or UInt variable.	The default value is null.

- **Precautions**
  When the currently logged-in account is locked, the system does not allow online changes to the date and time.

- **Example**
  Use in scripts:

```
function Script_1() {
//Set the HMI date and time, including year, month, day, hour, minute, and second. This function is supported by touchscreens only
//smartTags('Tag_1'), variable bound to the year. After the setting, the year of the current system is the current value of Tag_1
//smartTags('Tag_2'), variable bound to the month. After the setting, the month of the current system is the current value of Tag_2
//smartTags('Tag_3'), variable bound to the day. After the setting, the day of the current system is the current value of Tag_3
//smartTags('Tag_4'), variable bound to the hour. After the setting, the hour of the current system is the current value of Tag_4
//smartTags('Tag_5'), variable bound to the minute. After the setting, the minute of the current system is
```

```
the current value of Tag_5
//smartTags('Tag_6'), variable bound to the second. After the setting, the second of the current system is the current value of Tag_6
setDateTime(smartTags('Tag_1'),smartTags('Tag_2'),smartTags('Tag_3'),smartTags('Tag_4'),smartTags('Tag_5'),smartTags('Tag_6'));
}
```

19.10.2 Setting the Time Zone

This function is used for setting the HMI time standard (Universal Time Coordinated, UTC).

- **Conditions**

  This function is available only on touchscreens, not on PCs. It can be executed only on an actual touchscreen, not on a simulated touchscreen of a PC.

- **Function format**

  setTimeZone(/*time zone (UTC)*/)

- **Related parameters**

Parameter	Description	Value
Time zone (UTC)	Configured as a constant. Select an option from the drop-down list.	The default option is UTC.

- **Precautions**

  When the currently logged-in account is locked, the system does not allow online changes to the time zone.

- **Example**

  Use in scripts:

```
function Script_1() {
//Set the HMI time standard as UTC
//After the setting, the system's current time zone changes to the selected time zone. See the parameter settings in the scripts
setTimeZone("international date line (UTC-12:00)");
}
```

19.10.3 Setting the Date

This function is used for setting the HMI date, including the year, month, and day.

- **Conditions**

  This function is available only on touchscreens, not on PCs. It can be executed only on an actual touchscreen, not on a simulated touchscreen of a PC.

- **Function format**

  setDate(/*year*/, /*month*/, /*day*/)

- **Related parameters**

Parameter	Description	Value
Year	Configured as Int or UInt variable.	The default value is null.
Month	Configured as Int or UInt variable.	The default value is null.
Day	Configured as Int or UInt variable.	The default value is null.

- **Precautions**
  When the currently logged-in account is locked, the system does not allow online changes to the date.
- **Example**
  Use in scripts:

```
function Script_1() {
//Set the HMI date, including year, month, and day. This function is supported by touchscreens only
//smartTags('Tag_1'), variable bound to the year. After the setting, the year of the current system time is the current value of Tag_1
//smartTags('Tag_2'), variable bound to the month. After the setting, the month of the current system time is the current value of Tag_2
//smartTags('Tag_3'), variable bound to the day. After the setting, the day of the current system time is the current value of Tag_3
setDate(smartTags('Tag_1'), smartTags('Tag_2'), smairtTags('Tag_3'));
}
```

19.10.4 Setting the Time

This function is used for setting the HMI time, including hour, minute, and second.

- **Conditions**

  This function is available only on touchscreens, not on PCs. It can be executed only on an actual touchscreen, not on a simulated touchscreen of a PC.

- **Function format**

  ```
  setTime(/*hour*/,/*minute*/,/*second*/)
  ```

- **Related parameters**

Parameter	Description	Value
Hour	Configured as Int or UInt variable.	The default value is null.
Minute	Configured as Int or UInt variable.	The default value is null.
Second	Configured as Int or UInt variable.	The default value is null.

- **Precautions**
  When the currently logged-in account is locked, the system does not allow online changes to the time.
- **Example**
  Use in scripts:

```
function Script_1() {
//Set the HMI time, including hour, minute, and second
//smartTags('Tag_4'), variable bound to the hour. After the setting, the hour of the current system time is the current value of Tag_4
```

```
//smartTags('Tag_5'), variable bound to the minute. After the setting, the minute of the current system time is the current value of Tag_5
//smartTags('Tag_6'), variable bound to the second. After the setting, the second of the current system time is the current value of Tag_6
setTime(smartTags('Tag_4'), smartTags('Tag_5'), smartTags('Tag_6'));
}
```

19.10.5 Getting the Date and Time

This function is used for writing the latest date and time to a variable.

- **Function format**

```
getDateTime(/*variable (Inout)*/)
```

- **Related parameters**

Parameter	Description	Value
Variable	Configured as a variable. The data type is DateTime.	The default value is null.

- **Example**

Use in scripts:

```
function Script_1() {
//Assign the current system time to the datetime variable
//After this function is executed, the value of variable Tag_8 is the current system time, which can be viewed in the date time domain
getDateTime(smartTags('Tag_8'));
}
```

19.10.6 Getting the Timestamp

This function is used for getting the current timestamp of the CPU and writing it to a variable.

- **Function format**

```
getTimeStamp(/*variable (InOut)*/)
```

- **Related parameters**

Parameter	Description	Value
Variable	Output variable for the timestamp.	The default value is null.

- **Example**

Use in scripts:

```
function Script_1() {
//Get the current timestamp of the system and write it to a Lint or ULINT variable
//smartTags('Tag_19'): After this function is executed, the value of variable Tag_19 is the current timestamp of the system, accurate to milliseconds
getTimeStamp(smartTags('Tag_19'));
}
```

19.11 Print

19.11.1 Screenshot

The screenshot function is used for capturing the current screen image. The screenshot area on a monitor is the display area of the monitoring software (excluding device borders); the screenshot area on a touchscreen is the entire screen display area.

Screenshot files are named according to the rule "screenshot_YYYY-MM-DD_HH-MM-SS-MS" and stored in PNG format.

- **Function format**

  screenshot(/*storage location*/, /*storage path*/, /*status*/)

- **Related parameters**

Parameter	Description	Value
Storage location	The supported storage locations include SD card and USB.	SD card, USB: The number of stored screenshots depends on the file size and available storage space. If the storage is full, the screenshot operation will fail. ◦ 1: SD card of IT9000 device ◦ 2: Device connected to USB1 port of IT9000 device ◦ 3: Device connected to USB2 port of IT9000 device
Storage path	Specify the storage path for the screenshot files. Both constants and variables are supported, but variables cannot be used within JavaScript scripts.	◦ Constant: fixed value. The relative path must be entered. Enter the folder name only, such as "/screenShot", rather than the full path. If the folder titled Screenshot does not exist, the system will create it automatically. ◦ Variable: String variables are supported.
Status	Return the result of the screenshot operation, represented by INT or UINT variable value.	2: Executing 4: Execution success 12: Execution failure This parameter is optional.

- **Example**

  Use in scripts:

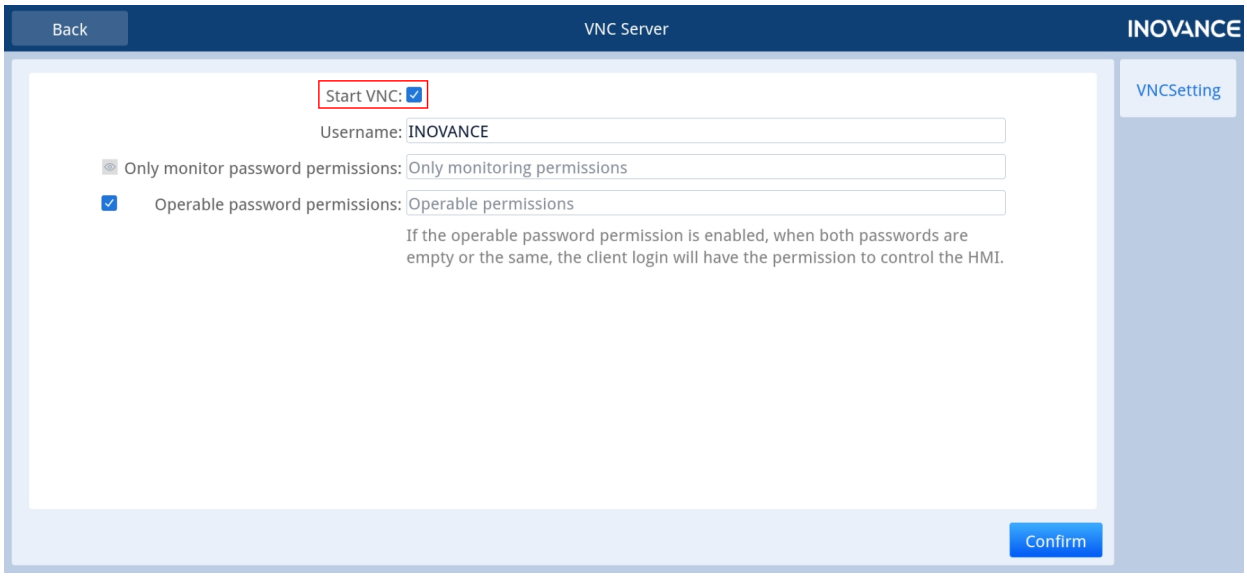
```
//2: Take a screenshot and save it to USB1 of IT9000
// "/screenShot": storage path
// smartTags('status_1'): associated with variable status_1. When the operation is successful, status_1 returns 4; otherwise, status_1 returns 12

screenshot(2,"/screenShot",smartTags('status_1'));
```

19.12 VNC Operations

19.12.1 Setting the VNC Enable

19.12.2 Setting the VNC Username



19.12.3 Setting the VNC View-Only Password

19.12.4 Setting the VNC Control Password

19.12.5 Setting the VNC Control Permission

19.12.1 Setting the VNC Enable

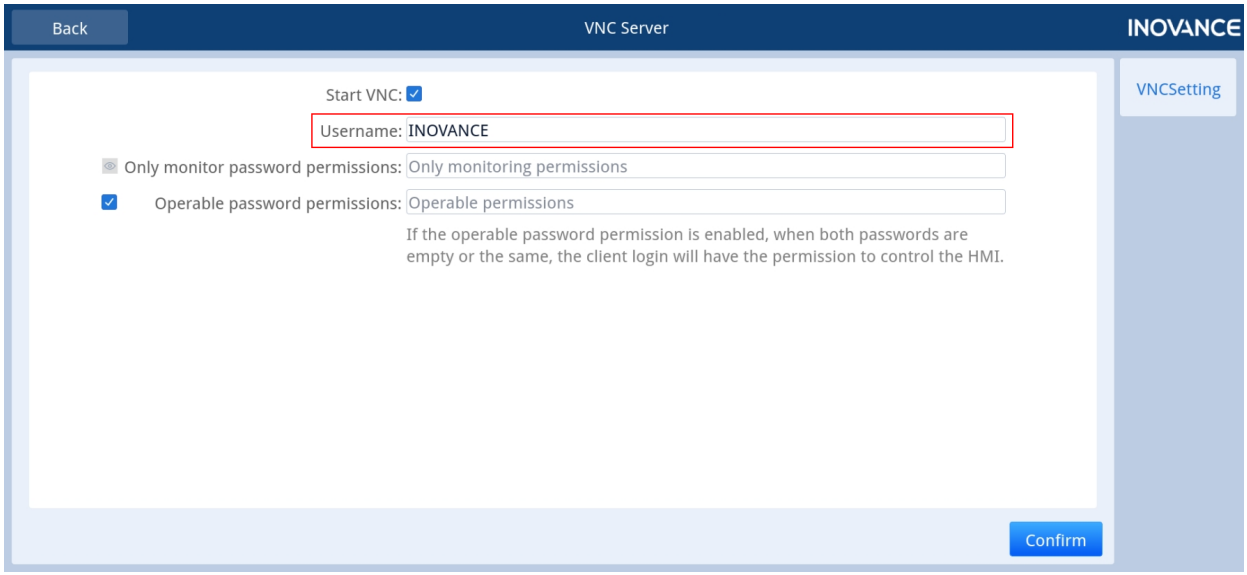
The setVNCEnable function is used for controlling whether to enable the VNC server. It has the same function as the Enable VNC option on the hardware touchscreen.

- **Function format**

  setVNCEnable(/*enable flag*/, /*status*/)

- **Related parameters**

Parameter	Description	Value
Enable flag	Enable command	Constants: Enable (True), Disable (False) Variables: Bool type
Status	Return a value	2: Executing 4: Execution success 12: Execution failure This parameter is optional.



- **Example**

  Use in scripts:

```
//Enable the VNC server and return the execution result to the variable Status.
setVNCEnable(true, smartTags('status'));
```

19.12.2 Setting the VNC Username

The setVNCName function is used for specifying the username for accessing the VNC server. It has the same function as the "Username" option on the hardware touchscreen.

- **Function format**

  setVNCName(/*username*/,/*status*/)

- **Related parameters**

Parameter	Description	Value
Username	Required field. Up to 32 English characters.	Constant or String variable
Status	Return a value	2: Executing 4: Execution success 12: Execution failure This parameter is optional.

- **Example**

  Use in scripts:

```
function Script_2() {
//Specify the username for accessing the VNC server as User_01, and return the execution result to the variable Status.
setVNCName("User_01", smartTags('Status'));
}
```

19.12.3 Setting the VNC View-Only Password

The setVNCOnlyViewPassword function is used for setting the VNC view-only password. It has the same function as the View-Only Password option on the hardware touchscreen.

This password allows users to access the server in view-only mode, providing the permission to view screen without any interactive operations.

- **Function format**

  setVNCOnlyViewPassword(/*password*/, /*status*/)

- **Related parameters**

Parameter	Description	Value
Password	Optional field. Up to 32 characters, including letters, numbers, special characters, and punctuations.	
Status	Return a value	2: Executing 4: Execution success 12: Execution failure This parameter is optional.

- **Example**

  Use in scripts:

```
function Script_3() {
//Set the username and password with view-only permission, and return the execution result of setVNCOnlyViewPassword to the variable Status_view.
setVNCName("User_01",smartTags('Status'));
setVNCOnlyViewPassword("Aa123456", smartTags('Status_view'))
}
```

19.12.4 Setting the VNC Control Password

The setVNCControlPassword function is used for setting the VNC control password. It has the same function as the Control Password option on the hardware touchscreen.

This function can be used to set a password. However, you can use the password to access the server and control/modify system configurations only when the control permission is enabled (through the setVNCControlPermission function).

- **Function format**

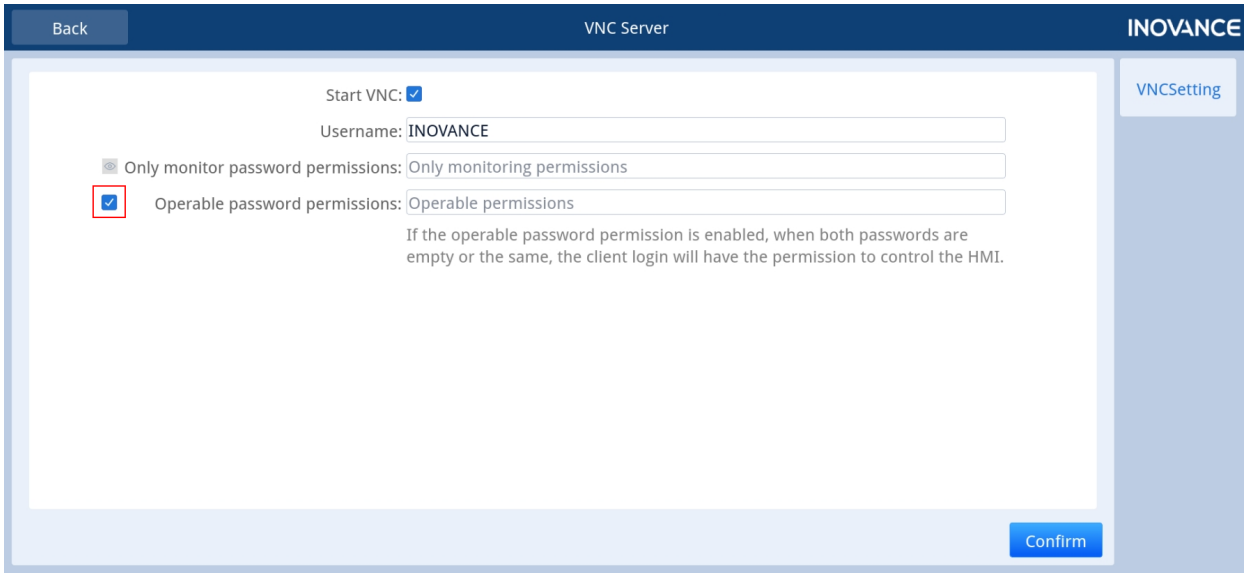
  setVNCControlPassword(/*password*/,/*status*/)

- **Related parameters**

Parameter	Description	Value
Password	Optional field. Up to 32 characters, including letters, numbers, special characters, and punctuations.	-
Status	Return a value	2: Executing 4: Execution success 12: Execution failure This parameter is optional.

- **Example**

  Use in scripts:



```
function Script_4() {
//Set the username and password with control permission, and return the execution result of setVNCControlPassword to the variable Status_control.
setVNCName("User_01",smartTags('Status'));
setVNCControlPassword("Aa123456", smartTags('Status_control'));
}
```

19.12.5 Setting the VNC Control Permission

The setVNCControlPermission function is used for enabling or disabling the VNC control permission. It has the same function as the Control Password option on the hardware touchscreen.

This function enables interactive operations, including controlling and modifying system configurations, after control password verification.

Only when this permission is enabled can users use the control password to gain full access rights.

- **Function format**

  setVNCControlPermission(/*enable flag*/, /*status*/)

- **Related parameters**

Parameter	Description	Value
Enable flag	Enable command	Constants: Enable (True), Disable (False) Variables: Bool type
Status	Return a value	2: Executing 4: Execution success 12: Execution failure This parameter is optional.

- **Example**

  Use in scripts:

```
//Enable the VNC remote control permission, and return the execution result to the variable Status.
setVNCControlPermission(true, smartTags('status')
```

19.13 Timer

Name	Function	Format	Example

Set periodic task	setIntervalTask	setintervalTask(/*callback function*/,/*execution interval*/)	function Script_1() {
			//Execute the increaseValue function periodically, where increaseValue is the function object executed by the periodic task, and the scheduled interval is 1000 (ms)
			//smartTags('Tag_1')--object of variable Tag_1; 1 means increment step; true means resetting after exceeding the limit; false means not recording the operation
			let id=setIntervalTask(increaseValue, 1000,smartTags('Tag_1'),1,true,false);
			//The return value id is the id of the periodic task and is used to stop the periodic task. Write the id into variable Tag_1
			setValue(smartTags('Tag_1'),id);
			//After the setValue is executed, the value of variable Tag_1 is the id
			}

Clear periodic task	clearIntervalTask	clearIntervalTask(/*timer flag*/)	function Script_1() {
			//Stop a periodic task
			//Get the id of the periodic task, smartTags('Tag_1')--object of variable Tag_1
			let id=getValue(smartTags('Tag_1');
			//Stop the periodic task based on the id clearIntervalTask(id);
			}

Name	Function	Format	Example

Set timeout task	setTimeoutTask	setTimeoutTask(/*callback func*/,/*scheduled time*/)	function Script_1() {
			//Delay the execution of the increaseValue function, where increaseValue is the function object executed by the delay task, and the delay interval is 5000 (ms)
			//smartTags('Tag_1')--object of variable Tag_1; 1 means increment step; true means resetting after exceeding the limit; false means not recording the operation
			let id=setTimeoutTask(increaseValue, 1000,smartTags('Tag_1'),1,true,false);
			//The return value id is the id of the delay task and is used to stop the delay task. Write the id into variable
			Tag_1setValue(smartTags('Tag_1'),id);
			//After the setValue is executed, the value of variable Tag_1 is the id
			}

Clear timeout task	clearTimeoutTask	clearTimeoutTask(/*timer flag*/)	function Script_1() {
			//Stop a delay task
			//Get the id of the delay task, smartTags('Tag_1')--object of variable Tag_1
			let id=getValue(smartTags('Tag_1');
			//Stop the delay task based on
			the id clearTimeoutTask(id);
			}

20 Hardware Device

20.1 Introduction to Hardware Guides

Diverse hardware devices can be configured in the iFA software. You can obtain the guides for a device in the following two ways to review parameter details and other information.

- iFA help system
  The guides for hardware devices supported by iFA have been integrated into the help system. After selecting a device in the device list of the iFA software, press “F1” to access the guide information page for the selected device in the help system.
- Inovance website
  Visit https://www.inovance.com/global, choose Service&Support > Support > Documentation Download.

> NOTE
>
> The guide links can be accessed with network connectivity.
>
> The guides for some devices are not yet available on the Inovance website. Pressing “F1” after selecting such a device redirects to the help system homepage. We will continuously update or complete the device guides.

20.2 PLC

20.2.1 EVO400

Product Series	Description	Link to the Guide
EVO410-A12P16	Introduces product information, installation, wiring, configuration and commissioning, fault diagnosis, and maintenance of the EVO400 series PLCs.	EVO400 Series Programmable Logic Controller User Guide
EVO410-A14P16		
EVO410-A15P16

EVO410-A15N16		
EVO410-A17N16		

20.2.2 EVO500

Product Series	Description	Link to the Guide
EVO510-A12P16	Introduces product information, installation, wiring, configuration and commissioning, fault diagnosis, and maintenance of the EVO510 series PLCs.	EVO510 Programmable Logic Controller User Guide
EVO510-A14P16		
EVO510-A15P16		
EVO521-0808TN(TP)	Introduces product information, mechanical installation, electrical installation, and communication connections of the EVO500 series PLCs.	EVO500 Series Programmable Logic Controller User Guide
EVO522-0808TN(TP)		
EVO523-0808TN(TP)		

20.2.3 EVO700

Product Series	Description	Link to the Guide
EVO763-0804TN	Introduces product information, installation, wiring, power connection and disconnection, configuration and commissioning, functions, fault diagnosis, maintenance, and servicing of the EVO700 series PLCs.	EVO700 Series Programmable Logic Controller User Guide
EVO764-0804TN		
EVO764-0804TN-Q		
EVO765-0804TN		
EVO766-0804TN		

20.2.4 EVO700C

Product Series	Description	Link to the Guide
EVO760C-C30	Introduces product information, installation, wiring, configuration and commissioning, fault diagnosis, and maintenance of the EVO760C series PLCs.	EVO760C Ultra-Compact Intelligent Controller User Guide
EVO760C-C40		
EVO780C-A60	Introduces product information, installation, wiring, configuration and commissioning, fault diagnosis, and maintenance of the EVO780C series PLCs.	EVO780C Series Intelligent Programmable Logic Controller User Guide
EVO780C-A70		
EVO780C-A80		

20.2.5 EVO800

Product Series	Description	Link to the Guide
EVO810	A collection of guides for the EVO800 series large-scale programmable logic controller redundant system, including system guide and equipment guide. • Equipment guide: Provides a brief overview of product properties, including model and nameplate, components, technical specifications, and terminal assignment. • System guide: Covers all typical use scenarios of the system, with detailed description of the system, installation, wiring, configuration and commissioning, and fault diagnosis.	EVO800 Series Large-Scale Programmable Logic Controller Redundant System Guide Collection
EVO820		

20.2.6 EVO1000

Product Series	Description	Link to the Guide
EVO1000EF	A collection of guides for the EVO1000EF series failsafe PLC, including system guide and equipment guide. • Equipment guide: Provides a brief overview of product properties, including model and nameplate, components, technical specifications, and terminal assignment. • System guide: Covers all typical use scenarios of the system, with detailed description of the system, installation, wiring, configuration and commissioning, and fault diagnosis.	EVO1000EF Series Failsafe PLC User Guide

20.2.7 APC

Product Series	Description	Link to the Guide
APC520-A10P16	Introduces product information, installation, wiring, configuration and commissioning, functions, and fault diagnosis of the APC520C series PLCs.	APC520 Series Advanced Process Controller User Guide
APC520-A10N16		
APC760C-A10	Introduces product information, installation, wiring, configuration and commissioning, functions, and fault diagnosis of the APC760C series PLCs.	APC760C Series Advanced Process Controller User Guide

GR10-0808ETNE	Introduces product information, mechanical design, electrical design, and software diagnostics of the GR10-0808ETNE module.	GR10-0808ETNE EtherCAT Slave I/O Module User Guide
GR10-1616ETNE	Introduces product information, mechanical design, electrical design, and software diagnostics of the GR10-1616ETNE module.	GR10-1616ETNE EtherCAT Slave I/O Module User Guide

20.4.3.2 AI

Product Series	Description	Link to the Guide
GR10-4ADE	Introduces product information, mechanical and electrical design, programming examples, and software diagnostics of the GR10-4ADE module.	GR10-4ADE Analog Input Module User Guide

20.4.3.3 AO

Product Series	Description	Link to the Guide
GR10-4DAE	Introduces product information, mechanical and electrical design, programming examples, and software diagnostics of the GR10-4DAE module.	GR10-4DAE Analog Output Module User Guide

20.4.3.4 Temperature

Product Series	Description	Link to the Guide
GR10-8TCE	Introduces product information, mechanical design, electrical design, programming examples, and software diagnostics of the GR10-8TCE module.	GR10-8TCE Temperature Detection Module User Guide

20.4.3.5 Pulse Input

Product Series	Description	Link to the Guide
GR10-2HCE	Introduces specifications, features, and use methods of the GR10-2HCE module.	GR10-2HCE EtherCAT Slave Counter Module User Guide
GR10-5HCE	Introduces specifications, features, and use methods of the GR10-5HCE module.	GR10-5HCE EtherCAT Slave Counter Module User Guide

20.4.3.6 Pulse Output

Product Series	Description	Link to the Guide
GR10-2PHE	Introduces product information, mechanical design, electrical design, and software diagnostics of the GR10-2PHE module.	GR10-2PHE High-Speed Differential Pulse Positioning Remote Module User Guide
GR10-4PME	Introduces product information, mechanical design, electrical design, and software diagnostics of the GR10-4PME module.	GR10-4PME EtherCAT Slave Positioning Module User Guide

20.4.3.7 EtherCAT Splitter

Product Series	Description	Link to the Guide
GR10-EC-3SW	Introduces product information, specifications, mechanical installation, and electrical installation of the GR10-EC-3SW module.	GR10-EC-3SW 3-Port EtherCAT Splitter Module User Guide
GR10-EC-6SW	Introduces product information, specifications, mechanical design, and electrical design of the GR10-EC-6SW module.	GR10-EC-6SW 6-Port EtherCAT Splitter Module User Guide

20.4.4 GR20

20.4.4.1 Digital Slave

Product Series	Description	Link to the Guide
GR20-16EMNL	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GR20-16EMNL module.	GR20-16EMNL Digital Input and Output Module User Guide
GR20-16EMPL	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GR20-16EMPL module.	GR20-16EMPL Digital Input and Output Module User Guide
GR20-16EMNL-BIT	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GR20-16EMNL module.	GR20-16EMNL Digital Input and Output Module User Guide
GR20-16EMNL-BYTE	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GR20-16EMNL module.	GR20-16EMNL Digital Input and Output Module User Guide
GR20-16EMPL-BIT	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GR20-16EMPL module.	GR20-16EMPL Digital Input and Output Module User Guide
GR20-16EMPL-BYTE	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GR20-16EMPL module.	GR20-16EMPL Digital Input and Output Module User Guide

20.4.4.2 Optical Fiber Converter

Product Series	Description	Link to the Guide
GR20-1OP	Introduces product information, mechanical installation, and electrical installation of the GR20-1OP-EN module.	GR20-1OP-EN Fiber Optic Converter Module User Guide

20.4.5 GR20T

20.4.5.1 DI

Product Series	Description	Link to the Guide
GR20T-ECT-1600END	Introduces product information, mechanical installation, electrical installation, program commissioning, and fault diagnosis of the GR20T-ECT-1600END/3200END module.	GR20T-ECT-1600END/3200END Digital Input Module User Guide
GR20T-ECT-3200END		

20.4.5.2 DO

Product Series	Description	Link to the Guide
GR20T-ECT-0016ETN	Introduces product information, mechanical installation, electrical installation, program commissioning, and fault diagnosis of the GR20T-ECT-0016ETN /0032ETN module.	GR20T-ECT-0016ETN/0032ETN Digital Output Module User Guide
GR20T-ECT-0032ETN		
GR20T-ECT-0016ETP	Introduces product information, mechanical installation, electrical installation, program commissioning, and fault diagnosis of the GR20T-ECT-0016ETP /0032ETP module.	GR20T-ECT-0016ETP/0032ETP Digital Output Module User Guide
GR20T-ECT-0032ETP		

20.4.5.3 DI/DO

Product Series	Description	Link to the Guide
GR20T-ECT-0808EMN	Introduces product information, mechanical installation, electrical installation, program commissioning, and fault diagnosis of the GR20T-ECT-0808EMN/1616EMN module.	GR20T-ECT-0808EMN/1616EMN Digital Input and Output Module User Guide
GR20T-ECT-1616EMN		
GR20T-ECT-1616EMN-E	Introduces product information, mechanical installation, electrical installation, program commissioning, and fault diagnosis of the GR20T-ECT-1616EMN-E module.	GR20T-ECT-1616EMN-E Digital Input and Output Module User Guide

20.4.6 GS20

20.4.6.1 IO-Link Master

Product Series	Description	Link to the Guide
GS20-ECT-8L	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-ECT-8L high-protection IO-Link master module.	GS20-ECT-8L High Protection IO-Link Master Module User Guide
GS20-EIP-8L	Introduces product information, mechanical installation, electrical installation, program commissioning, WEB functionality, fault diagnosis, and version compatibility information of the GS20-EIP-8L module.	GS20-EIP-8L Series High Protection IO-Link Master Module User Guide

20.4.6.2 Digital Slave

Product Series	Description	Link to the Guide
GS20-16EMNL	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-16EMNL module.	GS20-16EMNL Digital Input and Output Module User Guide
GS20-16EMPL	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-16EMPL module.	GS20-16EMPL Digital Input and Output Module User Guide
GS20-16EMNL-S	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-16EMNL-S module.	GS20-16EMNL-S Series Digital Input and Output Module User Guide

Product Series	Description	Link to the Guide
GS20-16EMPL-S	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-16EMPL-S module.	GS20-16EMPL-S Series Digital Input and Output Module User Guide
GS20-IOL-16EMPHC	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-IOL-16EMPHC/16EMNHC module.	GS20-IOL-16EMPHC/16EMNHC Series Digital Input and Output Module User Guide
GS20-IOL-16EMNHC		
GS20-IOL-16EMPTEC	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-IOL-16EMPTEC/16EMNTEC module.	GS20-IOL-16EMPTEC_16EMNTEC Series Digital Input and Output Module User Guide
GS20-IOL-16EMNTEC		
GS20-IOL-16EMPT	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-IOL-16EMPT/16EMNT module.	GS20-IOL-16EMPT/16EMNT Digital Input and Output Module User Guide
GS20-IOL-16EMNT		
GS20-16EMNL-BIT	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-16EMNL module.	GS20-16EMNL Digital Input and Output Module User Guide
GS20-16EMNL-BYTE	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-16EMNL module.	GS20-16EMNL Digital Input and Output Module User Guide
GS20-16EMNL-S-BYTE	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-16EMNL-S module.	GS20-16EMNL-S Series Digital Input and Output Module User Guide

Product Series	Description	Link to the Guide
GS20-16EMNL-SC	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-16EMNL-SC module.	GS20-16EMXL-SC Digital Input and Output Module User Guide
GS20-16EMPL-BIT	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-16EMPL module.	GS20-16EMPL Digital Input and Output Module User Guide
GS20-16EMPL-BYTE	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-16EMPL module.	GS20-16EMPL Digital Input and Output Module User Guide
GS20-16EMPL-S-BYTE	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-16EMPL-S module.	GS20-16EMPL-S Series Digital Input and Output Module User Guide
GS20-IOL-16EMPHC-J	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-IOL-16EMPHC/16EMNHC module.	GS20-IOL-16EMPHC/16EMNHC Series Digital Input and Output Module User Guide
GS20-IOL-16EMNHC-J		
GS20-IOL-16EMPTEC-J	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-IOL-16EMPTEC/16EMNTEC module.	GS20-IOL-16EMPTEC_16EMNTEC Series Digital Input and Output Module User Guide
GS20-IOL-16EMNTEC-J		

20.4.6.3 Analog Slave

Product Series	Description	Link to the Guide
GS20-IOL-8ADH	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-IOL-8ADH module.	GS20-IOL-8ADH Series Analog Input Module User Guide
GS20-IOL-12ENP2DAH	Introduces product information, mechanical installation, electrical installation, program commissioning, fault diagnosis, and object list of the GS20-IOL-12ENP2DAH module.	GS20-IOL-12ENP2DAH Series Digital and Analog Hybrid Module User Guide

20.4.7 GE20

20.4.7.1 Local Expansion Module

Product Series	Description	Link to the Guide
GE20-232/485	Introduces product information, mechanical installation, electrical installation, and programming examples of the GE20-232/485 communication expansion card.	GE20-232/485 Communication Expansion Card User Guide
GE20-232/485-RTC	Introduces product information, mechanical installation, electrical installation, and programming examples of the GE20-232/485-RTC communication expansion card.	GE20-232/485-RTC Communication Expansion Card User Guide
GE20-2AD1DA-I	Introduces product information, mechanical installation, electrical installation, and programming examples for the GE20-2AD1DA-I analog current input and output expansion card.	GE20-2AD1DA-I Analog Input and Output Current-Type Expansion Card User Guide
GE20-2AD1DA-V	Introduces product information, mechanical installation, electrical installation, and programming examples of the GE20-2AD1DA-V analog voltage input and output expansion card.	GE20-2AD1DA-V Analog Input and Output Voltage-Type Expansion Card User Guide

Product Series	Description	Link to the Guide
GE20-4DI	Introduces product information, mechanical installation, electrical installation, and programming examples of the GE20-4DI digital input expansion card.	GE20-4DI Digital Input Expansion Card User Guide
GE20-4DO-TN	Introduces product information, mechanical installation, electrical installation, and programming examples of the GE20-4DO-TN sink transistor output expansion card.	GE20-4DO-TN Sink-Type Transistor Output Expansion Card User Guide
GE20-RTC	Introduces product information, mechanical installation, electrical installation, and programming examples of the GE20-RTC clock expansion card.	GE20-RTC Clock Expansion Card User Guide
GE20-TF	Introduces product information, mechanical installation, and programming examples of the GE20-TF memory expansion card.	GE20-TF Memory Expansion Card User Guide
GE20-TF-RTC	Introduces product information, mechanical installation, and programming examples of the GE20-TF-RTC memory expansion card.	GE20-TF-RTC Memory Expansion Card (Integrated RTC) User Guide
GE20-CAN-485	Introduces product information, mechanical installation, electrical installation, and programming examples of the GE20-CAN-485 communication expansion card.	GE20-CAN-485 Communication Expansion Card User Guide

20.4.8 Hi50

20.4.8.1 I/O Coupler

Product Series	Description	Link to the Guide
Hi50-RTU-EIP-R00	A collection of equipment guides and system guides for Hi50 series I/O modules, covering all application scenarios of the system and including product information, system overview, EtherNet/IP, installation, wiring, configuration and commissioning, and fault diagnosis.	Hi50 Series Failsafe I/O System User Guide

20.4.8.2 DI

Product Series	Description	Link to the Guide
Hi50-0800END-F00	A collection of equipment guides and system guides for Hi50 series I/O modules, covering all application scenarios of the system and including product information, system overview, EtherNet/IP, installation, wiring, configuration and commissioning, and fault diagnosis.	Hi50 Series Failsafe I/O System User Guide

20.4.8.3 DO

Product Series	Description	Link to the Guide
Hi50-0004ETP-F2A	A collection of equipment guides and system guides for Hi50 series I/O modules, covering all application scenarios of the system and including product information, system overview, EtherNet/IP, installation, wiring, configuration and commissioning, and fault diagnosis.	Hi50 Series Failsafe I/O System User Guide
Hi50-0008ETP-F00		

20.4.8.4 AI

Product Series	Description	Link to the Guide
Hi50-4ADI-F00	A collection of equipment guides and system guides for Hi50 series I/O modules, covering all application scenarios of the system and including product information, system overview, EtherNet/IP, installation, wiring, configuration and commissioning, and fault diagnosis.	Hi50 Series Failsafe I/O System User Guide
Hi50-4ADV-F00		

20.4.8.5 Temperature

Product Series	Description	Link to the Guide
Hi50-4PT-F00	A collection of equipment guides and system guides for Hi50 series I/O modules, covering all application scenarios of the system and including product information, system overview, EtherNet/IP, installation, wiring, configuration and commissioning, and fault diagnosis.	Hi50 Series Failsafe I/O System User Guide
Hi50-4TC-F00		

20.4.8.6 Stopper Plate

Product Series	Description	Link to the Guide
Hi50-3ATT-000	A collection of equipment guides and system guides for Hi50 series I/O modules, covering all application scenarios of the system and including product information, system overview, EtherNet/IP, installation, wiring, configuration and commissioning, and fault diagnosis.	Hi50 Series Failsafe I/O System User Guide

20.4.9 Hi80

20.4.9.1 I/O Coupler

Product Series	Description	Link to the Guide
Hi80-RTU-EIP	A collection of equipment guides and system guides for Hi80 series I/O modules, covering all application scenarios of the system and including product information, system overview, EtherNet/IP, installation, wiring, configuration and commissioning, and fault diagnosis.	Hi80 Series High-Performance Distributed I/O System User Guide

20.4.9.2 DI

Product Series	Description	Link to the Guide
Hi80-1600ENP	A collection of equipment guides and system guides for Hi80 series I/O modules, covering all application scenarios of the system and including product information, system overview, EtherNet/IP, installation, wiring, configuration and commissioning, and fault diagnosis.	Hi80 Series High-Performance Distributed I/O System User Guide

20.4.9.3 DO

Product Series	Description	Link to the Guide
Hi80-0016ETP	A collection of equipment guides and system guides for Hi80 series I/O modules, covering all application scenarios of the system and including product information, system overview, EtherNet/IP, installation, wiring, configuration and commissioning, and fault diagnosis.	Hi80 Series High-Performance Distributed I/O System User Guide

20.4.9.4 AI

Product Series	Description	Link to the Guide
Hi80-8ADI	A collection of equipment guides and system guides for Hi80 series I/O modules, covering all application scenarios of the system and including product information, system overview, EtherNet/IP, installation, wiring, configuration and commissioning, and fault diagnosis.	Hi80 Series High-Performance Distributed I/O System User Guide
Hi80-8ADV		

20.4.9.5 AO

Product Series	Description	Link to the Guide
Hi80-8DAI	A collection of equipment guides and system guides for Hi80 series I/O modules, covering all application scenarios of the system and including product information, system overview, EtherNet/IP, installation, wiring, configuration and commissioning, and fault diagnosis.	Hi80 Series High-Performance Distributed IO System User Guide
Hi80-8DAV		

20.4.9.6 Temperature

Product Series	Description	Link to the Guide
Hi80-8LC	A collection of equipment guides and system guides for Hi80 series I/O modules, covering all application scenarios of the system and including product information, system overview, EtherNet/IP, installation, wiring, configuration and commissioning, and fault diagnosis.	Hi80 Series High-Performance Distributed I/O System User Guide

20.5 Wireless Module

Product Series	Description	Link to the Guide
AIR813-ECT-20S4	Introduces the installation, wiring, local management system operations, quick configuration examples, fault diagnosis, and maintenance of INO AIR wireless products.	Miniaturized Autonomous Wireless Product and Solution User Guide
AIR812-ECT-65S4		

20.6 Valve Terminal

Product Series	Description	Link to the Guide
IPT210-A-ECT	Introduces the installation of the EtherCAT fieldbus valve terminal series product, including installation procedure, mechanical installation, electrical installation, and commissioning instructions.	EtherCAT Fieldbus Valve Terminal User Guide
		IPT210 Series Fieldbus Valve Terminal Selection Guide
IPT300-A-ECT	Introduces the installation of the IPT300 distributed valve terminal series product, including installation procedure, mechanical installation, electrical installation, and commissioning instructions.	IPT300 Series Distributed Valve Terminal User Guide
IPT300s-A-ECT		IPT300 Series Distributed Valve Terminal Selection Guide

Product Series	Description	Link to the Guide
IPT210-A-EIP	Introduces the installation of the EtherNet/IP fieldbus valve terminal series product, including installation procedure, mechanical installation, electrical installation, and commissioning instructions.	EtherNet/IP Fieldbus Valve Terminal User Guide
		IPT210 Series Fieldbus Valve Terminal Selection Guide

20.7 Servo Drive

20.7.1 Single-Axis Servo Drive

Product Series	Description	Link to the Guide
IS650N/IS650	Introduces product information, mechanical installation, electrical installation of the IS650N series servo drive.	IS650N Series Servo Drive User Guide
SV600EN	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SV600EN series servo drive.	SV600EN Series Servo Drive Guide Package
SV605N/SV605	Introduces selection, installation, commissioning, function, troubleshooting, and parameters of the SV605N series servo drive.	SV605N Series Servo Drive User Guide
SV630N/SV630/SV630NS	Introduces selection, installation, commissioning, function, troubleshooting, and parameters of the SV630N series servo drive.	SV630N Series Servo Drive User Guide
SV630C	Introduces selection, installation, commissioning, function, troubleshooting, and parameters of the SV630C series servo drive.	SV630C Series Servo Drive User Guide
SV660C	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SV660C series servo drive.	SV660C Series Servo Drive User Guide
SV660N/SV660	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SV660N series servo drive.	SV660N Series Servo Drive User Guide
SV670N/SV670	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SV670N series servo drive.	SV670N Series Servo Drive User Guide

Product Series	Description	Link to the Guide
SV670-INT	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SV670-INT series servo drive.	SV670-INT Series Servo Drive User Guide
SV670N-LK	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SV670N-LK series servo drive.	SV670N-LK Series Servo Drive User Guide
SV680N/SV680	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SV680N series servo drive.	SV680N Series Servo Drive User Guide
SV680-INT	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SV680N-INT series servo drive.	SV680-INT Series Servo Drive User Guide
SV635N	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SV635N series servo drives.	SV635N Series Servo Drive User Guide
SV640	-	-
IS810	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the IS810N series servo drives.	IS810N Series Standard Servo Drive (Multidrive System) User Guide
SV605C	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SV605 series servo drives.	SV605P_C Series Servo Drive User Guide
SV630C	Introduces product information, installation, wiring, commissioning, and troubleshooting for common faults of the SV630C series servo drives.	SV630C Series Servo Drive User Guide
SV660C	Presents the functions and parameters of the SV660C series products, including function overview, basic servo functions, adjustment instructions, and parameter description.	SV660C Series Servo Drive User Guide
SV670C	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SV670C series servo drives.	SV670C Series Servo Drive User Guide

Product Series	Description	Link to the Guide
SV680P	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SV680P series servo drives.	SV680P Series Servo Drive User Guide

20.7.2 Multi-Axis Servo Drive

Product Series	Description	Link to the Guide
IS810N/IS810	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the IS810N series servo drives.	IS810N Series Standard Servo Drive (Multidrive System) User Guide
SV630ND	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SV630ND series servo drive.	SV630ND Series Servo Drive Guide Package
SV660ND	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SV660ND series servo drive.	SV660ND Series Servo Drive Guide Package
ES680	Introduces selection, installation, wiring, commissioning, functions, communication, troubleshooting, and routine maintenance of the ES680 series servo drives.	ES680 Series Servo Drive Advanced User Guide

20.7.3 Direct Drive Servo Drive

Product Series	Description	Link to the Guide
SV680LN	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SV680LN series servo drive.	SV680LN Direct Drive Servo Drive Guide Package
SV670LN	Introduces model selection, installation, wiring, commissioning, functions, troubleshooting, and parameter descriptions.	SV670LN Series Direct Drive Servo Drive User Guide
TV670C	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the TV670C series servo drive.	-

20.7.4 Low-Voltage Servo Drive

Product Series	Description	Link to the Guide
SVD60N	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SVD60N series servo drive.	SVD60N Series Servo Drive Guide Package

Product Series	Description	Link to the Guide
SVD60C	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the SVD60C series servo drive.	SVD60C Series Servo Drive User Guide

20.7.5 Stepper Servo Drive

Product Series	Description	Link to the Guide
STD60N	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the STD60N series servo drive.	STD60N Series Stepper System Manual Package

20.8 Low-Voltage AC Drive

20.8.1 General-Purpose Low-Voltage AC Drive

Product Series	Description	Link to the Guide
MD630N	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the MD630N series AC drive.	MD630 Series General-Purpose AC Drive User Guide
MD810	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the MD810 series AC drive.	MD810 Series AC Drive (Multidrive System) Function Guide
MD800	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the MD800 series AC drive.	MD800 Series AC Drive (Multidrive System) User Guide
MD520	Introduces product selection, mechanical design, electrical design, installation, communication, commissioning, function application, troubleshooting, and product certifications and standards.	MD520 Series General-Purpose AC Drive User Guide

20.8.2 Industrial AC Drive

Product Series	Description	Link to the Guide
MD580	Introduces selection, installation, wiring, commissioning, functions, troubleshooting, and parameters of the MD580 series hoist-specific AC drive.	MD580 Series Low-Voltage High-Performance Industrial AC Drive Guide Package

21 Appendix

21.1 Appendix 1: List of Fault Codes

Fault Code	Level	Description	Cause	Remedy
0x10060010	Fatal	IEC task runtime exceeding watchdog threshold or task exit timeout	The watchdog malfunctions.	Check the program execution time.
0x10060011	Fatal	Hardware watchdog error (hardware support required: not applicable to current product)	The hardware watchdog malfunctions.	Program timeout. Check the program execution time.
0x10060012	Fatal	I/O configuration error	An error occurs in I/O parameter configuration.	iFA software I/O parameter configuration error. Contact the manufacturer for support.
0x10060013	Fatal	Program verification error	An error occurs during program verification.	Attempt to re-download the program. If the fault persists, contact the manufacturer.
0x10060014	Fatal	Local bus access error	An error occurs while accessing the local bus.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060015	Fatal	I/O data update error	An error occurs during I/O data update.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060016	Fatal	Execution time exceeding cycle time	Task timeout.	Program timeout. Check the program execution time.
0x10060017	Fatal	Online program modification timeout	An error occurs in online modification.	Re-download fully.
0x10060018	Fatal	External library interface not implemented in RTS	The external library interface is improper.	Check the user-defined library type.
0x1006001B	Fatal	Loading startup project failed	An error occurs while loading the startup project.	Check whether the startup project is configured incorrectly.
0x1006001C	Fatal	Heap memory overflow	A heap memory overflow has occurred.	/

Fault Code	Level	Description	Cause	Remedy
0x1006001E	Fatal	Loading the startup project causes a crash.	An error occurs while loading the startup project.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060021	Fatal	The startup project does not match the current device.	The project startup is abnormal.	The project does not match the device model.
0x10060022	Fatal	Task scheduling error	An error occurred during task scheduling.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060023	Fatal	Project file verification error	An error occurs during project file verification.	/
0x10060024	Fatal	The current power-loss retention does not match the project.	The current power-loss retention does not match the project.	/
0x10060025	Fatal	IEC task not configured properly	The IEC task is not configured properly.	Contact the manufacturer for correct IDE version.
0x10060027	Critical	Power-off file verification error	An error occurs during power-off file verification.	Contact the manufacturer to resolve the power-off retention error.
0x10060028	Critical	Unable to load the program for online modification	A timeout occurred while acquiring the system time slice.	Attempt to re-download the program. If the fault persists, contact the manufacturer.
0x10060029	Critical	Downloading user project failed	The user project size exceeds the available system disk space.	Clear the PLC space and try re-downloading, or reduce the user project size.
0x1006003A	Critical	Disk offline	Disk offline	Generally caused by interference or hardware damage. Check the environmental conditions, or restart.
0x1006003B	Critical	Bad block on hard drive	Bad block on hard drive	It is recommended to replace the hard drive.
0x1006003C	Warning	Hard drive overheating	Hard drive overheating	It is recommended to check the ambient temperature.
0x1006003D	Warning	Hard drive life critical	Hard drive life critical	It is recommended to replace the hard drive.

Fault Code	Level	Description	Cause	Remedy
0x1006003E	Warning	Hard drive undercooling	Hard drive undercooling	It is recommended to check the ambient temperature.
0x10060050	Fatal	Illegal instruction	The instruction is illegal.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060051	Fatal	Access violation	An access violation occurs.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060052	Fatal	Privileged access	Privileged access	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060053	Fatal	Page error	An error occurs on the page.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060054	Fatal	Stack overflow error	A stack overflow has occurred.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060055	Fatal	Invalid location	Invalid location	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060056	Fatal	Invalid handle	Invalid handle	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060057	Fatal	Page protection	Page protection	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060059	Fatal	Invalid OP instruction operation	The OP instruction operation is invalid.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x1006005A	Fatal	Unaligned memory access	The memory access is unaligned.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.

Fault Code	Level	Description	Cause	Remedy
0x100600CC	Warning	CPU overheat	CPU overheat	It is recommended to check the ambient temperature, CPU usage or other factors.
0x100600CE	Warning	CPU undercooling	CPU undercooling	It is recommended to check the ambient temperature.
0x100600FF	Fatal	TCP thread fault	The TCP thread enters a deadlock state.	A deadlock has occurred in the TCP thread. Check and resolve the deadlock issue in the program, then restart the system and verify whether normal operation is restored. If the issue persists, contact the manufacturer.
0x10060100	Fatal	Data type misaligned	The data type is misaligned.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060101	Warning	An array index out-of-bounds error occurs in the project.	An array element in the project exceeds the defined upper or lower bound for the array.	Check arrays in the project where the elements are under a user-defined variable, and verify whether the computed values of the user-defined variable are out of the array range.
0x10060102	Warning	Division by zero in the project	The project contains a case where the divisor is zero.	Check division operations in the project for cases where the divisor is zero.
0x10060103	Fatal	Floating-point overflow	A floating-point overflow has occurred.	/
0x10060104	Fatal	Non-continuable error caused by missing operating system library interface.	A "Non-continuable" error occurred because the operating system library interface could not be found.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060105	Fatal	CPU monitoring thread watchdog error	A CPU monitoring thread watchdog error occurs.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.

Fault Code	Level	Description	Cause	Remedy
0x10060106	Fatal	An abnormal pointer exists in the project.	A null pointer or invalid pointer exists in the project.	Check whether a null pointer or invalid pointer exists in the project.
0x10060150	Fatal	FPU: Error	FPU: Error	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060151	Fatal	FPU: Floating-point operand exception	FPU: Floating-point operand exception	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060152	Fatal	FPU: Floating-point division by zero	FPU: Floating-point division by zero	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060153	Fatal	FPU: Inaccurate floating-point results	FPU: The floating-point operation result is inaccurate.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060154	Fatal	FPU: Invalid operation	FPU: Invalid operation	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060155	Fatal	FPU: Floating-point overflow	FPU: Floating-point overflow	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060157	Fatal	FPU: Floating-point underflow	FPU: Floating-point underflow	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10060158	Warning	Incorrect TYPE_CLASS parameter passed in external library function.	Incorrect TYPE_CLASS parameter passed in external library function.	Modify the TYPE_CLASS parameter passed to the external library function so that its data type aligns with that of the ANY type parameter.

Fault Code	Level	Description	Cause	Remedy
0x10060182	Warning	Server timeout	The connection channel between iFA and the controller is closed or fails, causing a server timeout.	Check the network cable connection status, or check whether the channel is unexpectedly closed.
0x10060184	Warning	Transmission verification error on the server channel between iFA and the controller.	A transmission verification error occurred on the connection channel between iFA and the controller.	Log out of all iFA sessions, and then log back in to the device.
0x10060185	Warning	A transmission error occurred on the server channel between iFA and the controller (receive mode).	The client between iFA and the controller attempts to send information, but the channel was in receive mode.	Log out of all iFA sessions, and then log back in to the device.
0x10060187	Warning	The number of available server channels for the connection between iFA and the controller has been exhausted.	There are no available channels for the connection from iFA to the controller.	Check whether the number of connection channels exceeds the limit. Close any unnecessary connection channels, and then reconnect.
0x10060189	Warning	The message length on the server connected from iFA to the controller exceeds the buffer capacity.	The message length between iFA and controller the buffer capacity.	Log out of all iFA sessions, and then log back in to the device.
0x1006018A	Information	The channel request on the server connection between iFA and the controller is invalid.	The channel request on the server connection between iFA and the controller is invalid.	No impact on normal use
0x1006018B	Information	The server channels for the connection between iFA and the controller is closed.	The server channels for the connection between iFA and the controller is closed.	The service is closed with prompt message.

Fault Code	Level	Description	Cause	Remedy
0x10060200	Fatal	The program hit a hardware breakpoint.	The program hit a hardware breakpoint.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10061000	Fatal	Infinite loop type error	Infinite loop type error	Check the user program.
0x10061010	Fatal	IEC task runtime exceeding two task cycles	The IEC task runtime exceeds two task cycles.	Check the user program execution time.
0x10061020	Fatal	Local rack power failure	The power supply of the local rack is abnormal.	Check the cause of power failure.
0x10061021	Fatal	Backup rack power failure	The power supply of the backup rack is abnormal.	Check the cause of power failure.
0x10061022	Fatal	Identical redundant rack numbers	Two redundant racks have the same number.	Check the redundant rack numbers, set them to Rack A/B, and then restart the racks.
0x10061023	Fatal	Inconsistent redundant rack firmware versions	Two redundant racks have different firmware versions.	Check that the firmware versions of the redundant racks are consistent.
0x10061024	Fatal	Module removed	The module is faulty.	Check whether the module has been removed.
0x10061025	Fatal	PCIE communication error (redundant module)	The module is faulty.	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10061026	Fatal	Backplane communication SLOT0 channel abnormal	The module is faulty.	Check whether the module is seated and operating properly, and whether the CPU core 3 load is high; adjust the task cycle and task load properly to reduce the CPU core 3 load.
0x10061027	Critical	Both fiber optic links are disconnected.	The redundant communication links are faulty.	Check the fiber optic links of the synchronization module, and check the indicator lights. Reinsert the fiber optic cable to check if the issue is resolved. Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.

Fault Code	Level	Description	Cause	Remedy
0x10061028	Fatal	EtherNet/IP link fault	The communication link is faulty.	Check the status of the EtherNet/IP port cable. Try re-inserting the network cable to see if the issue is resolved. Restart the controller and check whether the fault is cleared. If not, contact the manufacturer.
0x10061029	Critical	Controller module CPU junction temperature exceeding the threshold	The device junction temperature is abnormal.	/
0x1006102A	Critical	Controller module FPGA junction temperature exceeding the threshold	The device junction temperature is abnormal.	/
0x1006102B	Critical	Synchronization module CPU junction temperature exceeding the threshold	The device junction temperature is abnormal.	/
0x1006102C	Critical	Synchronization module FPGA junction temperature exceeding the threshold	The device junction temperature is abnormal.	/
0x1006102D	Critical	Primary and backup data synchronization lasting for more than one cycle	The task cycle is set too short, and thus redundant data cannot be synchronized in time.	Increase the user task cycle and re-download the project.
0x1006102E	Critical	Start/Stop switch mismatch	The primary and backup start/stop switches are set at different positions.	Set the same position for primary and backup start/stop switches.
0x1006102F	Critical	Power-off retentive memory self-test failed	The power-off retentive memory self-test fails.	Contact the manufacturer for hardware replacement.

Fault Code	Level	Description	Cause	Remedy
0x10061030	Critical	Backplane communication SLOT1 channel abnormal	The communication between the module and backplane is abnormal.	Check whether the module is seated and operating properly, and whether the CPU core 3 load is high; adjust the task cycle and task load properly to reduce the CPU core 3 load.
0x10061031	Critical	Backplane communication SLOT2 channel abnormal	The communication between the module and backplane is abnormal.	Check whether the module is seated and operating properly, and whether the CPU core 3 load is high; adjust the task cycle and task load properly to reduce the CPU core 3 load.
0x10061032	Critical	Backplane communication SLOT3 channel abnormal	The communication between the module and backplane is abnormal.	Check whether the module is seated and operating properly, and whether the CPU core 3 load is high; adjust the task cycle and task load properly to reduce the CPU core 3 load.
0x10061033	Critical	Backplane communication SLOT4 channel abnormal	The communication between the module and backplane is abnormal.	Check whether the module is seated and operating properly, and whether the CPU core 3 load is high; adjust the task cycle and task load properly to reduce the CPU core 3 load.
0x10061034	Critical	Module removed from SLOT1	The module is removed.	Check whether the module is operating properly.
0x10061035	Critical	Module removed from SLOT2	The module is removed.	Check whether the module is operating properly.
0x10061036	Critical	Module removed from SLOT3	The module is removed.	Check whether the module is operating properly.
0x10061037	Critical	Module removed from SLOT4	The module is removed.	Check whether the module is operating properly.
0x10061038	Critical	IP address conflict detected on LAN1	Multiple devices in the network share the same IP address.	Check the IP addresses of devices in the network, and reconfigure a new IP address for the current device or other devices that share the same IP address as the current device.

Fault Code	Level	Description	Cause	Remedy
0x10061039	Critical	IP address conflict detected on LAN2	Multiple devices in the network share the same IP address.	Check the IP addresses of devices in the network, and reconfigure a new IP address for the current device or other devices that share the same IP address as the current device.
0x1006103A	Critical	IP address conflict detected on EIP3	Multiple devices in the network share the same IP address.	Check the IP addresses of devices in the network, and reconfigure a new IP address for the current device or other devices that share the same IP address as the current device.
0x1006103B	Fatal	Instantaneous voltage drop followed by recovery	The supply voltage is unstable with instantaneous drop.	Turn the device off and then back on.
0x1006103C	Fatal	Synchronizing board offline	The synchronizing board is faulty or not inserted.	Insert the synchronizing board as needed.
0x1006103D	Fatal	EIP PCIE link fault (main control module)	EMC interference	Turn the device off and then back on.
0x1006103E	Fatal	Controller module not seated properly	The controller module is not seated properly.	Power off the device, re-insert the module, and then power on the device.
0x1006103F	Critical	System temperature abnormal	The controller module operating temperature exceeds the threshold.	Check if the operating temperature exceeds the limit.
0x10061040	Critical	Slot number mismatch	The board slot numbers are mismatched.	Insert the proper board according to the structural diagram.
0x10061041	Critical	Backup PLC synchronizing board not inserted properly	The synchronizing board of the redundant backup PLC is not inserted properly.	Check the synchronizing board status. If abnormal, power off and re-insert the board.

Fault Code	Level	Description	Cause	Remedy
0x10061042	Critical	Backup PLC control board offline	The control board firmware of the backup PLC is running abnormally, or the control board is not inserted.	Check the fault code on the control board segment display, and take appropriate actions based on the fault code displayed.
0x10061043	Critical	Primary PLC synchronizing board not inserted properly	The redundant primary PLC synchronizing board is not inserted properly.	Check the synchronizing board status. If abnormal, power off and re-insert the board.
0x10061044	Critical	Dual optical fiber receive packets verification error	The optical fiber links are faulty.	Re-insert the optical fiber.
0x10061045	Critical	Abnormal	The temperature sensor failed to read the temperature.	Check if the module is normal.
0x10061046	Critical	The temperature readings from two CPUs differ excessively.	The temperature sensor or the ambient temperature is abnormal.	Check whether the ambient temperature is normal.
0x10061047	Fatal	Input parameter value out of range	1. The value of the input parameter for the type conversion instruction exceeds the instruction conversion range. 2. The K parameter of the MUX instruction is out of range.	1. Check whether the input parameter of the type conversion instruction is within the valid range. 2. Check whether the K parameter of the MUX instruction exceeds the number of comparison values.
0x10061048	Fatal	Power-off memory capacitor data abnormal	The power-off memory capacitor performance has degraded.	Contact the service provider for component replacement or maintenance.
0x10061049	Critical	IP address conflict detected on LAN1_A	Multiple devices in the network share the same IP address.	Check the IP addresses of devices in the network, and reconfigure a new IP address for the current device or other devices that share the same IP address as the current device.

Fault Code	Level	Description	Cause	Remedy
0x1006104A	Critical	IP address conflict detected on LAN1_B	Multiple devices in the network share the same IP address.	Check the IP addresses of devices in the network, and reconfigure a new IP address for the current device or other devices that share the same IP address as the current device.
0x1006104B	Warning	The system resource usage is nearing the upper limit.	The current process has reached the upper limit of file descriptor usage.	Contact the manufacturer.
0x1006104C	Information	The system resource usage has returned to normal.	The current process for the file descriptor usage has returned to normal.	/
0x1006104E	Critical	IP address conflict detected on LAN4	Multiple devices in the network share the same IP address.	Check the IP addresses of devices in the network, and reconfigure a new IP address for the current device or other devices that share the same IP address as the current device.
0x1006104F	Critical	IP address conflict detected on LAN3	Multiple devices in the network share the same IP address.	Check the IP addresses of devices in the network, and reconfigure a new IP address for the current device or other devices that share the same IP address as the current device.
0x1006104D	Critical	DHCP IP change	The DHCP IP address has been updated due to network changes, and the communication service is currently not functioning properly. Re-download the program to the PLC, or power cycle the PLC to restore normal operation.	Re-download the PLC, or perform a power cycle.

Fault Code	Level	Description	Cause	Remedy
0x10061050	Warning	Multiple default gateways configured on current PLC	1. Multiple default gateways have been configured on the PLC, which may affect cross-subnet communication. It is recommended to set a single default gateway. 2. For details on the configuration of multiple default gateways, you can view them in the "Network setting" interface under the "Online" menu.	1. In the iFA device tree interface, right-click the PLC device name. In the pop-up "Change device" interface, upgrade to the latest device version. 2. When performing a full download via iFA, select the "Set IP address in the project" mode, and disable all redundant default gateways, retaining a single default gateway only on the network ports that require cross-subnet communication.
0x10061051	Information	Current PLC gateway configuration restored to normal	/	/
0x10061052	Warning	Current project network configuration not effective	There may be an IP conflict.	1. Check the local network for conflicting IP addresses. 2. Perform the download again.
0x10062000	Warning	CPU average load too high	The average load of the CPU is too high.	Check the project configuration to inspect excessive load in the user logic or device configuration.
0x10062001	Warning	CPU2 high load alarm	The load of the CPU2 is too high.	Check the project configuration to inspect excessive load in the user logic or device configuration.
0x10062002	Warning	CPU3 load too high	The load of the CPU3 is too high.	Check the project configuration to inspect excessive load in the user logic or device configuration.
0x10062003	Warning	CPU0 load too high	The load of the CPU0 is too high.	Check the project configuration to inspect excessive load in the user logic or device configuration.

Fault Code	Level	Description	Cause	Remedy
0x10062004	Warning	CPU1 load too high	The load of the CPU1 is too high.	Check the project configuration to inspect excessive load in the user logic or device configuration.
0x10062005	Information	CPU average load too high fault cleared	The fault "CPU average load too high" has been cleared.	The fault "CPU average load too high" has been cleared.
0x10062006	Information	CPU2 load too high fault cleared	The fault "CPU2 load too high" has been cleared.	The fault "CPU2 load too high" has been cleared.
0x10062007	Information	CPU3 load too high fault cleared	The fault "CPU3 load too high" has been cleared.	-
0x10062008	Information	CPU0 load too high fault cleared	The fault "CPU0 load too high" has been cleared.	-
0x10062009	Information	CPU1 load too high fault cleared	The fault "CPU1 load too high" has been cleared.	-
0x1006200A	Information	CPU average load high	The average load of the CPU is high.	Check the project configuration to inspect excessive load in the user logic or device configuration.
0x1006200B	Information	CPU2 load high	The load of the CPU2 is high.	Check the project configuration to inspect excessive load in the user logic or device configuration.
0x1006200C	Information	CPU3 load high	The load of the CPU3 is high.	Check the project configuration to inspect excessive load in the user logic or device configuration.
0x1006200D	Information	CPU0 load high	The load of the CPU0 is high.	Check the project configuration to inspect excessive load in the user logic or device configuration.
0x1006200E	Information	CPU1 load high	The load of the CPU1 is high.	Check the project configuration to inspect excessive load in the user logic or device configuration.
0x1006200F	Information	CPU average load high cleared	The CPU average load high is cleared.	-

Fault Code	Level	Description	Cause	Remedy
0x10062010	Information	CPU2 load high cleared	The CPU2 load high is cleared.	-
0x10062011	Information	CPU3 load high cleared	The CPU3 load high is cleared.	-
0x10062012	Information	CPU0 load high cleared	The CPU0 load high is cleared.	-
0x10062013	Information	CPU1 load high cleared	The CPU1 load high is cleared.	-
0x10062014	Warning	Memory load too high	The memory load is too high.	Check the project configuration to inspect excessive load in the user logic or device configuration.
0x10062015	Information	Memory load too high fault cleared	The fault "memory load too high" has been cleared.	The fault "memory load too high" has been cleared.
0x10062016	Information	Memory load high	The memory load is high.	Check the project configuration to inspect excessive load in the user logic or device configuration.
0x10062017	Information	Memory load high cleared	The memory load high is cleared.	-
0x10062018	Warning	CPU temperature exceeds 115℃	The PLC operating ambient temperature exceeds the product specification requirements.	1. Check whether the PLC operating ambient temperature exceeds the specified product temperature limit. 2. Check whether the PLC cooling condition is normal and whether the cabinet cooling system is operating normally.
0x10062019	Critical	Failed to switch the network port to independent IP mode.	The current device does not support independent IP mode on the network ports.	Contact the manufacturer.
0x10062020	Warning	Manual primary-backup switchover	Manual primary-backup switchover is detected.	Check whether the primary-backup switchover is manually triggered.
0x10062021	Warning	Primary unit switched to backup unit	The primary unit is switched to the backup unit.	Identify the reason for switchover

Fault Code	Level	Description	Cause	Remedy
0x10062022	Warning	Optical fiber 1 link disconnected	The redundant optical fiber link 1 is faulty.	Check the connection of optical fiber link 1 of the synchronization module, and re-insert the optical fiber to see if the alarm is cleared.
0x10062023	Warning	Optical fiber 2 link disconnected	The redundant optical fiber link 2 is faulty.	Check the connection of optical fiber link 2 of the synchronization module, and re-insert the optical fiber to see if the alarm is cleared.
0x10062024	Warning	Optical fiber link switched	The redundant optical fiber link is faulty.	Check the connection of the optical fiber link of the synchronization module.
0x10062025	Warning	SD card inserted	The SD card is recovered.	Check the SD card.
0x10062026	Warning	SD card removed	The SD card is not detected.	Check the SD card.
0x10062027	Warning	SD card full	SD card warning	Manage the SD card contents to free up space.
0x10062028	Warning	Local rack project running abnormally (project not loaded successfully)	The local rack project is faulty.	Check the local rack project.
0x10062029	Warning	Local rack running status abnormal (project running abnormally)	The local rack is running abnormally.	Identify the cause and take appropriate actions.
0x1006202A	Warning	RTC battery voltage low	The RTC battery has a low voltage or is not inserted.	Replace the RTC battery.
0x1006202B	Warning	Primary-backup switchover timeout	The optical fiber link is faulty, or the data exchanged over the link is too large.	Check the switchover log, data traffic size, and optical fiber link status to comprehensively analyze the cause of timeout.
0x1006202C	Warning	Controller module ambient temperature exceeding the threshold	The ambient temperature is high.	Cool down the device operating environment.
0x1006202D	Warning	The start/stop DIP switch states on the two racks are inconsistent.	The start/stop DIP switch states on the two racks are inconsistent.	Adjust the start/stop DIP switch states on both racks so that they match.

Fault Code	Level	Description	Cause	Remedy
0x1006202E	Warning	A-side power supply module fault	The A-side power supply is not connected, overvoltage, or undervoltage.	Check the A-side power supply.
0x1006202F	Warning	B-side power supply module fault	The B-side power supply is not connected, overvoltage, or undervoltage.	Check the B-side power supply.
0x10062030	Warning	Modbus TCP configuration error	The Modbus parameters are not configured properly.	Recheck the Modbus configuration parameters, modify the improper ones, and then re-download the project.
0x10062031	Warning	SD card read-only	The inserted SD card is set to read-only.	Modify the SD card attribute to read-write and then re-inserting the card.
0x10062032	Warning	SLOT0 backplane communication data verification error	The configured backplane communication parameters are inconsistent.	After modifying the backplane communication settings to ensure consistency, re-download the project.
0x10062033	Warning	SLOT1 backplane communication data verification error	The configured backplane communication parameters are inconsistent.	After modifying the backplane communication settings to ensure consistency, re-download the project.
0x10062034	Warning	SLOT2 backplane communication data verification error	The configured backplane communication parameters are inconsistent.	After modifying the backplane communication settings to ensure consistency, re-download the project.
0x10062035	Warning	SLOT3 backplane communication data verification error	The configured backplane communication parameters are inconsistent.	After modifying the backplane communication settings to ensure consistency, re-download the project.
0x10062036	Warning	SLOT4 backplane communication data verification error	The configured backplane communication parameters are inconsistent.	After modifying the backplane communication settings to ensure consistency, re-download the project.

Fault Code	Level	Description	Cause	Remedy
0x10062037	Warning	Wi-Fi off	The Wi-Fi function is turned off.	/
0x10062038	Warning	No controller module program operation permissions	The permissions are insufficient.	Check the user permissions.
0x10062039	Warning	Project file consistency check failed during download	The project file consistency check fails.	Check the project or re-download the full project.
0x1006203A	Warning	Device configuration file MD5 mismatch	The MD5 value for the device configuration file is mismatched.	Re-compile the project and download the full project.
0x1006203B	Warning	Device configuration file MD5 verification error	The MD5 verification for the device configuration file fails.	Re-compile the project and download the full project.
0x1006203C	Warning	Loading device configuration file failed	The device configuration file is not loaded successfully.	Check the log for details and take appropriate actions.
0x1006203D	Warning	Parsing device configuration file failed	The device configuration file is not parsed successfully.	Check the log for details and take appropriate actions, and then re-compile and download the project. If the problem persists, contact technical support engineers.
0x1006203E	Warning	The master redundancy project has become non-redundant - redundancy exited.	/	/
0x1006203F	Warning	Primary and backup unit IP configuration mismatch	The IP addresses of the two units for a certain port is mismatched.	Check the network settings to identify the port, and then modify the IP addresses to keep them consistent.
0x10062040	Warning	Primary-backup synchronization data verification error	Data synchronization is delayed due to optical fiber module fault or too short IEC task cycle.	Check whether the optical fiber link is faulty or whether the IEC task cycle is set too short.

Fault Code	Level	Description	Cause	Remedy
0x10062041	Warning	SD card working directory not found	The SD card working directory has hung up unexpectedly.	Restart the controller system to automatically create the SD card mount directory.
0x10062042	Warning	Optical fiber 2 receive packet verification error	The optical fiber 1 link is faulty.	Re-insert the optical fiber.
0x10062043	Warning	Optical fiber 1 receive packet verification error	The optical fiber 2 link is faulty.	Re-insert the optical fiber.
0x10062044	Warning	Abnormal reading of backup capacitor parameters	The capacitor capacity decreases, and the internal resistance increases.	1. In single mode: See the maintenance section of the product manual for handling procedures. 2. In redundant mode: Manually switch between primary and backup racks.
0x10062045	Warning	Abnormal reading of backup capacitor parameters	Line anomaly; internal communication link failure	Restart the controller and check whether the fault is cleared. If not, contact the manufacturer for hardware inspection.
0x10062046	Warning	SD card access failure	SD card type mismatch	Check the SD card file system type.
0x10062047	Warning	SD card power supply fault	1. The SD card itself has an issue. 2. An SD card slot issue exists.	1. Verify with a new SD card. If the SD card works properly on a PC but not on the controller, contact after-sales support. 2. Alternatively, verify this SD card on a PC or another controller. If it works normally, contact after-sales support. If it does not, replace the SD card.
0x10062048	Warning	No redundancy allowed due to breakpoint set for primary rack	The breakpoint is set in the user program of the primary rack.	After the execution of "Delete breakpoint" under "Commissioning > Delete Breakpoint" menu in the iFA software, the primary and backup racks can normally achieve the redundancy.
0x10062049	Warning	CPU4 high load alarm	The load of the CPU4 is too high.	Check the project configuration to inspect excessive load in the user logic or device configuration.

Fault Code	Level	Description	Cause	Remedy
0x1006204A	Warning	CPU5 high load alarm	The load of the CPU5 is too high.	Check the project configuration to inspect excessive load in the user logic or device configuration.
0x1006204B	Information	CPU4 load too high fault cleared	The fault "CPU4 load too high" has been cleared.	The fault "CPU4 load too high" has been cleared.
0x1006204C	Information	CPU5 load too high fault cleared	The fault "CPU5 load too high" has been cleared.	The fault "CPU5 load too high" has been cleared.
0x1006204D	Warning	The dual rack modules do not match, so redundancy is lost.	The positions, version information, or IP addresses of the dual rack modules do not match.	Check if the positions, version information, or IP addresses of the dual rack modules match.
0x1006204E	Fatal	EN module not seated properly	EN module is not seated correctly.	Power off the device, re-insert the module, and then power on the device.
0x1006204F	Fatal	EN module SDIO RT interface clock frequency deviation	The clock frequency deviation has occurred on the SDIO RT interface of the EN module.	Contact the manufacturer.
0x10062050	Fatal	EN module SDIO NRT interface clock frequency deviation	The clock frequency deviation has occurred on the SDIO NRT interface of the EN module.	Contact the manufacturer.

0x10066501	Warning	Single-bit ECC error on the MSRAM safety module	A single-bit ECC error has occurred on the MSRAM safety module.	After confirming it is safe, power cycle the system and check whether normal operation is restored.

Fault Code	Level	Description	Cause	Remedy
0x10066502	Fatal	Double-bit ECC error on the MSRAM safety module	A double-bit ECC error has occurred on the MSRAM safety module.	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066503	Fatal	MSRAM safety module MSRAM-T1 diagnostic procedure abnormal	MSRAM safety module ECC function abnormal	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066601	Fatal	R5F safety module R5F.CPU3 diagnostic procedure abnormal	Illegal memory access by the R5F core. MPU triggered protection.	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066602	Fatal	R5F safety module R5F.CPU5 diagnostic procedure abnormal	Illegal instruction access by the R5F core	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066603	Fatal	R5F safety module R5F.CPU6 diagnostic procedure abnormal	R5F module static configuration register readback comparison error	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066604	Fatal	R5F safety module R5F.CPU7 diagnostic procedure abnormal	R5F module write configuration readback comparison error	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066606	Warning	Single-bit ECC error on the R5F safety module	A single-bit ECC error has occurred on the R5F safety module.	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066607	Fatal	Double-bit ECC error on the R5F safety module	A double-bit ECC error has occurred on the R5F safety module.	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066608	Fatal	R5F safety module R5F.RAM-T1 diagnostic procedure abnormal	R5F safety module ECC function abnormal	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066701	Fatal	VIM safety module R5F.VIM4 diagnostic procedure abnormal	VIM module static configuration register readback comparison error	After confirming it is safe, power cycle the system and check whether normal operation is restored.

Fault Code	Level	Description	Cause	Remedy
0x10066702	Fatal	VIM safety module R5F.VIM5 diagnostic procedure abnormal	VIM module write configuration readback comparison error	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066703	Warning	Single-bit ECC error on the VIM safety module	A single-bit ECC error has occurred on the VIM safety module.	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066704	Fatal	Double-bit ECC error on the VIM safety module	A double-bit ECC error has occurred on the VIM safety module.	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066705	Fatal	VIM safety module R5F.VIM2 diagnostic procedure abnormal	PBIST memory check error	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066707	Fatal	VIM safety module R5F.VIM-T1 diagnostic procedure abnormal	VIM safety module ECC function abnormal	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066801	Fatal	WWDT safety module RTI1 diagnostic procedure abnormal	WWDT module static configuration register readback comparison error	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066802	Fatal	WWDT safety module RTI2 diagnostic procedure abnormal	WWDT module write configuration readback comparison error	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066901	Fatal	Timers safety module TIM1 diagnostic procedure abnormal	Dual timer comparison error, Timer 1oo2 error	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066902	Fatal	Timers safety module TIM2 diagnostic procedure abnormal	Timer basic function test result abnormal	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066903	Fatal	Timers safety module TIM3 diagnostic procedure abnormal	Timers module write configuration readback comparison error	After confirming it is safe, power cycle the system and check whether normal operation is restored.

Fault Code	Level	Description	Cause	Remedy
0x10066904	Fatal	Timers safety module TIM4 diagnostic procedure abnormal	Timers module write configuration readback comparison error	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066A01	Fatal	ESM safety module ESM1 diagnostic procedure abnormal	ESM module static configuration register readback comparison error	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066A02	Fatal	ESM safety module ESM2 diagnostic procedure abnormal	ESM module write configuration readback comparison error	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066A03	Fatal	ESM safety module ESM3 diagnostic procedure abnormal	ESM module basic function test result abnormal	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066B01	Fatal	Program execution sequence monitoring fault	The program did not follow the expected execution path.	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066C01	Fatal	External window watchdog triggered.	Timeout due to failure to feed the watchdog.	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066C02	Fatal	External window watchdog triggered.	Feed the watchdog ahead of schedule	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066C03	Fatal	Internal watchdog action	Timeout due to failure to feed the watchdog.	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066C04	Fatal	External window watchdog not enabled	The external window watchdog is not enabled.	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0x10066D01	Fatal	Abnormal execution of CPU safety diagnostic measures	Abnormal execution of CPU safety diagnostic measures	After confirming it is safe, power cycle the system and check whether normal operation is restored.
0xA1C20000	Information	No fault	/	/

Fault Code	Level	Description	Cause	Remedy
0xA1C21001	Critical	The number of I/O modules configured is more than the number of I/O modules actually scanned.	The number of the configured modules exceeds the actual number of I/O modules.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA1C21002	Critical	The number of I/O modules configured is less than the number of I/O modules actually scanned.	The number of the configured modules is less than the actual number of I/O modules.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA1C21003	Critical	I/O module type mismatch	The number of the configured modules does not match the actual number of I/O modules.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA1C21004	Critical	An error occurred during I/O module parameter configuration.	It failed to configure the I/O module on the protocol stack.	1. Check the number, type and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA1C21005	Critical	An error occurred while switching the I/O module status.	It failed to set the I/O module on the protocol stack.	1. Check the number, type and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA1C21006	Critical	I/O module communication disconnection	Communication interruption between the I/O module and the PLC	1. Check the contact of the communication interface for the expansion module or restart the rack.

Fault Code	Level	Description	Cause	Remedy
0xA1C21007	Critical	Protocol stack failed to scan for modules	The device did not detect the I/O modules or the I/O modules are not inserted.	1. Check whether the expansion module is properly installed and supplied with power. 2. Check the contact of the communication interface of the expansion module or restart the rack.
0xA1C21008	Critical	The power of the actual inserted modules exceed the limit.	The sum of rated currents for the modules inserted actually exceeds 2 A of the bus current.	1. Check the number and installation order of the expansion modules. 2. Check if the PS2 relay power is used.
0xA1C21009	Critical	I/O module state transition timeout	I/O module state transition timeout (30s): OP state not reached.	1. Check the number and installation order of the expansion modules. 2. Check for any unexpected module disconnections. 3. Check if the load of the current project configuration is too high. 4. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0320000	Information	No fault	/	/
0xA0321004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0321005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0321006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.

Fault Code	Level	Description	Cause	Remedy
0xA0325001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0325002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0325003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0325011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0330000	Information	No fault	/	/
0xA0331004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0331005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0331006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0335001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0335002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.

Fault Code	Level	Description	Cause	Remedy
0xA0335003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0335011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0340000	Information	No fault	/	/
0xA0341004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0341005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0341006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0345001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0345002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0345003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0345011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0FB0000	Information	No fault	/	/

Fault Code	Level	Description	Cause	Remedy
0xA0FB1004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0FB1005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0FB1006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0FB5001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0FB5002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0FB5003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0FB5011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.

0xA0651004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0651005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0651006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.

Fault Code	Level	Description	Cause	Remedy
0xA0655001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0655002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0655003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0655011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0460000	Information	No fault	/	/
0xA0461004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0461005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0461006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0465001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0465002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.

Fault Code	Level	Description	Cause	Remedy
0xA0465003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0465011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0465021	Critical	Module ADC malfunction	The ADC of the module malfunctions.	1. Check the module for hardware faults. 2. Replace the module.
0xA0465023	Critical	ADC reference voltage error	The ADC reference voltage is abnormal.	1. Check the module for hardware faults. 2. Replace the module.
0xA0466001	Critical	Channel open circuit	Data channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA0466002	Critical	Channel short circuit	The data channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA0466003	Critical	The channel data exceeds the upper limit.	The channel data exceeds the configured upper limit.	1. Check whether the external input signal of the input module is abnormal.
0xA0466004	Critical	The channel data is below the lower limit.	The channel data is below the configured lower limit.	1. Check whether the external input signal of the input module is abnormal.
0xA0466005	Critical	The channel data overflows.	The input data on the channel overflows.	1. Check whether the external input signal of the input module is abnormal.
0xA0466006	Critical	The channel data underflows.	The input data on the channel underflows.	1. Check whether the external input signal of the input module is abnormal.
0xA0490000	Information	No fault	/	/

Fault Code	Level	Description	Cause	Remedy
0xA0491004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0491005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0491006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0495001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0495002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0495003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0495004	Critical	ADC configuration error	ADC configuration error	1. Check the module for hardware faults. 2. Replace the module.
0xA0495021	Critical	Module ADC malfunction	The ADC of the module malfunctions.	1. Check the module for hardware faults. 2. Replace the module.
0xA0496001	Critical	Channel open circuit	Data channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.

Fault Code	Level	Description	Cause	Remedy
0xA0496002	Critical	Channel short circuit	The data channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA0496003	Critical	The channel data exceeds the upper limit.	The channel data exceeds the configured upper limit.	1. Check whether the external input signal of the input module is abnormal.
0xA0496004	Critical	The channel data is below the lower limit.	The channel data is below the configured lower limit.	1. Check whether the external input signal of the input module is abnormal.
0xA0496005	Critical	The channel data overflows.	The input data on the channel overflows.	1. Check whether the external input signal of the input module is abnormal.
0xA0496006	Critical	The channel data underflows.	The input data on the channel underflows.	1. Check whether the external input signal of the input module is abnormal.
0xA05A0000	Information	No fault	/	/
0xA05A1004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA05A1005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA05A1006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA05A5001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.

Fault Code	Level	Description	Cause	Remedy
0xA05A5002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA05A5003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA05A5011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA05A6001	Critical	Channel open circuit	Data channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA05A6002	Critical	Channel short circuit	The data channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA05A6003	Critical	The channel data exceeds the upper limit.	The channel data exceeds the configured upper limit.	1. Check whether the external input signal of the input module is abnormal.
0xA05A6004	Critical	The channel data is below the lower limit.	The channel data is below the configured lower limit.	1. Check whether the external input signal of the input module is abnormal.
0xA05A6005	Critical	The channel data overflows.	The input data on the channel overflows.	1. Check whether the external input signal of the input module is abnormal.
0xA05A6006	Critical	The channel data underflows.	The input data on the channel underflows.	1. Check whether the external input signal of the input module is abnormal.
0xA05F0000	Information	No fault	/	/
0xA05F1004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.

Fault Code	Level	Description	Cause	Remedy
0xA05F1005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA05F1006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA05F5021	Critical	Module ADC malfunction	The ADC of the module malfunctions.	1. Check the module for hardware faults. 2. Replace the module.
0xA05F6001	Critical	Channel open circuit	Data channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA05F6002	Critical	Channel short circuit	The data channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA05F6003	Critical	The channel data exceeds the upper limit.	The channel data exceeds the configured upper limit.	1. Check whether the external input signal of the input module is abnormal.
0xA05F6004	Critical	The channel data is below the lower limit.	The channel data is below the configured lower limit.	1. Check whether the external input signal of the input module is abnormal.
0xA05F6005	Critical	The channel data overflows.	The input data on the channel overflows.	1. Check whether the external input signal of the input module is abnormal.
0xA05F6006	Critical	The channel data underflows.	The input data on the channel underflows.	1. Check whether the external input signal of the input module is abnormal.
0xA05F6008	Critical	Channel ADC malfunction	The channel ADC malfunctions.	1. Check the module for hardware faults. 2. Replace the module.
0xA05B0000	Information	No fault	/	/

Fault Code	Level	Description	Cause	Remedy
0xA05B1004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA05B1005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA05B1006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA05B5001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA05B5002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA05B5003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA05B5011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA05B6001	Critical	Channel open circuit	Data channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA05B6002	Critical	Channel short circuit	The data channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.

Fault Code	Level	Description	Cause	Remedy
0xA05B6003	Critical	The channel data exceeds the upper limit.	The channel data exceeds the configured upper limit.	1. Check whether the external input signal of the input module is abnormal.
0xA05B6004	Critical	The channel data is below the lower limit.	The channel data is below the configured lower limit.	1. Check whether the external input signal of the input module is abnormal.
0xA05B6005	Critical	The channel data overflows.	The input data on the channel overflows.	1. Check whether the external input signal of the input module is abnormal.

0xA0781006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0785001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0785002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0785003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0785011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0350000	Information	No fault	/	/
0xA0351004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0351005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0351006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.

Fault Code	Level	Description	Cause	Remedy
0xA0355001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0355002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0355003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0355011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0680000	Information	No fault	/	/
0xA0681005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0681006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0685001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0685002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0685003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.

Fault Code	Level	Description	Cause	Remedy
0xA0685005	Critical	External 5 V power supply failure	The external 5 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0685011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0686002	Critical	Channel short circuit	Incorrect channel wiring on the I/O module	1. Check the external wiring of the module channel. 2. Replace the module.
0xA0440000	Information	No fault	/	/
0xA0441005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0441006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0445001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0445002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0445003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0445011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.

Fault Code	Level	Description	Cause	Remedy
0xA0446050	Critical	Short circuit	For any channel that is not outputting, the chip detects a short circuit between the DO and VDD.	/
0xA0446051	Critical	Switch ON disconnection	For any channel that is outputting, the chip detects that the DO is not connected to a load.	/
0xA0446052	Critical	Switch OFF disconnection	For any channel that is not outputting, the chip detects that the DO is not connected to a load.	/
0xA0446053	Critical	Overcurrent	For any channel that is outputting, the chip detects that the output current exceeds the current limit of the chip (2.4 A to 3.2 A, typical value 2.8 A).	/

Fault Code	Level	Description	Cause	Remedy
0xA0446054	Critical	Overload	When the output current is too large, but the overcurrent protection value is not reached, the power consumption of the chip output channel increases and the temperature increases. When the junction temperature reaches 165℃, an overload error occurs.	/
0xA0430000	Information	No fault	/	/
0xA0431005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0431006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0435001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0435002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0435003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.

Fault Code	Level	Description	Cause	Remedy
0xA0435011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0520000	Information	No fault	/	/
0xA0521004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0521005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0521006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0525001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0525002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0525003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0525011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0525021	Critical	Module ADC malfunction	The ADC of the module malfunctions.	1. Check the module for hardware faults. 2. Replace the module.
0xA0525023	Critical	ADC reference voltage error	The ADC reference voltage is abnormal.	1. Check the module for hardware faults. 2. Replace the module.

Fault Code	Level	Description	Cause	Remedy
0xA0526001	Critical	Channel open circuit	Data channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA0526002	Critical	Channel short circuit	The data channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA0526003	Critical	The channel data exceeds the upper limit.	The channel data exceeds the configured upper limit.	1. Check whether the external input signal of the input module is abnormal.
0xA0526004	Critical	The channel data is below the lower limit.	The channel data is below the configured lower limit.	1. Check whether the external input signal of the input module is abnormal.
0xA0480000	Information	No fault	/	/
0xA0481004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0481005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0481006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0485001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.

Fault Code	Level	Description	Cause	Remedy
0xA0485002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0485003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0485011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0485021	Critical	Module ADC malfunction	The ADC of the module malfunctions.	1. Check the module for hardware faults. 2. Replace the module.
0xA0485023	Critical	ADC reference voltage error	The ADC reference voltage is abnormal.	1. Check the module for hardware faults. 2. Replace the module.
0xA0486001	Critical	Channel open circuit	Data channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA0486002	Critical	Channel short circuit	The data channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA0486003	Critical	The channel data exceeds the upper limit.	The channel data exceeds the configured upper limit.	1. Check whether the external input signal of the input module is abnormal.
0xA0486004	Critical	The channel data is below the lower limit.	The channel data is below the configured lower limit.	1. Check whether the external input signal of the input module is abnormal.
0xA0486005	Critical	The channel data overflows.	The input data on the channel overflows.	1. Check whether the external input signal of the input module is abnormal.
0xA0486006	Critical	The channel data underflows.	The input data on the channel underflows.	1. Check whether the external input signal of the input module is abnormal.

Fault Code	Level	Description	Cause	Remedy
0xA0510000	Information	No fault	/	/
0xA0511004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0511005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0511006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0515001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0515002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0515003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0515011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0515021	Critical	Module ADC malfunction	The ADC of the module malfunctions.	1. Check the module for hardware faults. 2. Replace the module.
0xA0515023	Critical	ADC reference voltage error	The ADC reference voltage is abnormal.	1. Check the module for hardware faults. 2. Replace the module.

Fault Code	Level	Description	Cause	Remedy
0xA0516001	Critical	Channel open circuit	Data channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA0516002	Critical	Channel short circuit	The data channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA0516003	Critical	The channel data exceeds the upper limit.	The channel data exceeds the configured upper limit.	1. Check whether the external input signal of the input module is abnormal.
0xA0516004	Critical	The channel data is below the lower limit.	The channel data is below the configured lower limit.	1. Check whether the external input signal of the input module is abnormal.
0xA0470000	Information	No fault	/	/
0xA0471004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0471005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0471006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0475001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.

Fault Code	Level	Description	Cause	Remedy
0xA0475002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0475003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0475011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0475021	Critical	Module ADC malfunction	The ADC of the module malfunctions.	1. Check the module for hardware faults. 2. Replace the module.
0xA0475023	Critical	ADC reference voltage error	The ADC reference voltage is abnormal.	1. Check the module for hardware faults. 2. Replace the module.
0xA0476001	Critical	Channel open circuit	Data channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA0476002	Critical	Channel short circuit	The data channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA0476003	Critical	The channel data exceeds the upper limit.	The channel data exceeds the configured upper limit.	1. Check whether the external input signal of the input module is abnormal.
0xA0476004	Critical	The channel data is below the lower limit.	The channel data is below the configured lower limit.	1. Check whether the external input signal of the input module is abnormal.
0xA0476005	Critical	The channel data overflows.	The input data on the channel overflows.	1. Check whether the external input signal of the input module is abnormal.
0xA0476006	Critical	The channel data underflows.	The input data on the channel underflows.	1. Check whether the external input signal of the input module is abnormal.

0xA08A1004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.

Fault Code	Level	Description	Cause	Remedy
0xA08A1005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA08A1006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA08A2003	Critical	2SCOM-MDB module placed in the wrong slot	The 2SCOM-MDB module is placed in an incorrect slot.	The module must be placed in one of the first four slots.
0xA08A2004	Critical	The number of instructions (sub-modules) on serial port 0/1 of the 2SCOM-MDB module exceeds 31.	The number of instructions (submodules) for serial port 0/1 exceeds 31.	Reduce the number of instructions (submodules) for serial port 0/1.
0xA08A2005	Critical	The process data of the 2SCOM-MDB module exceeds 480 bytes.	The module process data (whether reading or writing) exceeds 480 bytes.	Reduce the module process data.
0xA08A2030	Critical	The serial port parameters of the 2SCOM-MDB module channel are configured incorrectly.	The configuration parameters sent to the module are outside the set range or do not meet the format requirement.	Check the configuration parameters according to the instructions.
0xA08A2033	Critical	The port parameters of the 2SCOM-MDB module channel are configured incorrectly.	The configuration parameters sent to the module are outside the set range or do not meet the format requirement.	Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0xA08A2040	Critical	The Modbus slave address of the 2SCOM-MDB module channel is configured incorrectly.	The configuration parameters sent to the module are outside the set range or do not meet the format requirement.	Check the configuration parameters according to the instructions.
0xA08A6044	Critical	Noise detected on 2SCOM-MDB module channel	Noise has been detected on the channel signal line.	Check whether disturbance exists.
0xA08A6045	Critical	2SCOM-MDB module channel parity bit error	Parity bit error	Check whether the parity bit configuration parameter is correct and whether the parity bit calculation is correct.
0xA08A6046	Critical	Channel instructions (submodules) of the 2SCOM-MDB module are configured incorrectly.	The added instruction (submodule) type does not match the operation mode of serial port 0/1.	Check whether the added instruction (submodule) type matches the operation mode of serial port 0/1.
0xA08A6060	Critical	M: Modbus response parameter mismatch	Transmit/receive instructions mismatch (The parameter in the response message does not match that in the query), or the instruction is not supported by the master station (the instruction code is not supported in the master query message).	Check for communication errors. Verify if the function code is supported by the master station.
0xA08A6061	Critical	M: Modbus slave ID mismatch	Transmit/receive address mismatch (The slave address in response message and query message do not match.)	Check for communication errors.

Fault Code	Level	Description	Cause	Remedy
0xA08A6062	Critical	M: Modbus response address mismatch	The start address in response message does not match that in the query.	Check for communication faults. Use a serial port assistant to monitor communication data frames. If this error occurs frequently, set the free coefficient in the startup parameters to 0.
0xA08A6063	Critical	M: Modbus response data length mismatch	Data frame length error: The received frame length does not conform to the standard, or the received frame length is less than 5.	Check for communication errors.
0xA08A6064	Critical	M: Modbus communication timeout	Receiving timeout	1. Check if the wiring is correct. 2. Check if the module configuration parameters match the parameter settings of the slave. 3. Use a serial port assistant to monitor communication data, and check if the slave responds.
0xA08A6065	Critical	M: Modbus CRC check fault	CRC check error	Check for communication errors.
0xA08A6066	Critical	Illegal function code	Illegal function code	The slave device does not support this parameter.
0xA08A6067	Critical	Illegal data address	Illegal data address	The specified data address does not exist in the slave device.
0xA08A6068	Critical	Illegal data value	The data value is illegal.	The specified data exceeds the range or is not allowed.
0xA08A6069	Critical	Slave device fault	Slave device fault	An unknown error occurred during response processing on the slave device.
0xA08A6500	Critical	modbus slave offline	In the modbus communication network, a slave has lost communication.	1. Check the modbus configuration, including station number/baud rate and so on. 2. Check the hardware wiring and termination resistors.
0xA08B0000	Information	No fault	/	/

Fault Code	Level	Description	Cause	Remedy
0xA08B1004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA08B1005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA08B1006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA08B2003	Critical	2S485-MDB module placed in the wrong slot	The 2S485-MDB module is placed in an incorrect slot.	The module must be placed in one of the first four slots.
0xA08B2004	Critical	The number of instructions (submodules) on serial port 0/1 of the 2S485-MDB module exceeds 31.	The number of instructions (submodules) for serial port 0/1 exceeds 31.	Reduce the number of instructions (submodules) for serial port 0/1.
0xA08B2005	Critical	The process data of the 2S485-MDB module exceeds 480 bytes.	The module process data (whether reading or writing) exceeds 480 bytes.	Reduce the module process data.
0xA08B2040	Critical	The Modbus slave address of the 2S485-MDB module channel is configured incorrectly.	The configuration parameters sent to the module are outside the set range or do not meet the format requirement.	Check the configuration parameters according to the instructions.
0xA08B2041	Critical	The serial port parameters of the 2S485-MDB module channel are configured incorrectly.	The configuration parameters sent to the module are outside the set range or do not meet the format requirement.	Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0xA08B6070	Critical	Noise detected on 2S485-MDB module channel	Noise has been detected on the channel signal line.	Check whether disturbance exists.
0xA08B6071	Critical	2S485-MDB module channel parity bit error	Parity bit error	Check whether the parity bit configuration parameter is correct and whether the parity bit calculation is correct.
0xA08B6072	Critical	Channel instructions (submodules) of the 2S485-MDB module are configured incorrectly.	The added instruction (submodule) type does not match the operation mode of serial port 0/1.	Check whether the added instruction (submodule) type matches the operation mode of serial port 0/1.
0xA08B6060	Critical	M: Modbus response parameter mismatch	Transmit/receive instructions mismatch (The parameter in the response message does not match that in the query), or the instruction is not supported by the master station (the instruction code is not supported in the master query message).	Check for communication errors. Verify if the function code is supported by the master station.
0xA08B6061	Critical	M: Modbus slave ID mismatch	Transmit/receive address mismatch (The slave address in response message and query message do not match.)	Check for communication errors.
0xA08B6062	Critical	M: Modbus response address mismatch	The start address in response message does not match that in the query.	Check for communication faults. Use a serial port assistant to monitor communication data frames. If this error occurs frequently, set the free coefficient in the startup parameters to 0.

Fault Code	Level	Description	Cause	Remedy
0xA08B6063	Critical	M: Modbus response data length mismatch	Data frame length error: The received frame length does not conform to the standard, or the received frame length is less than 5.	Check for communication errors.
0xA08B6064	Critical	M: Modbus communication timeout	Receiving timeout	1. Check if the wiring is correct. 2. Check if the module configuration parameters match the parameter settings of the slave. 3. Use a serial port assistant to monitor communication data, and check if the slave responds.
0xA08B6065	Critical	M: Modbus CRC check fault	CRC check error	Check for communication errors.
0xA08B6066	Critical	Illegal function code	Illegal function code	The slave device does not support this parameter.
0xA08B6067	Critical	Illegal data address	Illegal data address	The specified data address does not exist in the slave device.
0xA08B6068	Critical	Illegal data value	The data value is illegal.	The specified data exceeds the range or is not allowed.
0xA08B6069	Critical	Slave device fault	Slave device fault	An unknown error occurred during response processing on the slave device.
0xA08B6500	Critical	modbus slave offline	In the modbus communication network, a slave has lost communication.	1. Check the modbus configuration, including station number/baud rate and so on. 2. Check the hardware wiring and termination resistors.
0xA0500000	Information	No fault	/	/
0xA0501004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0501005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.

Fault Code	Level	Description	Cause	Remedy
0xA0501006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0505001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0505002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0505003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0505011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0505022	Critical	Module DAC malfunction	The DAC of the module malfunctions.	1. Check the module for hardware faults. 2. Replace the module.
0xA0506001	Critical	Channel open circuit	Data channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA0506002	Critical	Channel short circuit	The data channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0xA0506003	Critical	The channel data exceeds the upper limit.	The channel data exceeds the configured upper limit.	1. Check whether the external input signal of the input module is abnormal.

Fault Code	Level	Description	Cause	Remedy
0xA0506004	Critical	The channel data is below the lower limit.	The channel data is below the configured lower limit.	1. Check whether the external input signal of the input module is abnormal.
0xA0506005	Critical	Channel data overflow	The channel data exceeds the configured high limit.	1. Check whether the external input signal of the input module is abnormal.
0xA0506006	Critical	Channel data underflow	The channel data is below the configured low limit.	1. Check whether the external input signal of the input module is abnormal.
0xA0870000	Information	No fault	/	/
0xA0871004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0871005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0871006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0875001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0875002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0875003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.

Fault Code	Level	Description	Cause	Remedy
0xA0875011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0876500	Critical	The DN slave connected to the master is offline.	In the DeviceNet network, a slave has lost communication.	1. Check the DN configuration, including station number/ baud rate/data length and so on. 2. Check the hardware wiring and termination resistors.
0xA0880000	Information	No fault	/	/
0xA0881004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0881005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0881006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0885001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0885002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0885003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0885011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0820000	Information	No fault	/	/

Fault Code	Level	Description	Cause	Remedy
0xA0821004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0821005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0821006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0822020	Critical	Baud rate configuration error	The baud rate of the CAN channel is configured incorrectly.	1. Check the corresponding configuration parameters.
0xA0822021	Critical	Communication mode configuration error	The communication mode of the CAN channel is incorrectly configured.	1. Check the corresponding configuration parameters.
0xA0822022	Critical	Buffer size configuration error	The buffer size of the CAN channel is configured incorrectly.	1. Check the corresponding configuration parameters.
0xA0822023	Critical	Heartbeat interval configuration error	The heartbeat interval configuration error has occurred in the CAN channel.	1. Check the corresponding configuration parameters.
0xA0822024	Critical	Standard frame upper/ lower limit configuration error	The upper and lower limits for the standard frame on the CAN channels are configured incorrectly.	1. Check the corresponding configuration parameters.

Fault Code	Level	Description	Cause	Remedy
0xA0822025	Critical	Extended frame upper limit configuration error	The upper limit for the extended frame on the CAN channel is incorrectly configured.	1. Check the corresponding configuration parameters.
0xA0822026	Critical	Extended frame lower limit configuration error	The lower limit for the extended frame on the CAN channel is incorrectly configured.	1. Check the corresponding configuration parameters.
0xA0825001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0825002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0825003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0825011	Critical	Chip overheating	The internal chip in the I/O module is overheated.	1. Check the module for hardware faults. 2. Replace the module.
0xA0826020	Critical	Transmit buffer full	The transmit buffer for the CAN channel is full.	1. Reduce the transmit data length or increase the transmit interval. 2. Increase the baud rate.
0xA0826021	Critical	Receive buffer full	The receive buffer for the CAN channel is full.	1. Reduce the transmit data length or increase the transmit interval.
0xA0826022	Critical	Receive frame count error	A receive frame count error has occurred on the CAN channel.	1. Check the frame counter value written to the module over the bus.
0xA0826023	Critical	Bus load rate too high	The bus load ratio of the CAN channel exceeds 30%.	1. Check the data on the bus and the load rate.

Fault Code	Level	Description	Cause	Remedy
0xA0826024	Critical	CAN data transmit error	The transmit error counter (TEC) on the CAN channel has reached 127.	1. Check the connections of the communication line. 2. Check the termination resistor.
0xA0826025	Critical	CAN data receive error	The receive error counter (REC) on the CAN channel has reached 127.	1. Check the connections of the communication line. 2. Check the termination resistor.
0xA0830000	Information	No fault	/	/
0xA0831004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0831005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0831006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0832010	Critical	Baud rate configuration error	The baud rate of the 485 channel is configured incorrectly.	1. Check the corresponding configuration parameters.
0xA0832011	Critical	Communication mode configuration error	The communication mode of the RS485 channel is incorrectly configured.	1. Check the corresponding configuration parameters.
0xA0832012	Critical	Bit-related parameter configuration error	Bit-related parameter configuration error for the RS485 channel	1. Check the corresponding configuration parameters.
0xA0832013	Critical	Data packet size configuration error	Data packet size configuration error for the RS485 channel	1. Check the corresponding configuration parameters.

Fault Code	Level	Description	Cause	Remedy
0xA0832014	Critical	Message interval configuration error	The message interval of the RS485 channel is configured incorrectly.	1. Check the corresponding configuration parameters.
0xA0832015	Critical	Transmit buffer configuration error	The transmit buffer for the RS485 channel is configured incorrectly.	1. Check the corresponding configuration parameters.
0xA0832016	Critical	Receive buffer configuration error	The receive buffer for the RS485 channel is configured incorrectly.	1. Check the corresponding configuration parameters.
0xA0835001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0835002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0835003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0836010	Critical	Transmit buffer full	The transmit buffer for the RS485 channel is full.	1. Reduce the transmit data length or increase the transmit interval. 2. Set the baud rate to a greater value.
0xA0836011	Critical	Receive buffer full	The receive buffer for the RS485 channel is full.	1. Reduce the transmit data length or increase the transmit interval.
0xA0836012	Critical	Receive frame count value error	Receive frame counter error on RS485 channel. Non-consecutive frame counter values.	1. Check the frame counter value written to the module over the local bus.

Fault Code	Level	Description	Cause	Remedy
0xA0836013	Critical	Receive frame segment value error	Receive frame segnum value error on RS485 channel. Non-consecutive frame segnum values.	1. Check the frame segnum value written to the module over the local bus.
0xA0836014	Critical	Communication noise interference	Noise detected on the RS485 channel.	1. Check for noise interference on the corresponding serial port.
0xA0836015	Critical	Data check error	Parity bit fault detected on the RS485 module channel.	1. Check whether the parity bit configuration parameter of the serial port matches the configured value.
0xA0860000	Information	No fault	/	/
0xA0861004	Critical	I/O module configuration failure	I/O module parameter configuration failed.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0861005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0861006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA0862030	Critical	Serial port parameter configuration error.	Serial port parameter configuration error on the COM channel.	1. Check the corresponding configuration parameters.
0xA0862031	Critical	Data packet size configuration error.	Data packet size configuration error on the COM channel.	1. Check the corresponding configuration parameters.
0xA0862032	Critical	Timeout configuration error	Timeout configuration error on the COM channel.	1. Check the corresponding configuration parameters.

Fault Code	Level	Description	Cause	Remedy
0xA0862033	Critical	Port protocol configuration error.	Port protocol configuration error on the COM channel.	1. Check the corresponding configuration parameters.
0xA0865001	Critical	Power supply overvoltage	The supply voltage exceeds the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0865002	Critical	Power supply undervoltage	The supply voltage is below the rated operating voltage of the I/O module.	1. Check the power supply of the module.
0xA0865003	Critical	External 24 V power supply failure	The external 24 V power supply to the I/O modules is lost.	1. Check the power supply of the module.
0xA0866040	Critical	Transmit buffer full	The transmit buffer for the COM channel is full.	1. Reduce the transmit data length or increase the transmit interval. 2. Set the baud rate to a greater value.
0xA0866041	Critical	Receive buffer full	The receive buffer for the COM channel is full.	1. Reduce the transmit data length or increase the transmit interval.
0xA0866042	Critical	Receive frame count value error	Receive frame counter error on RS485 channel. Non-consecutive frame counter values.	1. Check the frame counter value written to the module over the local bus.
0xA0866043	Critical	Receive frame segment value error	Receive frame segnum value error on RS485 channel. Non-consecutive frame segnum values.	1. Check the frame segnum value written to the module over the local bus.
0xA0866044	Critical	Communication noise interference	Noise detected on the COM channel.	1. Check for noise interference on the corresponding serial port.

Fault Code	Level	Description	Cause	Remedy
0xA0866045	Critical	Data check error	Parity bit error on the COM channel.	1. Check whether the parity bit configuration parameter of the serial port matches the configured value.
0xA85C1000	Information	The configured module type matches the type of the actually installed module.	/	/
0xA85C1001	Critical	The configured module type is inconsistent with the type of the module actually installed.	The configured module type is inconsistent with the type of the module actually installed.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA85C1002	Critical	Not inserted in the device	Not inserted in the device	1. Check whether the extension card is correctly inserted into the device.
0xA8661000	Information	The configured module type matches the type of the actually installed module.	/	/
0xA8661001	Critical	The configured module type is inconsistent with the type of the module actually installed.	The configured module type is inconsistent with the type of the module actually installed.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA8661002	Critical	Not inserted in the device	Not inserted in the device	1. Check whether the extension card is correctly inserted into the device.
0xA8701000	Information	The configured module type matches the type of the actually installed module.	/	/
0xA8701001	Critical	The configured module type is inconsistent with the type of the module actually installed.	The configured module type is inconsistent with the type of the module actually installed.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.

Fault Code	Level	Description	Cause	Remedy
0xA8701002	Critical	Not inserted in the device	Not inserted in the device	1. Check whether the extension card is correctly inserted into the device.
0xA8711000	Information	The configured module type matches the type of the actually installed module.	/	/
0xA8711001	Critical	The configured module type is inconsistent with the type of the module actually installed.	The configured module type is inconsistent with the type of the module actually installed.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA8711002	Critical	Not inserted in the device	Not inserted in the device	1. Check whether the extension card is correctly inserted into the device.
0xA87A1000	Information	The configured module type matches the type of the actually installed module.	/	/
0xA87A1001	Critical	The configured module type is inconsistent with the type of the module actually installed.	The configured module type is inconsistent with the type of the module actually installed.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0xA87A1002	Critical	Not inserted in the device	Not inserted in the device	1. Check whether the extension card is correctly inserted into the device.
0xA87B1000	Information	The configured module type matches the type of the actually installed module.	/	/
0xA87B1001	Critical	The configured module type is inconsistent with the type of the module actually installed.	The configured module type is inconsistent with the type of the module actually installed.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.

Fault Code	Level	Description	Cause	Remedy
0xA87B1002	Critical	Not inserted in the device	Not inserted in the device	1. Check whether the extension card is correctly inserted into the device.
0x32C81000	Information	The configured module type matches the type of the actually installed module.	/	/
0x32C81001	Critical	The configured module type is inconsistent with the type of the module actually installed.	The configured module type is inconsistent with the type of the module actually installed.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.

Fault Code	Level	Description	Cause	Remedy
0x00441000	Warning	Protocol stack failed to scan for modules	Possible causes: 1. The expansion module does not exist. 2. No expansion module was scanned due to local bus communication failure.	1. Check whether the expansion module is properly installed and supplied with power. 2. Check the contact of the communication interface of the expansion module or restart the rack.
0x00441001	Critical	The number of I/O modules configured is more than the number of I/O modules actually scanned.	Possible causes: 1. The actual slot position of the expansion module does not match the configuration settings. 2. A local bus communication fault causes the scanned modules to differ from the configured modules.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0x00441002	Critical	The number of I/O modules configured is less than the number of I/O modules actually scanned.	Possible causes: 1. The actual slot position of the expansion module does not match the configuration settings. 2. A local bus communication fault causes the scanned modules to differ from the configured modules.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.

Fault Code	Level	Description	Cause	Remedy
0x00441003	Critical	The type of I/O modules configured is inconsistent with that of the I/O modules actually scanned.	Possible causes: 1. The actual slot position of the expansion module does not match the configuration settings. 2. A local bus communication fault causes the scanned modules to differ from the configured modules.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0x00441004	Critical	I/O module configuration failure	The I/O module is not configured successfully.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0x00441005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.
0x00441006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0x00441007	Critical	Module type mismatch	The hardware component has been inserted, but the type of this component does not match that of the configured module.	1. Check the inserted module, and correct the configuration if necessary.

Fault Code	Level	Description	Cause	Remedy
0x00441008	Critical	New module inserted	A new hardware component has been inserted, and the type of this component matches that of the configured module.	/
0x00441009	Warning	Local bus cyclic data communication error	Local bus cyclic data frame transmission error: Data inconsistency (CRC check error, etc.). Possible cause: 1. Increased electromagnetic interference. 2. F module fault	1. Check the contact of the communication interface of the expansion module or restart the rack. 2. Eliminate or reduce the electromagnetic interference. 3. Replace the F module.
0x0044100A	Warning	Local bus cyclic data communication timeout	Local bus cyclic data frame transmission timeout. Possible causes: 1. Incorrect communication period setting. 2. Bus faults exist.	1. Modify the communication cycle. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0x0044100B	Critical	Configuration conflict	The same I/O module is configured under multiple controllers.	1. Check the configuration, resolve the conflict, and then re-download.
0x0044100C	Critical	The stopper plate is faulty or missing.	The stopper plate is faulty or missing.	1. Reinstall or replace the stopper plate.
0x0044100D	Critical	Module watchdog timeout	Possible causes: 1. Module MCU power loss. 2. Module MCU crash.	1. Check the module power supply. In case of power loss, restore the power supply. 2. Power cycle the module.

Fault Code	Level	Description	Cause	Remedy
0x0044100E	Critical	IP address conflict	IP address conflict among network devices (PLCs, couplers, etc.) in the configuration	Check the IP addresses of the network devices (PLCs, couplers, etc.) in the configuration.
0x0044100F	Critical	The I/O module does not support the currently selected industry standard.	The I/O module does not support the currently selected industry standard.	Replace or update the I/O module.
0x00441010	Critical	Configuration error: Module 1 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441011	Critical	Configuration error: Module 2 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441012	Critical	Configuration error: Module 3 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441013	Critical	Configuration error: Module 4 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441014	Critical	Configuration error: Module 5 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441015	Critical	Configuration error: Module 6 type error	The configured module type does not match the actual module type.	1. Check the module type.

Fault Code	Level	Description	Cause	Remedy
0x00441016	Critical	Configuration error: Module 7 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441017	Critical	Configuration error: Module 8 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441018	Critical	Configuration error: Module 9 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441019	Critical	Configuration error: Module 10 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x0044101A	Critical	Configuration error: Module 11 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x0044101B	Critical	Configuration error: Module 12 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x0044101C	Critical	Configuration error: Module 13 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x0044101D	Critical	Configuration error: Module 14 type error	The configured module type does not match the actual module type.	1. Check the module type.

Fault Code	Level	Description	Cause	Remedy
0x0044101E	Critical	Configuration error: Module 15 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x0044101F	Critical	Configuration error: Module 16 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441020	Critical	Configuration error: Module 17 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441021	Critical	Configuration error: Module 18 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441022	Critical	Configuration error: Module 19 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441023	Critical	Configuration error: Module 20 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441024	Critical	Configuration error: Module 21 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441025	Critical	Configuration error: Module 22 type error	The configured module type does not match the actual module type.	1. Check the module type.

Fault Code	Level	Description	Cause	Remedy
0x00441026	Critical	Configuration error: Module 23 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441027	Critical	Configuration error: Module 24 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441028	Critical	Configuration error: Module 25 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00441029	Critical	Configuration error: Module 26 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x0044102A	Critical	Configuration error: Module 27 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x0044102B	Critical	Configuration error: Module 28 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x0044102C	Critical	Configuration error: Module 29 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x0044102D	Critical	Configuration error: Module 30 type error	The configured module type does not match the actual module type.	1. Check the module type.

Fault Code	Level	Description	Cause	Remedy
0x0044102E	Critical	Configuration error: Module 31 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x0044102F	Critical	Configuration error: Module 32 type error	The configured module type does not match the actual module type.	1. Check the module type.
0x00442003	Critical	The 2SCOM-MDB/2S485-MDB module is placed in a wrong slot.	Slot position error	Place the module in the first four slots.
0x00442004	Critical	The number of submodules for serial port 0/1 of the 2SCOM-MDB/2S485-MDB module exceeds 31.	The number of submodules for serial port 0/1 cannot exceed 31.	Reduce the number of submodules for serial port 0/1.
0x00442005	Critical	The process data of the 2SCOM-MDB/2S485-MDB module exceeds 480 bytes.	The module process data (whether reading or writing) must not exceed 480 bytes.	Reduce the module process data.
0x00442010	Critical	The baud rate of the RS485 module channel is configured incorrectly.	The baud rate of the RS485 module channel is configured incorrectly.	1. Check the configuration parameters according to the instructions.
0x00442011	Critical	The communication mode of the RS485 module channel is configured incorrectly.	The communication mode of the RS485 module channel is configured incorrectly.	1. Check the configuration parameters according to the instructions.
0x00442012	Critical	The data bit-related parameters of the RS485 module channel is configured incorrectly.	The data bit-related parameters of the RS485 module channel is configured incorrectly.	1. Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0x00442013	Critical	The data packet size of the RS485 module channel is configured incorrectly.	The data packet size of the RS485 module channel is configured incorrectly.	1. Check the configuration parameters according to the instructions.
0x00442014	Critical	The message interval of the RS485 module channel is configured incorrectly.	The message interval of the RS485 module channel is configured incorrectly.	1. Check the configuration parameters according to the instructions.
0x00442015	Critical	The transmit buffer of the RS485 module channel is configured incorrectly.	The transmit buffer of the RS485 module channel is configured incorrectly.	1. Check the configuration parameters according to the instructions.
0x00442016	Critical	The receive buffer of the RS485 module channel is configured incorrectly.	The receive buffer of the RS485 module channel is configured incorrectly.	1. Check the configuration parameters according to the instructions.
0x00442020	Critical	The baud rate of the CAN module channel is configured incorrectly.	The baud rate of the CAN module channel is configured incorrectly.	1. Check the configuration parameters according to the instructions.
0x00442021	Critical	The communication method of the CAN module channel is configured incorrectly.	The communication method of the CAN module channel is configured incorrectly.	1. Check the configuration parameters according to the instructions.
0x00442022	Critical	The data bit-related parameters of the CAN module channel is configured incorrectly.	The data bit-related parameters of the CAN module channel is configured incorrectly.	1. Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0x00442023	Critical	The buffer size of the CAN module channel is configured incorrectly.	The buffer size of the CAN module channel is configured incorrectly.	1. Check the configuration parameters according to the instructions.
0x00442024	Critical	The heartbeat interval of the CAN module channel is configured incorrectly.	The heartbeat interval of the CAN module channel is configured incorrectly.	1. Check the configuration parameters according to the instructions.
0x00442025	Critical	The standard frame upper limit of the CAN module channel is configured incorrectly.	The standard frame upper limit of the CAN module channel is configured incorrectly.	1. Check the configuration parameters according to the instructions.
0x00442026	Critical	The standard frame lower limit of the CAN module channel is configured incorrectly.	The standard frame lower limit of the CAN module channel is configured incorrectly.	1. Check the configuration parameters according to the instructions.
0x00442030	Critical	The serial port parameters of the 2SCOM module channel are configured incorrectly.	The serial port parameters of the 2SCOM module channel are configured incorrectly.	1. Check the configuration parameters according to the instructions.
0x00442031	Critical	The data packet size is incorrectly configured for the channels of the 2SCOM module.	The data packet size is incorrectly configured for the channels of the 2SCOM module.	1. Check the configuration parameters according to the instructions.
0x00442032	Critical	The timeout parameter is incorrectly configured for the channels of the 2SCOM module.	The timeout parameter is incorrectly configured for the channels of the 2SCOM module.	1. Check the configuration parameters according to the instructions.
0x00442033	Critical	The port parameters of the 2SCOM module channel are configured incorrectly.	The port parameters of the 2SCOM module channel are configured incorrectly.	1. Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0x00442040	Critical	The Modbus slave address of the 2SCOM-MDB/2S485-MDB module channel is configured incorrectly.	The Modbus slave address of the 2SCOM-MDB/ 2S485-MDB module channel is configured incorrectly.	1. Check the configuration parameters according to the instructions.
0x00442041	Critical	The serial port parameters of the 2S485-MDB module channel are configured incorrectly.	The serial port parameters of the 2S485-MDB module channel are configured incorrectly.	1. Check the configuration parameters according to the instructions.
0x00442100	Critical	Preset value out of range	The preset value is larger than the maximum value or smaller than the minimum value.	1. Check the configuration parameters according to the instructions.
0x00442101	Critical	Counter configuration error	1. The instruction enabled the single-ended counting function, but the DI is not configured for counting. 2. The single-ended interface enabled by the instruction does not match the counting interface configured on the DI. 3. The counter is configured as a differential interface, but DI0 or DI1 is set to counting mode.	1. Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0x00442102	Critical	Signal type not supported	The signal type is not set to an allowed value, which includes phase A/B 1x frequency, phase A/B 2x frequency, phase A/B 4x frequency, pulse + direction, CW/ CCW, single-phase counting (A), and single-phase counting (B).	1. Check the configuration parameters according to the instructions.
0x00442103	Critical	Counter limit error	Maximum value <= Minimum value	1. Check the configuration parameters according to the instructions.
0x00442104	Critical	Incorrect setting of unit pulse increment	The unit pulse increment is less than 1.	1. Check the configuration parameters according to the instructions.
0x00442105	Critical	Incorrect setting of time base for speed measurement	The time base is not set to an allowed value. See object 800nh .3 in the object dictionary for allowed values.	1. Check the configuration parameters according to the instructions.
0x00442106	Critical	Incorrect setting of input filter parameter	The input filter parameter is not set to the allowed value. See object 800nh.2 in the object dictionary for allowed values.	1. Check the configuration parameters according to the instructions.
0x00442107	Critical	Incorrect setting of frequency sampling time	The frequency sampling time is not set to the allowed value. See object 800nh .5 in the object dictionary for allowed values.	1. Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0x00442108	Critical	Incorrect configuration of the clearing function	The clearing function is enabled through commands, but the DI is not configured with the clearing function.	1. Check the configuration parameters according to the instructions.
0x00442109	Critical	Incorrect configuration of the preset function	The preset function is enabled through commands, but the DI is not configured with the preset function.	1. Check the configuration parameters according to the instructions.
0x0044210A	Critical	Incorrect configuration of comparison 0 function	The comparison function is enabled through commands, but the DO is not configured with the comparison function.	1. Check the configuration parameters according to the instructions.
0x0044210B	Critical	Incorrect configuration of comparison 1 function	The comparison function is enabled through commands, but the DO is not configured with the comparison function.	1. Check the configuration parameters according to the instructions.
0x0044210C	Critical	Incorrect configuration of comparison 2 function	The comparison function is enabled through commands, but the DO is not configured with the comparison function.	1. Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0x0044210D	Critical	Incorrect configuration of comparison 3 function	The comparison function is enabled through commands, but the DO is not configured with the comparison function.	1. Check the configuration parameters according to the instructions.
0x0044210E	Critical	Incorrect configuration of probe 0 function	The probe function is enabled through commands, but the DI is not configured with the probe function.	1. Check the configuration parameters according to the instructions.
0x0044210F	Critical	Incorrect configuration of probe 1 function	The probe function is enabled through commands, but the DI is not configured with the probe function.	1. Check the configuration parameters according to the instructions.
0x00442110	Critical	Incorrect configuration of probe 2 function	The probe function is enabled through commands, but the DI is not configured with the probe function.	1. Check the configuration parameters according to the instructions.
0x00442111	Critical	Incorrect configuration of probe 3 function	The probe function is enabled through commands, but the DI is not configured with the probe function.	1. Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0x00442112	Critical	DO0 parameter error	The parameter is not set to the allowed value, which includes normal output and comparison output.	1. Check the configuration parameters according to the instructions.
0x00442113	Critical	DO1 parameter error	The parameter is not set to the allowed value, which includes normal output and comparison output.	1. Check the configuration parameters according to the instructions.
0x00442114	Critical	DO2 parameter error	The parameter is not set to the allowed value, which includes normal output and comparison output.	1. Check the configuration parameters according to the instructions.
0x00442115	Critical	DO3 parameter error	The parameter is not set to the allowed value, which includes normal output and comparison output.	1. Check the configuration parameters according to the instructions.
0x00442116	Critical	DI0 parameter error	The parameter is not set to the allowed value, which includes normal input, probe function, counting, clear, preset, and gating.	1. Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0x00442117	Critical	DI1 parameter error	The parameter is not set to the allowed value, which includes normal input, probe function, counting, clear, preset, and gating.	1. Check the configuration parameters according to the instructions.
0x00442118	Critical	DI2 parameter error	The parameter is not set to the allowed value, which includes normal input, probe function, counting, clear, preset, and gating.	1. Check the configuration parameters according to the instructions.
0x00442119	Critical	DI3 parameter error	The parameter is not set to the allowed value, which includes normal input, probe function, counting, clear, preset, and gating.	1. Check the configuration parameters according to the instructions.
0x00445001	Critical	Power supply overvoltage	The module power supply is unstable or has failed.	1. Check the power supply of the module.
0x00445002	Critical	Power supply undervoltage	The module power supply is unstable or has failed.	1. Check the power supply of the module.
0x00445003	Critical	External 24 V power supply failure	The external 24 V power supply fails.	1. Check the power supply of the module.
0x00445004	Critical	Module ADC parameters not configured properly	1. The ADC parameters of the module are not configured properly.	1. Check the stability of the external 24 V power voltage for the module. 2. Restart the module.

Fault Code	Level	Description	Cause	Remedy
0x00445005	Critical	External 5 V power supply failure	Unstable power supply to the module or power failure	1. Check the power supply on the user side of the module. 2. If the power is normal after check but the fault persists, replace the module.
0x00445011	Critical	Chip overheating	The chip is overheating.	1. Check the module for hardware faults. 2. Replace the module.
0x00445012	Information	Chip overtemperature fault cleared	The chip overtemperature fault is cleared.	/
0x00445013	Critical	Chip connection error	The chip is connected improperly.	1. Check the module for hardware faults. 2. Replace the module.
0x00445014	Information	Chip connection fault cleared	The chip connection fault is cleared.	/
0x00445021	Critical	Module ADC malfunction	The ADC of the module malfunctions.	1. Check the module for hardware faults. 2. Replace the module.
0x00445022	Critical	Module DAC malfunction	The DAC of the module malfunctions.	1. Check the module for hardware faults. 2. Replace the module.
0x00445023	Critical	ADC reference voltage error	The ADC reference voltage is abnormal.	1. Check the module for hardware faults. 2. Replace the module.
0x00445024	Critical	Hardware fault	Hardware fault	1. Check whether the module hardware is faulty.
0x00445025	Information	Hardware fault cleared	The hardware fault has been cleared.	/
0x00445031	Critical	Reference channel fault	The reference channel is faulty.	1. Check the cold junction channel hardware of the thermocouple (TC) module. 2. Replace the module.
0x00446001	Critical	Channel open circuit	The channel is open-circuit.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module or replace the module.

Fault Code	Level	Description	Cause	Remedy
0x00446002	Critical	Channel short circuit	The channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module or replace the module.
0x00446003	Critical	The channel data exceeds the upper limit.	The channel data exceeds the upper limit.	1. Check whether the external input signal of the input module is abnormal.
0x00446004	Critical	The channel data is below the lower limit.	The channel data is below the lower limit.	1. Check whether the external input signal of the input module is abnormal.
0x00446005	Critical	Channel data overflow	The channel data overflows.	1. Check whether the external input signal of the input module is abnormal.
0x00446006	Critical	Channel data underflow	The channel data underflows.	1. Check whether the external input signal of the input module is abnormal.
0x00446007	Critical	Channel overcurrent	1. This module requires a rated load to operate properly. However, the detected output channel current is too high, triggering overcurrent protection.	1. Check the external wiring for short circuits. 2. Check the load for overcurrent. 3. Check the module for damage.
0x00446008	Critical	Channel ADC malfunction	1. The channel ADC has failed.	1. Check the module for hardware faults. 2. Replace the module.
0x00446009	Critical	Channel data not configured properly	1. The configuration parameters sent to the module are outside the set range or do not meet the requirements.	1. Check whether the downloaded configuration parameters are valid.

Fault Code	Level	Description	Cause	Remedy
0x0044600A	Critical	TC-ISO module channel cold junction fault	1. The sampling channel of the internal cold junction in the TC-ISO module is faulty.	1. Check the cold junction channel hardware of the thermocouple (TC) module. 2. Replace the module.
0x00446010	Critical	The transmit buffer of the RS485 module channel is full.	The transmit buffer of the RS485 module channel is full.	Reduce the transmit data length or increase the transmit interval. Set the baud rate to a greater value. All channels must be checked.
0x00446011	Critical	The receive buffer of the RS485 module channel is full.	The receive buffer of the RS485 module channel is full.	Reduce the transmit data length or increase the transmit interval. All channels must be checked.
0x00446012	Critical	The receiving frame counter value of the RS485 module channel is faulty.	The receiving frame counter value of the RS485 module channel is faulty.	Check all channels for the frame counter value.
0x00446013	Critical	The receiving frame segnum value of the RS485 module channel is faulty.	The receiving frame segnum value of the RS485 module channel is faulty.	Check all channels for the frame segnum value.
0x00446014	Critical	Noise detected on RS485 module channel	Noise detected on RS485 module channel	Check all channels for interference.
0x00446015	Critical	RS485 module channel parity bit error	RS485 module channel parity bit error	Check whether the parity bit configuration parameter is correct and whether the parity bit calculation is correct. All channels must be checked.
0x00446020	Critical	The transmit buffer of the CAN module channel is full.	The transmit buffer of the CAN module channel is full.	Reduce the transmit data length or increase the transmit interval. Set the baud rate to a greater value.
0x00446021	Critical	The receive buffer of the CAN module channel is full.	The receive buffer of the CAN module channel is full.	Reduce the transmit data length or increase the transmit interval. Set the baud rate to a greater value.

Fault Code	Level	Description	Cause	Remedy
0x00446022	Critical	The receive frame counter of the CAN module is faulty.	The receive frame counter of the CAN module is faulty.	Check the frame counter value.
0x00446023	Critical	The bus load ratio of the CAN module exceeds 30%.	The bus load ratio of the CAN module exceeds 30%.	Check the data on the bus and the load rate.
0x00446024	Critical	The transmit error counter (TEC) on the CAN module exceeds 127.	The transmit error counter (TEC) on the CAN module exceeds 127.	Check the connection between the transmission line and the bus, or the bus load rate.
0x00446025	Critical	The receive error counter (REC) on the CAN module exceeds 127.	The receive error counter (REC) on the CAN module exceeds 127.	Check the connection between the receiving line and the bus, or the bus load rate
0x00446030	Critical	SSI module channel 24 V output error	An error occurs in 24 V output of the SSI module channel.	Check the output voltage.
0x00446031	Critical	SSI module channel communication error	An error occurs during channel communication of the SSI module.	Check the connection between D+ and D- terminals.
0x00446032	Critical	SSI module channel data error	The SSI module channel data is abnormal.	Check whether the baud rate is configured properly.
0x00446035	Critical	4LC_PID module channel output overload DO0	DO output short circuit or overload	1. Check the external wiring for short circuits. 2. Check the load for overcurrent. 3. Check the module for damage.
0x00446036	Critical	4LC_PID module channel output overload DO1	DO output short circuit or overload	1. Check the external wiring for short circuits. 2. Check the load for overcurrent. 3. Check the module for damage.
0x00446040	Critical	The transmit buffer of the 2SCOM module channel is full.	The transmit buffer of the 2SCOM module channel is full.	Reduce the transmit data length or increase the transmit interval. Set the baud rate to a greater value. All channels must be checked.

Fault Code	Level	Description	Cause	Remedy
0x00446041	Critical	The receive buffer of the 2SCOM module channel is full.	The receive buffer of the 2SCOM module channel is full.	Reduce the transmit data length or increase the transmit interval. All channels must be checked.
0x00446042	Critical	The receiving frame counter value of the 2SCOM module channel is faulty.	The receiving frame counter value of the 2SCOM module channel is faulty.	Check all channels for the frame counter value.
0x00446043	Critical	The receiving frame segnum value of the 2SCOM module channel is faulty.	The receiving frame segnum value of the 2SCOM module channel is faulty.	Check all channels for the frame segnum value.
0x00446044	Critical	Noise detected on 2SCOM module channel	Noise detected on 2SCOM module channel	Check all channels for interference.
0x00446045	Critical	2SCOM module channel parity bit error	2SCOM module channel parity bit error	Check whether the parity bit configuration parameter is correct and whether the parity bit calculation is correct. All channels must be checked.
0x00446046	Critical	Channel submodules of the 2SCOM-MDB module are configured incorrectly.	The added sub-module type does not match the operation mode of serial port 0/1.	Check whether the submodule matches the operation mode of serial port 0/1. All channels must be checked.
0x00446050	Critical	Short circuit	For any channel that is not outputting, the chip detects a short circuit between the DO and VDD.	1. Check the configuration parameters according to the instructions.
0x00446051	Critical	Switch ON disconnection	For any channel that is outputting, the chip detects that the DO is not connected to a load.	1. Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0x00446052	Critical	Switch OFF disconnection	For any channel that is not outputting, the chip detects that the DO is not connected to a load.	1. Check the configuration parameters according to the instructions.
0x00446053	Critical	Overcurrent	For any channel that is outputting, the chip detects that the output current exceeds the current limit of the chip (2.4 A to 3.2 A, typical value 2.8 A).	1. Check the configuration parameters according to the instructions.
0x00446054	Critical	Overload	When the output current is too large, but the overcurrent protection value is not reached, the power consumption of the chip output channel increases and the temperature increases. When the junction temperature reaches 165℃, an overload error occurs.	1. Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0x00446060	Critical	M: Modbus response parameter mismatch	Transmit/receive instructions mismatch (The parameter in the response message does not match that in the query), or the instruction is not supported by the master station (the instruction code is not supported in the master query message).	Check for communication errors. Verify if the function code is supported by the master station. All channels must be checked.
0x00446061	Critical	M: Modbus slave ID mismatch	Transmit/receive address mismatch (The slave address in response message and query message do not match.)	Check all channels for communication errors.
0x00446062	Critical	M: Modbus response address mismatch	The start address in response message does not match that in the query.	Check all channels for communication errors.
0x00446063	Critical	M: Modbus response data length mismatch	Data frame length error: The received frame length does not conform to the standard, or the received frame length is less than 5.	Check all channels for communication errors.
0x00446064	Critical	M: Modbus communication timeout	Receiving timeout	Check all channels for communication errors.
0x00446065	Critical	M: Modbus CRC check fault	CRC check error	Check all channels for communication errors.
0x00446066	Critical	Illegal function code	Illegal function code	The slave device does not support this parameter.

Fault Code	Level	Description	Cause	Remedy
0x00446067	Critical	Illegal data address	Illegal data address	The specified data address does not exist in the slave device.
0x00446068	Critical	Illegal data value	The data value is illegal.	The specified data exceeds the range or is not allowed.
0x00446069	Critical	Slave device fault	Slave device fault	An unknown error occurred during response processing on the slave device.
0x00446070	Critical	Noise detected on 2S485-MDB module channel	Noise detected on the pin	Check all channels for interference.
0x00446071	Critical	2S485-MDB module channel parity bit error	Parity bit error	Check whether the parity bit configuration parameter is correct and whether the parity bit calculation is correct. All channels must be checked.
0x00446072	Critical	Channel submodules of the 2S485-MDB module are configured incorrectly.	The added sub-module type does not match the operation mode of serial port 0/1.	Check whether the submodule matches the operation mode of serial port 0/1. All channels must be checked.
0x00446800	Critical	Phase A open circuit	Phase A open circuit	1. Check the configuration parameters according to the instructions.
0x00446801	Critical	Phase B open circuit	Phase B open circuit	1. Check the configuration parameters according to the instructions.
0x00446802	Critical	Frequency out of limit	Differential interface: frequency > 4 M; Single-ended interface: frequency > 500K	1. Check the configuration parameters according to the instructions.
0x00446803	Critical	Count value overflow	Count value >= Maximum value	1. Check the configuration parameters according to the instructions.
0x00446804	Critical	Count value underflow	Count value <= Minimum value	1. Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0x00446805	Critical	Comparison function 0 quantity/step out of range	The quantity is greater than 1024 or less than 1, or the step is less than 1.	1. Check the configuration parameters according to the instructions.
0x00446806	Critical	Comparison function 1 quantity/step out of range	The quantity is greater than 1024 or less than 1, or the step is less than 1.	1. Check the configuration parameters according to the instructions.
0x00446807	Critical	Comparison function 2 quantity/step out of range	The quantity is greater than 1024 or less than 1, or the step is less than 1.	1. Check the configuration parameters according to the instructions.
0x00446808	Critical	Comparison function 3 quantity/step out of range	The quantity is greater than 1024 or less than 1, or the step is less than 1.	1. Check the configuration parameters according to the instructions.
0x00446809	Critical	The output hold time/ pulse number is not configured properly for the comparison function 0.	The hold time is smaller than 10, or the pulse number is smaller than 1.	1. Check the configuration parameters according to the instructions.
0x0044680A	Critical	Comparison function 1 output hold time/pulse number not configured properly	The hold time is smaller than 10, or the pulse number is smaller than 1.	1. Check the configuration parameters according to the instructions.
0x0044680B	Critical	Comparison function 2 output hold time/pulse number not configured properly	The hold time is smaller than 10, or the pulse number is smaller than 1.	1. Check the configuration parameters according to the instructions.
0x0044680C	Critical	Comparison function 3 output hold time/pulse number not configured properly	The hold time is smaller than 10, or the pulse number is smaller than 1.	1. Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0x0044680D	Critical	The output start position and step direction is not configured properly for the comparison function 0.	Start and end positions are equal; start position < end position, step size < 0; start position > end position, step size > 0.	1. Check the configuration parameters according to the instructions.
0x0044680E	Critical	The output start position and step direction is not configured properly for the comparison function 1.	Start and end positions are equal; start position < end position, step size < 0; start position > end position, step size > 0.	1. Check the configuration parameters according to the instructions.
0x0044680F	Critical	The output start position and step direction is not configured properly for the comparison function 2.	Start and end positions are equal; start position < end position, step size < 0; start position > end position, step size > 0.	1. Check the configuration parameters according to the instructions.
0x00446810	Critical	The output start position and step direction is not configured properly for the comparison function 3.	Start and end positions are equal; start position < end position, step size < 0; start position > end position, step size > 0.	1. Check the configuration parameters according to the instructions.
0x00446811	Critical	The comparison value is out of range for the comparison function 0.	The comparison value is greater than the maximum value or less than the minimum value.	1. Check the configuration parameters according to the instructions.
0x00446812	Critical	Comparison function 1 comparison value out of range	The comparison value is greater than the maximum value or less than the minimum value.	1. Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0x00446813	Critical	Comparison function 2 comparison value out of range	The comparison value is greater than the maximum value or less than the minimum value.	1. Check the configuration parameters according to the instructions.
0x00446814	Critical	Comparison function 3 comparison value out of range	The comparison value is greater than the maximum value or less than the minimum value.	1. Check the configuration parameters according to the instructions.
0x00446815	Critical	The type is not configured properly for the comparison function 0.	The comparison type is not set to the allowed value, which includes multi-point comparison and uniformly-spaced comparison.	1. Check the configuration parameters according to the instructions.
0x00446816	Critical	Comparison function 1 type not configured properly	The comparison type is not set to the allowed value, which includes multi-point comparison and uniformly-spaced comparison.	1. Check the configuration parameters according to the instructions.
0x00446817	Critical	Comparison function 2 type not configured properly	The comparison type is not set to the allowed value, which includes multi-point comparison and uniformly-spaced comparison.	1. Check the configuration parameters according to the instructions.
0x00446818	Critical	Comparison function 3 type not configured properly	The comparison type is not set to the allowed value, which includes multi-point comparison and uniformly-spaced comparison.	1. Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0x00446819	Critical	The output control mode is not configured properly for the comparison function 0.	The control mode is not set to the allowed value, which includes time control, pulse control, and level control.	1. Check the configuration parameters according to the instructions.
0x0044681A	Critical	The output control mode is not configured properly for the comparison function 1.	The control mode is not set to the allowed value, which includes time control, pulse control, and level control.	1. Check the configuration parameters according to the instructions.
0x0044681B	Critical	Comparison function 2 output control mode not configured properly	The control mode is not set to the allowed value, which includes time control, pulse control, and level control.	1. Check the configuration parameters according to the instructions.
0x0044681C	Critical	Comparison function 3 output control mode not configured properly	The control mode is not set to the allowed value, which includes time control, pulse control, and level control.	1. Check the configuration parameters according to the instructions.
0x0044681D	Critical	DO0 short circuit	DO0 short circuit	1. Check the configuration parameters according to the instructions.
0x0044681E	Critical	DO1 short circuit	DO1 short circuit	1. Check the configuration parameters according to the instructions.
0x0044681F	Critical	DO2 short circuit	DO2 short circuit	1. Check the configuration parameters according to the instructions.
0x00446820	Critical	DO3 short circuit	DO3 short circuit	1. Check the configuration parameters according to the instructions.

Fault Code	Level	Description	Cause	Remedy
0x00447001	Warning	The temperature is too low.	The internal temperature of the module box is lower than the lower limit.	Operate the F module within the specified temperature range.
0x00447002	Warning	High temperature	The internal temperature of the module box is higher than the upper limit.	Operate the F module within the specified temperature range.
0x00447004	Critical	Incorrect parameter	Parameter configuration error or out-of-range diagnostics	Correct the parameter assignment.
0x00447005	Critical	The parameter set version is incorrect.	The version of the downloaded parameter set does not match the version of the parameter set running in the module.	Check the parameter assignment.
0x00447007	Critical	Module error	Possible causes: 1. Excessive electromagnetic interference occurred. 2. Module initialization error. 3. Power-on self-test error (peripheral).	1. Correct the fault. Then, remove and reinsert the module, or power cycle it. 2. If the module cannot be put back into operation, consider replacing it with a new one.
0x00447008	Critical	Module error	Possible causes: 1. Excessive electromagnetic interference occurred. 2. MCU self-diagnosis error (CPU, ROM, RAM)	1. Correct the fault. Then, remove and reinsert the module, or power cycle it. 2. If the module cannot be put back into operation, consider replacing it with a new one.

Fault Code	Level	Description	Cause	Remedy
0x00447009	Critical	Module error	Possible causes: 1. Excessive electromagnetic interference. 2. Dual MCU interaction error.	1. Correct the fault. Then, remove and reinsert the module, or power cycle it. 2. If the module cannot be put back into operation, consider replacing it with a new one.
0x0044700A	Critical	Module error	Possible causes: 1. Excessive electromagnetic interference occurred. 2. Clock diagnosis error.	1. Correct the fault. Then, remove and reinsert the module, or power cycle it. 2. If the module cannot be put back into operation, consider replacing it with a new one.
0x0044700B	Critical	Module error	Possible causes: 1. Excessive electromagnetic interference occurred. 2. Program execution sequence error.	1. Correct the fault. Then, remove and reinsert the module, or power cycle it. 2. If the module cannot be put back into operation, consider replacing it with a new one.
0x0044700C	Critical	Module error	Possible causes: 1. Excessive electromagnetic interference occurred. 2. Watchdog trip.	1. Correct the fault. Then, remove and reinsert the module, or power cycle it. 2. If the module cannot be put back into operation, consider replacing it with a new one.
0x00447011	Fatal	Potential group type mismatch	Incorrect potential group type	Replace with the correct potential group module.
0x00447012	Warning	Excessive internal temperature deviation of the module	Possible causes: 1. Excessive electromagnetic interference occurred. 2. Excessive internal temperature deviation of the module.	If the fault persists and cannot be cleared automatically, replace the module with a new one.
0x00447013	Warning	The user-side power supply voltage is too high.	Power supply voltage too high	Check the user-side power supply voltage.
0x00447014	Critical	The user-side power supply voltage is too low.	Power supply undervoltage	Check the user-side power supply voltage.

Fault Code	Level	Description	Cause	Remedy
0x00447015	Critical	User-Side power supply detection circuit fault	Possible causes: 1. Increased electromagnetic interference. 2. F module fault	1. Eliminate/reduce electromagnetic interference. 2. Replace the F module.
0x00447016	Critical	CIP Safety communication fault	CIP Safety communication fault (CRC error, mixed frame error, data frame timeout, frame sequence error, etc.) Possible causes: 1. Increased electromagnetic interference. 2. F module fault	1. Eliminate/reduce electromagnetic interference. 2. Replace the F module.
0x00447017	Critical	The module safety address is out of range.	The DIP switch address on the module is set to all zeros or all ones.	Check the DIP switch address setting on the module and power cycle it.
0x00447030	Critical	Overflow	Measurement overflow	Check the communication connection between the module and the sensor.
0x00447031	Critical	Overlimit	Measurement overlimit	Check the communication connection between the module and the sensor.
0x00447032	Critical	Underlimit	Measurement underlimit	Check the communication connection between the module and the sensor.
0x00447033	Critical	Underflow	Measurement underflow	Check the communication connection between the module and the sensor.
0x00447034	Critical	Channel overload	Channel overload	Check the actuator.
0x00447035	Critical	Channel overload or disconnection	Possible causes: 1. Channel overload. 2. Channel not connected. 3. External cable disconnection of the channel.	1. Eliminate the overload. 2. Connect the external cable. 3. Disable overload and wire break detection in the parameters.

Fault Code	Level	Description	Cause	Remedy
0x00447036	Critical	Wiring break	Possible causes: 1. External cable disconnected. 2. External circuit fault. 3. Sensor fault. 4. Incorrect sensor type set in the parameters. 5. Input channel unused. 6. Output channel not connected. 7. F module fault	1. Identify and resolve possible causes of the fault. 2. Replace the F module.
0x00447037	Critical	Interference among channels	Interference among channels	1. Eliminate any crosstalk in the process wiring. 2. Check the configured test time and the process wiring.
0x00447038	Critical	Channel-to-power supply short circuit	Possible causes: 1. Channel-to-power supply short circuit. 2. Channel readback error. 3. Short circuit between two output channels. 4. Excessive capacitive load.	1. Eliminate any crosstalk in the process wiring. 2. Check the configured test time and the process wiring. 3. Increase the test time (shutdown test).
0x00447039	Critical	Channel-to-ground short circuit	A short circuit to ground means: 1. Output cable shorted to ground. 2. Output signal shorted to ground. 3. Capacitive load too high. 4. Channel overload. 5. Channel read-back fault.	1. Correct the process wiring. 2. Increase the test time (shutdown test). 3. Check the actuator. 4. Check load conditions. 5. Replace the F module.

Fault Code	Level	Description	Cause	Remedy
0x0044703A	Critical	Differential fault, channel status 0/0 (1oo2 non-equivalent evaluation)	The difference time set for the 1oo2 evaluation has been exceeded. Possible causes: 1. Process signal error. 2. Sensor fault. 3. Configured discrepancy time too low. 4. Channel-to-ground short circuit or open circuit. 5. Fault occurred during discrepancy check.	1. Check the process signal. 2. Replace the sensor. 3. Check the parameter assignment for the error time. 4. Check the process wiring.
0x0044703B	Critical	Differential fault, channel status 0/1 (1oo2 equivalent evaluation)	The difference time set for the 1oo2 evaluation has been exceeded. Possible causes: 1. Process signal error. 2. Sensor fault. 3. Configured discrepancy time too low. 4. Channel-to-ground short circuit or open circuit. 5. Fault occurred during discrepancy check.	1. Check the process signal. 2. Replace the sensor. 3. Check the parameter assignment for the error time. 4. Check the process wiring.

Fault Code	Level	Description	Cause	Remedy
0x0044703C	Critical	Differential fault, channel status 1/0 (1oo2 equivalent evaluation)	The difference time set for the 1oo2 evaluation has been exceeded. Possible causes: 1. Process signal error. 2. Sensor fault. 3. Configured discrepancy time too low. 4. Channel-to-ground short circuit or open circuit. 5. Fault occurred during discrepancy check.	1. Check the process signal. 2. Replace the sensor. 3. Check the parameter assignment for the error time. 4. Check the process wiring.
0x0044703D	Critical	Differential fault, channel status 1/1 (1oo2 non-equivalent evaluation)	The difference time set for the 1oo2 evaluation has been exceeded. Possible causes: 1. Process signal error. 2. Sensor fault. 3. Configured discrepancy time too low. 4. Channel-to-power supply short circuit or channel-to-channel short circuit. 5. Fault occurred during discrepancy check.	1. Check the process signal. 2. Replace the sensor. 3. Check the parameter assignment for the error time. 4. Check the process wiring.

Fault Code	Level	Description	Cause	Remedy
0x0044703E	Critical	Sensor signal jitter	The number of signal changes exceeds the limit within the configured "Monitoring Window" time. Possible causes: 1. "Jitter monitoring window time" parameter set too high. 2. "Number of signal changes" parameter set too low. 3. Momentary break or short circuit (poor contact) in the sensor cable. 4. Excessive electromagnetic interference. 5. Sensor or switch switchover. 6. Sensor failure.	1. Check the "Monitoring Window" parameter. 2. Check the "Number of Signal Changes" parameter. 3. Check the process wiring. 4. Eliminate/reduce electromagnetic interference. 5. Replace the sensor.
0x0044703F	Fatal	Channel switch fault	Possible causes: 1. Increased electromagnetic interference. 2. Channel-to-power supply short circuit. 3. Switch fault inside the module. 4. Excessive capacitive load.	1. Eliminate/reduce electromagnetic interference. 2. Monitor the process signal. 3. Increase the test time (shutdown test). 4. Replace the F module.
0x00447040	Warning	Too high frequency	Maximum switching frequency of the module exceeded.	Reduce the switching frequency.

Fault Code	Level	Description	Cause	Remedy
0x00447041	Fatal	Channel comparison fault	Code value comparison error between the two MCUs. Possible causes: 1. Increased electromagnetic interference 2. F module fault	1. Eliminate/reduce electromagnetic interference. 2. Replace the F module.
0x00447042	Fatal	Analog-to-digital conversion error (ADC fault)	Internal error during analog-to-digital conversion. Possible causes: 1. Increased electromagnetic interference. 2. F module fault	Replace the F module.
0x00447043	Critical	Error time exceeded	The error time set for the 1oo2 evaluation has been exceeded. Possible causes: 1. Improper parameter assignment. 2. Fault occurred in one of the two sensors.	Check the error time, sensor, and wiring.
0x00447044	Critical	TC cold junction measured overlimit	TC cold junction measured value exceeds upper limit.	Check the configuration parameters of TC cold junction upper and lower limits, as well as the TC cold junction sensor and wiring.
0x00447045	Critical	TC cold junction measured underlimit	TC cold junction measured value exceeds lower limit.	Check the configuration parameters of TC cold junction upper and lower limits, as well as the TC cold junction sensor and wiring.

Fault Code	Level	Description	Cause	Remedy
0x00447046	Critical	TC cold junction fault	The value is outside the measurement range of the TC cold junction. Possible causes: 1. External TC cold junction fault (external cold junction mode). 2. TC backplane fault (internal cold junction mode)	1. Check the TC cold junction sensor and wiring (external cold junction mode). 2. Replace the TC module backplane (internal cold junction mode).
0x00448000	Information	The channel fault has been cleared.	/	/
0x00448001	Critical	Channel 0 overflow	Channel overflow	1. Check whether the external input signal of the input module is abnormal.
0x00448002	Critical	Channel 0 underflow	Channel underflow	1. Check whether the external input signal of the input module is abnormal.
0x00448003	Critical	Channel 0 exceeds the upper limit.	Channel above the upper limit	1. Check whether the external input signal of the input module is abnormal.
0x00448004	Critical	Channel 0 is below the lower limit.	Channel below the lower limit	1. Check whether the external input signal of the input module is abnormal.
0x00448005	Critical	Channel 0 open circuit	Channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0x00448006	Critical	The channel 0 is short-circuited.	The channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module or replace the module.

Fault Code	Level	Description	Cause	Remedy
0x00448007	Critical	Hardware fault in the DAC of channel 0.	The hardware in the channel DAC is faulty.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0x00448101	Critical	Channel 1 overflow	Channel overflow	1. Check whether the external input signal of the input module is abnormal.
0x00448102	Critical	Channel 1 underflow	Channel underflow	1. Check whether the external input signal of the input module is abnormal.
0x00448103	Critical	Channel 1 exceeds the upper limit.	Channel above the upper limit	1. Check whether the external input signal of the input module is abnormal.
0x00448104	Critical	Channel 1 is below the lower limit.	Channel below the lower limit	1. Check whether the external input signal of the input module is abnormal.
0x00448105	Critical	Channel 1 open circuit	Channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0x00448106	Critical	The channel 1 is short-circuited.	The channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module or replace the module.
0x00448107	Critical	Hardware fault in the DAC of channel 1	The hardware in the channel DAC is faulty.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0x00448201	Critical	Channel 2 overflow	Channel overflow	1. Check whether the external input signal of the input module is abnormal.
0x00448202	Critical	Channel 2 underflow	Channel underflow	1. Check whether the external input signal of the input module is abnormal.

Fault Code	Level	Description	Cause	Remedy
0x00448203	Critical	Channel 2 exceeds the upper limit.	Channel above the upper limit	1. Check whether the external input signal of the input module is abnormal.
0x00448204	Critical	Channel 2 is below the lower limit.	Channel below the lower limit	1. Check whether the external input signal of the input module is abnormal.
0x00448205	Critical	Channel 2 open circuit	Channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0x00448206	Critical	The channel 2 is short-circuited.	The channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module or replace the module.
0x00448207	Critical	Hardware fault in the DAC of channel 2	The hardware in the channel DAC is faulty.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0x00448301	Critical	Channel 3 overflow	Channel overflow	1. Check whether the external input signal of the input module is abnormal.
0x00448302	Critical	Channel 3 underflow	Channel underflow	1. Check whether the external input signal of the input module is abnormal.
0x00448303	Critical	Channel 3 exceeds the upper limit.	Channel above the upper limit	1. Check whether the external input signal of the input module is abnormal.
0x00448304	Critical	Channel 3 is below the lower limit.	Channel below the lower limit	1. Check whether the external input signal of the input module is abnormal.
0x00448305	Critical	Channel 3 open circuit	Channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.

Fault Code	Level	Description	Cause	Remedy
0x00448306	Critical	The channel 3 is short-circuited.	The channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module or replace the module.
0x00448307	Critical	Hardware fault in the DAC of channel 3.	The hardware in the channel DAC is faulty.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0x00448401	Critical	Channel 4 overflow	Channel overflow	1. Check whether the external input signal of the input module is abnormal.
0x00448402	Critical	Channel 4 underflow	Channel underflow	1. Check whether the external input signal of the input module is abnormal.
0x00448403	Critical	Channel 4 exceeds the upper limit.	Channel above the upper limit	1. Check whether the external input signal of the input module is abnormal.
0x00448404	Critical	Channel 4 is below the lower limit.	Channel below the lower limit	1. Check whether the external input signal of the input module is abnormal.
0x00448405	Critical	Channel 4 open circuit	Channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0x00448406	Critical	The channel 4 is short-circuited.	The channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module or replace the module.
0x00448407	Critical	Hardware fault in the DAC of channel 4.	The hardware in the channel DAC is faulty.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.

Fault Code	Level	Description	Cause	Remedy
0x00448501	Critical	Channel 5 overflow	Channel overflow	1. Check whether the external input signal of the input module is abnormal.
0x00448502	Critical	Channel 5 underflow	Channel underflow	1. Check whether the external input signal of the input module is abnormal.
0x00448503	Critical	Channel 5 exceeds the upper limit.	Channel above the upper limit	1. Check whether the external input signal of the input module is abnormal.
0x00448504	Critical	Channel 5 is below the lower limit.	Channel below the lower limit	1. Check whether the external input signal of the input module is abnormal.
0x00448505	Critical	Channel 5 open circuit	Channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0x00448506	Critical	The channel 5 is short-circuited.	The channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module or replace the module.
0x00448507	Critical	Hardware fault in the DAC of channel 5.	The hardware in the channel DAC is faulty.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0x00448601	Critical	Channel 6 overflow	Channel overflow	1. Check whether the external input signal of the input module is abnormal.
0x00448602	Critical	Channel 6 underflow	Channel underflow	1. Check whether the external input signal of the input module is abnormal.
0x00448603	Critical	Channel 6 exceeds the upper limit.	Channel above the upper limit	1. Check whether the external input signal of the input module is abnormal.
0x00448604	Critical	Channel 6 is below the lower limit.	Channel below the lower limit	1. Check whether the external input signal of the input module is abnormal.

Fault Code	Level	Description	Cause	Remedy
0x00448605	Critical	Channel 6 open circuit	Channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0x00448606	Critical	The channel 6 is short-circuited.	The channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module or replace the module.
0x00448607	Critical	Hardware fault in the DAC of channel 6.	The hardware in the channel DAC is faulty.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0x00448701	Critical	Channel 7 overflow	Channel overflow	1. Check whether the external input signal of the input module is abnormal.
0x00448702	Critical	Channel 7 underflow	Channel underflow	1. Check whether the external input signal of the input module is abnormal.
0x00448703	Critical	Channel 7 exceeds the upper limit.	Channel above the upper limit	1. Check whether the external input signal of the input module is abnormal.
0x00448704	Critical	Channel 7 is below the lower limit.	Channel below the lower limit	1. Check whether the external input signal of the input module is abnormal.
0x00448705	Critical	Channel 7 open circuit	Channel open circuit	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.
0x00448706	Critical	The channel 7 is short-circuited.	The channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module or replace the module.

Fault Code	Level	Description	Cause	Remedy
0x00448707	Critical	Hardware fault in the DAC of channel 7.	The hardware in the channel DAC is faulty.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module, or replace the module.

Fault Code	Level	Description	Cause	Remedy
0x00640000	Information	Connected successfully	/	/
0x00640001	Critical	Target device offline	The target device is offline.	1. Check if the target IP is configured properly. 2. Check if the network cable between the devices is disconnected. 3. In case of repeated disconnection and reconnection, try increasing the "Timeout multiplier" parameter on the connection configuration interface.
0x00640002	Critical	Target device online but not responding	The target device is online but not responding.	1. Check whether the target IP is configured properly. 2. Check whether the target device is operating properly.
0x00640003	Warning	Target device dropping frames	The target device drops frames.	Check the network connection stability.
0x00640004	Critical	Connection error	Connection error	1. On the "Connection status" interface, check the specific cause of each connection error, and resolve it according to the instructions. 2. In case of repeated disconnection and reconnection, try increasing the "Timeout multiplier" parameter on the connection configuration interface. 3. If a coupler device is connected, confirm that the configuration of the I/O module devices under the coupler matches the actual connection.
0x00640005	Critical	Declaring IP address failed	The IP address is not declared successfully.	Check if the IP address of the device in the iFA Evolution and the one configured in the network match that of the physical device, and check whether the EIP port number is occupied.

Fault Code	Level	Description	Cause	Remedy
0x00640006	Critical	Multicast not configured for EIP in redundant mode	Multicast is not configured for EIP in redundant mode.	In redundant mode, configure the EIP connection type as multicast in iFA software.
0x00640007	Warning	Ring opened	The ring is disconnected.	Check the EIP network for disconnected cables or powered-off I/O devices.
0x00640008	Information	Ring closed	/	/
0x00640009	Warning	Connection established but target device variables not yet ready	1. The primary PLC or target device is currently loading and starting up. 2. The connection with the primary PLC or target device is not configured properly. 3. Variables are temporarily not accessible due to online modification on the target device.	1. Check whether the target device is currently loading and starting up. 2. Check the connection issue details in the "Connection status" section.
0x0064000A	Warning	Closing connection	/	/
0x0064000B	Critical	EIP thread task exception	An exception occurs in the EIP thread task.	Re-compile and download the project. If the fault persists, contact the manufacturer.
0x0064000C	Critical	PLC and slave connection timeout less than 200 ms in redundant mode	The RPI * timeout multiplier in slave connection configuration of the configuration software is less than 200 ms.	Modify the PRI and timeout multiplier in the configuration software to keep their product greater than 200 ms.
0x0064000D	Critical	The PPS value of an EIP connection exceeds the protocol stack specification limit.	The PPS value of an EIP connection exceeds the protocol stack specification limit.	1. Reduce the number of EIP connections. 2. Increase the RPI parameter of EIP connections.

Fault Code	Level	Description	Cause	Remedy
0x00780005	Critical	Declaring IP address failed	The IP address is not declared successfully.	Check if the IP address of the device in the iFA Evolution and the one configured in the network match that of the physical device, and check whether the EIP port number is occupied.
0x0078000B	Critical	EIP thread task exception	An exception occurs in the EIP thread task.	Re-compile and download the project. If the fault persists, contact the manufacturer.
0x00830000	Information	Connected successfully	/	/
0x00830001	Critical	Target device offline	The target device is offline.	1. Check if the target IP is configured properly. 2. Check if the network cable between the devices is disconnected. 3. In case of repeated disconnection and reconnection, try increasing the "Timeoutmultiplier" parameter on the connection configuration interface.
0x00830002	Critical	Target device online but not responding	The target device is online but not responding.	1. Check whether the target IP is configured properly. 2. Check whether the target device is operating properly.
0x00830003	Warning	Target device dropping frames	The target device drops frames.	Check the network connection stability.
0x00830004	Critical	Connection error	Connection error	1. On the "Connection status" interface, check the specific cause of each connection error, and resolve it according to the instructions. 2. In case of repeated disconnection and reconnection, try increasing the "Timeout multiplier" parameter on the connection configuration interface.

Fault Code	Level	Description	Cause	Remedy
0x00830005	Critical	Declaring IP address failed	The IP address is not declared successfully.	Check whether the IP address of the device in iFA and the one configured in the network match that of the physical device, or use "netstat -ano | find 44818" to check the pid and verify whether the EIP port number is occupied.
0x0083000A	Warning	Closing connection	/	/
0x0083000B	Critical	EIP thread task exception	An exception occurs in the EIP thread task.	Re-compile and download the project. If the fault persists, contact the manufacturer.
0x00641000	Information	Connection closed	The connection is closed.	-
0x00641001	Critical	The device is attempting to reconnect to the target device which has already established a connection.	The device is attempting to reconnect to the target device which has already established a connection.	Check whether the configuration is correct.
0x00641002	Critical	Transmission type and trigger mode not supported	The transmission type and trigger mode are not supported.	Check if the transmission type and trigger mode are set properly.
0x00641011	Critical	Connection ownership conflict. Multiple connection attempts to the same target device.	Connection ownership conflict. Multiple connection attempts to the same target device.	Check if multiple masters are connecting to the device simultaneously or if there is a configuration error.
0x00641012	Critical	Invalid connection size	Invalid connection size	Check if the connection parameters are set correctly.
0x00641013	Critical	The device is not configured. The configuration data is not set for the device requiring configuration.	The device is not configured. The configuration data is not set for the device requiring configuration.	Check if the configuration data length is correctly set and if the configuration path is correct.

Fault Code	Level	Description	Cause	Remedy
0x00641014	Critical	RPI is not supported, or there is an issue with the timeout multiplier or inhibit time.	RPI is not supported, or there is an issue with the timeout multiplier or inhibit time.	Check if the RPI and the timeout multiplier meet the target device requirements.
0x00641015	Critical	RPI is not accepted.	RPI is not accepted.	Check if the RPI meets the target device requirements.
0x00641016	Critical	The local connection is at full capacity. The connection manager cannot support additional connections.	The local connection is at full capacity. The connection manager cannot support additional connections.	Check the project configuration, and if the number of connections to this device has reached the limit
0x00641017	Critical	Vendor Id or Product Code does not match the device.	Vendor Id or Product Code does not match the device.	Check if the configured device matches the target device.
0x00641018	Critical	The product type does not match the device.	The product type does not match the device.	Check if the configured device matches the target device.
0x00641019	Critical	The primary or secondary version number does not match the device.	The primary or secondary version number does not match the device.	Check whether the device version in the EDS file matches the target device.
0x0064101A	Critical	The connection request failed because there are currently no open connections.	The connection request failed because there are currently no open connections.	Check if other connections have been established before using ListenOnly.
0x0064101B	Critical	The target application cannot support more connections.	The target application cannot support more connections.	The target device connection is full, and check the connection status of the target device.
0x0064101C	Critical	RPI is less than the inhibit time.	RPI is less than the inhibit time.	Adjust RPI to a value greater than or equal to the inhibit time.
0x0064101D	Critical	Connection timeout	Connection timeout	In case of connection timeout, check the target device status or link status.

Fault Code	Level	Description	Cause	Remedy
0x0064101E	Critical	An invalid segment path or segment value exists in the path.	An invalid segment path or segment value exists in the path.	/
0x0064101F	Critical	Vendor-specific error	Vendor-specific error	Contact the manufacturer according to the specific error.
0x00641020	Critical	The specified transmission type in the Transmission type/ Trigger mode parameter is not supported.	The specified transmission type in the Transmission type/Trigger mode parameter is not supported.	/
0x00641021	Critical	The specified trigger mode in the Transmission type/ Trigger mode parameter is not supported.	The specified trigger mode in the Transmission type/Trigger mode parameter is not supported.	Check if the trigger type is correct.
0x00641022	Critical	The direction requested in the Transmission type /Trigger mode parameter is not supported.	The direction requested in the Transmission type/Trigger mode parameter is not supported.	/
0x00641023	Critical	O->T fixed/variable flag is not supported.	O->T fixed/ variable flag is not supported.	Check if the O->T fixed/ variable flag is set correctly.
0x00641024	Critical	T->O fixed/variable flag is not supported.	T->O fixed/ variable flag is not supported.	Check if the T-> O fixed/ variable flag is set correctly.
0x00641025	Critical	O->T priority is not supported.	O->T priority is not supported.	Check if the O-> T priority is set correctly and if the target device supports this priority.
0x00641026	Critical	T->O priority is not supported.	T->O priority is not supported.	Check if the T-> O priority is set correctly and if the target device supports this priority.
0x00641027	Critical	O->T connection type is not supported.	O->T connection type is not supported.	Check if the O-> T connection type is set correctly.
0x00641028	Critical	T->O connection type is not supported.	T->O connection type is not supported.	Check if the T->O connection type is set correctly.

Fault Code	Level	Description	Cause	Remedy
0x00641029	Critical	O->T redundancy owner flag is not supported.	O->T redundancy owner flag is not supported.	/
0x0064102A	Critical	The data segment provided in the connection path parameters does not contain the acceptable 16-bit word count for the requested configuration application path. The data area length is invalid.	The data segment provided in the connection path parameters does not contain the acceptable 16-bit word count for the requested configuration application path. The data area length is invalid.	The configuration data length is set incorrectly.
0x0064102B	Critical	The requested size in the O->T network connection parameters is not supported.	The requested size in the O->T network connection parameters is not supported.	Check if the O-> T length is set correctly.
0x0064102C	Critical	The requested size in the T->O network connection parameters is not supported.	The requested size in the T->O network connection parameters is not supported.	Check if the T-> O length is set correctly.
0x0064102D	Critical	The specified configuration application path does not match the valid configuration application path.	The specified configuration application path does not match the valid configuration application path.	Check if the configuration instance ID in the connection path is correct.
0x00641030	Critical	The specified consumption application path does not match the valid consumption application path.	The specified consumption application path does not match the valid consumption application path.	Check if the consumption connection point ID in the connection path is correct.

Fault Code	Level	Description	Cause	Remedy
0x00641031	Critical	The specified production application path does not match the valid production application path.	The specified production application path does not match the valid production application path.	Check if the production connection point ID in the connection path is correct.
0x00641032	Critical	Configuration symbol does not exist.	Configuration symbol does not exist.	/
0x00641033	Critical	Consumption symbol does not exist.	Consumption symbol does not exist.	/
0x00641034	Critical	Production symbol does not exist.	Production symbol does not exist.	/
0x00641035	Critical	The specified application paths for configuration, consumption, and/or production are inconsistent with each other.	The specified application paths for configuration, consumption, and/or production are inconsistent with each other.	Check whether the path is correctly set.
0x00641036	Critical	The information in the data segment is inconsistent with the consumer data format.	The information in the data segment is inconsistent with the consumer data format.	Check whether the configuration data format content is correct.
0x00641037	Critical	The information in the data segment is inconsistent with the production data format.	The information in the data segment is inconsistent with the production data format.	Check whether the configuration data format content is correct.
0x00641041	Critical	The target does not support the function that empty Forward Open requests.	The target does not support the function that empty Forward Open requests.	Check if the connection type is set correctly.

Fault Code	Level	Description	Cause	Remedy
0x00641042	Critical	The connection timeout multiplier is retained, or the resulting timeout value is too large for the device to support.	The connection timeout multiplier is retained, or the resulting timeout value is too large for the device to support.	Check if the timeout multiplier is set correctly.
0x00641043	Critical	The connection size does not match the existing multicast connection.	The connection size does not match the existing multicast connection.	Check if the current ListenOnly length matches the previous connection.
0x00641044	Critical	The fixed/variable connection type does not match the existing multicast connection.	The fixed/variable connection type does not match the existing multicast connection.	Check if the current ListenOnly connection type matches the previous connection.
0x00641045	Critical	The fixed/variable connection priority does not match the existing multicast connection.	The fixed/variable connection priority does not match the existing multicast connection.	Check if the current ListenOnly priority matches the previous connection.
0x0064104F	Critical	The fixed/variable transmission type does not match the existing multicast connection.	The fixed/variable transmission type does not match the existing multicast connection.	Check if the current ListenOnly transfer type matches the previous connection.
0x00641050	Critical	The fixed/variable production trigger does not match the existing multicast connection.	The fixed/variable production trigger does not match the existing multicast connection.	Check if the current ListenOnly trigger type matches the previous connection.
0x00641051	Critical	The fixed/variable production inhibit time does not match the existing multicast connection.	The fixed/variable production inhibit time does not match the existing multicast connection.	Check if the current ListenOnly inhibition time matches the previous connection.
0x00641052	Critical	Other errors	Other errors	Check the specific fault code in the iFA project for the device.

Fault Code	Level	Description	Cause	Remedy
0x0064E001	Critical	System supply voltage (between phases A and B) error	1. The combined 24 V power supply voltage on the system side exceeds the operating voltage range. 2. The hardware circuit is faulty.	Check the stability of the 24 V supply voltage to the system.
0x0064E002	Fatal	FLASH initialization failed	FLASH chip malfunction	Restart or replace the module.
0x0064E003	Fatal	Chip initialization failed	The key chips are not initialized successfully.	Restart or replace the module.
0x0064E004	Critical	Field supply voltage (between phases A and B) error	1. The combined 24 V power supply voltage on the user side exceeds the operating voltage range. 2. The hardware circuit is faulty.	1. Check whether the 24 V supply voltage of the user side is within the proper range. 2. Check the connection between the module and the backplane.
0x0064E005	Fatal	Component initialization failed	The software components are not initialized successfully.	Restart or replace the module.
0x0064E006	Critical	Abnormal semaphores for synchronization	The inter-thread communication fails.	Restart or replace the module.
0x0064E007	Critical	Module parameters not configured properly	Module parameters not configured properly	Check whether the issued parameters are proper.
0x0064E008	Fatal	ADC chip malfunction	ADC chip malfunction	Power on and restart the module.
0x0064E009	Fatal	DAC chip malfunction	DAC chip malfunction	Power on and restart the module.
0x0064E00A	Fatal	DO chip malfunction	DO chip malfunction	Power on and restart the module.
0x0064E00B	Critical	Wire break fault	Open circuit in the channel wiring.	Check the channel wiring for abnormalities.

Fault Code	Level	Description	Cause	Remedy
0x0064E00C	Critical	Short circuit	1. The load is excessive. 2. A short circuit to ground has occurred.	1. Check whether the load meets the specification requirements. 2. Check the wiring for a short circuit to ground.
0x0064E00D	Critical	Short circuit to supply voltage (VS)	1. The channel wiring is shorted to 24 V voltage.	Check whether the channel wiring is short to 24 V voltage.
0x0064E00E	Critical	Reference junction fault	The reference junction is faulty.	/
0x0064E00F	Critical	Overflow error	The acquired value/output value exceeds the maximum value of current range.	Check whether the range is proper or the wiring is improper.
0x0064E010	Critical	Underflow error	The acquired value/output value is below the maximum value of current range.	Check whether the range is proper or the wiring is improper.
0x0064E011	Warning	Over-limit error	The acquired value/output value exceeds the upper limit of current range.	Check whether the range is proper.
0x0064E012	Warning	Under-limit error	The acquired value/output value is below the lower limit of current range.	Check whether the range is proper.
0x0064E013	Critical	User-side module seated status abnormal	The user-side module is not seated properly.	Check the connection between the module and backplane.
0x0064E014	Critical	Key chip configuration lost	Chip configuration mismatch	Re-issue the configuration or restart the module.
0x0064E015	Fatal	FPGA initialization failed	FPGA initialization failed	Power on and restart the module.
0x0064E016	Fatal	System-side module seated status abnormal	The system-side module is not seated properly.	Check the connection between the module and backplane.
0x0064E017	Fatal	PHY chip malfunction	PHY chip malfunction	Power on and restart the module.

Fault Code	Level	Description	Cause	Remedy
0x0064E018	Warning	MCU chip temperature too high or too low	MCU chip temperature too high or too low	Check the operating temperature of the coupler.
0x0064E019	Critical	Dedicated connection disconnected or timed out	The dedicated connection is disconnected or timed out.	Check the connection with the dedicated master station.
0x0064E01A	Critical	Input connection disconnected or timeout	The input connection is disconnected or timed out.	Check the connection with the master station.
0x0064E01B	Critical	Module not detected by the coupler	The module is not configured.	Configure the module or check the module connection.
0x0064E01C	Critical	IP address conflict	An IP address conflict has occurred.	Check and update the IP addresses of the devices in the network.
0x0064E01F	Critical	FPGA communication error	The FPGA communication is faulty.	Power on and restart the module.
0x0064E020	Fatal	Acquiring basic information failed	Acquiring basic information failed	Replace the module or check for interference.
0x0064E021	Critical	Issuing configuration information failed	The module fails to issue the configuration information.	Replace the module or check for interference.
0x0064E022	Critical	Issuing status switch instruction failed	Issuing status switch instruction failed	Replace the module or check for interference.
0x0064E023	Critical	Reading module status failed	Reading the module status fails.	Replace the module or check for interference.
0x0064E024	Critical	User data error	User data error	Replace the module or check for interference.
0x0064E025	Fatal	Module not detected	The module is not detected.	Check the connection between the module and backplane.
0x0064E026	Critical	Type mismatch	The type of the configured module does not match that of the actually scanned one.	Replace with the correct module.

Fault Code	Level	Description	Cause	Remedy
0x0064E027	Critical	Version mismatch	The software version of the configured module does not match that of the actually scanned one.	Update the module firmware.
0x0064E028	Fatal	Module data length out of limit	Total module data length exceeds the acceptable range of the coupler.	Update the firmware or check the module configuration.
0x0064E029	Fatal	Configuration verification error	The controller configuration project differs from the actual devices.	Check the configuration and reconfigure the system.
0x0064E02A	Critical	Flash erase cycles approaching the erase endurance	The use time is long or fault logs are too much.	Replace the module.
0x0064E02B	Warning	Frame loss in periodic data exchange	The firmware is mismatched, or the interference is high.	Update the firmware or check surrounding environment.
0x0064E02C	Warning	Upgrading MCU firmware failed	The firmware transmission fails or encounters an error during upgrade.	Re-upgrade the firmware.
0x0064E02D	Warning	Upgrading FPGA firmware failed	The firmware transmission fails or encounters an error during upgrade.	Re-upgrade the firmware.
0x0064E02E	Warning	Configuration data verification error	The slave configuration data is modified unexpectedly.	Re-download the configuration parameters to the module.
0x0064E02F	Warning	Backplane identification error	The number of backplane slots is incorrect.	Replace or inspect the backplane.
0x0064E030	Warning	No PDO data received	The local bus is interfered.	Remove interference on the local bus.

Fault Code	Level	Description	Cause	Remedy
0x0064E031	Warning	High CPU or memory usage	The module is operating improperly or malfunctioning.	Restart or replace the module.
0x0064E032	Critical	Slave device fault	1. Slave device not responding or response timeout. 2. Slave device response data error. 3. The wiring is abnormal.	1. Check whether the slave device is operating normally. 2. Check whether the serial port parameters of the master/slave, "Response timeout" parameter, "CRC byte order", and "flow control" parameter settings are correct. 3. Check the wiring.
0x0064E033	Critical	Illegal function code	The slave device does not support this parameter.	Check whether the slave device supports this parameter.
0x0064E034	Critical	Illegal address.	The slave device does not support this address.	Check if the slave device supports this address.
0x0064E035	Critical	Illegal data value	An illegal value exists in the request frame.	Check whether the Modbus protocol supports this value.
0x0064E036	Warning	Noise interference.	The communication circuit is subject to interference.	Check the wiring or the noise interference.
0x0064E037	Critical	Parity error.	Parity error in the received serial data.	Check whether the "Parity check", "Data bits", and "Stop bits" settings match between the master and slave.
0x0064E038	Critical	Sensor 24 V power supply fault	The module's 24 V sensor power supply is abnormal.	Check whether the module's 24 V sensor power supply is stable.
0x0064E039	Critical	Sensor 5 V power supply fault	The module's 5 V sensor power supply is abnormal.	Check whether the module's 5 V sensor power supply is stable.
0x0064E03A	Critical	SSI communication error	Encoder wiring fault / noise interference / parity error.	1. Check whether the encoder is subject to interference. 2. Check whether the wiring of the encoder is correct.
0x0064E03B	Critical	Reserved	/	/

Fault Code	Level	Description	Cause	Remedy
0x0064E03C	Critical	Phase A wire break fault	Open circuit in the phase A wiring of the channel.	Check whether the phase A wiring of the channel is correct.
0x0064E03D	Critical	Phase B wire break fault	Open circuit in the phase B wiring of the channel.	Check whether the phase B wiring of the channel is correct.
0x0064E03E	Critical	Phase Z wire break fault	Open circuit in the phase Z wiring of the channel.	Check whether the phase Z wiring of the channel is correct.
0x0064E03F	Critical	DO0 wire break fault	Open circuit in DO0 wiring	Check whether the DO0 wiring is correct.
0x0064E040	Critical	DO1 wire break fault	Open circuit in DO1 wiring	Check whether the DO1 wiring is correct.
0x0064E041	Critical	DO0 shorted to power supply	The DO0 wiring is shorted to 24 V power supply.	Check whether the DO0 wiring is short to 24 V power supply.
0x0064E042	Critical	DO1 shorted to power supply	The DO1 wiring is shorted to 24 V power supply.	Check whether the DO1 wiring is short to 24 V power supply.
0x0064E043	Critical	DO0 shorted to ground	The DO0 wiring is shorted to the ground.	Check whether the DO0 wiring is shorted to the ground.
0x0064E044	Critical	DO1 shorted to ground	The DO1 wiring is shorted to the ground.	Check whether the DO1 wiring is short to the ground.
0x0064E045	Critical	Synchronization signal fault	Channel synchronization signal error	Power cycle or replace the module.
0x0064E046	Critical	Insufficient module memory	The module memory is insufficient.	Upgrade the new firmware or replace the module.
0x0064E047	Critical	Backplane type mismatch	Backplane type mismatch.	Check the configuration and the actual backplane.
0x0064E048	Warning	Process data specification error	The process data does not match the parameter configuration.	Check the process data.
0x0064E101	Information	System supply voltage (between phases A and B) error cleared	System supply voltage (between phases A and B) error cleared	/

0x0064E112	Information	Under-limit error cleared	Under-limit error cleared	/
0x0064E113	Information	User-Side module seated status abnormal cleared	User-Side module seated status abnormal cleared	/
0x0064E114	Information	Lost configuration recovered	Lost configuration recovered	/
0x0064E115	Information	FPGA initialization failure cleared	FPGA initialization failure cleared	/
0x0064E116	Information	Module not seated properly cleared	Module not seated properly cleared	/
0x0064E117	Information	PHY chip malfunction cleared	PHY chip malfunction cleared	/
0x0064E118	Information	MCU chip temperature too high or too low fault cleared	The fault "MCU chip temperature too high or too low" has been cleared.	/
0x0064E119	Information	The dedicated connection disconnection or timeout fault has been cleared.	The dedicated connection is disconnected or timed out.	/
0x0064E11A	Information	The dedicated connection disconnection or timeout fault has been cleared.	The dedicated connection disconnection or timeout fault has been cleared.	/
0x0064E11B	Information	Module not detected by the coupler cleared	The module not configured is cleared.	/
0x0064E11C	Information	The IP address conflict is cleared.	The IP address conflict is cleared.	/
0x0064E11F	Information	The FPGA communication error is cleared.	The FPGA communication error is cleared.	/
0x0064E120	Information	Basic information acquisition failure cleared	Basic information acquisition failure cleared	/

Fault Code	Level	Description	Cause	Remedy
0x0064E121	Information	Module configuration information download failure cleared.	The failure to download the configuration information to the module is cleared.	/
0x0064E122	Information	Failure to send state change command to the module cleared.	The failure to send the state switching command to the module is cleared.	/
0x0064E123	Information	Module status read failure cleared	The fault "Module status read failure" has been cleared.	/
0x0064E124	Information	User data error cleared	User data error cleared	/
0x0064E125	Information	Module not detected (offline) cleared	Module not detected (offline) cleared	/
0x0064E126	Information	Module type mismatch cleared	Module type mismatch cleared	/
0x0064E127	Information	Configuration version mismatch cleared	Configuration version mismatch cleared	/
0x0064E128	Information	Module data length out of limit cleared	Module data length out of limit cleared	/
0x0064E129	Information	Configuration verification failure cleared	Configuration verification failure cleared	/
0x0064E12A	Information	The flash erase cycles approaching the erase endurance is cleared.	The flash erase cycles approaching the erase endurance is cleared.	/
0x0064E12B	Information	Frame loss in periodic data exchange cleared	Frame loss in periodic data exchange cleared	/
0x0064E12C	Information	MCU firmware upgrade failure cleared	The MCU firmware upgrade failure is cleared.	/

Fault Code	Level	Description	Cause	Remedy
0x0064E12D	Information	FPGA firmware upgrade failure cleared	The FPGA firmware upgrade failure is cleared.	/
0x0064E12E	Information	Configuration data verification error cleared	Configuration data verification error cleared	/
0x0064E12F	Information	Backplane identification fault cleared	The backplane identification fault is cleared.	/
0x0064E130	Information	Received empty PDO data fault cleared	The fault "Received PDO data is empty" has been cleared.	/
0x0064E131	Information	High CPU or memory usage cleared	High CPU or memory usage cleared	/
0x0064E132	Information	Slave device fault cleared	The slave device fault has been cleared.	/
0x0064E133	Information	Illegal parameter cleared	The illegal parameter has been cleared.	/
0x0064E134	Information	Illegal address cleared	The illegal address has been cleared.	/
0x0064E135	Information	Illegal value cleared	The illegal value has been cleared.	/
0x0064E136	Information	Noise interference cleared	The noise interference has been cleared.	/
0x0064E137	Information	Parity check error cleared	The parity check error has been cleared.	/
0x0064E138	Information	Sensor 24 V power supply fault cleared	The module 24 V sensor power supply fault has been cleared.	/
0x0064E139	Information	Sensor 5 V power supply fault cleared	The module 5 V sensor power supply fault has been cleared.	/

Fault Code	Level	Description	Cause	Remedy
0x0064E13A	Information	SSI communication error cleared	The encoder interference has been cleared, or the wiring is correct.	/
0x0064E13B	Information	Reserved	/	/
0x0064E13C	Information	Phase A open circuit fault cleared	The fault "Open circuit in the phase A wiring of the channel" has been cleared.	/
0x0064E13D	Information	Phase B open circuit fault cleared	The fault "Open circuit in the phase B wiring of the channel" has been cleared.	/
0x0064E13E	Information	Phase C open circuit fault cleared	The fault "Open circuit in the phase Z wiring of the channel" has been cleared.	/
0x0064E13F	Information	DO0 open circuit fault cleared	The fault "Open circuit in DO0 wiring" has been cleared.	/
0x0064E140	Information	DO1 open circuit fault cleared	The fault "Open circuit in DO1 wiring" has been cleared.	/
0x0064E141	Information	The fault "DO0 shorted to power supply" has been cleared.	The fault "The DO0 wiring is shorted to 24 V." has been cleared.	/
0x0064E142	Information	The fault "DO1 shorted to power supply" has been cleared.	The fault "The DO1 wiring is shorted to 24 V." has been cleared.	/
0x0064E143	Information	The fault "DO0 shorted to ground" has been cleared.	The fault "The DO0 wiring is shorted to the ground." has been cleared.	/

Fault Code	Level	Description	Cause	Remedy
0x0064E144	Information	The fault "DO1 shorted to ground" has been cleared.	The fault "The DO1 wiring is shorted to the ground." has been cleared.	/
0x0064E145	Information	Synchronization signal fault cleared	The synchronization signal fault has been cleared.	/
0x0064E146	Information	Insufficient module memory fault cleared.	The insufficient module memory fault has been cleared.	/
0x0064E147	Information	Backplane type mismatch cleared	The backplane type mismatch has been cleared.	/
0x0064E148	Information	Process data specification error cleared	The mismatch between process data and parameter configuration has been cleared.	/
0x0064F001	Information	A too long array in EIP Class3/UCMM causes some elements to be transmitted at different times.	EIP Class3/UCMM contains the arrays with too large length.	It is recommended to set the UCMM array to 200 bytes or less, and the Class3 array to 1400 bytes or less.
0x0064FFFF	Critical	EIP stack startup failed	The EIP stack startup fails.	Try restarting the device, and then use the iFA software to start the EIP task.
0x00831000	Information	Connection closed	The connection is closed.	-
0x0083FFFF	Critical	EIP stack startup failed	The EIP stack startup fails.	Try restarting the device, and then use the iFA software to start the EIP task.
0x64200100	Information	Coupler fault cleared	The coupler fault is cleared.	/
0x64200101	Critical	Coupler software version outdated	The coupler software version is outdated.	Contact the manufacturer for updated coupler software.
0x64200102	Critical	Coupler diagnostic bytes mismatch	The number of coupler diagnostic bytes is mismatched.	Reconfigure the number of coupler diagnostic bytes.

Fault Code	Level	Description	Cause	Remedy
0x64200103	Information	The I/O module fault has been cleared.	The I/O module fault has been cleared.	/
0x64200104	Critical	Getting coupler version information failed	The coupler version information is not obtained.	1. Check the network connection stability. 2. Check whether the coupler is operating properly. 3. Power off and then restart the coupler. If the fault persists, contact the manufacturer.
0x64200105	Critical	Getting coupler diagnostic bytes failed	The number of coupler diagnostic bytes is not obtained.	1. Check the network connection stability. 2. Check whether the coupler is operating properly. 3. Power off and then restart the coupler. If the fault persists, contact the manufacturer.
0x64200106	Warning	Device configuration or module parameter configuration failure	The devices or module parameters are not configured successfully.	1. Check the network connection stability. 2. Check whether the coupler is operating properly. 3. Power off and then restart the coupler. If the fault persists, contact the manufacturer.
0x64201003	Critical	I/O module type mismatch	The type of the configured I/O module is mismatched with that of the actually scanned one.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0x64201004	Critical	I/O module configuration failure	The I/O module is not configured successfully.	1. Check the contact of the communication interface for the expansion module or restart the rack.
0x64201005	Critical	Switching I/O module status failed	Switching I/O module status failed	1. Check the contact of the communication interface for the expansion module or restart the rack.

Fault Code	Level	Description	Cause	Remedy
0x64201006	Critical	I/O module offline	The I/O module is offline.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0x64201007	Critical	Module type mismatch	The hardware component has been inserted, but the type of this component does not match that of the configured module.	Check the inserted module, and correct the configuration if necessary.
0x64201008	Critical	New module inserted	A new hardware component has been inserted, and the type of this component matches that of the configured module.	/
0x64201009	Critical	Communication fault: CRC error	Data message frame has transmission error: data inconsistency (CRC (cyclic redundancy check) error).	Check the contact of the communication interface for the expansion module or restart the rack.
0x6420100A	Critical	Communication fault: timeout	Possible causes: 1. The monitoring time is set incorrectly. 2. There is a bus fault.	1. Correct the fault. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0x6420100B	Critical	Configuration conflict	The same I/O module is configured under multiple controllers.	Detect the configuration, resolve the conflict, and then re-download.
0x6420100C	Critical	The stopper plate is faulty or missing.	The stopper plate is faulty or missing.	Reinstall or replace the stopper plate.

Fault Code	Level	Description	Cause	Remedy
0x64202100	Critical	CH0 preset value out of range	The CH0 preset value is out of range.	Modify the preset value to keep it not greater than the maximum value and not smaller than the minimum value.
0x64202101	Critical	CH0 counter configuration error	The CH0 counter is not configured properly.	1. The instruction enabled the single-ended counting function, but the DI is not configured for counting. 2. Check whether the enabled single-ended interface matches the configured DI for counting. 3. Ensure that DI0 and DI1 are not set to counter mode simultaneously. 4. The counter is configured as a differential interface, but DI0 or DI1 is configured with the counting mode.
0x64202102	Critical	CH0 signal type not supported	The CH0 signal type is not supported.	The signal type is not set to an allowed value, which includes phase A/B 1x frequency, phase A/B 2x frequency, phase A/B 4x frequency, pulse + direction, CW/CCW, single-phase counting (A), and single-phase counting (B).
0x64202103	Critical	CH0 counter limit not configured properly	The CH0 counter limit is not configured properly.	Maximum value <= Minimum value
0x64202104	Critical	CH0 unit pulse increment not configured properly	The CH0 unit pulse increment is not configured properly.	The unit pulse increment is less than 1.
0x64202105	Critical	CH0 speed measurement time base not configured properly	The time base for CH0 speed measurement is not configured properly.	Check that the time base is an allowed value.
0x64202106	Critical	CH0 input filter parameter not configured properly	The CH0 input filter parameter is not configured properly.	Check that the input filter parameter is an allowed value.

Fault Code	Level	Description	Cause	Remedy
0x64202107	Critical	CH0 frequency sampling time not configured properly	The CH0 frequency sampling time is not configured properly.	Check that the frequency sampling time is an allowed value.
0x64202108	Critical	CH0 reset function not configured properly	CH0 reset function not configured properly	The clearing function is enabled through commands, but the DI is not configured with the clearing function.
0x64202109	Critical	CH0 preset function not configured properly	The CH0 preset function is not configured properly.	The preset function is enabled through commands, but the DI is not configured with the preset function.
0x6420210A	Critical	CH0 comparison 0 function not configured properly	The CH0 comparison 0 function is not configured properly.	The comparison function is enabled through commands, but the DO is not configured with the comparison function.
0x6420210B	Critical	CH0 comparison 1 function not configured properly	The CH0 comparison 1 function is not configured properly.	The comparison function is enabled through commands, but the DO is not configured with the comparison function.
0x6420210C	Critical	CH0 comparison 2 function not configured properly	The CH0 comparison 2 function is not configured properly.	The comparison function is enabled through commands, but the DO is not configured with the comparison function.
0x6420210D	Critical	CH0 comparison 3 function not configured properly	The CH0 comparison 3 function is not configured properly.	The comparison function is enabled through commands, but the DO is not configured with the comparison function.
0x6420210E	Critical	CH0 probe 0 function not configured properly	The CH0 probe 0 function is not configured properly.	The probe function is enabled through commands, but the DI is not configured with the probe function.
0x6420210F	Critical	CH0 probe 1 function not configured properly	The CH0 probe 1 function is not configured properly.	The probe function is enabled through commands, but the DI is not configured with the probe function.

Fault Code	Level	Description	Cause	Remedy
0x64202110	Critical	CH0 probe 2 function not configured properly	The CH0 probe 2 function is not configured properly.	The probe function is enabled through commands, but the DI is not configured with the probe function.
0x64202111	Critical	CH0 probe 3 function not configured properly	The CH0 probe 3 function is not configured properly.	The probe function is enabled through commands, but the DI is not configured with the probe function.
0x64202112	Critical	CH0 DO0 parameter not configured properly	The CH0 DO0 parameter is not configured properly.	The parameter is not set to the allowed value, which includes normal output and comparison output.
0x64202113	Critical	CH0 DO1 parameter not configured properly	The CH0 DO1 parameter is not configured properly.	The parameter is not set to the allowed value, which includes normal output and comparison output.
0x64202114	Critical	CH0 DO2 parameter not configured properly	The CH0 DO2 parameter is not configured properly.	The parameter is not set to the allowed value, which includes normal output and comparison output.
0x64202115	Critical	CH0 DO3 parameter not configured properly	The CH0 DO3 parameter is not configured properly.	The parameter is not set to the allowed value, which includes normal output and comparison output.
0x64202116	Critical	CH0 DI0 parameter not configured properly	The CH0 DI0 parameter is not configured properly.	The parameter is not set to the allowed value, which includes normal input, probe function, counting, clear, preset, and gating.
0x64202117	Critical	CH0 DI1 parameter not configured properly	The CH0 DI1 parameter is not configured properly.	The parameter is not set to the allowed value, which includes normal input, probe function, counting, clear, preset, and gating.
0x64202118	Critical	CH0 DI2 parameter not configured properly	The CH0 DI2 parameter is not configured properly.	The parameter is not set to the allowed value, which includes normal input, probe function, counting, clear, preset, and gating.
0x64202119	Critical	CH0 DI3 parameter not configured properly	The CH0 DI3 parameter is not configured properly.	The parameter is not set to the allowed value, which includes normal input, probe function, counting, clear, preset, and gating.

Fault Code	Level	Description	Cause	Remedy
0x64205001	Critical	Power supply overvoltage	The power supply voltage is too high.	1. Check the power supply of the module.
0x64205002	Critical	Power supply undervoltage	The power supply voltage is too low.	1. Check the power supply of the module.
0x64205003	Critical	External 24 V power supply failure	The external 24 V power supply fails.	1. Check the power supply of the module.
0x64205004	Critical	Module ADC parameters not configured properly	The ADC parameters of the module are not configured properly.	1. Check the stability of the external 24 V power voltage for the module. 2. Restart the module.
0x64205005	Critical	External 5 V power supply failure	The external 5 V power supply fails.	1. Check the power supply of the module.
0x64205011	Critical	Chip overheating	The chip is overheating.	1. Check the module for hardware faults. 2. Replace the module.
0x64205021	Critical	Module ADC malfunction	The ADC of the module malfunctions.	1. Check the module for hardware faults. 2. Replace the module.
0x64205022	Critical	Module DAC malfunction	The DAC of the module malfunctions.	1. Check the module for hardware faults. 2. Replace the module.
0x64205023	Critical	ADC reference voltage error	The ADC reference voltage is abnormal.	1. Check the module for hardware faults. 2. Replace the module.
0x64205031	Critical	Reference channel fault	The reference channel is faulty.	1. Check the cold junction channel hardware of the thermocouple (TC) module. 2. Replace the module.
0x64206001	Critical	Channel open circuit	The channel is open-circuit.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module or replace the module.

Fault Code	Level	Description	Cause	Remedy
0x64206002	Critical	Channel short circuit	The channel is short-circuited.	1. Check the external wiring of the module channel. 2. If the external wiring is correct, check the internal hardware of the module or replace the module.
0x64206003	Critical	The channel data exceeds the upper limit.	The channel data exceeds the upper limit.	1. Check whether the external input signal of the input module is abnormal.
0x64206004	Critical	The channel data is below the lower limit.	The channel data is below the lower limit.	1. Check whether the external input signal of the input module is abnormal.
0x64206005	Critical	Channel data overflow	The channel data overflows.	1. Check whether the external input signal of the input module is abnormal.
0x64206006	Critical	Channel data underflow	The channel data underflows.	1. Check whether the external input signal of the input module is abnormal.
0x64206007	Critical	Channel overcurrent	The channel current exceeds the limit.	1. Check the external wiring for short circuits. 2. Check the load for overcurrent. 3. Check the module for damage.
0x64206008	Critical	Channel ADC malfunction	The channel ADC malfunctions.	1. Check the module for hardware faults. 2. Replace the module.
0x64206009	Critical	Channel data not configured properly	The channel data is not configured properly.	1. Check whether the downloaded configuration parameters are valid.
0x64206030	Critical	SSI module channel 24 V output error	An error occurs in 24 V output of the SSI module channel.	Check the output voltage.
0x64206031	Critical	SSI module channel communication error	An error occurs during channel communication of the SSI module.	Check the connection between D+ and D- terminals.
0x64206032	Critical	SSI module channel data error	The SSI module channel data is abnormal.	Check whether the baud rate is configured properly.
0x64206050	Critical	Short circuit to VDD	A short circuit to VDD occurs.	Check the hardware wiring.

Fault Code	Level	Description	Cause	Remedy
0x64206051	Critical	Switch-on open circuit	An open circuit occurs when the switch is ON.	Check the hardware wiring.
0x64206052	Critical	Switch-off open circuit	An open circuit occurs when the switch is OFF.	Check the hardware wiring.
0x64206053	Critical	Overcurrent	The current exceeds the limit.	Check the hardware wiring.
0x64206054	Critical	Overload	Overload	Check the hardware wiring.
0x64206800	Critical	Phase A open circuit	An open circuit occurs in phase A.	Check the hardware wiring.
0x64206801	Critical	Phase B open circuit	An open circuit occurs in phase B.	Check the hardware wiring.
0x64206802	Critical	Frequency out of limit	The frequency is out of limit.	Check the hardware wiring.
0x64206803	Critical	Count value overflow	The count value overflows.	Check the hardware wiring.
0x64206804	Critical	Count value underflow	Count value underflow	Check the hardware wiring.
0x64206805	Critical	Comparison function 0 quantity/step out of range	The quantity/step is out of range for the comparison function 0.	Check the hardware wiring.
0x64206806	Critical	Comparison function 1 quantity/step out of range	The quantity/step is out of range for the comparison function 1.	Check the hardware wiring.
0x64206807	Critical	Comparison function 2 quantity/step out of range	The quantity/step is out of range for the comparison function 2.	Check the hardware wiring.
0x64206808	Critical	Comparison function 3 quantity/step out of range	The quantity/step is out of range for the comparison function 3.	Check the hardware wiring.
0x64206809	Critical	Comparison function 0 output hold time/pulse number not configured properly	The output hold time/pulse number is not configured properly for the comparison function 0.	Check the hardware wiring.

Fault Code	Level	Description	Cause	Remedy
0x6420680A	Critical	Comparison function 1 output hold time/pulse number not configured properly	The output hold time/pulse number is not configured properly for the comparison function 1.	Check the hardware wiring.
0x6420680B	Critical	Comparison function 2 output hold time/pulse number not configured properly	The output hold time/pulse number is not configured properly for the comparison function 2.	Check the hardware wiring.
0x6420680C	Critical	Comparison function 3 output hold time/pulse number not configured properly	The output hold time/pulse number is not configured properly for the comparison function 3.	Check the hardware wiring.
0x6420680D	Critical	Comparison function 0 output start/stop position and step direction not configured properly	The output start/stop position and step direction is not configured properly for the comparison function 0.	Check the hardware wiring.
0x6420680E	Critical	Comparison function 1 output start/stop position and step direction not configured properly	The output start/stop position and step direction is not configured properly for the comparison function 1.	Check the hardware wiring.
0x6420680F	Critical	The output start/stop position and step direction is not configured properly for the comparison function 2.	The output start/stop position and step direction is not configured properly for the comparison function 2.	Check the hardware wiring.

Fault Code	Level	Description	Cause	Remedy
0x64206810	Critical	The output start/stop position and step direction is not configured properly for the comparison function 3.	The output start/stop position and step direction is not configured properly for the comparison function 3.	Check the hardware wiring.
0x64206811	Critical	Comparison function 0 comparison value out of range	The comparison value is out of range for the comparison function 0.	Check the hardware wiring.
0x64206812	Critical	Comparison function 1 comparison value out of range	The comparison value is out of range for the comparison function 1.	Check the hardware wiring.
0x64206813	Critical	Comparison function 2 comparison value out of range	The comparison value is out of range for the comparison function 2.	Check the hardware wiring.
0x64206814	Critical	Comparison function 3 comparison value out of range	The comparison value is out of range for the comparison function 3.	Check the hardware wiring.
0x64206815	Critical	Comparison function 0 type not configured properly	The type is not configured properly for the comparison function 0.	Check the hardware wiring.
0x64206816	Critical	Comparison function 1 type not configured properly	The type is not configured properly for the comparison function 1.	Check the hardware wiring.
0x64206817	Critical	Comparison function 2 type not configured properly	The type is not configured properly for the comparison function 2.	Check the hardware wiring.

Fault Code	Level	Description	Cause	Remedy
0x64206818	Critical	Comparison function 3 type not configured properly	The type is not configured properly for the comparison function 3.	Check the hardware wiring.
0x64206819	Critical	Comparison function 0 output control mode not configured properly	The output control mode is not configured properly for the comparison function 0.	Check the hardware wiring.
0x6420681A	Critical	Comparison function 1 output control mode not configured properly	The output control mode is not configured properly for the comparison function 1.	Check the hardware wiring.
0x6420681B	Critical	Comparison function 2 output control mode not configured properly	The output control mode is not configured properly for the comparison function 2.	Check the hardware wiring.
0x6420681C	Critical	Comparison function 3 output control mode not configured properly	The output control mode is not configured properly for the comparison function 3.	Check the hardware wiring.
0x6420681D	Critical	DO0 short circuit	A short circuit occurs in DO0.	Check the hardware wiring.
0x6420681E	Critical	DO1 short circuit	A short circuit occurs in DO1.	Check the hardware wiring.
0x6420681F	Critical	DO2 short circuit	A short circuit occurs in DO2.	Check the hardware wiring.
0x64206820	Critical	DO3 short circuit	A short circuit occurs in DO3.	Check the hardware wiring.
0x64210103	Information	Slave fault cleared	The slave fault has been cleared.	/
0x64211800	Critical	Port connection to no device	Port connection to no device	/
0x64211802	Critical	Invalid vendor ID	Invalid vendor ID	/
0x64211803	Critical	Invalid device ID	Invalid device ID	/

Fault Code	Level	Description	Cause	Remedy
0x64211806	Critical	Pin1 short circuit	Pin1 short circuit	/
0x64211807	Critical	Pin1 overcurrent	Pin1 overcurrent	/
0x64211810	Critical	Pin2 short circuit (DO mode)	Pin2 short circuit (DO mode)	/
0x64216000	Critical	Invalid cycle time	Invalid cycle time	/
0x64216001	Critical	Incorrect version for slave station	Incorrect version for slave station	/
0x64214210	Warning	Overtemperature	Overtemperature	The ambient temperature is high. Lower down the temperature before using the module.
0x64214220	Warning	Low temperature	Low temperature	The ambient environment is low. Increase the temperature before using the module.
0x64215011	Critical	Loss of data for which retention upon power-off is configured	Loss of data for which retention upon power-off is configured	Configuration of retention upon power-off fails. Re-configure the parameter for retention upon power-off.
0x64215100	Critical	Device power supply error	Device power supply error	The UA power supply of the module fails. Enable the power supply to pin 2 on the master or use the external UA power supply.
0x64215110	Warning	System power supply overvoltage	System power supply overvoltage	The US power supply voltage of the module is higher than the normal operating voltage. Reduce the US power supply voltage.
0x64215111	Warning	System power supply undervoltage	System power supply undervoltage	The US power supply voltage of the module is lower than the normal operating voltage. Increase the US power supply voltage.
0x64216320	Critical	Incorrect parameter	Incorrect parameter	The module parameters have been configured incorrectly. Configure the parameters correctly according to the product data.

Fault Code	Level	Description	Cause	Remedy
0x64216321	Critical	Missing parameter	Missing parameter	In expert mode, an input signal is detected for a channel configured as output. Modify the input/output configuration parameter 0x41 according to actual usage.
0x64217710	Critical	DO short circuit	DO short circuit	A short circuit has occurred on the module output. Check the external wiring.
0x64218CA0	Critical	PIN1 short circuit	PIN1 short circuit	A short circuit occurs on the module PIN1. Check the external wiring.
0x64218CA1	Critical	No cascaded devices connected	No cascaded device is connected.	Check if any cascaded devices are connected.
0x64218CA2	Critical	Cascaded device verification failed	Cascaded device verification failed	Check if a compatible cascaded device is connected.
0x64218DA0	Warning	Cascaded device temperature out of range	The cascaded device temperature is out of range.	The ambient temperature of the cascaded device is too high. Decrease the temperature before using the device.
0x64218DA1	Warning	Cascaded device temperature too low	The cascaded device temperature is too low.	The ambient temperature of the cascaded device is too low. Increase the temperature before using the device.
0x64218DA4	Critical	Retentive data loss due to cascaded device power failure	The retentive data upon cascaded device power failure is lost.	Failed to save configuration parameters for the cascaded device. Re-configure the parameters.
0x64218DA6	Critical	Cascaded device power supply error	Power supply error on the cascaded device.	The UA power supply for the cascaded device module is not provided. Enable the master PIN2 power supply or connect an external UA power source.
0x64218DA8	Warning	Cascaded device system power supply voltage out of range	The system power supply voltage for the cascaded device exceeds the limit.	The US power supply voltage of the cascaded device module is higher than the normal operating voltage. Reduce the US power supply voltage.

Fault Code	Level	Description	Cause	Remedy
0x64218DA9	Warning	Cascaded device system power supply undervoltage	The system power supply voltage for the cascaded device is below the limit.	The US power supply voltage of the cascaded device module is lower than the normal operating voltage. Increase the US power supply voltage.
0x64218DAC	Critical	Cascaded device parameter error	The parameter in the cascaded device is faulty.	The parameters for the cascaded device module have been configured incorrectly. Configure the parameters correctly according to the product data.
0x64218DAD	Critical	Missing parameters in the cascaded device	The parameters in the cascaded device are missing.	In expert mode of the cascaded device, if an input signal is detected on a channel that is configured as an output, modify the I/O configuration parameter 0x41 to match the actual usage.
0x64218DAF	Critical	Cascaded device DO short circuit	The DO on the cascaded device is short-circuited.	There is a short circuit on the output of the cascaded device module. Check the external wiring.
0x64218DB0	Critical	Cascaded device PIN1 short circuit	PIN1 on the cascaded device is short-circuited.	There is a short circuit on PIN1 of the cascaded device module. Check the external wiring.
0x64217701	Critical	Port 1 disconnection	A disconnection has occurred at port 1.	Check if the input connection is correct.
0x64217702	Critical	Port 2 disconnection	A disconnection has occurred at port 2.	Check if the input connection is correct.
0x64217703	Critical	Port 3 disconnection	A disconnection has occurred at port 3.	Check if the input connection is correct.
0x64217704	Critical	Port 4 disconnection	A disconnection has occurred at port 4.	Check if the input connection is correct.
0x64217705	Critical	Port 5 disconnection	A disconnection has occurred at port 5.	Check if the input connection is correct.

Fault Code	Level	Description	Cause	Remedy
0x64217706	Critical	Port 6 disconnection	A disconnection has occurred at port 6.	Check if the input connection is correct.
0x64217707	Critical	Port 7 disconnection	A disconnection has occurred at port 7.	Check if the input connection is correct.
0x64217708	Critical	Port 8 disconnection	A disconnection has occurred at port 8.	Check if the input connection is correct.
0x64218C11	Warning	Port 1 input above the upper limit	The port 1 input exceeds the upper limit.	The input exceeds the upper measurement limit. Reduce the input.
0x64218C12	Warning	Port 2 input above the upper limit	The port 2 input exceeds the upper limit.	The input exceeds the upper measurement limit. Reduce the input.
0x64218C13	Warning	Port 3 input above the upper limit	The port 3 input exceeds the upper limit.	The input exceeds the upper measurement limit. Reduce the input.
0x64218C14	Warning	Port 4 input above the upper limit	The port 4 input exceeds the upper limit.	The input exceeds the upper measurement limit. Reduce the input.
0x64218C15	Warning	Port 5 input above the upper limit	The port 5 input exceeds the upper limit.	The input exceeds the upper measurement limit. Reduce the input.
0x64218C16	Warning	Port 6 input above the upper limit	The port 6 input exceeds the upper limit.	The input exceeds the upper measurement limit. Reduce the input.
0x64218C17	Warning	Port 7 input above the upper limit	The port 7 input exceeds the upper limit.	The input exceeds the upper measurement limit. Reduce the input.
0x64218C18	Warning	Port 8 input above the upper limit	The port 8 input exceeds the upper limit.	The input exceeds the upper measurement limit. Reduce the input.
0x64218C21	Critical	Port 1 input overflow	An overflow has occurred at port 1.	The input exceeds the normal measurement range. Check the input.
0x64218C22	Critical	Port 2 input overflow	An overflow has occurred at port 2.	The input exceeds the normal measurement range. Check the input.
0x64218C23	Critical	Port 3 input overflow	An overflow has occurred at port 3.	The input exceeds the normal measurement range. Check the input.

Fault Code	Level	Description	Cause	Remedy
0x64218C24	Critical	Port 4 input overflow	An overflow has occurred at port 4.	The input exceeds the normal measurement range. Check the input.
0x64218C25	Critical	Port 5 input overflow	An overflow has occurred at port 5.	The input exceeds the normal measurement range. Check the input.
0x64218C26	Critical	Port 6 input overflow	An overflow has occurred at port 6.	The input exceeds the normal measurement range. Check the input.
0x64218C27	Critical	Port 7 input overflow	An overflow has occurred at port 7.	The input exceeds the normal measurement range. Check the input.
0x64218C28	Critical	Port 8 input overflow	An overflow has occurred at port 8.	The input exceeds the normal measurement range. Check the input.
0x64218C31	Warning	Port 1 input below lower limit	The port 1 input is below the lower limit.	The input is below the lower measurement limit. Increase the input.
0x64218C32	Warning	Port 2 input below lower limit	The port 2 input is below the lower limit.	The input is below the lower measurement limit. Increase the input.
0x64218C33	Warning	Port 3 input below lower limit	The port 3 input is below the lower limit.	The input is below the lower measurement limit. Increase the input.
0x64218C34	Warning	Port 4 input below lower limit	The port 4 input is below the lower limit.	The input is below the lower measurement limit. Increase the input.
0x64218C35	Warning	Port 5 input below lower limit	The port 5 input is below the lower limit.	The input is below the lower measurement limit. Increase the input.
0x64218C36	Warning	Port 6 input below lower limit	The port 6 input is below the lower limit.	The input is below the lower measurement limit. Increase the input.
0x64218C37	Warning	Port 7 input below lower limit	The port 7 input is below the lower limit.	The input is below the lower measurement limit. Increase the input.
0x64218C38	Warning	Port 8 input below lower limit	The port 8 input is below the lower limit.	The input is below the lower measurement limit. Increase the input.
0x9DD20000	Information	Fault cleared	/	Channel fault cleared

Fault Code	Level	Description	Cause	Remedy
0x9DD20070	Critical	Slave address setting error	The set slave station address does not match the actual slave station address.	1. Check if the slave response data is correct. 2. Check if the master device address matches the slave device address.
0x9DD20072	Critical	Illegal data address	The accessed peer data address does not exist or is out of bounds.	Check if the data access address or data length exceeds the limit.
0x9DD20073	Critical	CRC check error	Data message CRC check error	1. Check if the terminal matching resistor is set properly. 2. Optimize the wiring by eliminating potential interference sources.
0x9DD20074	Critical	Unsupported command code	Attempted to access a command code not supported by the peer.	Check if the slave supports the parameter requested by the master.
0x9DD20075	Critical	Receiving timeout	1. The communication link is faulty. 2. The peer device is not operational.	1. Check if the master serial port configuration is correct. 2. Check if the serial port of the peer device is working properly. 3. Check if the peer device Modbus-RTU is started normally. 4. Optimize the wiring by eliminating potential interference sources.
0x9DD20076	Critical	Illegal data value	The data value is illegal.	Check if the response data from the peer slave is faulty.
0x9DD20077	Critical	Buffer overflow	Buffer overflow	Check if the number of requested coils or registers exceeds the maximum supported by Modbus.
0x9DD20078	Critical	Slave fault	Slave fault	Check if the peer slave device is faulty.
0x9E360000	Information	Fault cleared	/	The channel fault has been cleared.

Fault Code	Level	Description	Cause	Remedy
0x9E360072	Critical	Illegal data address	The accessed peer data address does not exist or is out of bounds.	Check if the data access address or data length exceeds the limit.
0x9E360074	Critical	Unsupported command code	Attempted to access a command code not supported by the peer.	Check if the slave supports the parameter requested by the master.
0x9E360075	Critical	Receiving timeout	1. The communication link is faulty. 2. The peer device is not operational.	1. Check if the master IP address or port is configured correctly. 2. Check if the TCP network of the peer device is working properly. 3. Check if the peer device Modbus-TCP is started normally. 4. Optimize the wiring by eliminating potential interference sources.
0x9E360076	Critical	Illegal data value	The data value is illegal.	Check if the response data from the peer slave is faulty.
0x9E360077	Critical	Buffer overflow	Buffer overflow	Check if the number of requested coils or registers exceeds the maximum supported by Modbus.
0x9E360078	Critical	Slave fault	Slave fault	Check if the peer slave is faulty.
0x9E36009A	Critical	TCP cannot be connected to the device.	TCP link error	1. Check if the master IP address or port is configured correctly. 2. Check if the network of the peer device is working properly. 3. Check if the wiring is disconnected. 4. Optimize the wiring by eliminating potential interference sources.
0x9E35009B	Critical	TCP master IP address declaration failed.	EtherNet port IP address does not match the device network port IP address.	Check if the EtherNet port IP address is set correctly.

Fault Code	Level	Description	Cause	Remedy
0x9E3E009B	Critical	TCP slave IP address declaration failed.	EtherNet port IP address does not match the device network port IP address.	Check if the EtherNet port IP address is set correctly.
0x9E36009C	Critical	TCP slave port is occupied.	The slave station was started on the PC, consuming the Modbus port configured in iFA.	Close the slave started on the PC to release the occupied port.
0x9E980001	Warning	Missing configuration parameter for the PLC's general I/O function: Bus cycle task.	The iFA software version is incompatible. The required parameters are missing in the downloaded device configuration file.	Update the iFA software version. (The current run uses default parameters.)
0x9E980002	Critical	The axis is in commissioning state.	The axis associated with this instruction is currently in commissioning state.	Exit the axis commissioning mode, and then execute this instruction.
0x9E980003	Critical	Invalid terminal setting for HC_PWM.	No appropriate terminal is checked on the iFA interface.	Check the PWM output terminal on the iFA interface.
0x9E980004	Critical	Terminal conflict for HC_PWM.	Multiple instances are output to the same terminal simultaneously.	Check whether multiple instances are output to the same terminal.
0x9E980005	Critical	HC_PWM pulse period and pulse width are both set to 0.	The period and pulse width are both set to 0.	Set a non-zero value.
0x9E980006	Critical	HC_PWM pulse period is set to 0.	The period is set to 0.	Set a non-zero value.
0x9E980007	Critical	HC_PWM pulse width is equal to 0.	The pulse width is set to 0.	Set a non-zero value.
0x9E980008	Critical	HC_PWM pulse width exceeds the pulse period.	The pulse width exceeds the pulse period.	Set the pulse width to a value less than the pulse period.

Fault Code	Level	Description	Cause	Remedy
0x9E980009	Critical	HC_PWM pulse period and pulse width are both set to values below the minimum.	The period and pulse width are both set to values below the minimum.	Set the pulse period to a value of at least 5, and the pulse width to a value of at least 2.
0x9E98000A	Critical	HC_PWM pulse period is set to a value below the minimum.	The period is below the minimum.	Set the period to a value of at least 5.
0x9E98000B	Critical	HC_PWM pulse width is set to a value below the minimum.	The pulse width is below the minimum.	Set the pulse width to a value of at lease 2.
0x9E98000C	Critical	HC_PWM pulse period and pulse width are both set to values above the maximum.	The period and pulse width are both above the maximum.	Set the pulse period and pulse width to values of at most 214748364.
0x9E98000D	Critical	HC_PWM pulse period is set to a value above the maximum.	The pulse period is greater than the maximum value.	Set the pulse period to a value of at most 214748364.
0x9E98000E	Critical	HC_PWM pulse period is set above the maximum.	The pulse width is greater than the maximum value.	Set the pulse width to a value of at most 214748364.
0x9E98000F	Critical	The External input of HC_EnableInterrupt is out of range.	1. The External input is out of range. 2. The pin for External is not configured in the software.	1. Set the External input to a value between 0 and 15. 2. Enable external interrupt for the External pin in the iFA.
0x9E980010	Critical	The Compare input of HC_EnableInterrupt is out of range.	1. The Compare input is out of range. 2. The corresponding channel is not configured with a high-speed counter.	1. Set the Compare input to a value between 0 and 15. 2. Assign the high-speed counter channel configured for Compare to a local encoder axis.
0x9E980011	Critical	HC_EnableInterrupt enabled repeatedly.	Multiple HC_EnableInterrupt function blocks are not allowed to be triggered at the same time.	Use the same HC_EnableInterrupt function block to enable all interrupts.

Fault Code	Level	Description	Cause	Remedy
0x9E980012	Critical	HC_EnableInterrupt is not supported on this device.	The interrupt task is supported on EVO500 and APC500 series devices only.	Check whether the PLC model is from the EVO500 or APC500 series.
0x00400000	Information	No fault	No fault	No fault
0x00400001	Critical	The network card has no connection.	No LINK signal from the network card	Check whether the network cable between the master and slave stations is disconnected.
0x00400002	Warning	Slave station number mismatch	The number of online slaves is greater than that of configured slaves.	Scan devices on the master station or compare device configurations, and check whether the configured number of slave stations matches the number of online slave stations.
0x00400003	Critical	Alias conflict	There is a slave alias conflict when the alias is enabled.	1. Scan devices on the master station or compare device configurations, and check if there is a slave alias conflict when the alias is enabled. 2. Check the PLC log and locate the specific error based on diagnostic information.
0x00400004	Critical	The master device continuously loses frames.	EtherCAT frames are not received.	Check the master station online interface and PLC logs, and locate the specific error based on diagnostic information.
0x00400005	Warning	The master device occasionally loses frames.	The link quality is affected by interference.	1. Replace the network cable. 2. Replace the current or the previous slave. 3. Add a ferrite core or replace the network cable with a higher-grade one. 4. Check the master online interface and PLC logs, and locate the specific error based on diagnostic information.
0x00400006	Warning	Main network card has no connection.	In redundant ring network, the main network card has no connection.	Check whether the network cable of the main network card is disconnected.

Fault Code	Level	Description	Cause	Remedy
0x00400007	Warning	Redundant network card has no connection.	In redundant ring network, the redundant network card has no connection.	Check whether the network cable of the redundant network card is disconnected.
0x00400008	Warning	An alias is 0.	A slave alias name is 0 when the alias is enabled.	1. Scan devices on the master station or compare device configurations, and check if a slave alias name is 0 when the alias is enabled. 2. Check the PLC log and locate the specific error based on diagnostic information.
0x00410000	Information	No fault	No fault	No fault
0x00410001	Critical	The slave is disconnected.	Slave network cable disconnected	1. Check whether the slave is disconnected from the network. 2. Check whether the slave is powered off.
0x00410002	Critical	Type mismatch	Vendor ID, product code, or version number mismatch	1. Use EtherCAT scanning function to compare the configuration with scanning results. 2. Power off and restart the slave which the master failed to access.
0x00410003	Critical	IN/OUT reversal	The IN and OUT ports on the slave are connected in reverse.	1. Check the Ethernet cable connection of the current device. 2. The device may be connected in reverse. Use the functions to scan the device or compare device configuration to identify the location of the reversed slave station, and check its Ethernet cable connection.
0x00410004	Critical	State error	Initialization, pre-operational, safe-operational, operational, or boot error	Check the master station online interface and PLC logs, and locate the specific error based on diagnostic information.

Fault Code	Level	Description	Cause	Remedy
0x00410005	Warning	SDO configuration error	SDO configuration error	Check the master station online interface and PLC logs, and locate the specific error based on diagnostic information.
0x00410006	Critical	Status switchover timeout	Timeout during transition between initialization, pre-operational, safe-operational, operational, or boot states.	Check the master station online interface and PLC logs, and locate the specific error based on diagnostic information.
0x00410007	Warning	SDO transmission timeout	SDO transmission timeout	Check the master station online interface and PLC logs, and locate the specific error based on diagnostic information.
0x00410008	Warning	IN port disconnected	In redundant ring network, the slave IN port is disconnected.	Check whether the Ethernet cable at the slave IN port is disconnected.
0x00410009	Warning	OUT port disconnected	In redundant ring network, the slave OUT port is disconnected.	Check if the Ethernet cable at the slave OUT port is disconnected.
0x00411001	Critical	Undefined error	Any state, 0x134 = 0x0001	/
0x00411002	Critical	No memory	Any state, 0x134 = 0x0002	Insufficient heap memory
0x00411011	Critical	Invalid requested state change	I->S, I->O, P->O, O->B, S->B ,P->B, 0x134=0x0011	Check whether the state requested by the master is valid.
0x00411012	Critical	Unknown requested state change	Any state, 0x134 = 0x0012	Check whether the state requested by the master is valid.
0x00411013	Critical	Bootstrap not supported	I->B, 0x134 = 0x0013. During transition from initialization to bootstrap state, the slave does not support bootstrap state.	Check if the slave XML and slave firmware versions match.

Fault Code	Level	Description	Cause	Remedy
0x00411014	Critical	No valid firmware	I->P, 0x134 = 0x0014. During transition from initialization to pre-operational state, the DPRAM address exceeds the limit.	1. Check if the slave ESC version matches. 2. Check if the MCU software version matches.
0x00411015	Critical	Invalid mailbox configuration	I->B, 0x134=0x0015. Mailbox configuration error during transition from initialization to bootstrap.	1. Check if the slave XML and slave firmware versions match. 2. Check if the slave mailbox SM configuration has been modified.
0x00411016	Critical	Invalid mailbox configuration	I->P, 0x134=0x0016. Mailbox configuration error during transition from initialization to pre-operational state.	1. Check if the slave XML and slave firmware versions match. 2. Check if the slave mailbox SM (0/1) configuration has been modified.
0x00411017	Critical	Invalid sync manager configuration	P->S, S->O, 0x134=0x0017. A fault occurs in the synchronization manager configuration during transition from pre-operational to safe-operational state or from safe-operational to operational state.	1. Check if the slave XML and slave firmware versions match. 2. Check if the slave SM (2/3) configuration has been modified.

Fault Code	Level	Description	Cause	Remedy
0x00411018	Critical	No valid inputs available	O, S->O, 0x134=0x0018. The input data is invalid in operational state or during transition from safe-operational to operational state.	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411019	Critical	No valid outputs available	O, S->O, 0x134=0x0019. The output data is invalid in operational state or during transition from safe-operational to operational state.	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x0041101A	Critical	Synchronization fault	O, S->O, 0x134=0x001A. The process data frame is lost or the jitter is excessive in operational state or during transition from safe-operational to operational state.	1. Check whether the network cable is connected reliably. 2. Check the master and slave cycles. 3. Check if there is a value in the slave 0x300 register (The data link error counter is enabled on the master station online interface). 4. Check the parameter value of the slave synchronization loss window (Inovance).
0x0041101B	Critical	Sync manager watchdog	O, S, 0x134=0x001B. Process data watchdog timeout in operational state or safe-operational state.	1. Check the watchdog configuration. 2. Check the master cycle. 3. Check if there is a value in the slave 0x300 register (The data link error counter is enabled on the master station online interface). 4. Check if the network port connection is normal.

Fault Code	Level	Description	Cause	Remedy
0x0041101C	Critical	Invalid sync manager type	O, S, P->S, 0x134=0x001C. A fault occurs in the synchronization manager type configuration in operational state, safe-operational state, or during transition from pre-operational to safe-operational state.	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x0041101D	Critical	Invalid output configuration	O, S, P->S, 0x134=0x001D. A fault occurs in the output synchronization manager configuration in operational state, safe-operational state, or during transition from pre-operational to safe-operational state.	1. Check if the slave XML and slave firmware versions match. 2. Check if the slave output SM (2) configuration has been modified. 3. Check if the PDO configuration is correct (Check if "PDO assignment" or "PDO configuration" is unchecked). 4. Check if the PDO mapping was configured successfully via SDO.
0x0041101E	Critical	Invalid input configuration	O, S, P->S, 0x134=0x001E. A fault occurs in the input synchronization manager configuration in operational state, safe-operational state, or during transition from pre-operational to safe-operational state	1. Check if the slave XML and slave firmware versions match. 2. Check if the slave input SM (3) configuration has been modified. 3. Check if the PDO configuration is correct (Check if "PDO assignment" or "PDO configuration" is unchecked). 4. Check if the PDO mapping was configured successfully via SDO.

Fault Code	Level	Description	Cause	Remedy
0x0041101F	Critical	Invalid watchdog configuration	O, S, P->S, 0x134=0x001F. A fault occurs in the watchdog configuration in operational state, safe-operational state, or during transition from pre-operational to safe-operational state.	1. Check the SM watchdog configuration. 2. Check the watchdog prescaler setting. (reg0x400)
0x00411020	Critical	Starting the slave in cold mode	Any state, 0x134=0x0020	/
0x00411021	Critical	Slave needs INIT	B, P, S, O, 0x134=0x0021	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411022	Critical	Slave needs PREOP	S, O, 0x134=0x0022	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411023	Critical	Slave needs SAFEOP	O, 0x134=0x0023	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411024	Critical	Invalid input mapping	P->S, 0x134=0x0024. A fault occurs in the input PDO mapping configuration during transition from pre-operational to safe-operational state.	1. Check the input PDO mapping configuration (0x1600~0x17FF). 2. Check if the PDO mapping length exceeds the limit.
0x00411025	Critical	Invalid output mapping	P->S, 0x134=0x0025. A fault occurs in the output PDO mapping configuration during transition from pre-operational to safe-operational state.	1. Check the output PDO mapping configuration (0x1A00~0x1BFF). 2. Check if the PDO mapping length exceeds the limit.

Fault Code	Level	Description	Cause	Remedy
0x00411026	Critical	Inconsistent settings	P->S, 0x134=0x0026	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411027	Critical	FreeRun not supported	P->S, 0x134=0x0027	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411028	Critical	Synchronization not supported	P->S, 0x134=0x0028	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411029	Critical	Mode requiring three buffer zones	P->S, 0x134=0x0029. Buffer configuration error during transition from pre-operational to safe-operational state.	1. Check the SM configuration. 2. Check the synchronization mode configuration.
0x0041102A	Critical	Background watchdog	S, O, 0x134=0x002A	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x0041102B	Critical	No valid inputs and outputs	O, S->O, 0x134=0x002B. The input and output data are invalid in operational state or during transition from safe-operational to operational state.	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x0041102C	Critical	Fatal sync error	O, 0x134=0x002C. The synchronization signal is lost in operational state.	1. Check the slave synchronization signal. 2. Check the synchronization cycle setting.

Fault Code	Level	Description	Cause	Remedy
0x0041102D	Critical	No sync error	S->O, 0x134=0x002D. There is no synchronization signal during transition from safe-operational to operational state.	1. Check the slave startup time configuration. 2. Check the time interval between the slave DC enable time and the configured startup time.
0x00411030	Critical	Invalid DC SYNC configuration	O, S->O, P->S, 0x134=0x0030. The synchronization (SYNC) signal is configured incorrectly in operational state, during transition from safe-operational state to operational state, or from pre-operational to safe-operational state.	1. Check the slave synchronization mode configuration. 2. Check the slave ESC status. 3. Check the DC activation status.
0x00411031	Critical	Invalid DC latch configuration	O, S->O, P->S, 0x134=0x0031. The latch (LATCH) signal is configured incorrectly in operational state, during transition from safe-operational state to operational state, or from pre-operational to safe-operational state.	1. Power cycle the device. 2. Contact the manufacturer for assistance.

Fault Code	Level	Description	Cause	Remedy
0x00411032	Critical	PLL error	O, S->O, 0x134=0x0032. A PLL fault occurs in operational state or during transition from safe-operational to operational state.	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411033	Critical	DC sync I/O error	O, S->O, 0x134=0x0033	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411034	Critical	DC sync timeout fault	O, S->O, 0x134=0x0034	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411035	Critical	DC invalid sync period	P->S, 0x134=0x0035	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411036	Critical	DC sync0 period	P->S, 0x134=0x0036. The synchronization (SYNC0) signal period is configured incorrectly during transition from pre-operational to safe-operational state.	1. Check the slave synchronization signal (SYNC0) period configuration.
0x00411037	Critical	DC Sync1 period	P->S, 0x134=0x0037. The synchronization (SYNC1) signal period is configured incorrectly during transition from pre-operational to safe-operational state.	1. Check the slave synchronization signal (SYNC1) period configuration.
0x00411041	Critical	AOE mailbox communication error	B, P, S, O, 0x134=0x0041	1. Power cycle the device. 2. Contact the manufacturer for assistance.

Fault Code	Level	Description	Cause	Remedy
0x00411042	Critical	EOE mailbox communication error	B, P, S, O, 0x134=0x0042	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411043	Critical	COE mailbox communication error	B, P, S, O, 0x134=0x0043	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411044	Critical	FOE mailbox communication error	B, P, S, O, 0x134=0x0044	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411045	Critical	SOE mailbox communication error	B, P, S, O, 0x134=0x0045	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x0041104F	Critical	VOE email communication error	B, P, S, O, 0x134=0x004F	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411050	Critical	EEPROM no access	Any, 0x134=0x0050	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411051	Critical	EEPROM error	Any, 0x134=0x0051	Check if the XML file is programmed.
0x00411052	Critical	External hardware is not ready.	The EtherCAT slave cannot switch states due to loss of connection with an external device or signal.	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411060	Critical	Local restart of the slave	Any, 0x134=0x0060	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411061	Critical	The device's identification value has been changed.	P, P+E	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411070	Critical	Configuration mismatch	The actual device does not match the configuration.	Check if the configuration matches the actual device.
0x00411080	Critical	Power supply undervoltage	/	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411081	Critical	Power supply voltage too high	/	1. Power cycle the device. 2. Contact the manufacturer for assistance.

Fault Code	Level	Description	Cause	Remedy
0x00411082	Critical	The temperature is too low.	/	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00411083	Critical	High temperature	/	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x004110F0	Critical	The application controller is available.	/	1. Power cycle the device. 2. Contact the manufacturer for assistance.
0x00412101	Critical	Wireless connection establishment timeout	The TS terminal device cannot connect to the wireless network.	1. Troubleshoot based on the MS device indicators, and eliminate issues such as power supply faults, overheating, and version upgrade problems. 2. Check the wireless network configuration on the MS side, including frequency channels, number of TS connections, and whitelist settings. 3. Verify that the antennas of the MS and TS devices are correctly installed and tightened. 4. Check the surroundings for radio interference from other devices. Use a near-end tool with a frequency scanning function to scan for a clear frequency band. 5. Check if there is significant obstruction or excessive distance between the MS and the TS devices.
0x00412102	Critical	MS is not the first slave.	The MS is not directly connected to the PLC; other devices exist between them.	1. Check if there are any other devices between the PLC and the MS. If there are, remove them and reconnect them to the MS's three-port wired side.

Fault Code	Level	Description	Cause	Remedy
0x00412103	Critical	Wireless side real-time channel resource allocation failed.	Under the current channel conditions, the wireless side is unable to allocate sufficient real-time channel resources for transmitting PDO data.	1. Check if the antennas of the MS and TS devices are properly tightened. 2. Check the surroundings for radio interference from other devices. Use a near-end tool with a frequency scanning function to scan for a clear frequency band. 3. Check if there is significant obstruction or excessive distance between the MS and the TS devices. 4. It is recommended to enable LRW mode. 5. Reduce the number of wireless slave devices or reduce the PDO mapping data for the slaves.
0x00412104	Critical	PLC transmission phase is not aligned with the wireless side.	In MS mode, there are scenarios where no ECAT PDO frames or multiple ECAT PDO frames are received within a single communication cycle.	1. Check and increase the synchronization offset parameter in the background configuration, then restart the PLC. 2. Alternatively, increase the PLC control cycle and configure the corresponding synchronization offset parameter. 3. Replace the PLC with a high-performance model that has lower packet jitter.

Fault Code	Level	Description	Cause	Remedy
0x00412105	Warning	Non-process data continuous loss	Under current channel conditions, the non-process data packet error rate is high or the transmission delay is large on the wireless side.	1. Reduce the number of wireless-side slaves or reduce the number of TS devices. 2. It is recommended to enable slave auto-restart. 3. Check if the antennas of the MS and TS devices are properly tightened. 4. Check the surroundings for radio interference from other devices. Use a near-end tool with a frequency scanning function to scan for a clear frequency band. 5. Check if there is significant obstruction or excessive distance between the MS and the TS devices.
0x00412106	Warning	Process data continuous loss	Under current channel conditions, the process data packet error rate is high on the wireless side.	1. Check if the antennas of the MS and TS devices are properly tightened. 2. Check the surroundings for radio interference from other devices. Use a near-end tool with a frequency scanning function to scan for a clear frequency band. 3. Check if there is significant obstruction or excessive distance between the MS and the TS devices.
0x00412107	Warning	MS processing PLC data continuous abnormality	Some PLC data frames are not sent to slaves.	1. It is recommended to enable slave auto-restart. 2. Reduce the number of wireless-side slaves or reduce the number of TS devices, then restart the system.
0x00412108	Critical	Invalid iFA configuration parameters	iFA configuration parameter validation fails on the MS side.	1. Check the Mac address, frequency points, wireless frequency band identifier, and other parameters configured on the MS.

Fault Code	Level	Description	Cause	Remedy
0x00412109	Critical	Failed to read system time	MS fails to read the system time as the first slave.	1. Restart the wireless MS device and check if the fault is cleared. 2. If the fault cannot be cleared, it is recommended to replace the wireless MS device.
0x00412301	Critical	IN/OUT reverse connection detected on TS side	The IN/OUT connection for the slave on the TS side is reversed.	1. Check each connected slave by its TS-id to determine if there is any IN/OUT reverse connection.
0x00412302	Critical	Abnormal communication between TS and slave	The communication between the TS and its connected slaves is abnormal.	1. Check whether the TS is connected to an EtherCAT slave device. 2. Check if any slave device connected after the TS reports an alarm. If an alarm is present, clear it and restart the PLC. 3. Check if any non-ECAT slave switch exists among the devices connected after the TS.
0x00412303	Critical	Synchronization anomaly detected on TS side	The synchronization function on the TS side is abnormal.	1. Try to restart the PLC service. 2. Power off and then power on the slave device, restart the wireless system, and re-run the PLC. 3. Replace with a DC synchronous high-performance slave. 4. Use non-DC mode on the PLC to control slave operation.
0x00412304	Warning	Changing number of devices connected to TS	Devices connected to the TS side are removed or added.	1. Check if the network cables between the TS and the slaves are disconnected. 2. When the number of devices connected to the TS side changes, re-run the PLC.

Fault Code	Level	Description	Cause	Remedy
0x00412305	Critical	TS offline	Some TS devices are offline in the wireless system, resulting in communication interruption.	1. Troubleshoot based on the MS device indicators, and eliminate issues such as power supply faults, overheating, and version upgrade problems. 2. Verify that the antennas of the MS and TS devices are correctly installed and tightened. 3. Check the surroundings for radio interference from other devices. Use a near-end tool with a frequency scanning function to scan for a clear frequency band. 4. Check if there is significant obstruction or excessive distance between the MS and the TS devices.
0x00412306	Warning	Topological anomaly	TS detects a branch-type slave.	1. Check if a branch-type device is connected to the TS side and if there are three or more ports connected.
0x04030000	Information	Fault cleared	Fault cleared	The fault has been cleared.
0x04030004	Critical	The following error is out of range.	Tracking error out of range	1. Check if "Position hysteresis management" is enabled in the software settings. 2. Increase the set value of "Hysteresis limit". 3. If possible, increase the stiffness parameters of the servo drive.
0x04030005	Critical	EtherCAT communication error	Slave communication error	1. Check if the physical network of the slave station is disconnected. 2. Check whether the current state and requested state of the slave are Operational. 3. Manually switch to operational state. 4. Check if there is a drive fault.

Fault Code	Level	Description	Cause	Remedy
0x04030006	Critical	The axis cycle time is less than 0.	The axis cycle time is incorrectly set.	1. Check if the task cycle time in the axis parameters is less than 0.
0x04030007	Critical	Control axis emergency stop active	The axis is in emergency stop control.	1. Check if the immediate stop instruction was called. 2. Call the MC_Reset instruction to reset the fault. 3. Clear the emergency stop status via the software cold reset or hot reset.
0x04030009	Critical	Servo drive alarm or fault	Servo drive alarm or fault	1. Drive error. Check the value 0x603F in the object dictionary. 2. Determine the drive fault type according to the corresponding drive guide, and then clear the fault.
0x0403000A	Critical	Synchronization error	Function block and input/output interface refresh cycle do not match.	1. The input/output refresh cycle is out of sync with the function block call cycle. 2. If the program is written in ST, check whether the motion function block is being inhibited by an IF condition during execution. 3. If the program is written in LD language EN/ENO, check whether the motion function block is being inhibited by an EN during execution.
0x0403000B	Critical	Faults occurred during homing.	Faults occurred during homing.	1. Check whether the limit switch signal is installed in an incorrect position, causing simultaneous response of the limit switch signal. 2. Check whether the homing process exceeds the homing timeout.
0x0403000C	Critical	SDO data read timeout	SDO data read timeout	1. Check for communication faults on the slave.

Fault Code	Level	Description	Cause	Remedy
0x0403000D	Critical	The servo absolute value system does not match the position restoration mode.	The servo absolute value system does not match the position restoration mode.	1. Select a recovery mode compatible with the position system.
0x0403000E	Critical	The area mapped to the axis and storing its key data is not found.	The area mapped to the axis and storing its key data is not found.	1. The position system cannot be restored to normal.
0x0403000F	Critical	The power-retain variables needed for the servo position recovery scheme are missing.	The power-retain variables needed for the servo position recovery scheme are missing.	1. The position system cannot be restored to normal.
0x04030010	Critical	The power-retain variables needed for the PLC position recovery scheme are missing.	The power-retain variables needed for the PLC position recovery scheme are missing.	1. The position system cannot be restored to normal.
0x04030011	Critical	The encoder revolution count after restoration exceeds the limited range of the data type.	The encoder revolution count after restoration exceeds the limited range of the data type.	1. The position system cannot be restored to normal.
0x04030012	Critical	Abnormal termination during input parameter processing.	Abnormal termination during input parameter processing.	1. Check whether the communication status is abnormal. 2. Check whether the axis controlled by the instruction is in a faulty state.
0x04030001	Critical	The axis is in commissioning state.	The axis is in commissioning state.	1. Exit the axis commissioning mode, then execute the corresponding instruction.
0x01957001	Warning	The temperature is too low.	The internal temperature of the module box is lower than the lower limit.	Operate the F module within the specified temperature range.

Fault Code	Level	Description	Cause	Remedy
0x01957002	Warning	High temperature	The internal temperature of the module box is higher than the upper limit.	Operate the F module within the specified temperature range.
0x01957004	Critical	Incorrect parameter	Parameter configuration error or out-of-range diagnostics	Correct the parameter assignment.
0x01957005	Critical	The parameter set version is incorrect.	The version of the downloaded parameter set does not match the version of the parameter set running in the module.	Check the parameter assignment.
0x01957007	Critical	Module error	Possible causes: 1. Excessive electromagnetic interference occurred. 2. Module initialization error. 3. Power-on self-test error (peripheral).	1. Correct the fault. Then, remove and reinsert the module, or power cycle it. 2. If the module cannot be put back into operation, consider replacing it with a new one.
0x01957008	Critical	Module error	Possible causes: 1. Excessive electromagnetic interference occurred. 2. MCU self-diagnosis error (CPU, ROM, RAM)	1. Correct the fault. Then, remove and reinsert the module, or power cycle it. 2. If the module cannot be put back into operation, consider replacing it with a new one.
0x01957009	Critical	Module error	Possible causes: 1. Excessive electromagnetic interference. 2. Dual MCU interaction error.	1. Correct the fault. Then, remove and reinsert the module, or power cycle it. 2. If the module cannot be put back into operation, consider replacing it with a new one.

Fault Code	Level	Description	Cause	Remedy
0x0195700A	Critical	Module error	Possible causes: 1. Excessive electromagnetic interference occurred. 2. Clock diagnosis error.	1. Correct the fault. Then, remove and reinsert the module, or power cycle it. 2. If the module cannot be put back into operation, consider replacing it with a new one.
0x0195700B	Critical	Module error	Possible causes: 1. Excessive electromagnetic interference occurred. 2. Program execution sequence error.	1. Correct the fault. Then, remove and reinsert the module, or power cycle it. 2. If the module cannot be put back into operation, consider replacing it with a new one.
0x0195700C	Critical	Module error	Possible causes: 1. Excessive electromagnetic interference occurred. 2. Watchdog trip.	1. Correct the fault. Then, remove and reinsert the module, or power cycle it. 2. If the module cannot be put back into operation, consider replacing it with a new one.
0x01957011	Fatal	Potential group type mismatch	Incorrect potential group type	Replace with the correct potential group module.
0x01957012	Warning	Excessive internal temperature deviation of the module	Possible causes: 1. Excessive electromagnetic interference occurred. 2. Excessive internal temperature deviation of the module.	If the fault persists and cannot be cleared automatically, replace the module with a new one.
0x01957013	Warning	The user-side power supply voltage is too high.	Power supply voltage too high	Check the user-side power supply voltage.
0x01957014	Critical	The user-side power supply voltage is too low.	Power supply undervoltage	Check the user-side power supply voltage.
0x01957015	Critical	User-Side power supply detection circuit fault	Possible causes: 1. Increased electromagnetic interference. 2. F module fault	1. Eliminate/reduce electromagnetic interference. 2. Replace the F module.

Fault Code	Level	Description	Cause	Remedy
0x01957016	Critical	Communication fault: CIP Safety communication fault	CIP Safety communication fault (CRC error, mixed frame error, data frame timeout, frame sequence error, etc.) Possible causes: 1. Increased electromagnetic interference. 2. F module fault	1. Eliminate/reduce electromagnetic interference. 2. Replace the F module.
0x01957017	Critical	The module safety address is out of range.	The DIP switch address on the module is set to all zeros or all ones.	Check the DIP switch address setting on the module and power cycle it.
0x01957030	Critical	Overflow	Measurement overflow	Check the communication connection between the module and the sensor.
0x01957031	Critical	Overlimit	Measurement overlimit	Check the communication connection between the module and the sensor.
0x01957032	Critical	Underlimit	Measurement underlimit	Check the communication connection between the module and the sensor.
0x01957033	Critical	Underflow	Measurement underflow	Check the communication connection between the module and the sensor.
0x01957034	Critical	Channel overload	Channel overload	Check the actuator.
0x01957035	Critical	Channel overload or disconnection	Possible causes: 1. Channel overload. 2. Channel not connected. 3. External cable disconnection of the channel.	1. Eliminate the overload. 2. Connect the external cable. 3. Disable overload and wire break detection in the parameters.

Fault Code	Level	Description	Cause	Remedy
0x01957036	Critical	Wiring break	Possible causes: 1. External cable disconnected. 2. External circuit fault. 3. Sensor fault. 4. Incorrect sensor type set in the parameters. 5. Input channel unused. 6. Output channel not connected. 7. F module fault	1. Identify and resolve possible causes of the fault. 2. Replace the F module.
0x01957037	Critical	Interference among channels	Interference among channels	1. Eliminate any crosstalk in the process wiring. 2. Check the configured test time and the process wiring.
0x01957038	Critical	Channel-to-power supply short circuit	Possible causes: 1. Channel-to-power supply short circuit. 2. Channel readback error. 3. Short circuit between two output channels. 4. Excessive capacitive load.	1. Eliminate any crosstalk in the process wiring. 2. Check the configured test time and the process wiring. 3. Increase the test time (shutdown test).
0x01957039	Critical	Channel-to-ground short circuit	A short circuit to ground means: 1. Output cable shorted to ground. 2. Output signal shorted to ground. 3. Capacitive load too high. 4. Channel overload. 5. Channel read-back fault.	1. Correct the process wiring. 2. Increase the test time (shutdown test). 3. Check the actuator. 4. Check load conditions. 5. Replace the F module.

Fault Code	Level	Description	Cause	Remedy
0x0195703A	Critical	Differential fault, channel status 0/0 (1oo2 non-equivalent evaluation)	The difference time set for the 1oo2 evaluation has been exceeded. Possible causes: 1. Process signal error. 2. Sensor fault. 3. Configured discrepancy time too low. 4. Channel-to-ground short circuit or open circuit. 5. Fault occurred during discrepancy check.	1. Check the process signal. 2. Replace the sensor. 3. Check the parameter assignment for the error time. 4. Check the process wiring.
0x0195703B	Critical	Differential fault, channel status 0/1 (1oo2 equivalent evaluation)	The difference time set for the 1oo2 evaluation has been exceeded. Possible causes: 1. Process signal error. 2. Sensor fault. 3. Configured discrepancy time too low. 4. Channel-to-ground short circuit or open circuit. 5. Fault occurred during discrepancy check.	1. Check the process signal. 2. Replace the sensor. 3. Check the parameter assignment for the error time. 4. Check the process wiring.

Fault Code	Level	Description	Cause	Remedy
0x0195703C	Critical	Differential fault, channel status 1/0 (1oo2 equivalent evaluation)	The difference time set for the 1oo2 evaluation has been exceeded. Possible causes: 1. Process signal error. 2. Sensor fault. 3. Configured discrepancy time too low. 4. Channel-to-ground short circuit or open circuit. 5. Fault occurred during discrepancy check.	1. Check the process signal. 2. Replace the sensor. 3. Check the parameter assignment for the error time. 4. Check the process wiring.
0x0195703D	Critical	Differential fault, channel status 1/1 (1oo2 non-equivalent evaluation)	The difference time set for the 1oo2 evaluation has been exceeded. Possible causes: 1. Process signal error. 2. Sensor fault. 3. Configured discrepancy time too low. 4. Channel-to-power supply short circuit or channel-to-channel short circuit. 5. Fault occurred during discrepancy check.	1. Check the process signal. 2. Replace the sensor. 3. Check the parameter assignment for the error time. 4. Check the process wiring.

Fault Code	Level	Description	Cause	Remedy
0x0195703E	Critical	Sensor signal jitter	The number of signal changes exceeds the limit within the configured "Monitoring Window" time. Possible causes: 1. "Jitter monitoring window time" parameter set too high. 2. "Number of signal changes" parameter set too low. 3. Momentary break or short circuit (poor contact) in the sensor cable. 4. Excessive electromagnetic interference. 5. Sensor or switch switchover. 6. Sensor failure.	1. Check the "Monitoring Window" parameter. 2. Check the "Number of Signal Changes" parameter. 3. Check the process wiring. 4. Eliminate/reduce electromagnetic interference. 5. Replace the sensor.
0x0195703F	Fatal	Channel switch fault	Possible causes: 1. Increased electromagnetic interference. 2. Channel-to-power supply short circuit. 3. Switch fault inside the module. 4. Excessive capacitive load.	1. Eliminate/reduce electromagnetic interference. 2. Monitor the process signal. 3. Increase the test time (shutdown test). 4. Replace the F module.
0x01957040	Warning	Too high frequency	Maximum switching frequency of the module exceeded.	Reduce the switching frequency.

Fault Code	Level	Description	Cause	Remedy
0x01957041	Fatal	Channel comparison fault	Code value comparison error between the two MCUs. Possible causes: 1. Increased electromagnetic interference 2. F module fault	1. Eliminate/reduce electromagnetic interference. 2. Replace the F module.
0x01957042	Fatal	Analog-to-digital conversion error (ADC fault)	Internal error during analog-to-digital conversion. Possible causes: 1. Increased electromagnetic interference. 2. F module fault	Replace the F module.
0x01957043	Critical	Error time exceeded	The error time set for the 1oo2 evaluation has been exceeded. Possible causes: 1. Improper parameter assignment. 2. Fault occurred in one of the two sensors.	Check the error time, sensor, and wiring.
0x01957044	Critical	TC cold junction measured overlimit	TC cold junction measured value exceeds upper limit.	Check the configuration parameters of TC cold junction upper and lower limits, as well as the TC cold junction sensor and wiring.
0x01957045	Critical	TC cold junction measured underlimit	TC cold junction measured value exceeds lower limit.	Check the configuration parameters of TC cold junction upper and lower limits, as well as the TC cold junction sensor and wiring.

Fault Code	Level	Description	Cause	Remedy
0x01957046	Critical	TC cold junction fault	The value is outside the measurement range of the TC cold junction. Possible causes: 1. External TC cold junction fault (external cold junction mode). 2. TC backplane fault (internal cold junction mode)	1. Check the TC cold junction sensor and wiring (external cold junction mode). 2. Replace the TC module backplane (internal cold junction mode).

0x0195F046	Information	TC cold junction fault cleared	/	/
0x01911000	Warning	Protocol stack failed to scan for modules	Possible causes: 1. The expansion module does not exist. 2. No expansion module was scanned due to local bus communication failure.	1. Check whether the expansion module is properly installed and supplied with power. 2. Check the contact of the communication interface of the expansion module or restart the rack.
0x01911001	Critical	The number of I/O modules configured is more than the number of I/O modules actually scanned.	Possible causes: 1. The actual slot position of the expansion module does not match the configuration settings. 2. A local bus communication fault causes the scanned modules to differ from the configured modules.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.

Fault Code	Level	Description	Cause	Remedy
0x01911002	Critical	The number of I/O modules configured is less than the number of I/O modules actually scanned.	Possible causes: 1. The actual slot position of the expansion module does not match the configuration settings. 2. A local bus communication fault causes the scanned modules to differ from the configured modules.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0x01911003	Critical	The type of I/O modules configured is inconsistent with that of the I/O modules actually scanned.	Possible causes: 1. The actual slot position of the expansion module does not match the configuration settings. 2. A local bus communication fault causes the scanned modules to differ from the configured modules.	1. Check the number and installation order of the expansion modules. 2. Check the contact of the communication interface for the expansion module or restart the rack.
0x01911004	Warning	Module configuration failure	The local bus communication failure causes an error when the master module interacts with the expansion module.	Check the contact of the communication interface of the expansion module or restart the rack.
0x01911005	Warning	The module status is not switched successfully.	The local bus communication failure causes an error when the master module interacts with the expansion module.	Check the contact of the communication interface of the expansion module or restart the rack.

Fault Code	Level	Description	Cause	Remedy
0x01911006	Warning	The module is offline or has been removed.	Possible causes: 1. The I/O module is powered off or unplugged. 2. The error is caused by an excessive frame loss rate in local bus communication.	1. Check whether the module is powered off or removed from the slot. 2. Check the contact of the communication interface of the expansion module or restart the rack.
0x01911007	Warning	Module type mismatch	The hardware component has been inserted, but the type of this component does not match that of the configured module.	Check the inserted module, and correct the configuration if necessary.
0x01911008	Information	New module inserted	A new hardware component has been inserted, and the type of this component matches that of the configured module.	/
0x01911009	Warning	Local bus cyclic data communication error	Local bus cyclic data frame transmission error: Data inconsistency (CRC check error, etc.). Possible cause: 1. Increased electromagnetic interference. 2. F module fault	1. Check the contact of the communication interface of the expansion module or restart the rack. 2. Eliminate or reduce the electromagnetic interference. 3. Replace the F module.
0x0191100A	Warning	Local bus cyclic data communication timeout	Local bus cyclic data frame transmission timeout. Possible causes: 1. Incorrect communication period setting. 2. Bus faults exist.	1. Modify the communication cycle. 2. Check the contact of the communication interface for the expansion module or restart the rack.

Fault Code	Level	Description	Cause	Remedy
0x0191100B	Critical	Configuration conflict	The same I/O module is configured under multiple controllers.	Detect the configuration, resolve the conflict, and then re-download.
0x0191100C	Critical	The stopper plate is faulty or missing.	The stopper plate is faulty or missing.	Reinstall or replace the stopper plate.
0x0191100D	Critical	Module watchdog timeout	Possible causes: 1. Module MCU power loss. 2. Module MCU crash.	1. Check the module power supply. In case of power loss, restore the power supply. 2. Power cycle the module.
0x0191100E	Critical	IP address conflict	IP address conflict among network devices (PLCs, couplers, etc.) in the configuration	Check the IP addresses of the network devices (PLCs, couplers, etc.) in the configuration.
0x0191100F	Critical	The I/O module does not support the currently selected industry standard.	The I/O module does not support the currently selected industry standard.	Replace or update the I/O module.
0x01911010	Critical	Acyclic data communication fault: Unexpected	Local bus acyclic data frame transmission error: Data inconsistency (CRC error, request frame error, invalid response frame length, service code mismatch, sequence number mismatch, and so on.) Possible causes: 1. Increased electromagnetic interference 2. I/O module firmware version mismatch	1. Check the contact of the communication interface of the expansion module or restart the rack. 2. Eliminate or reduce the electromagnetic interference. 3. Replace or update the I/O module.

Fault Code	Level	Description	Cause	Remedy
0x01911011	Critical	Acyclic data communication fault: Timeout	Local bus cyclic data frame transmission timeout. Possible causes: 1. I/O module MCU power loss or hang 2. I/O module firmware version mismatch. 3. Bus fault present.	1. Check the module power supply or power cycle the module. 2. Replace or update the I/O module. 3. Check the contact of the communication interface of the expansion module or restart the rack.
0x01919001	Information	Configuration match successful	The fault "The number of I/O modules configured exceeds the number of I/O modules actually scanned" has been cleared.	/
0x01919002	Information	Configuration match successful	The fault "The number of I/O modules configured is less than the number of I/O modules actually scanned" has been cleared.	/
0x01919003	Information	Configuration match successful	The fault "The type of I/O modules configured is inconsistent with that of the I/O modules actually scanned" has been cleared.	/
0x01919004	Information	Module configuration successful	/	/
0x01919005	Information	The module status is switched successfully.	/	/

0x01919010	Information	Acyclic data communication fault cleared	/	/
0x01919011	Information	Acyclic data communication timeout fault cleared	/	/
0x01900000	Information	Connected successfully	/	/
0x01900001	Critical	CIP Safety connection failed. The target returned an error message.	1. The target node is different. 2. Connection parameters are abnormal. 3. The target node is abnormal.	1. Check if the IP address is correctly set. 2. Check if the configuration in iFA matches the actual device. 3. Check the specific fault code and modify the faulty communication parameters. 4. Check if the target device is operating normally. 5. Check if the project UNID matches the device UNID. If not, reset the UNID.

Fault Code	Level	Description	Cause	Remedy
0x01900002	Critical	CIP Safety connection timeout. The target node does not exist.	1. The network cable is disconnected. 2. The target node address is incorrectly set (IP, slot number). 3. The target node is faulty.	1. Check the link stability. 2. Check if the IP address is correctly set. 3. Check if the configuration in iFA matches the actual device. 4. Check if the target device is operating normally.
0x01900003	Critical	Communication timeout on the CIP Safety originator	1. The network cable is disconnected. 2. The communication timeout is set too short. 3. Excessive interference occurred. 4. The target device has entered an abnormal state.	1. Check the link stability. 2. Increase the timeout time. 3. Check if the target device is working normally.
0x01900004	Critical	Communication timeout on the CIP Safety destination	1. The network cable is disconnected. 2. The communication timeout is set too short. 3. Excessive interference occurred. 4. The target device has entered an abnormal state.	1. Check the link stability. 2. Increase the timeout time. 3. Check if the target device is working normally.
0x01900005	Critical	The IP address changes during device operation.	1. The IP address knob switch was adjusted during operation.	1. Set the IP address knob switch back to its original position. 2. Power cycle the device.
0xA0BF0070	Warning	The I/O module types between the master and slaves do not match.	The I/O module types between the master and slaves do not match.	Change the I/O configuration modules of the master and slave stations to make them consistent.

Fault Code	Level	Description	Cause	Remedy
0xA0BF0071	Warning	The input data slot length of the corresponding modules between the master and slaves does not match.	The input data slot length of the corresponding modules between the master and slaves does not match.	Change the I/O configuration modules of the master and slave stations to make them consistent. Overwritten by error 0X70 (higher priority).
0xA0BF0072	Warning	The output data slot length of the corresponding modules between the master and slaves does not match.	The output data slot length of the corresponding modules between the master and slaves does not match.	Change the I/O configuration modules of the master and slave stations to make them consistent. Overwritten by error 0X70 (higher priority).
0xA0BF0080	Warning	The PN master PLC is in stop status.	The PN master PLC is in stop status.	Switch the master PLC to run mode.
0xA0BF0081	Warning	The network between the PN master and slaves is not connected.	The network between the PN master and slaves is not connected.	Check whether the network ports between the PN master and slaves are properly connected.
0x9CA50000	Information	No fault	No fault	No fault
0x9CA50001	Critical	CANopen master configuration error	CANOpen configuration error	1. Check if CANopen is configured correctly. 2. Check the PDO COB-IDs for conflicts.
0x9CA50010	Warning	CANopen slave offline	The CANopen slave is offline.	1. Check whether the baud rate of the CAN bus device matches the configured value. 2. Check if the CAN bus wiring is abnormal, and if the termination resistors are consistent. 3. Check if the CANopen slave number matches the configured number.
0x00500001	Information	No fault	No fault	/
0x00500002	Critical	The master device continuously loses frames.	Unable to receive WTSN frames.	Check the IFA online interface and PLC logs. The network administrator can locate the specific error according to the diagnostic information.

Fault Code	Level	Description	Cause	Remedy
0x00500003	Critical	The network card has no connection.	No LINK signal from the network card	Check whether the network cable is properly inserted and securely connected, and whether all slave devices are powered normally.
0x00500004	Warning	The master device occasionally loses frames.	The link quality is affected by interference.	/
0x00500201	Critical	AcID configuration failure	AcID configuration error in multiple masters.	/
0x00500202	Warning	Slave station number mismatch	The number of online slaves is greater than/less than that of configured slaves.	Scan devices on the master station or compare device configurations, and check whether the configured number of slave stations matches the number of online slave stations.
0x00500203	Critical	Invalid configuration parameters of the master station	The configuration file (such as XML or NI) may contain syntax errors, parameter values out of range, or mismatches with the actual hardware.	Check the configuration parameters in the configuration file.
0x00501001	Critical	Failed to configure the master.	A problem occurred during master station initialization, possibly due to insufficient system resources, driver issues, or configuration file errors.	/
0x00510001	Information	No error	No fault	/
0x00510002	Warning	Unspecified error	An error is indicated on the device, but no specific details are available.	/

Fault Code	Level	Description	Cause	Remedy
0x00510003	Critical	The slave is disconnected.	Slave network cable disconnected	/
0x00510004	Warning	Type mismatch	Vendor ID, product code, or version number mismatch	/
0x00510005	Warning	The PS0 and PS1 connections are reversed.	The PS0 and PS1 ports on the slave station are reversed.	/
0x00510006	Warning	PS0 port disconnected.	The PS0 port on the slave station is disconnected.	/
0x00510007	Warning	PS1 port disconnected.	The PS1 port on the slave station is disconnected.	/
0x00510008	Warning	PT0 port disconnected.	The PT0 port on the slave station is disconnected.	/
0x00510009	Warning	PT1 port disconnected.	The PT1 port on the slave station is disconnected.	/
0x0051000a	Warning	PT2 port disconnected.	The PT2 port on the slave station is disconnected.	/
0x0051000b	Warning	PT3 port disconnected.	The PT3 port on the slave station is disconnected.	/
0x0051000c	Warning	Watchdog timeout	Watchdog timeout	/
0x0051000d	Warning	Module type mismatch	The hardware component has been inserted, but the type of this component does not match that of the configured module.	/

Fault Code	Level	Description	Cause	Remedy
0x0051000f	Warning	New module inserted	A new hardware component has been inserted, and the type of this component matches that of the configured module.	/
0x00510010	Critical	Data rate change	Data rate change	/
0x00510101	Critical	No memory	Less hardware memory, A-Device needs more memory.	Download a smaller file.
0x00510102	Critical	Incorrect FCS	FCS error detected	/
0x00510103	Critical	WTSn frame encoding error	A WTSn encoding error has been detected.	/
0x00510104	Critical	AnID not set	AnID has not been set before the device is operated.	/
0x00510105	Critical	AnID changed	AnID changed	/
0x00510201	Critical	Invalid requested state change	Invalid AR state transition: the state transition instruction violates the state mechanism, such as attempting to transition directly from the Init state to the OP state.	/
0x00510202	Critical	State error	The requested state is unknown or invalid.	/
0x00510203	Critical	Status switchover timeout	Status switchover timeout	/
0x00510204	Critical	SE configuration error	SE configuration error	/
0x00510205	Critical	SE transmission timeout	SE transmission timeout	/
0x00510206	Critical	Management controller change	Management controller change	/

Fault Code	Level	Description	Cause	Remedy
0x00510301	Critical	Configuration error	The same device is configured under multiple controllers.	/
0x00510302	Critical	Invalid DTNA address	Invalid DTNA address	/
0x00510303	Critical	TNA parameter change	TNA parameter change	/
0x00510304	Critical	Local subnet parameter change	Local subnet parameter change	/
0x00510401	Critical	Reference clock change	Reference clock change	/
0x00510402	Critical	Node desynchronization	Node desynchronization	/
0x00510403	Critical	Large time deviation	Large deviation from reference time	/
0x00510404	Critical	Unexpected time deviation	Unexpected deviation from reference time or neighbor time	/
0x00510405	Critical	Severe time deviation	Severe deviation from reference time or neighbor time	/
0x00510406	Critical	Synchronization error	Network jitter caused the slave to lose synchronization.	/
0x00510407	Critical	Sync manager watchdog	The time since the slave last received cyclic data has exceeded the watchdog timeout.	/
0x00510408	Critical	Fatal SYNC error	MCU did not receive the SYNC hardware interruption.	/
0x00511001	Critical	Invalid Output Configuration	The configured output process data is invalid.	/

Fault Code	Level	Description	Cause	Remedy
0x00511002	Critical	Invalid Input Configuration	The configured input process data is invalid.	/
0x00511003	Critical	Invalid Device Setup	Invalid state transition sequence (for example, attempting to transition directly from INIT to OP without passing through PRM).	/
0x00511004	Critical	Invalid Sync Cycle Time	The configured Cycle Time is not supported.	/
0x00511301	Critical	Segmentation fault	/	/
0x9CA60000	Information	No fault	No fault	No fault
0x9CA60001	Warning	CANopen slave offline	The CANopen slave is offline.	1. Check whether the baud rate of the CAN bus device matches the configured value. 2. Check if the CAN bus wiring is abnormal, and if the termination resistors are consistent. 3. Check if the CANopen slave number matches the configured number.
0x019F0000	Information	Connected successfully	/	/
0x019F0001	Critical	Unexpected FSoE instruction fault (master)	In the current state of FSoE communication, this command must not appear.	1. Check whether the instruction sent by the safety slave is incorrect. 2. Check whether the instruction field of the safety data frame is accidentally modified.
0x019F0002	Critical	FSoE unknown instruction (master)	An undefined instruction was detected in FSoE communication.	1. Check whether the instruction sent by the safety slave is incorrect. 2. Check whether the instruction field of the safety data frame is accidentally modified.

Fault Code	Level	Description	Cause	Remedy
0x019F0003	Critical	Invalid FSoE connection ID (master)	The ID of the connection established by the FSoE does not match the ID received.	1. Check whether the connection ID sent by the safety slave is incorrect. 2. Check whether the safety data field in the safety data frame has been accidentally modified in the connection state.
0x019F0004	Critical	FSoE CRC error (master)	The CRC value of the FSoE data frame does not match the calculated value.	1. Check whether the CRC sent by the safety slave is incorrect. 2. Check whether the CRC field of the safety data frame is accidentally modified.
0x019F0005	Critical	FSoE watchdog timeout (master)	No data frame was received within the FSoE communication cycle.	1. Check whether the safety slave is sending safety data frames. 2. Check whether the watchdog time setting is proper. 3. Check whether the cable is disconnected.
0x019F0006	Critical	Invalid FSoE slave address (master)	1. The FSoE communication address setting is out of range. 2. The address configured on the FSoE master does not match the address configured on the slave.	1. Check whether the slave address sent by the safety slave is correct. 2. Check whether the slave address of the safety slave is configured correctly. 3. Check whether the safety data field in the safety data frame has been accidentally modified in the connection state.
0x019F0007	Critical	Invalid FSoE safety data (master)	The FSoE communication parameters are incorrect or the connection fails. In this case, the safety data is invalid.	1. Check whether the data sent by the safety slave in the connection state or parameter state is incorrect. 2. Check whether the safety data field of the safety data frame has been accidentally modified in the connection state or parameter state.

Fault Code	Level	Description	Cause	Remedy
0x019F0008	Critical	Invalid FSoE communication parameter length (master)	The length and value of the FSoE communication parameters are out of the specified range.	1. Check whether the communication parameter data length sent by the safety slave is incorrect in the parameter state. 2. Check whether the safety data field of the safety data frame is accidentally modified in the parameter state.
0x019F0009	Critical	Invalid FSoE communication parameter data (master)	FSoE communication parameter data is out of range.	1. Check whether the communication parameter data sent by the safety slave is incorrect in the parameter state. 2. Check whether the safety data field of the safety data frame is accidentally modified in the parameter state.
0x019F000A	Critical	Invalid FSoE application parameter length (master)	The length of the FSoE communication application parameters does not match the preset value.	1. Check whether the application parameter data length sent by the safety slave is incorrect in the parameter state. 2. Check whether the safety data field of the safety data frame is accidentally modified in the parameter state.
0x019F000B	Critical	Invalid FSoE application parameter data (master)	The FSoE communication application program parameter data is out of the range.	1. Check whether the application parameter data sent by the safety slave is incorrect in the parameter state. 2. Check whether the safety data field of the safety data frame is accidentally modified in the parameter state.
0x019F00FF	Critical	Unknown fault (master)	1. Instance number out of range.	1. Check whether the connected device exceeds the specifications.

Fault Code	Level	Description	Cause	Remedy
0x019F2001	Critical	Unexpected FSoE instruction fault (slave)	In the current state of FSoE communication, this command must not appear.	1. Check whether the instruction sent by the safety master is incorrect. 2. Check whether the instruction field of the safety data frame is accidentally modified.
0x019F2002	Critical	FSoE unknown instruction (slave)	An undefined instruction was detected in FSoE communication.	1. Check whether the instruction sent by the safety master is incorrect. 2. Check whether the instruction field of the safety data frame is accidentally modified.
0x019F2003	Critical	Invalid FSoE connection ID (slave)	The ID of the connection established by the FSoE does not match the ID received.	1. Check whether the connection ID sent by the safety master is incorrect. 2. Check whether the safety data field in the safety data frame has been accidentally modified.
0x019F2004	Critical	FSoE CRC error (slave)	The CRC value of the FSoE data frame does not match the calculated value.	1. Check whether the CRC sent by the safety master is incorrect. 2. Check whether the CRC field of the safety data frame is accidentally modified.
0x019F2005	Critical	FSoE watchdog timeout (slave)	No data frame was received within the FSoE communication cycle.	1. Check whether the safety master is sending data. 2. Check whether the watchdog time setting is proper. 3. Check whether the cable is disconnected.
0x019F2006	Critical	Invalid FSoE slave address (slave)	1. The FSoE communication address setting is out of range. 2. The address configured on the FSoE master does not match the address configured on the slave.	1. Check whether the slave address sent by the safety master is correct. 2. Check whether the slave address of the safety slave is configured correctly. 3. Check whether the safety data field in the safety data frame has been accidentally modified in the connection state.

Fault Code	Level	Description	Cause	Remedy
0x019F2007	Critical	Invalid FSoE safety data (slave)	The FSoE communication parameters are incorrect or the connection fails. In this case, the safety data is invalid.	1. Check whether the data sent by the safety master in the connection state or parameter state is incorrect. 2. Check whether the safety data field of the safety data frame has been accidentally modified in the connection state or parameter state.
0x019F2008	Critical	Invalid FSoE communication parameter length (slave)	The length and value of the FSoE communication parameters are out of the specified range.	1. Check whether the communication parameter data length sent by the safety master is incorrect in the parameter state. 2. Check whether the safety data field of the safety data frame is accidentally modified in the parameter state.
0x019F2009	Critical	Invalid FSoE communication parameter data (slave)	FSoE communication parameter data is out of range.	1. Check whether the communication parameter data sent by the safety master is incorrect in the parameter state. 2. Check whether the safety data field of the safety data frame is accidentally modified in the parameter state.
0x019F200A	Critical	Invalid FSoE application parameter length (slave)	The length of the FSoE communication application parameters does not match the preset value.	1. Check whether the application parameter data length sent by the safety master is incorrect in the parameter state. 2. Check whether the safety data field of the safety data frame is accidentally modified in the parameter state.
0x019F200B	Critical	Invalid FSoE application parameter data (slave)	The FSoE communication application program parameter data is out of the range.	1. Check whether the application parameter data sent by the safety master is incorrect in the parameter state. 2. Check whether the safety data field of the safety data frame is accidentally modified in the parameter state.

Fault Code	Level	Description	Cause	Remedy
0x019F20FF	Critical	Unknown fault (slave)	1. The first byte of the safety data was accidentally modified in the reset state. 2. The instance number is out of range.	1. Check whether the safety data field in the safety data frame in the reset state has been accidentally modified. 2. Check whether the connected device exceeds the specifications.
0x019F0040	Information	Disconnected	/	/
0xA7F80001	Information	Communication module online	The communication module is operating normally.	/
0xA7F80002	Critical	Communication module offline	The communication module is not inserted, or the communication module is operating abnormally	Check the corresponding slot, and insert a matching communication module.
0xA7F80003	Critical	Communication module mismatch	The inserted communication module does not match the configured module.	Check the corresponding slot, and replace a matching communication module.
0xA7F80004	Critical	Communication module fault.	Communication module operation fault.	Check the fault code in the additional information, then refer to the relevant manual for a detailed description of the fault code.
0xA7F80005	Information	Communication module fault cleared	The communication module is operating normally.	/
0xA7F80006	Critical	Master station communication fault on the communication module.	Master station communication fault on the PN/DP module.	Check the fault code in the additional information, then refer to the relevant manual for a detailed description of the fault code.

Fault Code	Level	Description	Cause	Remedy
0xA7F80007	Information	The master station communication on the communication module has returned to normal.	The master station communication on the PN/DP module has returned to normal.	/
0xA7F80008	Critical	Slave network connection fault status.	Slave connection fault status on the communication module.	Check the fault code in the additional information, then refer to the relevant manual for a detailed description of the fault code.
0xA7F80009	Information	The slave network connection is normal.	The slave network connection on the communication module is normal.	/
0xA7F8000A	Warning	Slave network connection diagnostic status.	Slave connection diagnostic status on the communication module.	A diagnostic event has occurred on a slave. Clear the diagnostic information for the corresponding slave.
0xA7F8000B	Critical	Slave not recognized on network	A slave has not been recognized on the communication module.	A slave has not been recognized. Configure the correct slave and connect it to the communication network.
0xA7F8000C	Warning	The master station of the communication module is not configured with a slave module.	The master station of the communication module is not configured with a slave module.	Configure the correct slave for the corresponding master module, and connect it to the communication network.
0xA7F8000D	Warning	Communication module unable to receive diagnostic information	The communication module cannot receive diagnostic information.	Check the indicators of the expansion module, and power cycle the module. If the module still cannot operate normally after power cycling, send it back to the factory for repair.
0xA7F8000E	Critical	Expansion communication module not properly seated	The expansion communication module is not seated properly.	Power off the device, reseat the module in the corresponding slot securely, then power it on.

21.2 Appendix 2: Version Compatibility Table

The following table shows the compatibility of software version and device firmware version.

> NOTE
>
> The software version is backward compatible with device firmware versions. Select the corresponding firmware version as needed.

Compatibility table of controller firmware and module

21.3 Appendix 3: PN/DP Master Diagnostic Codes

- PN master system diagnostic codes

Diagnostic Code	Description
0x00000000	HIL_SYS_SUCCESS Success
0x00000001	HIL_SYS_RAM_NOT_FOUND RAM Not Found
0x00000002	HIL_SYS_RAM_TYPE Invalid RAM Type
0x00000003	HIL_SYS_RAM_SIZE Invalid RAM Size
0x00000004	HIL_SYS_RAM_TEST Ram Test Failed
0x00000005	HIL_SYS_FLASH_NOT_FOUND Flash Not Found
0x00000006	HIL_SYS_FLASH_TYPE Invalid Flash Type
0x00000007	HIL_SYS_FLASH_SIZE Invalid Flash Size

Diagnostic Code	Description
0x00000008	HIL_SYS_FLASH_TEST Flash Test Failed
0x00000009	HIL_SYS_EEPROM_NOT_FOUND EEPROM Not Found
0x0000000A	HIL_SYS_EEPROM_TYPE Invalid EEPROM Type
0x0000000B	HIL_SYS_EEPROM_SIZE Invalid EEPROM Size
0x0000000C	HIL_SYS_EEPROM_TEST EEPROM Test Failed
0x0000000D	HIL_SYS_SECURE_EEPROM Security EEPROM Failure
0x0000000E	HIL_SYS_SECURE_EEPROM_NOT_INIT Security EEPROM Not Initialized
0x0000000F	HIL_SYS_FILE_SYSTEM_FAULT File System Fault
0x00000010	HIL_SYS_VERSION_CONFLICT Version Conflict
0x00000011	HIL_SYS_NOT_INITIALIZED System Task Not Initialized
0x00000012	HIL_SYS_MEM_ALLOC Memory Allocation Failed

- PN master communication diagnostic codes

Diagnostic Code	Description
0x00000000	SUCCESS_HIL_OK No error
0xC0000001	ERR_HIL_FAIL Common error, detailed error information optionally present in the data area of packet.
0xC0000002	ERR_HIL_UNEXPECTED Unexpected failure.
0xC0000003	ERR_HIL_OUTOFMEMORY Ran out of memory.
0xC0000004	ERR_HIL_UNKNOWN_COMMAND Unknown Command in Packet received.
0xC0000005	ERR_HIL_UNKNOWN_DESTINATION Unknown Destination in Packet received.
0xC0000006	ERR_HIL_UNKNOWN_DESTINATION_ID Unknown Destination Id in Packet received.

Diagnostic Code	Description
0xC0000007	ERR_HIL_INVALID_PACKET_LEN Packet length is invalid.
0xC0000008	ERR_HIL_INVALID_EXTENSION Invalid Extension in Packet received.
0xC0000009	ERR_HIL_INVALID_PARAMETER Invalid Parameter in Packet found.
0xC000000A	ERR_HIL_INVALID_ALIGNMENT Invalid alignment.
0xC000000C	ERR_HIL_WATCHDOG_TIMEOUT Watchdog error occurred.
0xC000000D	ERR_HIL_INVALID_LIST_TYPE List type is invalid.
0xC000000E	ERR_HIL_UNKNOWN_HANDLE Handle is unknown.
0xC000000F	ERR_HIL_PACKET_OUT_OF_SEQ A packet index has been not in the expected sequence.
0xC0000010	ERR_HIL_PACKET_OUT_OF_MEMORY The amount of fragmented data contained the packet sequence has been too large.
0xC0000011	ERR_HIL_QUE_PACKETDONE The packet done function has failed.
0xC0000012	ERR_HIL_QUE_SENDPACKET The sending of a packet has failed.
0xC0000013	ERR_HIL_POOL_PACKET_GET The request of a packet from packet pool has failed.
0xC0000014	ERR_HIL_POOL_PACKET_RELEASE The release of a packet-to-packet pool has failed.
0xC0000015	ERR_HIL_POOL_GET_LOAD The get packet pool load function has failed.
0xC0000016	ERR_HIL_QUE_GET_LOAD The get queue load function has failed.
0xC0000017	ERR_HIL_QUE_WAITFORPACKET The waiting for a packet from queue has failed.
0xC0000018	ERR_HIL_QUE_POSTPACKET The posting of a packet has failed.
0xC0000019	ERR_HIL_QUE_PEEKPACKET Peeking a packet from queue has failed.
0xC000001A	ERR_HIL_REQUEST_RUNNING Request is already running.

Diagnostic Code	Description
0xC000001B	ERR_HIL_CREATE_TIMER Creating a timer failed.
0xC000001C	ERR_HIL_BUFFER_TOO_SHORT Supplied buffer too short for the data.
0xC000001D	ERR_HIL_NAME_ALREADY_EXIST Supplied name already exists.
0xC000001E	ERR_HIL_PACKET_FRAGMENTATION_TIMEOUT The packet fragmentation has timed out.
0xC0000100	ERR_HIL_INIT_FAULT General initialization fault.
0xC0000101	ERR_HIL_DATABASE_ACCESS_FAILED Database access failure.
0xC0000102	ERR_HIL_CIR_MASTER_PARAMETER_FAILED Master parameter cannot activated at state operate.
0xC0000103	ERR_HIL_CIR_SLAVE_PARAMTER_FAILED Slave parameter cannot be activated at state operate.
0xC0000119	ERR_HIL_NOT_CONFIGURED Configuration not available.
0xC0000120	ERR_HIL_CONFIGURATION_FAULT General configuration fault.
0xC0000121	ERR_HIL_INCONSISTENT_DATA_SET Inconsistent configuration data.
0xC0000122	ERR_HIL_DATA_SET_MISMATCH Configuration data set mismatch.
0xC0000123	ERR_HIL_INSUFFICIENT_LICENSE Insufficient license.
0xC0000124	ERR_HIL_PARAMETER_ERROR Parameter error.
0xC0000125	ERR_HIL_INVALID_NETWORK_ADDRESS Network address invalid.
0xC0000126	ERR_HIL_NO_SECURITY_MEMORY Security memory chip missing or broken.
0xC0000127	ERR_HIL_NO_MAC_ADDRESS_AVAILABLE No MAC address available.
0xC0000140	ERR_HIL_NETWORK_FAULT General communication fault.
0xC0000141	ERR_HIL_CONNECTION_CLOSED Connection closed.
0xC0000142	ERR_HIL_CONNECTION_TIMEOUT Connection timeout.

Diagnostic Code	Description
0xC0000143	ERR_HIL_LONELY_NETWORK Lonely network.
0xC0000144	ERR_HIL_DUPLICATE_NODE Duplicate network address.
0xC0000145	ERR_HIL_CABLE_DISCONNECT Cable disconnected.
0xC0000180	ERR_HIL_BUS_OFF Bus Off flag is set.
0xC0000181	ERR_HIL_CONFIG_LOCK Changing configuration is not allowed.
0xC0000182	ERR_HIL_APPLICATION_NOT_READY Application is not at ready state.
0xC0000183	ERR_HIL_RESET_IN_PROCESS Application is performing a reset.
0xC0000200	ERR_HIL_WATCHDOG_TIME_INVALID Watchdog time is out of range.
0xC0000201	ERR_HIL_APPLICATION_ALREADY_REGISTERED Application is already registered.
0xC0000202	ERR_HIL_NO_APPLICATION_REGISTERED No application registered.
0xC0000203	ERR_HIL_INVALID_COMPONENT_ID Invalid component identifier.
0xC0000204	ERR_HIL_INVALID_DATA_LENGTH Invalid data length.
0xC0000205	ERR_HIL_DATA_ALREADY_SET The data was already set.
0xC0000206	ERR_HIL_NO_LOGBOOK_AVAILABLE Logbook not available.
0xC0001000	ERR_HIL_INVALID_HANDLE No description available - ERR_HIL_INVALID_HANDLE.
0xC0001001	ERR_HIL_UNKNOWN_DEVICE No description available - ERR_HIL_UNKNOWN_DEVICE.
0xC0001002	ERR_HIL_RESOURCE_IN_USE No description available - ERR_HIL_RESOURCE_IN_USE.
0xC0001003	ERR_HIL_NO_MORE_RESOURCES No description available - ERR_HIL_NO_MORE_RESOURCES.
0xC0001004	ERR_HIL_DRV_OPEN_FAILED No description available - ERR_HIL_DRV_OPEN_FAILED.
0xC0001005	ERR_HIL_DRV_INITIALIZATION_FAILED No description available - ERR_HIL_DRV_INITIALIZATION_FAILED.

Diagnostic Code	Description
0xC0001006	ERR_HIL_DRV_NOT_INITIALIZED No description available - ERR_HIL_DRV_NOT_INITIALIZED.
0xC0001007	ERR_HIL_DRV_ALREADY_INITIALIZED No description available - ERR_HIL_DRV_ALREADY_INITIALIZED.
0xC0001008	ERR_HIL_CRC No description available - ERR_HIL_CRC.
0xC0001010	ERR_HIL_DRV_INVALID_RESOURCE No description available - ERR_HIL_DRV_INVALID_RESOURCE.
0xC0001011	ERR_HIL_DRV_INVALID_MEM_RESOURCE No description available - ERR_HIL_DRV_INVALID_MEM_RESOURCE.
0xC0001012	ERR_HIL_DRV_INVALID_MEM_SIZE No description available - ERR_HIL_DRV_INVALID_MEM_SIZE.
0xC0001013	ERR_HIL_DRV_INVALID_PHYS_MEM_BASE No description available - ERR_HIL_DRV_INVALID_PHYS_MEM_BASE.
0xC0001014	ERR_HIL_DRV_INVALID_PHYS_MEM_SIZE No description available - ERR_HIL_DRV_INVALID_PHYS_MEM_SIZE.
0xC0001015	ERR_HIL_DRV_UNDEFINED_HANDLER No description available - ERR_HIL_DRV_UNDEFINED_HANDLER.
0xC0001020	ERR_HIL_DRV_ILLEGAL_VECTOR_ID No description available - ERR_HIL_DRV_ILLEGAL_VECTOR_ID.
0xC0001021	ERR_HIL_DRV_ILLEGAL_IRQ_MASK No description available - ERR_HIL_DRV_ILLEGAL_IRQ_MASK.
0xC0001022	ERR_HIL_DRV_ILLEGAL_SUBIRQ_MASK No description available - ERR_HIL_DRV_ILLEGAL_SUBIRQ_MASK.
0xC0001100	ERR_HIL_DPM_CHANNEL_UNKNOWN No description available - ERR_HIL_DPM_CHANNEL_UNKNOWN.
0xC0001101	ERR_HIL_DPM_CHANNEL_INVALID No description available - ERR_HIL_DPM_CHANNEL_INVALID.
0xC0001102	ERR_HIL_DPM_CHANNEL_NOT_INITIALIZED No description available - ERR_HIL_DPM_CHANNEL_NOT_INITIALIZED.
0xC0001103	ERR_HIL_DPM_CHANNEL_ALREADY_INITIALIZED No description available - ERR_HIL_DPM_CHANNEL_ALREADY_INITIALIZED.
0xC0001120	ERR_HIL_DPM_CHANNEL_LAYOUT_UNKNOWN No description available - ERR_HIL_DPM_CHANNEL_LAYOUT_UNKNOWN.
0xC0001121	ERR_HIL_DPM_CHANNEL_SIZE_INVALID No description available - ERR_HIL_DPM_CHANNEL_SIZE_INVALID.
0xC0001122	ERR_HIL_DPM_CHANNEL_SIZE_EXCEEDED No description available - ERR_HIL_DPM_CHANNEL_SIZE_EXCEEDED.
0xC0001123	ERR_HIL_DPM_CHANNEL_TOO_MANY_BLOCKS No description available - ERR_HIL_DPM_CHANNEL_TOO_MANY_BLOCKS.

Diagnostic Code	Description
0xC0001130	ERR_HIL_DPM_BLOCK_UNKNOWN No description available - ERR_HIL_DPM_BLOCK_UNKNOWN.
0xC0001131	ERR_HIL_DPM_BLOCK_SIZE_EXCEEDED No description available - ERR_HIL_DPM_BLOCK_SIZE_EXCEEDED.
0xC0001132	ERR_HIL_DPM_BLOCK_CREATION_FAILED No description available - ERR_HIL_DPM_BLOCK_CREATION_FAILED.
0xC0001133	ERR_HIL_DPM_BLOCK_OFFSET_INVALID No description available - ERR_HIL_DPM_BLOCK_OFFSET_INVALID.
0xC0001140	ERR_HIL_DPM_CHANNEL_HOST_MBX_FULL No description available - ERR_HIL_DPM_CHANNEL_HOST_MBX_FULL.
0xC0001141	ERR_HIL_DPM_CHANNEL_SEGMENT_LIMIT No description available - ERR_HIL_DPM_CHANNEL_SEGMENT_LIMIT.
0xC0001142	ERR_HIL_DPM_CHANNEL_SEGMENT_UNUSED No description available - ERR_HIL_DPM_CHANNEL_SEGMENT_UNUSED.
0xC0001143	ERR_HIL_NAME_INVALID No description available - ERR_HIL_NAME_INVALID.
0xC0001144	ERR_HIL_UNEXPECTED_BLOCK_SIZE No description available - ERR_HIL_UNEXPECTED_BLOCK_SIZE.
0xC0001145	ERR_HIL_COMPONENT_BUSY The component is busy and cannot handle the requested service.
0xC0001150	ERR_HIL_INVALID_HEADER Invalid (file) header. E.g. wrong CRC/MD5/Cookie.
0xC0001151	ERR_HIL_INCOMPATIBLE Firmware does not match device.
0xC0001152	ERR_HIL_NOT_AVAILABLE Update file or destination (XIP-Area) not found.
0xC0001153	ERR_HIL_READ Failed to read from file/area.
0xC0001154	ERR_HIL_WRITE Failed to write from file/area.
0xC0001155	ERR_HIL_IDENTICAL Update firmware and installed firmware are identical.
0xC0001156	ERR_HIL_INSTALLATION Error during installation of firmware.
0xC0001157	ERR_HIL_VERIFICATION Error during verification of firmware.
0xC0001158	ERR_HIL_INVALIDATION Error during invalidation of firmware files.
0xC0001160	ERR_HIL_FORMAT Volume is not formatted.

Diagnostic Code	Description
0xC0001161	ERR_HIL_VOLUME (De-)Initialization of volume failed.
0xC0001162	ERR_HIL_VOLUME_DRV (De-)Initialization of volume driver failed.
0xC0001163	ERR_HIL_VOLUME_INVALID The volume is invalid.
0xC0001164	ERR_HIL_VOLUME_EXCEEDED Number of supported volumes exceeded.
0xC0001165	ERR_HIL_VOLUME_MOUNT The volume is mounted (in use).
0xC0001166	ERR_HIL_ERASE Failed to erase file/directory/flash.
0xC0001167	ERR_HIL_OPEN Failed to open file/directory.
0xC0001168	ERR_HIL_CLOSE Failed to close file/directory.
0xC0001169	ERR_HIL_CREATE Failed to create file/directory.
0xC0001170	ERR_HIL_MODIFY Failed to modify file/directory.
0x0000F005	SUCCESS_HIL_FRAGMENTED Fragment accepted.
0x0000F006	ERR_HIL_RESET_REQUIRED Reset required.
0x0000F007	ERR_HIL_EVALUATION_TIME_EXPIRED Evaluation time expired. Reset required.

- PN slave diagnostic codes

  Each bit mask corresponds to a specific diagnostic status or fault type. When you obtain a diagnostic code, you can perform AND operation between the code and each bit mask.

  - If the result equals the bit mask, the corresponding diagnostic status exists and the bit is set to 1.
  - If the result is 0, the corresponding diagnostic status does not exist.

    For example, if the obtained diagnostic code is 0x00002001, it indicates errors of 0x00000001 and 0x00002000 occur simultaneously.

Bitmask	Description
0x00000001	PNM_AP_IOD_DIAGFLAG_NOT_EXISTING The device does not exist in the network
0x00000002	PNM_AP_IOD_DIAGFLAG_NOT_COMMUNICATING The device is not in cyclic dataexchange
0x00000004	PNM_AP_IOD_DIAGFLAG_ADDRESS_CONFLICT Multiple stations with the ip or the name exist

Bitmask	Description
0x00000008	PNM_AP_IOD_DIAGFLAG_FAULTY_DCP The device sent a faulty DCP response
0x00000010	PNM_AP_IOD_DIAGFLAG_NEGATIVE_RPC The device sent an RPC response with an error
0x00000020	PNM_AP_IOD_DIAGFLAG_DEACTIVATED The device sent an RPC response with an error
0x00000800	PNM_AP_IOD_DIAGFLAG_MODULEDIFF The device has a Module Diff Block with identification related entries
0x00001000	PNM_AP_IOD_DIAGFLAG_RESERVED_PNMV2 Used by PNMV2
0x00002000	PNM_AP_IOD_DIAGFLAG_MODULEDIFF_DIAGNOSIS The device has a Module Diff Block with diagnosis related entries

- DP slave information

SlaveState	SlaveState=0	SlaveState=1
SlaveDiag=0	No DataIOExchange between master and slave. This slave is not configured.	Slave is present on the bus. DataIOExchange between master and slave.
SlaveDiag=1	The master and the corresponding slave do not exchange their I/O data. The master holds newly received diagnostic data in the internal diagnostic buffer.	Slave is present on the bus. The master and the corresponding slave exchange their I/O data. The master holds newly received diagnostic data in the internal diagnostic buffer.

Service and Support

Should you encounter a safety accident during the use or operation of the product, or face challenges in operating and maintaining the equipment, which remain unresolved after the relevant documentation is consulted, we provide multiple channels to ensure prompt resolution:

- Channel #1: Contact service@inovance.com.
- Channel #2: Visit https://www.inovance.com/global to access document downloads, after-sales support, spare parts ordering, repair applications, and authenticity verification services.
- Channel #3: Download My Inovance app (https://zshc-eu.inovance.com/download-pc/) where you can access products info and documentation, and query product parameters.

We are committed to providing you with quick and professional technical support, and we look forward to your satisfaction and trust.
